BY COURIER

June 25, 2008

Ms. Kirsten Walli
Secretary
Ontario Energy Board
Suite 2700, 2300 Yonge Street
P.O. Box 2319
Toronto, ON.
M4P 1E4

Dear Ms. Walli:

EB-2007-0681 – Hydro One Networks' 2008 Distribution Rate Application – Evidence Update Filing

Hydro One Networks Inc. is updating the evidence filed to date with the Board with the addition of two new exhibits, Exhibit A-19-1 Witness List and Exhibit A-19-2 Curriculum Vitae.

An electronic copy of the complete application, including the attached updates, has been filed using the Board's Regulatory Electronic Submission System (RESS) and the proof of successful submission slip is attached.

Hydro One Networks will post electronic copies of the update on the Hydro One Networks' website for public access. In addition, one copy is being provided for public access at each of the following Hydro One Networks' offices –

Hydro One Networks Head Office, 8th Floor, South Tower, 483 Bay Street, Toronto, Ontario

Hydro One Networks Barrie Field Business Centre, 45 Sarjeant Drive, Barrie, Ontario

Hydro One Networks Peterborough Field Business Centre, 913 Crawford Drive, Peterborough, Ontario

Hydro One Networks Sudbury Field Business Centre, 957 Falconbridge Road, Sudbury, Ontario

Hydro One Networks Merivale Service Centre, 31 Woodfield Drive, Ottawa, Ontario

Hydro One Networks Dundas Field Business Centre, 40 Olympic Drive, Dundas, Ontario

Hydro One Networks Beachville Field Business Centre, 56 Embro Street, Beachville, Ontario

Hydro One Networks Thunder Bay Field Business Centre, 255 Burwood Road, Thunder Bay, Ontario

Hydro One Networks' point of contact for service of documents associated with this Application is listed in Exhibit A, Tab 1, Schedule 1.

Sincerely,

ORIGINAL SIGNED BY SUSAN FRANK

Susan Frank

ONTARIO ENERGY BOARD

IN THE MATTER OF *the Ontario Energy Board Act, 1998*;

AND IN THE MATTER OF an Application by Hydro One Networks Inc. For an Order or Orders approving rates for the distribution of electricity.

APPLICATION

1. The Applicant is Hydro One Networks Inc. ("Hydro One Networks"), a subsidiary of Hydro One Inc. Hydro One Networks is an Ontario corporation with its head office in Toronto. The Applicant carries on the business, among other things, of owning and operating transmission and distribution facilities in Ontario. The distribution business of Hydro One Networks will be referred to as "Hydro One Distribution".

2. Hydro One Networks hereby applies to the Ontario Energy Board (the "Board"), pursuant to section 78 of the *Ontario Energy Board Act, 1998,* for an Order or Orders approving the 2008 revenue requirement and customer rates for the distribution of electricity.

3. Hydro One Networks seeks approval of a revenue requirement of $1,067 million for the test year 2008. As part of the application, Hydro One Networks seeks approval to refund regulatory assets with a net balance of $(49) million, to be refunded over a four-year period at $(12) million per year. As a result of the expiry of historical rate riders to recover costs associated with a prior period as well as interim costs for smart meters, the resulting distribution rate increase for the average customer, relative to 2007 rates set by the Board under the Incentive Regulation Mechanism, would be on average less than 2.5% on the distribution

portion of the average customer total bill. This amounts to an average increase of less than 1% on the average customer total bill.

4. Hydro One Networks requests approval for electricity distribution rates that reflect the harmonization of rates for its acquired LDC and legacy customers and for a cost allocation and rate design that begins the process of establishing cost based rates.

5. Hydro One Networks also seeks approval for variance accounts related to incremental OEB costs, variances in actual pension costs, and bill impact mitigation.

6. Hydro One Networks will work within the framework of the Board established process for developing a third generation Incentive Regulation Model. Hydro One Networks anticipates that it will apply the Board’s third generation Incentive Regulation Model to adjust approved revenue requirement components to determine annual revenue requirements in 2009 and 2010.

7. The evidence to be filed with the Board will include a full description of all costs common to the Applicant’s distribution and transmission activities, but the revenue requirement and rates are based only upon those costs appropriately allocated to the distribution business.

8. The written evidence filed with the Board may be amended from time to time prior to the Board’s final decision on the Application. Further, the Applicant may seek meetings with Board staff and intervenors in an attempt to identify and reach agreements to settle issues arising out of this Application.

9. The persons affected by this Application are the ratepayers of Hydro One's distribution business. It is impractical to set out their names and addresses because they are too numerous.

10. Hydro One Networks requests that a copy of all documents filed with the Board by each party to this Application be served on the Applicant and the Applicant's counsel as follows:

a) The Applicant:

Mr. Glen MacDonald
Senior Advisor – Regulatory Affairs
Hydro One Networks Inc.

Address for personal service:	8th Floor, South Tower 483 Bay Street Toronto, ON M5G 2P5
Mailing Address:	8th Floor, South Tower 483 Bay Street Toronto, ON M5G 2P5
Telephone:	(416) 345-5913
Fax:	(416) 345-5866
Electronic access:	glen.e.macdonald@HydroOne.com

b) The Applicant's counsel:

Mr. D.H. Rogers, Q.C.
Rogers Partners LLP

Address for personal service:	181 University Avenue Suite 1900, P.O. Box 97 Toronto, ON M5H 3M7

Mailing Address:	181 University Avenue Suite 1900, P.O. Box 97 Toronto, ON M5H 3M7
Telephone:	(416) 594-4500
Fax:	(416) 594-9100
Electronic access:	don.rogers@rogersmoore.com

DATED at Toronto, Ontario, this 15th day of August, 2007.

HYDRO ONE NETWORKS INC.

By its counsel,

____

D.H. Rogers, Q.C.

SUMMARY OF APPLICATION

Hydro One Networks Inc. ("Hydro One" or "Hydro One Distribution" or "the Company") is applying for an Order approving the revenue requirement, cost allocation and rates for Hydro One's Distribution Business for the year 2008 ("test year") in accordance with the memorandum dated May 4, 2007, provided by the Ontario Energy Board (the "Board" or "OEB"), under Docket Number EB-2006-0330. This summary provides a brief description of the approvals being sought through this Application and a summary of reasons for the increase in revenue requirement.

1.0 SCOPE OF APPLICATION

The scope of this Application includes:

- the review of Hydro One's evidence in support of Distribution revenue requirements for 2008,
- the review of revised Distribution rates to be implemented in 2008, and
- the review of Hydro One's proposal for harmonizing acquired LDC and legacy customers' distribution rates into a reduced number of new rate classes over a 4 years period.

In its December 20, 2006 Cost of Capital report under Proceeding EB-2006-0088/EB-2006-0089, the Board determined that a deemed capital structure of 60% debt and 40% common equity was appropriate for all distributors in determining their revenue requirements. Hydro One has applied the Board's deemed capital structure of 60% debt and 40% common equity in determining its 2008 revenue requirements. For the 2008 test year, as per the Board's formulaic approach in Appendix B of the Cost of Capital Report, Hydro One has applied an equity return of 8.64% using the May 2007 Consensus

Forecast. The Company assumes that when the Board reaches its decision in this Application, Hydro One will be instructed to recalculate its 2008 test year equity return using a more current 2008 Consensus Forecast.

The Board's Decision on Hydro One's Distribution rates for 2006 under Proceeding RP-2005-0020/EB-2005-0378 approved methodologies to establish common corporate cost allocation, working capital and depreciation. The same methodologies were applied for and approved by the Board in their Decision on Hydro One Transmission's application under Proceeding EB-2006-0501, which included a 2008 test year. To ensure consistency is maintained for the 2008 test year, which is common to both the Distribution and Transmission Businesses, Hydro One has utilized these same methodologies. The interest rate used for construction work in progress (CWIP), also referred to as Allowance for Funds Used During Construction (AFUDC), reflects the Board's decision in EB-2006-0117, effective November 28, 2006. This decision prescribed that the interest rate to use for CWIP, effective May 1, 2006, would be the Scotia Capital All-Corporates Mid-Term Yield, as published on the Bank of Canada website and updated quarterly.

Hydro One assesses the condition of its Distribution assets on an ongoing basis, and the resulting Asset Condition Assessment has been used to shape the Sustainment OM&A and Capital plans set out in Exhibits C and D. Hydro One also undertook a stakeholder consultation process to increase understanding of the issues in this Application and to provide a forum for early identification of stakeholder concerns.

As discussed in Exhibit A, Tab 5, Schedule 1, this application by Hydro One Distribution is substantively consistent with the 2006 Electricity Distribution Rate Handbook ("the Handbook") issued by the Board on May 11, 2005, and with the Filing Requirements for Transmission and Distribution Applications (the "Filing Requirements") issued by the

Board on November 14, 2006. The evidence filed with this application is also consistent with Hydro One's Application for 2006 Distribution rates, and its Application for 2007 and 2008 Transmission rates, both of which were approved by the Board.

This application also fully reflects the impact of the Board's recent Decision with Reasons in EB-2007-0063, "OEB Combined Proceeding re: Smart Meters", issued on August 8, 2007. The smart meters decision is reflected and discussed in Exhibit F, Regulatory Assets.

Hydro One addresses through this Application all outstanding Board directives with respect to its Distribution Business. A listing of all relevant directives and the corresponding exhibit or a statement of status is provided in Exhibit A, Tab 17, Schedule 1.

In addition, over the next year, Hydro One will work within the framework of the Board established process for developing a third generation Incentive Regulation Model ("IRM"). Hydro One anticipates that it will apply the Board's third generation IRM to adjust revenue requirement components to determine annual revenue requirements in 2009 and 2010.

2.0 APPROVALS REQUESTED

2.1 Revenue Requirement

Respecting Hydro One's revenue requirement in the year 2008 for its Distribution Business, the Company is seeking approvals for:

1. A revenue requirement of $1,067 million for the 2008 test year, as set out in Exhibit E2, Tab 1, Schedule 1 on the basis of the methodology described in Exhibit E1, Tab 1, Schedule 1.
2. An OM&A cost expenditure level of $478 million in 2008 for the Distribution Business, as summarized in Exhibit C1, Tab 2, Schedule 1. Hydro One's request for this approval is supported by detailed evidence in various schedules in Exhibit C.
3. Other components of the "Cost of Service", as summarized in Exhibit C1, Tab 6, Schedule 1 and Exhibit C1, Tab 7, Schedule 1. These include Hydro One's depreciation and amortization rates and Payments in Lieu of corporate income taxes ("PILs") for the Distribution Business for 2008.
4. A Distribution business rate base of $4,382 million in 2008 as summarized in Exhibit D1, Tab 1, Schedule 1. Hydro One's request for this approval is supported by a discussion of the assets and the capital expenditures forecast for 2008 as found in Exhibit D.
5. Regulatory assets with a total balance of $(49) million to April 30, 2008, which would be refunded over a four-year period, as summarized in Exhibits F1, Tab 1, Schedule 1 and F1, Tab 2, Schedule 1.

Approval of the revenue requirement of $1,067 million for the 2008 test year and the regulatory assets with a total balance of $(49) million, combined with the expiry of rate riders, established under Proceeding RP-2004-0117/0118, and expiry of smart meters interim costs, result in a net distribution rate increase of less than 2.5%, relative to 2007 rates set by the OEB under the Incentive Regulation Mechanism. This distribution rate increase represents an increase of less than 1% on the average customer's total bill.

2.2 Cost Allocation and Rates

With respect to cost allocation and rates, Hydro One is seeking approvals of:

1. The 2008 rate schedules including terms and conditions of service as set out in Schedule 1 of Exhibit G2, Tab 4 to Exhibit G2, Tab 94. These schedules reflect the Company's proposed Retail Transmission Service Rates and loss factors.
2. The charges for the provision of miscellaneous services as set out in Exhibit G2, Tab 95, Schedule 1.
3. Hydro One Distribution's proposed cost allocation and rate design methodology, as described in Exhibit G1, Tab 1, Schedule 1 and supported by the remainder of the G Exhibit.
4. Hydro One Distribution's proposal for harmonizing acquired LDC and legacy customers' distribution rates into a reduced number of new rate classes over a 4 year period, as described in Exhibits G1, Tab 2, Schedule 5 and Exhibit G2, Tab 2, Schedule 1.
5. The modifications to the OEB cost allocation model as discussed in Exhibit G2, Tab 1, Schedule 1.
6. The disposition of the balances accumulated in Regulatory Accounts as shown in Exhibit F1, Tab 2, Schedule 1.

<u>Other</u>

7. Hydro One also seeks approval of variance accounts to track the impact of incremental OEB costs, variances between Hydro One's planned and actual pension costs, and the deferred revenue as a result of mitigation to limit customer's total bill impacts as described in Exhibit F1, Tab 3, Schedule 1.

3.0 CAUSES OF THE INCREASE IN REVENUE REQUIREMENT

Hydro One's revenue requirement of $1,067 million for 2008 is provided in Exhibit E2, Tab 1, Schedule 1. The main contributions to the increase in revenue requirement in 2008 are:

- Growth of about $660 million in the installed asset base since rates were established in the year 2006. This expansion was required to install smart meters, meet growth in customer demand, replace assets damaged by storms, resolve trouble calls, and replace end-of-life assets.
- Increases in OM&A requirements, largely precipitated by a planned increase in vegetation management, support of smart meters, lower overheads capitalized and the effects of escalation in replacement parts, materials and labour rates.
- The increase to the Hydro One Distribution Business common equity component from 36% to 40%. This deemed capital structure was determined by the Ontario Energy Board as being appropriate for all distributors in its December 20, 2006, Cost of Capital report.

These increases are offset by lower statutory tax rates, sales growth, a reduced return on equity, a decrease in asset removal costs, and lower interest rates. The increased revenue requirement combined with the expiry of rate riders, established under Proceeding RP-2004-0117/0118, and the expiry of smart meters interim costs, result in a net distribution rate increase of less than 2.5% relative to 2007 rates set by the OEB under the Incentive Regulation Mechanism, which represents an increase of less than 1% on the average customer's total bill.

The increases identified within the Application will ensure that customers within the Province will continue to be supplied in a secure and reliable manner, thereby contributing to the health and competitiveness of the Province's economy.

FINANCIAL SUMMARY

1.0 INTRODUCTION

Hydro One Distribution is making this application in accordance with the requirements of the Ontario Energy Board *Filing Requirements for Transmission and Distribution Applications* issued November 14, 2006. The proposed revenue requirement and rates included in this application have been prepared on the basis of a forward-looking 2008 test year. This submission also includes information for a 2007 bridge year, historical information for 2004, 2005 and 2006, and historic Board approved 2006 year.

Hydro One is proposing to recover a total revenue requirement of $1,067 million from its customers for the 2008 test year. Calculation of the revenue requirement appears in the evidence at Exhibit E2, Tab 1, Schedule 1.

Hydro One has not conducted a Cost of Capital or Rate of Return study in support of its current submission. Hydro One's submission is based on the capital structure, debt rates and return on equity formulas prescribed in the 'Report of the Board on Cost of Capital and 2nd Generation Incentive Regulation (December 20, 2006). The requested return on common equity is 8.64%, as specified by the formula in the report above. Hydro One Distribution's evidence in support of its Cost of Third Party Long Term Debt appears at Exhibit B1, Tab 1, Schedule 1 and Exhibit B1, Tab 2, Schedule 1, respectively.

Hydro One Distribution's OM&A expenditures have been determined on the basis of an examination of required work programs to ensure the most appropriate, cost-effective solutions to respond to corporate objectives. A description of Hydro One's planning process is provided at Exhibit A, Tab 14, Schedule 1. The proposed OM&A expenditures are $478 million, driven by such factors as the need to meet customer, regulatory and statutory requirements regarding service and reliability. These expenditures are itemized at Exhibit C2, Tab 2, Schedule 1 and discussed in written direct evidence at Exhibit C1, Tabs 1 and 2. Hydro One has used the Corporate Cost Allocation Methodology, approved in RP-2005-0020/EB-2005-0378, to allocate the costs of shared services OM&A and capital expenses between Transmission and Distribution.

Depreciation and amortization expense of $239 million for 2008 has been determined based on the results of Hydro One's depreciation policy. These costs are described in written evidence at Exhibit C1, Tab 6, Schedule 1 and shown in detail in C2, Tab 5, Schedule 1. Depreciation was calculated using the Depreciation Study methodology submitted as part of the 2006 Distribution rate filing (RP-2005-0020/EB-2005-0378). The Board accepted the methodology and resulting cost flows from the Depreciation Study for the purpose of setting rates.

In addition to the Depreciation Study, Hydro One has incorporated the methodologies of the Lead Lag study, submitted and accepted by the Board in RP-2005-0020/EB2005-0378, into the 2008 revenue requirement. The calculation of working capital, filed at Exhibit D1, Tab 1, Schedule 3, incorporates the methodologies of the Lead Lag study.

Hydro One Distribution's proposed Rate Base of $4,382 million is discussed at Exhibit D1, Tab 1, Schedule 1.

This submission reflects Hydro One Distribution's plan to invest in distribution assets to meet its objectives regarding public and employee safety; regulatory and legislative compliance; service quality and reliability; and meeting system growth requirements. The capital project and program approval and control policy is presented at Exhibit A, Tab 14, Schedule 4. Hydro One is forecasting total capital expenditures of $566 million. Details of Hydro One Distribution's capital budget are illustrated in schedules filed at Exhibit D2, Tab 2 and discussed in detail at Exhibit D1, Tab 3.

Hydro One Distribution earns approximately 4% of its revenues from sources other than its distribution tariff. As the costs incurred to generate these revenues are included in Hydro One's cost of service, these external revenues of $42 million in 2008 are recorded as an offset to the revenue requirement. External revenues are discussed at Exhibit E3, Tab 1, Schedule 1 and illustrated in Exhibit E3, Tab 2, Schedule 1.

In accordance with standard regulatory practice, Hydro One Distribution has incurred prior costs for which it is requesting approval in this submission. A total of $(49) million will be recorded as at April 30, 2008 in a series of regulatory assets. Hydro One is proposing to recover the $(49) million over four years, $(12) million per year starting in the 2008 test year. Hydro One's submissions regarding this account balance and proposed disposition appears at Exhibit F1, Tab 1, Schedule 1 and Exhibit F1, Tab 2, Schedule 1 respectively.

Hydro One Networks received OEB approval on October 10, 2007 to purchase the distribution system of Terrace Bay Superior Wires and amend its Distribution Licence to include in its service area the area previously served by Terrace Bay Superior Wires. The assets of Terrace Bay have subsequently been integrated into Hydro One Distribution's operations. The Terrace Bay acquisition adds $1.1 million to rate base and $0.3 million to revenue requirement. The customer forecast has been updated to reflect the Terrace Bay acquisition, as noted in Exhibit A, Tab 14, Schedule 3. Given the relatively minor impact on Hydro One Distribution's rate base and revenue requirement, these numbers have not been changed throughout the evidence. The distribution rates for Terrace Bay customers have been provided as part of Exhibit G2, Tab 82.

The following tables summarize the financial highlights for the 2008 Test Year.

Cost of Capital

Line No.		*Deemed* Capital Structure ($ millions)*	*Total Rate Base Percent*	*Cost Rate (%)*	*Exhibit*
		(a)	(b)	(c)	(d)
1	Total Debt	2,629.2	60.0%	5.65%	B2-1-1
2	Common Equity	1,752.8	40.0%	8.64%	B2-1-1
3	Total Rate Base	4,382.0	100.0%	6.84%	B1-1-1

* As per Board direction, Preferred Shares deemed to be $0 for regulatory purposes.

Financial Highlights

Line No.		*$ millions*	*Exhibit*
1	Total OM&A Expense	477.7	C2-1-1
2	Capital Expenditures	566.2	D2-2-1
3	Rate Base	4,382.0	D2-1-1
4	Revenue Requirement	1,066.8	E2-1-1
5	External Revenues	42.0	E3-2-1
6	Return on Capital	299.9	E2-1-1
7	Regulatory Assets Recovery	(12.2)	F2-2-1

2.0 2006 BOARD APPROVED VS. 2006 ACTUALS VARIANCE EXPLANATIONS

2.1 Operations, Maintenance & Administration

The following table compares 2006 actual costs versus 2006 Board approved costs for OM&A.

OM&A Cost Categories ($ million)	**2006 Actuals** ($ million)	**2006 Board Approved** ($ million)	**Variance** ($ million)
Sustaining	$255.6	$230.3	$25.3
Development	4.2	4.9	(0.7)
Operations	14.9	14.3	0.6
Customer Care	103.7	101.1	2.6
Shared Services & Other Costs	21.2	67.9	(46.7)
Taxes other than Income Taxes	4.5	4.6	(0.1)
Total OM&A	$404.1	$423.1	$(18.9)

Hydro One Distribution's OM&A costs were $404 million compared to $423 million approved by the Board in the RP-2005-0020/EB-2005-0378 Decision with Reasons, a decrease of $19 million. The majority of this differential comes from a decrease in Shared Services and Other Costs, ($47 million) offset by increases in Sustaining OM&A, $25 million, and Customer Care, $3 million.

Shared Services and Other Costs were $47 million below the $68 million approved by the OEB, primarily due to deferred pension expenses ($30 million), increased capitalized overhead credit ($11 million) and smart meter expenses ($5 million).

Corporate capitalized overhead was negative $59.8 million versus the approved negative $48.4 million. This reflects higher capital expenditures than planned which results in more overhead costs capitalized. OM&A expense is reduced by the amount of overhead capitalized. Hydro One will be adjusting the Overhead Capitalization rate in 2008 to return this amount to customers (see Exhibit C1, Tab 5, Schedule 2).

Sustaining OM&A actual 2006 costs was $25 million over the $230 million approved by the OEB. This was primarily due to work efforts required associated with system restoration and forestry work due to the unusually high number of major storms. In addition, smart meter expense was reclassified to sustaining from shared services, increasing sustaining by $5 million.

2.2 Capital Expenditures

Capital Expenditures ($ million)	**2006 Actuals** ($ million)	**2006 Board Approved** ($ million)	**Variance** ($ million)
Sustaining	$186.3	$119.6	$66.7
Development	146.8	137.2	9.6
Operations	2.1	3.5	(1.4)
Shared Services	57.4	72.7	(15.3)
Total	$392.6	$333.0	$59.6

Hydro One Distribution's capital expenditures in 2006 were $393 million compared to $333 million approved by the Board in the EB-2005-0378/RP-2005-0020 Distribution Decision, an increase of $60 million.

A number of factors resulted in capital spending above Board approved levels. The primary factors were the unusually high number of damaging storms in 2006 and an increased need for unplanned equipment replacement, which together contributed to $48 million of additional Sustaining capital. Smart Meters resulted in $14 million of additional Sustaining capital. As well, equipment and material cost escalation rose significantly above forecast levels between the completion of the 2006 business plan and the actual commencement of work. These equipment and material cost increases had a significant impact upon Sustaining and Development program investments. Development capital also increased as a result of Hydro One experiencing a higher than expected volume of more costly sub-division work and with the Company introducing new protection standards for subdivision connections in 2006.

2.3 Rate Base

Rate Base Component ($M)	2006 Actuals	2006 Board Approved	Variance
Gross Plant	$5,679.6	$5,550.0	$ 129.6
Accumulated Depreciation	(2,252.3)	(2,126.7)	(125.5)
Net Plant	**3,427.3**	**3,423.3**	**4.0**
Cash Working Capital[1]	265.6	265.6	-
Materials & Supplies Inventory	22.6	22.9	(0.3)
Total Rate Base	$3,715.4	$3,711.7	$ 3.7

Hydro One Distribution does not calculate actual cash working capital, thus the 2006 approved amount was used for illustrative purposes.

Total rate base was $3.7 million above the board approved amount, a variance of less than 1%.

SUMMARY OF DISTRIBUTION BUSINESS

1.0 INTRODUCTION

Hydro One Networks Inc. is licensed by the Ontario Energy Board (the "OEB" or the "Board") to own, operate and maintain electricity distribution facilities in the Province of Ontario. Hydro One's distribution system is one of the largest systems in North America and serves predominately rural Ontario along with several urban centres.

Hydro One Distribution is driven by Hydro One's corporate mission and business values. Together, they provide the basis to deliver on targeted performance objectives.

1.1 Corporate Mission

> ***"Our mission is to be an efficient transmission and distribution company that is best in North America in the areas of safety, customer service and reliability, while focusing on the development and retention of our employees and creating shareholder value."***

1.2 Strategic Goals and Performance Targets

The company's strategic goals as represented by its business values and performance targets are shown in Table 1 below. The performance targets shown are for 2010. The 2008 investments and expenditures described in this filing are consistent with achieving these 2010 targets and consistent with meeting the business values described in Exhibit A, Tab 14, Schedule 5.

Table 1:
Strategic Goals

Business Value	2010 Performance Target
Safety Focus on cultural change to create and maintain an injury-free workplace.	Zero serious injuries and zero serious near misses
Customer Service Become a more customer-focused company. Improve customer satisfaction. Build relationships with large and mid-size customers that reflect their commercial requirements.	90% customer satisfaction in all major segments
Reliability Maintain or improve reliability and service standards in the distribution system while expanding the system to meet Ontario's future needs.	First quartile distribution reliability (like with like comparison)
Employees Manage the challenges of labour demographics, productivity improvement, development of skills And retention of critical staff.	Attract, develop and retain productive employees
Shareholder Maintain an effective borrowing capability through stable credit quality, and deliver stable financial returns.	Maintain “A” credit rating Allowed regulated return on equity Top quartile capital/operating efficiency Top quartile employee productivity

2.0 SYSTEM BACKGROUND

The Hydro One Distribution system has evolved over almost 100 years. At Dec. 31, 2006, Hydro One Distribution managed $3.5 billion in fixed assets supplying electricity to customers across the province of Ontario. The assets consist of about 119,900 circuit kilometers of distribution line and 1006 distributing and regulating stations. The system delivers electricity at voltages below 50 kV from Ontario's transmission and generation systems to 34 Local Distribution Companies, approximately 1.2 million Retail Customers and 44 directly connected large users. The system is also likely to be used increasingly to serve distributed generators. As of the end of June, 2007, the Ontario Power Authority's (OPA's) Renewable Energy Standard Offer Program had resulted in about 1,000 projects exploring the feasibility of developing new renewable generation up to 10 MW connecting to Hydro One's distribution system. It is expected that many of these will go forward and connect to the system.

The Hydro One Distribution system is mainly radial in design, with very little redundancy in supply to customers, which is consistent with other rural systems. Because of this configuration, most component failures require immediate repair to restore service. To effectively manage the response to trouble calls from customers, initial problem assessment and dispatching of a response is handled through the single Ontario Grid Control Centre (OGCC).

The Hydro One Distribution system typically operates in a service territory characterized by low customer densities. To cost-effectively provide operating, maintenance and restoration services there are a number of Service Centers located throughout the Province. These Service Centers provide base locations for field crews and related materials, tools and equipment.

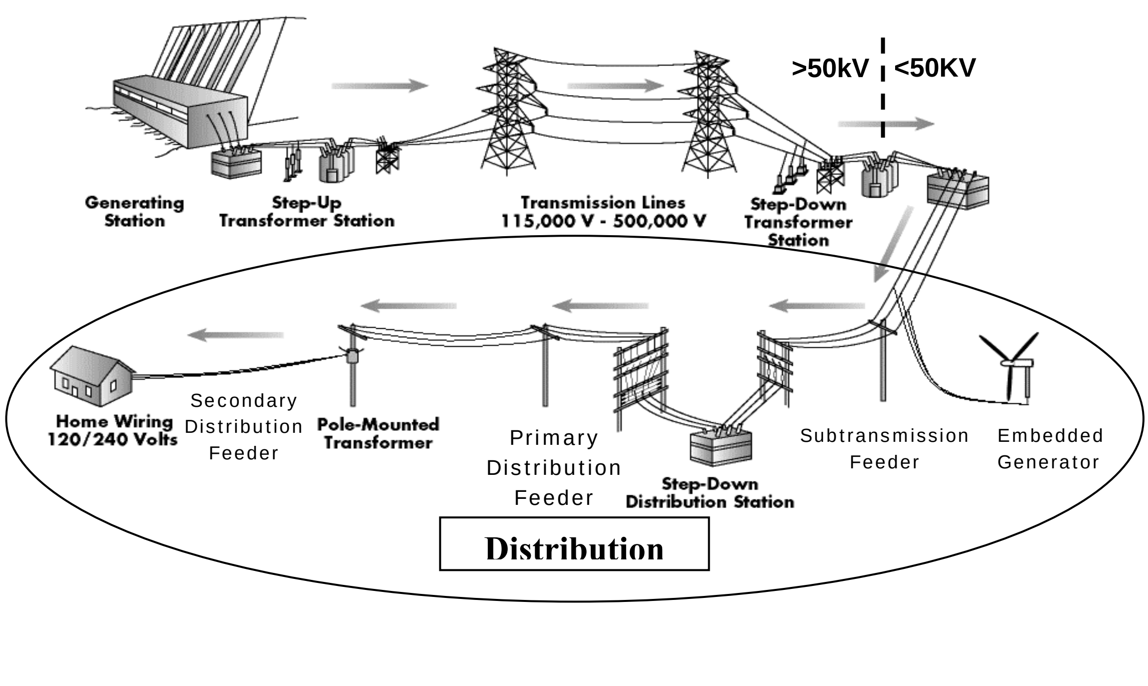
3.0 DISTRIBUTION SYSTEM COMPONENTS

The Hydro One Distribution system receives wholesale electricity from the transmission system and delivers it to consumers at lower voltages through a series of radial assets. It is also used to take electricity from smaller distributed generators connected directly to the distribution system, or connected to load customer systems which are connected to the distribution system. The system consists primarily of the following assets:

- Subtransmission feeders
- Distribution Stations
- Primary Distribution Feeders
- Pole top and pad mounted transformers
- Secondary distribution feeder

Figure 1 provides a simplified illustration of Hydro One Networks' distribution system.

Figure 1: Hydro One Networks' Distribution System [1]



[1] For illustrative purposes only, actual configuration may vary from case to case.

3.1 Subtransmission Feeders

Hydro One's 24,800 circuit kilometers of subtransmission feeders predominately originate at transmission transformer stations and in a some cases at distribution stations and provide a link between Hydro One Networks' system and large distribution connected customers, (e.g. generators, distribution LDCs) and other end use customers. Typically, subtransmission feeders supply service at 44 kV, 27.6 kV, 25 kV, 22 kV and 13.8 kV directly to end-use customers or deliver service to distribution stations owned by either LDCs or Hydro One Distribution where further voltage transformation takes place.

In some cases, regulating stations are used to maintain subtransmission feeder voltages within the prescribed limits. This is needed because the line voltage increases or decreases depending on the loading variations at the distribution stations supplied by the sub-transmission feeders.

3.2 Distribution Stations

Distribution stations step down voltage from transmission or sub-transmission levels to primary distribution voltage for distribution to commercial, industrial, farm, year-round residential and seasonal residential customers. In future, where the output of distributed generation served from a distribution station exceeds the demand of load customers served by that station, the distribution station will also be required to step up voltages as the flow reverses from the normal direction of serving load.

Distribution stations typically consist of one or two transformers, depending on the load that needs to be supplied. A loss of any one element (such as a transformer or a feeder) at a distribution station will normally result in the interruption of service to all customers served from that station until the failed component is repaired or replaced, or until an alternate service is enabled.

3.3 Primary Distribution Feeders

Hydro One Distribution has 95,100 circuit kilometers of primary distribution feeders operating from 4 kV to 13.8 kV. These feeders are radial circuits that deliver power from distribution stations to individual customers via pole top and pad mounted transformers and include overhead circuits, underground cables and submarine cables. These feeders are also likely to be used to serve increasing numbers of smaller new generators in future.

3.4 Pole Top and Pad Mounted Transformers

Hydro One Distribution's 435,000 pole top transformers are used to step down primary distribution voltages to secondary voltage level, the voltage level used by residential and small commercial customers. Hydro One's system also has 40,000 pad mounted transformers which perform the same function when power is supplied by underground feeders.

Depending on the proximity of adjacent customers, each single-phase pole top or pad mounted transformer may supply several customers at 240/120 volts whereas a three-phase pole top or pad mounted transformer supplies a single customer at 600/347 volts or 208/120 volts.

3.5 Secondary Distribution Feeders

Hydro One Distribution's system has approximately 48,000 kilometers of secondary distribution feeders connect pole top or pad mounted transformers with individual customers at the secondary voltage levels described in the previous section. These feeders could be either underground or overhead when originating from a pole top transformer and underground only when originating from a pad mounted transformer.

4.0 WORK PLANNING AND SYSTEM OPERATIONS

Hydro One Distribution's investment plans and work needs are based on a long-term planning cycle which takes into account various factors such as asset condition assessment studies, historical performance data, asset criticality, availability of spare equipment and material, asset demographics, load growth and future capacity requirements. Program and project needs are evaluated using the prioritization approach described in Exhibit A, Tab 14, Schedule 5. The prioritization approach uses business values reflecting Hydro One Distribution's mission and strategic objectives to develop a ranked list of projects and programs. The annual work plan is then refined to a more detailed level, scheduled and implemented. The work plan also includes provision for unplanned work necessitated by storm damage, equipment failures and other unforeseeable events.

The annual work plan is broadly grouped into Sustaining, Development and Operations categories, as further described below.

4.1 Sustaining

Asset sustaining work is defined as the work required to maintain existing infrastructure and facilities such that they operate at their required performance level. Hydro One Distribution plans and executes asset sustainment work to maintain customer delivery reliability system-wide while meeting applicable legislative, regulatory, safety and environmental requirements. The capital component of sustaining work deals primarily with refurbishment or replacement of end of life components or systems. The OM&A component of sustaining work addresses preventive and breakdown (corrective) maintenance within the useful life span of the asset.

The Sustainment OM&A and Capital components of the investment plan are described in Exhibit C1, Tab 2, Schedule 2 and Exhibit D1, Tab 3, Schedule 2 respectively.

4.2 Development

Hydro One Distribution plans and executes development work on the distribution system to connect new load customers and generators, and to ensure that the system has sufficient capability to supply existing and forecast loads. Included in the Development category is work to improve the reliability of service to customers, ensure that service is within acceptable utility standards, and in some cases mitigate risks associated with deteriorated assets, where a different network configuration is preferable to like-for-like asset replacement. The work is largely driven by customer demand and involves both short-term and long-term system reinforcement projects. Funding levels are based on meeting requirements of the Distribution System Code and Hydro One Distribution's Conditions of Service, and addressing the most critical system reinforcement needs.

The Development OM&A and Capital components of the investment plan are described in Exhibit C1, Tab 2, Schedule 3 and Exhibit D1, Tab 3, Schedule 3 respectively.

4.3 Operations

The Operations category primarily includes work to operate the distribution system on a day-to-day basis. As noted above, the distribution system is operated through a combination of central control and dispatch via the OGCC, and local response by field crews operating from service centers across Hydro One Distribution's service territory. This approach allows for efficient problem-identification and dispatch of personnel as well as timely customer notification. Currently the Hydro One Distribution system relies on power-off calls by customers to identify interruptions except at locations where a sub-transmission feeder originates at a transformer station. Real time monitoring exists at these transformer stations, but not on other locations on the distribution system.

The Hydro One Distribution system covers an extensive geographic area and its customer base is both urban and rural resulting in large density differences. The company's response capability is dependent on service center location, fault location and terrain. In general, high-density areas are served within 2 hours and in rural areas response times can be up to 4 hours due to travel requirements. This scale and diversity in the distribution system has a direct impact on Hydro One Distribution's costs and system-average interruption measures for both frequency and duration.

The Operations OM&A and Capital components of the investment plan are described in Exhibit C1, Tab 2, Schedule 4 and Exhibit D1, Tab 3, Schedule 4,

5.0 ASSET MANAGEMENT MODEL

Hydro One has adopted an Asset Management model in designing the processes used to plan, approve and implement work. The key principles include having functions primarily responsible for defining the work requirements (Asset Management functions) and functions primarily responsible for delivering asset and customer based services in accordance with the defined work (Work Execution functions). Primary responsibility for planning and decision making associated with the management of distribution assets falls under the Asset Management functions, whereas primary responsibility for providing engineering, design, estimating, construction, maintenance, operating, and customer care services falls under the Work Execution functions.

Both components of the business actively participate in all phases of work planning and implementation. However, the focus created by this approach allows Hydro One Distribution to better create the competencies and cost-efficiencies to effectively plan and implement the work.

5.1 Asset Management Functions

Hydro One manages its distribution assets using two main processes, Strategy Development and System Investment.

5.1.1 Strategy Development

The Strategy Development function provides a managed approach for developing strategies, policies, and standards associated with the operation, maintenance and expansion of the distribution system. This function is specifically responsible for designing programs to:

- Ensure compliance with regulatory requirements;
- Achieve business objectives such as public and employee safety, reliability, productivity and customer service;
- Provide feedback for continually improving process effectiveness and asset/business performance; and
- Incorporate new methodologies and refining existing methodologies to improve effectiveness and productivity of processes in place.

The Strategy Development function provides the strategies and framework used by the System Investment function to develop programs and investments for Hydro One's distribution assets.

5.1.2 System Investment

Hydro One's distribution business strives to continually improve the efficiency and effectiveness of the regulated wires assets. This involves asset management processes and practices to ensure that the asset related decisions are consistent, cost-efficient and effective. These decisions are aimed at developing a prioritized and rationalized investment plan for the operation, maintenance and upgrade of existing assets, and the addition of new assets.

Hydro One utilizes a Life Cycle Planning concept which recognizes that the distribution business encompasses a portfolio of assets that must be managed over the long term and reflects the fact that not all assets have the same life cycle characteristics or the same criticality with respect to achieving business values and performance.

In preparing investment plans, the planning function utilizes Asset Condition Assessment information (described in Exhibit D1, Tab 2, Schedule 1), historical performance data, asset criticality, availability of spares and asset demographics to develop a detailed list of specific work needs.

Each specific work need is evaluated against the business values, described in Exhibit A, Tab 14, Schedule 5, to establish the benefit of the work and the associated risks of not conducting it. Solutions are developed to mitigate these risks on a program-by-program basis. For each program a prioritization index (cost versus benefit) is developed and all investments are then prioritized in accordance with the process described in Exhibit A, Tab 14, Schedule 5. This prioritized list of programs is then detailed, scheduled and implemented by the work execution functions.

Substantial new generation appears likely to connect to Hydro One's distribution system over the next few years. At present, generators are connected on a completely user pay basis. As such, the distribution system is not being developed proactively to accommodate potential new generation. However, there is a need to evolve the distribution planning function to deal with issues related to such things as distribution system limits on generation capacity, maintaining reliability and power quality for other customers, and ensuring the necessary operational and planning flexibility to respond to changing system needs. As a result, the addition of new generators will lead to an expanded scope for distribution system planning going forward

5.2 Work Execution Functions

The work execution functions provide engineering, design, estimating, construction, maintenance, and operating services. Customer relationship management and support services and supporting research, environmental, and public/employee health and safety programs are also provided by these functions. These activities are performed by a multi-disciplined workforce capable of performing tasks related to operating, maintaining and expanding the distribution business. There are three primary work execution functions within Hydro One: Customer Operations, Grid Operations and Engineering and Construction.

5.2.1 Customer Operations

The Customer Operations function is responsible for the design, estimating, scheduling and completion of line construction and maintenance work for lines, including forestry and customer care support services. As well, the Customer Operations function has accountability for planning and connecting new retail customers to the distribution system and to address local system planning issues. The work activities are managed through the following core processes:

- Estimating Process,
- Planning and Scheduling Process,
- Project Management Process,
- Customer Connection Process,
- Condition Assessment, Line Maintenance, and Lines Sustaining Capital work execution,
- Lines Trouble Response and Correction Action Process,
- Lines Development Capital work execution,
- Work Program Management, and
- Work Reporting Processes.

Lines and Forestry services provide for the maintenance of overhead and underground distribution lines and for vegetation management. The vegetation management program is necessary to ensure that clearances to energized equipment are maintained and that these clearances provide a sustainable level of reliability.

Customer care services may be divided into the following high-level functions: meter reading; billing; settlements; customer contact handling; and collections.

5.2.2 Grid Operations

The Grid Operations function provides maintenance and technical services for stations and protection and control. This function also provides central operations and services for distribution which includes distribution system operation from the OGCC. The work activities are managed through the following core processes:

- Estimating Process,
- Planning and Scheduling Processes,
- Condition Assessment, Station Maintenance, and Station Sustaining Capital work execution,
- Trouble Response and Corrective Action Process,
- Work Program Management, and
- Work Reporting Processes.

The OGCC coordinates an extensive outage program with various internal stakeholders and external customers to support Hydro One's distribution expansion and maintenance programs. Required outages are assessed and coordinated to minimize their impact on reliability and customer operation.

Grid Operations also maintains back-up operating facilities which serve as a fully redundant back-up to the OGCC.

5.2.3 Engineering and Construction

The Engineering and Construction function provides services ranging from engineering and design to the construction and commissioning of new or enhanced facilities. These projects include the engineering, estimating, project management, and construction of stations, system protection and control, as well as engineering services as required. The work activities are managed through the following core processes:

- •• Estimating Process,
- •• Planning and Scheduling Process,
- •• Project Management Process, and
- •• Project/Program Controls Process.

6.0 RELIABILITY

The reliability of the distribution system and its ability to delivery power to customers without interruption is measured using the following two industry standard metrics:

- •• System Average Interruption Duration Index (SAIDI)
- •• System Average Interruption Frequency Index (SAIFI)

SAIDI is a measure that indicates the amount of time without power that an average customer on Hydro One Distribution's system experienced in a given year. SAIFI is a measure that indicates the number of times that an average customer on Hydro One Distribution's system was interrupted in a given year.

Reliability performance is affected by the level of equipment maintenance and replacement programs, which ensure assets remain in good operating condition, and by the level of vegetation management, which ensures that outages caused by tree contacts are minimized. In addition, the time required to respond to a power interruption has a direct impact on restoration time and therefore impacts the SAIDI measure.

Spending levels for vegetation management and other maintenance programs are determined by balancing the benefits achieved through a reduction in the number of incidents and reduced future costs (such as lower unit costs to remove less vegetation), against the cost of additional spending to achieve the longer term reductions. Costs and reliability are derived using life-cycle analysis and these are ranked against other investment plans using the prioritization methodology described in Exhibit A, Tab 14, Schedule 5 to arrive at the optimum spending levels.

The following two figures illustrate Hydro One Distribution's reliability performance over the 2003 to 2006 period. Note that an event is considered *force majeure* when it impacts more that 10% of customers serviced by Hydro One Distribution.

Figure 2: Yearly SAIDI Performance

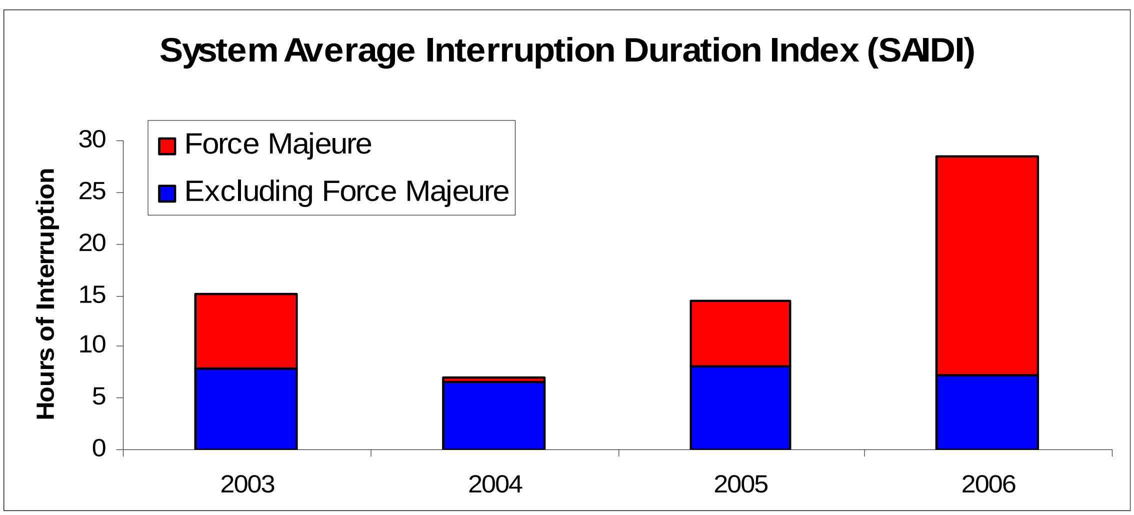


Figure 3: Yearly SAIFI Performance

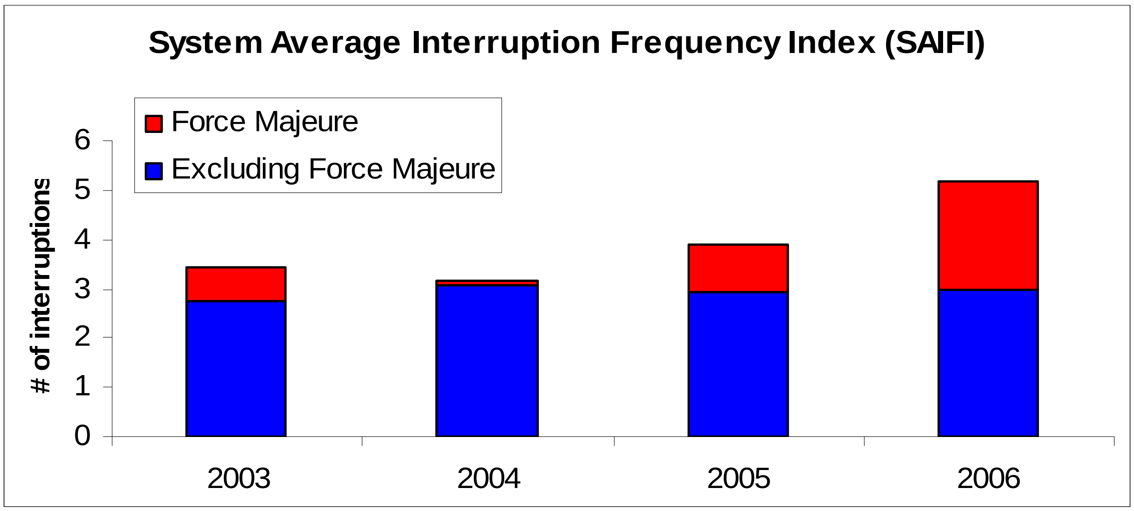
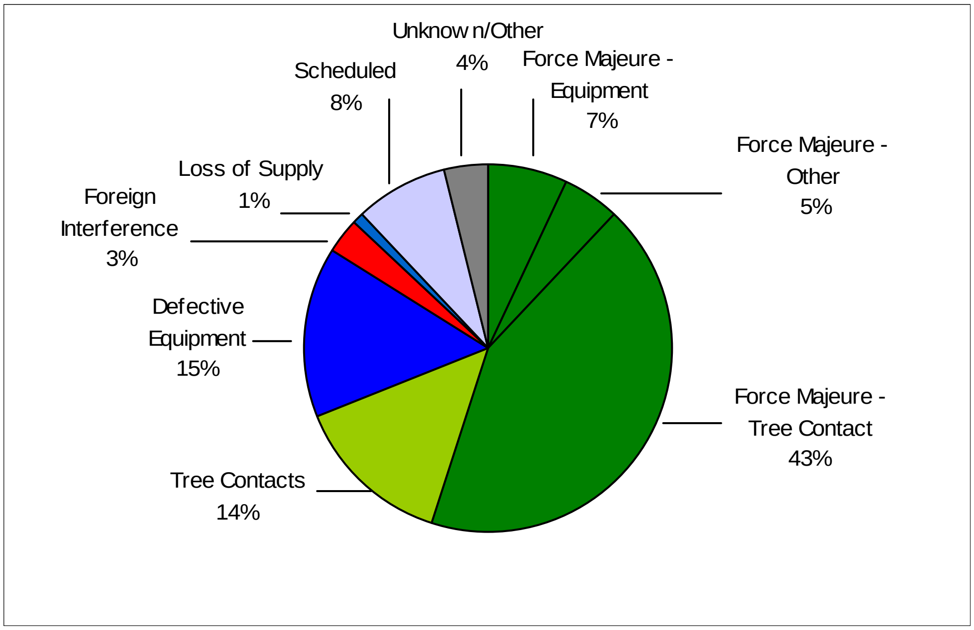


Excluding *force majeure* events, performance for both SAIDI and SAIFI has remained relatively consistent during the 2003 to 2006 period, with performance in 2006 remaining stable or improving relative to 2005. Including *force majeure* events, performance has varied significantly from year to year due to variations in the number and severity of storms that have affected the Hydro One Distribution system in a given year.

Figure 4 below illustrates the factors that contributed to the SAIDI performance over the 2003 to 2006 period.

Figure 4: Contributions to SAIDI - Four Year Average 2003 - 2006

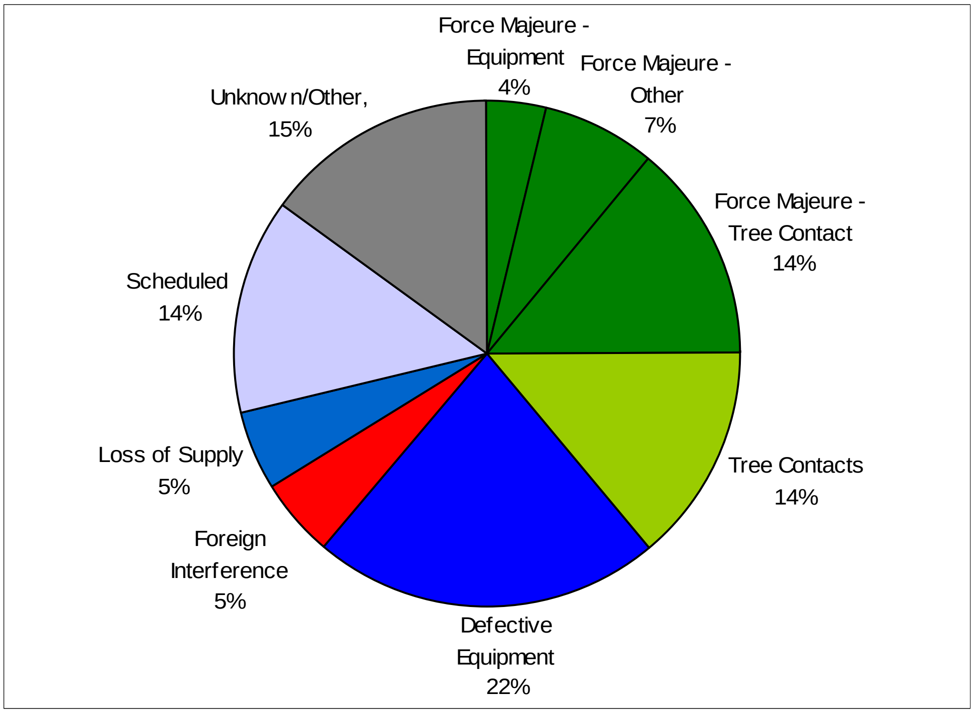


* Excludes Aug 14, 2003 blackout

Outages attributed *to Force majeure* events (e.g. high winds, ice or snow) contributed to 55% of SAIDI. With a focus on specific causes, it is noted that tree contacts account for 57% of total SAIDI (43% *force majeure* and a further 14% excluding *force majeure*). The next largest contributor to SAIDI was defective equipment at 15%.

Figure 5 below illustrates the factors that contributed to the SAIFI performance over the 2003 to 2006 period.

Figure 5: Contributions to SAIFI - Four Year Average 2003 - 2006



* Excludes Aug 14, 2003 blackout

Tree contact was the main contributor to SAIFI totaling 28% (i.e. 14% *force majeure* and a further 14% excluding *force majeure*). The other significant contributor was defective equipment at 22%.

NOTICES OF MOTION

To be filed behind this tab as and when Notices are filed.

COMPLIANCE WITH OEB FILING REQUIREMENTS FOR ELECTRICITY DISTRIBUTORS

1.0 INTRODUCTION

This application by Hydro One Distribution is substantially consistent with the requirements of the 2006 Electricity Distribution Rate Handbook ("the Handbook") issued by the Board on May 11, 2005 and with the Filing Requirements for Transmission and Distribution Applications (the "Filing Requirements") issued by the Board on November 14, 2006.

Hydro One Distribution's Application follows the format used in the previous Distribution Rates proceeding, which was well received by the Board and intervenors, and incorporates improvements made to the filing format as part of the recent Transmission Application. Hydro One's Application substantially satisfies the Filing Requirements and Handbook requirements except where it was not practical or appropriate to do so based on previous comments and direction from the Board, or as a result of specific government regulation.

2.0 TEST YEAR AND HISTORICAL PERIOD

The Filing Requirements indicate that a forward test-year methodology is to be utilized when a distributor is seeking the Board's approval for rebasing its rates. Hydro One Distribution's application has been filed using a forward test year and provides three years of historical data, consistent with the approach used in the two prior main rate cases for Distribution and Transmission rates. As such, this Application includes written evidence and supporting schedules for the following:

- 2008 test year;
- 2007 bridge year;
- 2004, 2005 and 2006 historical years;
- 2006 Board-approved historical year.

3.0 RATE BASE

The Filing Requirements, past direction from the Board, and a number of specific government regulations influence the determination of Hydro One Distribution's rate base and associated capital costs, as well as influencing the rate base information provided in the Application.

3.1 Sentinel Lighting

Hydro One Distribution includes sentinel lighting as a regulated activity by virtue of Regulation 116/02 dated March 22, 2002, made under the *Electricity Act, 1998*. This regulation allows Hydro One Distribution to include in its regulated rate base the assets and OM&A directly related to the provision of sentinel light services. As such, all costs and external revenues associated with sentinel lights have been included in the determination of the 2008 revenue requirement.

3.2 Generation Assets

Assets necessary to provide back up generation on Pelee Island continue to be included in the rate base. Hydro One is allowed to provide back-up generation on Pelee Island by virtue of an exemption granted to it by Ontario Regulation 71/02, made under the *Electricity Act, 1998,* and gazetted March 30, 2002, which amended Ontario regulation 160/99.

3.3 High Voltage Distribution Stations

Pursuant to the Board's RP-1998-0001 Decision, Hydro One Distribution is allowed to include the assets at its 88 High Voltage Distribution Stations (HVDSs) in the Company's distribution rate base.

The functionality of Hydro One Distribution's HVDSs was subsequently reviewed at the 2002 OEB proceeding RP-2000-0023 and the OEB reaffirmed the designation of HVDSs as distribution assets. This treatment of HVDS assets is also consistent with the Company's transmission rate base proposed in EB-2006-0501, which excluded HVDS assets.

3.4 Amortization Rates

Hydro One Distribution's 2008 Revenue Requirement reflects the adoption of the amortization rates approved by the Board in EB-2005-0378, based on the depreciation study by Foster Associates accepted by the Board in that proceeding.

3.5 Working Capital Allowance

Hydro One Distribution's 2008 Revenue Requirement reflects the cash working capital requirements using the methodology from the lead-lag study by Navigant Consulting Inc. approved by the Board in EB-2005-0378.

3.6 Interest Rates for Construction Work in Progress

The interest rate used for construction work in progress (CWIP), also referred to as Allowance for Funds Used During Construction (AFUDC), reflects the Board's decision in EB-2006-0017, effective November 28, 2006. This decision prescribed that the interest rate to use for CWIP would be the Scotia Capital All-Corporates Mid-Term Yield, as published on the Bank of Canada website and updated quarterly. As a result, 2007 bridge and 2008 test years reflect the prescribed CWIP rate on a forecast basis, while the historical years reflect CWIP at Hydro One Distribution's previously approved embedded cost of debt.

3.7 Capital Projects and Programs

Details for all capital projects and programs that exceed $1 million in net capital costs are provided in Investment Justification Documents (IJDs). The IJDs for these projects and programs are filed at Exhibit D2, Tab 2, Schedule 3.

3.8 In-Service Additions

Hydro One Distribution continues to plan, manage and perform its internal and external reporting on a work basis using its general ledger accounts, as these are reflective of the way in which Hydro One Distribution manages its operations. The evidence has been filed on the basis of Hydro One Distribution's accounting systems, but a schedule showing distribution in-service additions by OEB-specified USofA accounts for the 2008 test year, 2007 bridge year and 2006 historical year is filed at Exhibit D2, Tab 2, Schedule 4.

4.0 COST OF CAPITAL

Hydro One Distribution's filing reflects the direction provided in the Report of the Board on Cost of Capital and Second Generation Incentive Regulation, issued December 20, 2006, with respect to the Company's deemed capital structure, forecast debt costs and a common equity return.

5.0 COST OF SERVICE

5.1 Operating (OM&A) Costs

Hydro One Distribution continues to plan, manage and perform its internal and external reporting on a work basis using its general ledger accounts, as these are reflective of the way in which Hydro One Distribution manages its operations. The evidence has been filed on the basis of Hydro One Distribution's accounting systems but a schedule showing distribution OM&A expenditures by OEB-specified USofA accounts for the 2008 test year, 2007 bridge year and 2006 historical year is filed at Exhibit C2, Tab 2, Schedule 2.

5.2 Taxes / Payments-in-Lieu (PILs)

Hydro One Distribution will not be using the OEB Tax Model since it is filing on a forward test year basis. However, the equivalent level of detail has been filed for the 2008 test year at Exhibit C2, Tab 6, Schedule 1.

The Filing Requirements require an applicant to file the taxes it actually paid for the historic years (in this case 2004, 2005 and 2006) with respect to the distribution business of the applicant. Hydro One Distribution is not a legal entity and therefore does not file income tax returns at the distribution level. Corporate tax returns are filed at the Hydro One Networks Inc. level which includes transmission operations. The audited financial statements filed as Attachments to Exhibit A, Tab 9, Schedule 1 do, however, provide

PILs information for the 2004 – 2006 period on a GAAP basis at Note 6 for the 2004 and 2006 historic years and at Note 7 for the 2005 historic year.

6.0 OPERATING REVENUE AND REVENUE SUFFICIENCY/DEFICIENCY

The revenue sufficiency/deficiency for 2008, including operating revenue, is provided as Attachment A to Exhibit E1, Tab 1, Schedule 1. In addition, this Application provides customers and the Board with the impact on current rates resulting from the requested 2008 Revenue Requirement and proposed rate design changes, as detailed in Exhibit G1, Tab 7. Hydro One Distribution believes the detailed description of revenue requirement, in a form consistent to what it has filed in its last two main rate cases, combined with the assessment of rate impacts resulting from the proposals in this Application, provides customers and the Board with the necessary information to fully assess the merits of the Application.

DISTRIBUTION LICENCE

The Ontario Energy Board Act requires any entity that distributes electricity to obtain a Distributor's licence. The Hydro One Networks Inc distribution licence is attached. The licence identifies Hydro One's service territory, and addresses various obligations common to all Distributors, such as the obligation to connect, to provide non-discriminatory access to the distribution system, and to comply with Market rules.

Hydro One is providing its current Distribution Licence, which reflect the Board's approval of the purchase of Terrace Bay Superior Wires. Hydro One is also currently working with Board staff as part of proceeding EB-2007-0933 for an amendment to Hydro One's Electricity Distribution Licence to reflect past decisions of the Board.

The Company confirms that, as with all its licences, its Distributor's licence is being complied with in all material respects and is in good standing

Electricity Distribution Licence

ED-2003-0043

Hydro One Networks Inc.

Table of Contents **Page No.**

1 Definitions

In this Licence:

"**Accounting Procedures Handbook**" means the handbook, approved by the Board which specifies the accounting records, accounting principles and accounting separation standards to be followed by the Licensee;

"**Act**" means the *Ontario Energy Board Act, 1998*, S.O. 1998, c. 15, Schedule B;

"**Affiliate Relationships Code for Electricity Distributors and Transmitters**" means the code, approved by the Board which, among other things, establishes the standards and conditions for the interaction between electricity distributors or transmitters and their respective affiliated companies;

"**distribution services**" means services related to the distribution of electricity and the services the Board has required distributors to carry out, including the sales of electricity to consumers under section 29 of the Act, for which a charge or rate has been established in the Rate Order;

"**Distribution System Code**" means the code approved by the Board which, among other things, establishes the obligations of the distributor with respect to the services and terms of service to be offered to customers and retailers and provides minimum, technical operating standards of distribution systems;

"**Electricity Act**" means the *Electricity Act, 1998*, S.O. 1998, c. 15, Schedule A;

"**Licensee**" means Hydro One Networks Inc.

"**Market Rules**" means the rules made under section 32 of the Electricity Act;

"**Performance Standards**" means the performance targets for the distribution and connection activities of the Licensee as established by the Board in accordance with section 83 of the Act;

"**Rate Order**" means an Order or Orders of the Board establishing rates the Licensee is permitted to charge;

"**regulation**" means a regulation made under the Act or the Electricity Act;

"**Retail Settlement Code**" means the code approved by the Board which, among other things, establishes a distributor's obligations and responsibilities associated with financial settlement among retailers and consumers and provides for tracking and facilitating consumer transfers among competitive retailers;

"**service area**" with respect to a distributor, means the area in which the distributor is authorized by its licence to distribute electricity;

"**Standard Supply Service Code**" means the code approved by the Board which, among other things, establishes the minimum conditions that a distributor must meet in carrying out its obligations to sell electricity under section 29 of the Electricity Act;

"**wholesaler**" means a person that purchases electricity or ancillary services in the IESO administered markets or directly from a generator or, a person who sells electricity or ancillary services through the IESO-administered markets or directly to another person other than a consumer.

2 Interpretation

2.1 In this Licence, words and phrases shall have the meaning ascribed to them in the Act or the Electricity Act. Words or phrases importing the singular shall include the plural and vice versa. Headings are for convenience only and shall not affect the interpretation of the Licence. Any reference to a document or a provision of a document includes an amendment or supplement to, or a replacement of, that document or that provision of that document. In the computation of time under this Licence, where there is a reference to a number of days between two events, they shall be counted by excluding the day on which the first event happens and including the day on which the second event happens and where the time for doing an act expires on a holiday, the act may be done on the next day that is not a holiday.

3 Authorization

3.1 The Licensee is authorized, under Part V of the Act and subject to the terms and conditions set out in this Licence:

a) to own and operate a distribution system in the service area described in Schedule 1 of this Licence;

b) to retail electricity for the purposes of fulfilling its obligation under section 29 of the Electricity Act in the manner specified in Schedule 2 of this Licence; and

c) to act as a wholesaler for the purposes of fulfilling its obligations under the Retail Settlement Code or under section 29 of the Electricity Act.

4 Obligation to Comply with Legislation, Regulations and Market Rules

4.1 The Licensee shall comply with all applicable provisions of the Act and the Electricity Act and regulations under these Acts, except where the Licensee has been exempted from such compliance by regulation.

4.2 The Licensee shall comply with all applicable Market Rules.

5 Obligation to Comply with Codes

5.1 The Licensee shall at all times comply with the following Codes (collectively the "Codes") approved by the Board, except where the Licensee has been specifically exempted from such compliance by the Board. Any exemptions granted to the licensee are set out in Schedule 3 of this Licence. The following Codes apply to this Licence:

a) the Affiliate Relationships Code for Electricity Distributors and Transmitters;

b) the Distribution System Code;

c) the Retail Settlement Code; and

d) the Standard Supply Service Code.

5.2 The Licensee shall:

a) make a copy of the Codes available for inspection by members of the public at its head office and regional offices during normal business hours; and

b) provide a copy of the Codes to any person who requests it. The Licensee may impose a fair and reasonable charge for the cost of providing copies.

6 Obligation to Provide Non-discriminatory Access

6.1 The Licensee shall, upon the request of a consumer, generator or retailer, provide such consumer, generator or retailer with access to the Licensee's distribution system and shall convey electricity on behalf of such consumer, generator or retailer in accordance with the terms of this Licence.

7 Obligation to Connect

7.1 The Licensee shall connect a building to its distribution system if:

a) the building lies along any of the lines of the distributor's distribution system; and

b) the owner, occupant or other person in charge of the building requests the connection in writing.

7.2 The Licensee shall make an offer to connect a building to its distribution system if:

a) the building is within the Licensee's service area as described in Schedule 1; and

b) the owner, occupant or other person in charge of the building requests the connection in writing.

7.3 The terms of such connection or offer to connect shall be fair and reasonable and made in accordance with the Distribution System Code, and the Licensee's Rate Order as approved by the Board.

7.4 The Licensee shall not refuse to connect or refuse to make an offer to connect unless it is permitted to do so by the Act or a regulation or any Codes to which the Licensee is obligated to comply with as a condition of this Licence.

8 Obligation to Sell Electricity

8.1 The Licensee shall fulfill its obligation under section 29 of the Electricity Act to sell electricity in accordance with the requirements established in the Standard Supply Service Code, the Retail Settlement Code and the Licensee's Rate Order as approved by the Board.

9 Obligation to Maintain System Integrity

9.1 The Licensee shall maintain its distribution system in accordance with the standards established in the Distribution System Code and Market Rules, and have regard to any other recognized industry operating or planning standards adopted by the Board.

10 Market Power Mitigation Rebates

10.1 The Licensee shall comply with the pass through of Ontario Power Generation rebate conditions set out in Appendix A of this Licence.

11 Distribution Rates

11.1 The Licensee shall not charge for connection to the distribution system, the distribution of electricity or the retailing of electricity to meet its obligation under section 29 of the Electricity Act except in accordance with a Rate Order of the Board.

12 Separation of Business Activities

12.1 The Licensee shall keep financial records associated with distributing electricity separate from its financial records associated with transmitting electricity or other activities in accordance with the Accounting Procedures Handbook and as otherwise required by the Board.

13 Expansion of Distribution System

13.1 The Licensee shall not construct, expand or reinforce an electricity distribution system or make an interconnection except in accordance with the Act and Regulations, the Distribution System Code and applicable provisions of the Market Rules.

13.2 In order to ensure and maintain system integrity or reliable and adequate capacity and supply of electricity, the Board may order the Licensee to expand or reinforce its distribution system in accordance with Market Rules and the Distribution System Code, or in such a manner as the Board may determine.

14 Provision of Information to the Board

14.1 The Licensee shall maintain records of and provide, in the manner and form determined by the Board, such information as the Board may require from time to time.

14.2 Without limiting the generality of paragraph 14.1, the Licensee shall notify the Board of any material change in circumstances that adversely affects or is likely to adversely affect the business, operations or assets of the Licensee as soon as practicable, but in any event no more than twenty (20) days past the date upon which such change occurs.

14.3 The Licensee shall:

a) immediately notify the Board in writing of the notice; and

b) provide a plan to the Board as soon as possible, but no later than ten (10) days after the receipt of the notice, as to how the affected distribution services will be maintained in compliance with the terms of this licence.

15 Restrictions on Provision of Information

15.1 The Licensee shall not use information regarding a consumer, retailer, wholesaler or generator obtained for one purpose for any other purpose without the written consent of the consumer, retailer, wholesaler or generator.

15.2 The Licensee shall not disclose information regarding a consumer, retailer, wholesaler or generator to any other party without the written consent of the consumer, retailer, wholesaler or generator, except where such information is required to be disclosed:

a) to comply with any legislative or regulatory requirements, including the conditions of this Licence;

b) for billing, settlement or market operations purposes;

c) for law enforcement purposes; or

d) to a debt collection agency for the processing of past due accounts of the consumer, retailer, wholesaler or generator.

15.3 The Licensee may disclose information regarding consumers, retailers, wholesalers or generators where the information has been sufficiently aggregated such that their particular information cannot reasonably be identified.

15.4 The Licensee shall inform consumers, retailers, wholesalers and generators of the conditions under which their information may be released to a third party without their consent.

15.5 If the Licensee discloses information under this section, the Licensee shall ensure that the information provided will not be used for any other purpose except the purpose for which it was disclosed.

16 Customer Complaint and Dispute Resolution

16.1 The Licensee shall:

a) have a process for resolving disputes with customers that deals with disputes in a fair, reasonable and timely manner;

b) publish information which will make its customers aware of and help them to use its dispute resolution process;

c) make a copy of the dispute resolution process available for inspection by members of the public at each of the Licensee’s premises during normal business hours;

d) give or send free of charge a copy of the process to any person who reasonably requests it; and

e) subscribe to and refer unresolved complaints to an independent third party complaints resolution service provider selected by the Board. This condition will become effective on a date to be determined by the Board. The Board will provide reasonable notice to the Licensee of the date this condition becomes effective.

17 Term of Licence

17.1 This Licence shall take effect on September 29, 2004 and expire on September 28, 2024. The term of this Licence may be extended by the Board.

18 Fees and Assessments

18.1 The Licensee shall pay all fees charged and amounts assessed by the Board.

19 Communication

19.1 The Licensee shall designate a person that will act as a primary contact with the Board on matters related to this Licence. The Licensee shall notify the Board promptly should the contact details change.

19.2 All official communication relating to this Licence shall be in writing.

19.3 All written communication is to be regarded as having been given by the sender and received by the addressee:

a) when delivered in person to the addressee by hand, by registered mail or by courier;

b) ten (10) business days after the date of posting if the communication is sent by regular mail; and

c) when received by facsimile transmission by the addressee, according to the sender's transmission report.

20 Copies of the Licence

20.1 The Licensee shall:

a) make a copy of this Licence available for inspection by members of the public at its head office and regional offices during normal business hours; and

b) provide a copy of this Licence to any person who requests it. The Licensee may impose a fair and reasonable charge for the cost of providing copies.

SCHEDULE 1 DEFINITION OF DISTRIBUTION SERVICE AREA

This Schedule specifies the area in which the Licensee is authorized to distribute and sell electricity in accordance with paragraph 8.1 of this Licence.

1. Municipalities as set out in Appendix B – Tab 1.

2. First Nation Reserves as set out in Appendix B – Tab 2.

3. Unorganized Townships as set out in Appendix B – Tab 3.

4. Municipalities where areas are served by the Licensee and other distributors as set out in Appendix B – Tab 4.

5. Consumers located outside the municipalities served by the Licensee as set out in Appendix B – Tab 5.

SCHEDULE 2 PROVISION OF STANDARD SUPPLY SERVICE

This Schedule specifies the manner in which the Licensee is authorized to retail electricity for the purposes of fulfilling its obligation under section 29 of the Electricity Act.

The Licensee is authorized to retail electricity directly to consumers within its service area in accordance with paragraph 8.1 of this Licence, any applicable exemptions to this Licence, and at the rates set out in the Rate Orders.

SCHEDULE 3 LIST OF CODE EXEMPTIONS

This Schedule specifies any specific Code requirements from which the Licensee has been exempted.

The Licensee is exempt from the requirements of section 2.4.28 of the Distribution System Code until November 30, 2005.

APPENDIX A

MARKET POWER MITIGATION REBATES

1. Definitions and Interpretations

In this Licence

"embedded distributor" means a distributor who is not a market participant and to whom a host distributor distributes electricity;

"embedded generator" means a generator who is not a market participant and whose generation facility is connected to a distribution system of a distributor, but does not include a generator who consumes more electricity than it generates;

"host distributor" means a distributor who is a market participant and who distributes electricity to another distributor who is not a market participant.

In this Licence, a reference to the payment of a rebate amount by the IESO includes interim payments made by the IESO.

2. Information Given to IESO

a Prior to the payment of a rebate amount by the IESO to a distributor, the distributor shall provide the IESO, in the form specified by the IESO and before the expiry of the period specified by the IESO, with information in respect of the volumes of electricity withdrawn by the distributor from the IESO-controlled grid during the rebate period and distributed by the distributor in the distributor's service area to:

i consumers served by a retailer where a service transaction request as defined in the Retail Settlement Code has been implemented; and

ii consumers other than consumers referred to in clause (i) who are not receiving the fixed price under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998.*

b Prior to the payment of a rebate amount by the IESO to a distributor which relates to electricity consumed in the service area of an embedded distributor, the embedded distributor shall provide the host distributor, in the form specified by the IESO and before the expiry of the period specified in the Retail Settlement Code, with the volumes of electricity distributed during the rebate period by the embedded distributor's host distributor to the embedded distributor net of any electricity distributed to the embedded distributor which is attributable to embedded generation and distributed by the embedded distributor in the embedded distributor's service area to:

i consumers served by a retailer where a service transaction request as defined in the Retail Settlement Code has been implemented; and

ii consumers other than consumers referred to in clause (i) who are not receiving the fixed price under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998*.

c Prior to the payment of a rebate amount by the IESO to a distributor which relates to electricity consumed in the service area of an embedded distributor, the host distributor shall provide the IESO, in the form specified by the IESO and before the expiry of the period specified by the IESO, with the information provided to the host distributor by the embedded distributor in accordance with section 2.

The IESO may issue instructions or directions providing for any information to be given under this section. The IESO shall rely on the information provided to it by distributors and there shall be no opportunity to correct any such information or provide any additional information and all amounts paid shall be final and binding and not subject to any adjustment.

For the purposes of attributing electricity distributed to an embedded distributor to embedded generation, the volume of electricity distributed by a host distributor to an embedded distributor shall be deemed to consist of electricity withdrawn from the IESO-controlled grid or supplied to the host distributor by an embedded generator in the same proportion as the total volume of electricity withdrawn from the IESO-controlled grid by the distributor in the rebate period bears to the total volume of electricity supplied to the distributor by embedded generators during the rebate period.

3. Pass Through of Rebate

A distributor shall promptly pass through, with the next regular bill or settlement statement after the rebate amount is received, any rebate received from the IESO, together with interest at the Prime Rate, calculated and accrued daily, on such amount from the date of receipt, to:

a retailers who serve one or more consumers in the distributor’s service area where a service transaction request as defined in the Retail Settlement Code has been implemented;

b consumers who are not receiving the fixed price under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998* and who are not served by a retailer where a service transaction request as defined in the Retail Settlement Code has been implemented; and

c embedded distributors to whom the distributor distributes electricity.

The amounts paid out to the recipients listed above shall be based on energy consumed and calculated in accordance with the rules set out in the Retail Settlement Code. These payments may be made by way of set off at the option of the distributor.

If requested in writing by OPGI, the distributor shall ensure that all rebates are identified as coming from OPGI in the following form on or with each applicable bill or settlement statement:

“ONTARIO POWER GENERATION INC. rebate”

Any rebate amount which cannot be distributed as provided above or which is returned by a retailer to the distributor in accordance with its licence shall be promptly returned to the host distributor or IESO as applicable, together with interest at the Prime Rate, calculated and accrued daily, on such amount from the date of receipt.

Nothing shall preclude an agreement whereby a consumer assigns the benefit of a rebate payment to a retailer or another party.

Pending pass-through or return to the IESO of any rebate received, the distributor shall hold the funds received in trust for the beneficiaries thereof in a segregated account.

ONTARIO POWER GENERATION INC. REBATES

For the payments that relate to the period from May 1, 2006 to April 30, 2009, the rules set out below shall apply.

1. Definitions and Interpretations

In this Licence

"embedded distributor" means a distributor who is not a market participant and to whom a host distributor distributes electricity;

"embedded generator" means a generator who is not a market participant and whose generation facility is connected to a distribution system of a distributor, but does not include a generator who consumes more electricity than it generates;

"host distributor" means a distributor who is a market participant and who distributes electricity to another distributor who is not a market participant.

In this Licence, a reference to the payment of a rebate amount by the IESO includes interim payments made by the IESO.

2. Information Given to IESO

a Prior to the payment of a rebate amount by the IESO to a distributor, the distributor shall provide the IESO, in the form specified by the IESO and before the expiry of the period specified by the IESO, with information in respect of the volumes of electricity withdrawn by the distributor from the IESO-controlled grid during the rebate period and distributed by the distributor in the distributor's service area to:

i consumers served by a retailer where a service transaction request as defined in the Retail Settlement Code has been implemented and the consumer is not receiving the prices established under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998*; and

ii consumers other than consumers referred to in clause (i) who are not receiving the fixed price under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998*.

b Prior to the payment of a rebate amount by the IESO to a distributor which relates to electricity consumed in the service area of an embedded distributor, the embedded distributor shall provide the host distributor, in the form specified by the IESO and before the expiry of the period specified in the Retail Settlement Code, with the volumes of electricity distributed during the rebate period by the embedded distributor's host distributor to the embedded distributor net of any electricity distributed to the embedded distributor which is attributable to embedded generation and distributed by the embedded distributor in the embedded distributor's service area to:

i consumers served by a retailer where a service transaction request as defined in the Retail Settlement Code has been implemented; and

ii consumers other than consumers referred to in clause (i) who are not receiving the fixed price under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998*.

c Prior to the payment of a rebate amount by the IESO to a distributor which relates to electricity consumed in the service area of an embedded distributor, the host distributor shall provide the IESO, in the form specified by the IESO and before the expiry of the period specified by the IESO, with the information provided to the host distributor by the embedded distributor in accordance with section 2.

The IESO may issue instructions or directions providing for any information to be given under this section. The IESO shall rely on the information provided to it by distributors and there shall be no opportunity to correct any such information or provide any additional information and all amounts paid shall be final and binding and not subject to any adjustment.

For the purposes of attributing electricity distributed to an embedded distributor to embedded generation, the volume of electricity distributed by a host distributor to an embedded distributor shall be deemed to consist of electricity withdrawn from the IESO-controlled grid or supplied to the host distributor by an embedded generator in the same proportion as the total volume of electricity withdrawn from the IESO-controlled grid by the distributor in the rebate period bears to the total volume of electricity supplied to the distributor by embedded generators during the rebate period.

3. Pass Through of Rebate

A distributor shall promptly pass through, with the next regular bill or settlement statement after the rebate amount is received, any rebate received from the IESO, together with interest at the Prime Rate, calculated and accrued daily, on such amount from the date of receipt, to:

a retailers who serve one or more consumers in the distributor's service area where a service transaction request as defined in the Retail Settlement Code has been implemented and the consumer is not receiving the prices established under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998*;

b consumers who are not receiving the fixed price under sections 79.4, 79.5 and 79.16 of the *Ontario Energy Board Act, 1998* and who are not served by a retailer where a service transaction request as defined in the Retail Settlement Code has been implemented; and

c embedded distributors to whom the distributor distributes electricity.

The amounts paid out to the recipients listed above shall be based on energy consumed and calculated in accordance with the rules set out in the Retail Settlement Code. These payments may be made by way of set off at the option of the distributor.

If requested in writing by OPGI, the distributor shall ensure that all rebates are identified as coming from OPGI in the following form on or with each applicable bill or settlement statement:

"ONTARIO POWER GENERATION INC. rebate"

Any rebate amount which cannot be distributed as provided above or which is returned by a retailer to the distributor in accordance with its licence shall be promptly returned to the host distributor or IESO as applicable, together with interest at the Prime Rate, calculated and accrued daily, on such amount from the date of receipt.

Nothing shall preclude an agreement whereby a consumer assigns the benefit of a rebate payment to a retailer or another party.

Pending pass-through or return to the IESO of any rebate received, the distributor shall hold the funds received in trust for the beneficiaries thereof in a segregated account.

Tab 1 MUNICIPALITIES

Name of Municipality:	Township of Addington Highlands
Formerly Known as:	Township of Denbign, Abinger and Ashby, Township of Anglesea and Effingham, Kaladar, as at December 31. 1999.

Name of Municipality:	Township of Adelaide Metcalfe

Formerly Known As: Township of Alnwick, Township of Haldimand, as at December 31, 2000.

Name of Municipality: Township of Amaranth as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of The Archipelago as at March 31, 1999.
Formerly Known As: Conger, Cowper, Harrison, Henvey, Wallbridge plus geographic/unorganized townships and unsurveyed areas

Name of Municipality: Township of Armour as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Armstrong as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Town of Arnprior as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Municipality of Arran-Elderslie
Formerly Known As: Township of Arran, Township of Elderslie, Town of Chesley, Village of Tara, Village of Paisley, as at December 31, 1998.

Name of Municipality: Township of Ashfield-Colborne-Wawanosh
Formerly Known As: Township of Ashfield, Township of West Wananosh, Township of Colborne, as at December 31, 2000.

Name of Municipality: Township of Assiginack as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Athens
Formerly Known As: Township of Rear of Young and Escott, Village of Athens, as at December 31, 2000.

Name of Municipality: Township of Augusta as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Baldwin as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Town of Bancroft
Formerly Known As: Town of Bancroft, Township of Dungannon, as at December 31, 1998.

Name of Municipality: Township of Barrie Island as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Municipality of Bayham
Formerly Known As: Township of Baymen, Village of Port Burwell, Village of Vienna, as at December 31, 1997.

Name of Municipality: Township of Beckwith as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Billings as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Black River-Matheson as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Blandford-Blenheim as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Town of Blind River as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Bonfield as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Bonnechere Valley
Formerly Known As: Village of Eganville, Township of Grattan, Township of Sebastopol, Township of South Algona, as at December 31, 2000.

Name of Municipality: Township of Brethour as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Municipality of Brighton
Formerly Known As: Town of Brighton, Township of Brighton, as at December 31, 2001.

Name of Municipality: City of Brockville as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Brudenell, Lyndoch and Raglan
Formerly Known As: Township of Brudenell and Lyndoch, Township of Raglan, as at December 31, 1998.

Name of Municipality: Township of Burpee and Mills
Formerly Known As: Township of Burpee, Unorganized Twp of Mills, as at December 31, 1997.

Name of Municipality: Town of Caledon
Formerly Known As: Township of Albion, Township of Caledon, Village of Bolton, Village of Caledon East, Township of Chinguacousy (part), as at December 31, 1973.

Name of Municipality: Township of Calvin as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Town of Carleton Place as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Carling as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Carlow/Mayo
Formerly Known As: Township of Carlow, Township of Mayo, as at December 31, 2000.

Name of Municipality: Township of Casey as at March 31, 1999.
Formerly Known As: Same

Name of Municipality: Township of Cavan-Millbrook-North Monoghan
Formerly Known As: Township of Cavan, Township of North Monaghan, Village of Millbrook, as at December 31, 1997.

Name of Municipality: Township of Central Frontenac

SERVICE AREA MAP

The attached map is a representation of Hydro One Distribution's service territory. It is not a substitute for the written description in the licence. The map is accurate where LDC boundaries conform to existing or former municipal boundaries, but is only a best-effort representation in locations where there have been annexations or for other reasons the LDC boundaries are different from current or former municipal boundaries. Please note that Hydro One Distribution does not assume it will supply to areas of Ontario that currently do not have electrical service.

CORPORATE ORGANIZATION CHARTS

1.0 INTRODUCTION

Hydro One Networks Inc. ("Hydro One") is the electricity transmission and distribution successor company to the original Hydro-Electric Power Commission of Ontario, which became Ontario Hydro in 1974.

This schedule describes the current organization of Hydro One's electricity distribution business, beginning with an overview of the parent company (Hydro One Inc.), a discussion about Hydro One's distribution business, and a brief summary of Hydro One's affiliates and related parties.

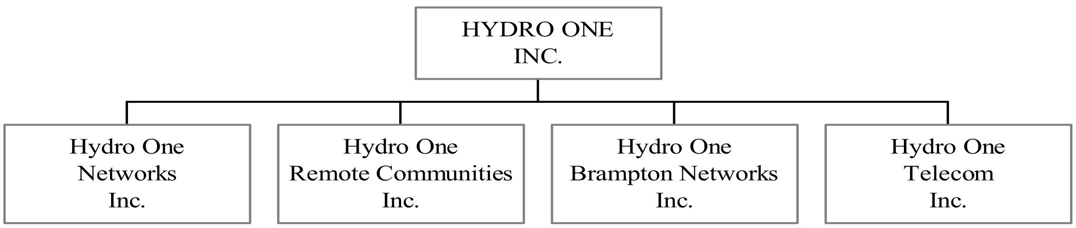
2.0 A BRIEF OVERVIEW OF HYDRO ONE INC.

Following the enactment of the *Electricity Act, 1998* and the anticipated restructuring of the former Ontario Hydro, Hydro One Inc. was incorporated under Ontario's *Business Corporations Act* on December 1, 1998 as Ontario Hydro Services Company Inc. and commenced carrying on business on May 1, 1999. On May 1, 2000, the company's name was changed to Hydro One Inc. In accordance with Section 48.1 of the *Electricity Act, 1998*, as amended, Hydro One Inc. is a holding company operating through its subsidiaries. Its principal subsidiary, Hydro One Networks Inc. (Hydro One) is the largest electricity transmitter and distributor to customers within Ontario.

Figure 1 below shows Hydro One Inc.'s principal subsidiaries, all of which are wholly-owned subsidiaries incorporated under Ontario's *Business Corporations Act*. The business functions of Hydro One and its subsidiaries are discussed in sections 3.0 and 5.0 of this Exhibit, respectively.

Figure 1

Hydro One Inc.



3.0 HYDRO ONE NETWORKS INC.

Hydro One is the primary subsidiary of Hydro One Inc. Its principal mandate is established by Section 48 (1) of the *Electricity Act, 1998,* which states:

> "The objects of Hydro One Inc. include, in addition to any other objects, owning and operating transmission systems and distribution systems through one or more subsidiaries."

Accordingly, Hydro One, as a subsidiary of Hydro One Inc., is permitted to carry on business related to the ownership, operation and management of both electricity transmission and distribution systems and facilities, under a separate Board-approved licence for each of its transmission and distribution businesses. A copy of Hydro One's distribution licence is provided in Exhibit A, Tab 6, Schedule 1.

Hydro One's businesses are carried out by four operating divisions (Customer Operations, Asset Management, Engineering and Construction Services and Grid Operations). There are also four service groups (Law, Finance, Corporate Services and Corporate and Regulatory Affairs). An organization chart indicating these divisions and the main functions of each is provided in Figure 2.

4.0 HYDRO ONE'S DISTRIBUTION BUSINESS

As stated earlier, Hydro One is mandated and licensed to provide both the transmission and distribution of electricity to customers in Ontario. Operating both businesses from the one corporation has enabled Hydro One to take advantage of a multi-skilled work force. Efficiencies have been realized through the sharing of certain facilities and equipment, where possible. For example, in 2004, the rationalization and amalgamation of a number of facilities (the Transmission and the Distribution Operations Management Centres and twelve transmission operating centres) were completed. This has enabled the monitoring, control and operation of all of the Company's transmission and much of the distribution assets from one location – the Ontario Grid Control Centre ("OGCC").

Although staff, equipment and facilities may be shared, the definition of work specific to the Distribution Business is undertaken annually and appropriate systems, processes and models provide for the isolation of costs related to this work. High level descriptions of the work to be performed by Hydro One in 2008 in relation to Hydro One's Distribution Business or on distribution assets can be found in the Summary of OM&A Expenses and Summary of Capital Budget Exhibits (Exhibit C1, Tab 2, Schedule 1 and Exhibit D1, Tab 3, Schedule 1, respectively), followed by their companion exhibits that provide details of the costs for Sustainment, Development, Operations, Customer Care and Shared Services.

Hydro One utilizes a centralized shared services model to deliver its common services. This serves as the most economic approach. Accordingly, common services are provided to the Transmission and Distribution businesses of Hydro One and to other subsidiaries of Hydro One Inc. on a centralized basis.

The costs of these services and assets are assigned to business units on the basis of cost causation. These costs and assets are directly assigned where it is possible to do so. All other costs are allocated based on cost drivers, direct benefits or other methods as appropriate. The series of exhibits in Exhibit C1, Tab 5, describe these allocation methods, as well as the derivation of the overhead capitalization rate, which determine the assignment of overhead costs to capital expenditures.

Hydro One commissioned R.J. Rudden Associates to conduct studies to recommend appropriate allocation methods for the assignment of these costs (the "Rudden Study"). The Rudden Study was presented for examination during Hydro One's 2006 Distribution Rates proceeding, RP-2005-0020/EB-2005-0378 and was accepted by the Board as an appropriate methodology for allocating costs among the subsidiaries. R.J. Rudden was retained in 2006 to update the cost allocation report, specific to the Transmission business, based on the same methodology as used in Hydro One's 2006 Distribution Rates proceeding. The Rudden methodology has been used to derive the 2008 common cost allocation to the Distribution business as discussed in Exhibit C1, Tab 5, Schedule 1.

5.0 AFFILIATES AND RELATED PARTIES

5.1 Other Subsidiaries of Hydro One Inc.

As noted in section 2.0 of this Exhibit, Hydro One Inc. owns three other subsidiaries - Hydro One Remote Communities Inc., Hydro One Brampton Networks Inc. and Hydro One Telecom Inc. The business function of each is provided below.

a) Hydro One Remote Communities Inc. carries on all business relating to ownership, operation, maintenance and construction of generation and distribution assets used in the supply of electricity to remote communities throughout northern Ontario that are not connected to the transmission grid.
b) Hydro One Brampton Networks Inc. carries on all business relating to the ownership, operation and management of electricity distribution systems and facilities in Brampton, Ontario.

c) Hydro One Telecom Inc. carries on all business relating to leasing dark fibre and providing lit capacity to other telecommunications carriers, large corporations, government, health care and education institutions.

5.2 Related Parties

Ontario Electricity Financial Corporation ("OEFC"), the Independent Electricity System Operator (the "IESO"), the Ontario Power Authority (the "OPA") and Ontario Power Generation Inc. ("OPG") are related parties of Hydro One Inc., due to their ownership by the Province. Each is described below.

a) OEFC is the financial successor corporation of Ontario Hydro, established under Section 54 of the *Electricity Act, 1998*. Among its primary responsibilities is the management and retirement of Ontario Hydro's outstanding debt and other financial obligations.
b) The IESO is the centralized independent electricity system operator responsible for maintaining the security and reliability of electricity supply in Ontario and for directing the operations of the IESO-controlled grid. The Ontario Energy Board approves the licence, business plan and fees of the IESO.
c) The OPA is mandated to ensure the adequacy and efficiency of electricity supply in the Province through planning of electricity supply and demand.
d) OPG's principal business is the generation and sale of electricity to customers in Ontario and in inter-connected markets. OPG is licensed by the Ontario Energy Board.

HYDRO ONE GOVERNANCE FRAMEWORK

1.0 OVERVIEW

The corporate governance structure and Internal Control Framework of Hydro One Inc. provide reasonable assurance regarding Hydro One Distribution's effective and efficient operations, reliable financial reporting and compliance with applicable laws and regulations. In the past few years, federal and provincial governments and regulators have moved decisively to increase the robustness and transparency of corporate governance, as well as expand the requirements for internal control and disclosure. Although the majority of Hydro One Distribution's practices already conform to these requirements, special projects have been undertaken to ensure full compliance. In 2006, the focus was on documenting and testing the controls over financial reporting. Tests of operational effectiveness will continue each year.

2.0 CORPORATE GOVERNANCE

Corporate governance is the mechanism by which a corporation ensures independent oversight of management activities on behalf of the shareholder(s). For Hydro One Inc., the Board of Directors and its associated committees fulfill this role, and provide direction to management through precepts such as ethical management (as established through our Code of Business Conduct), review and/or approval of a stated mission, goals and business objectives, organizational authorities, and business plans.

The company's corporate governance structure is illustrated in Figure 1. Hydro One's Board and Senior Management committees are also described in detail below.

Hydro One Corporate Governance

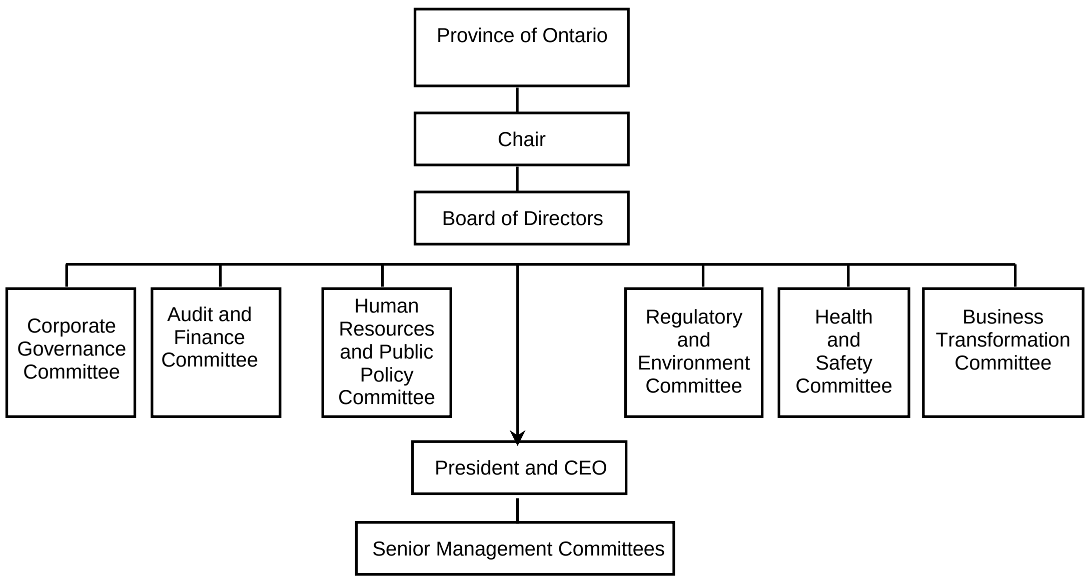

Figure 1

2.1 The Corporate Governance Committee is the Board governance committee of Hydro One Inc. and its subsidiaries. The committee is primarily responsible for carrying out an annual review of the mandates of the Board and each committee of the Board or subsidiary Boards. Other obligations include recommending issues for discussion at Board meetings, monitoring the quality of management's relationship with the Board, recommending suitable nominees to the Board of Directors, conducting the annual Board and individual Director effectiveness evaluations and reviewing all Director compensation.

2.2 The Audit and Finance Committee is mainly responsible for overseeing the accounting, financial reporting and auditing practices for Hydro One Inc. and its subsidiaries. Specifically, the committee makes recommendations regarding financial objectives and plans, and risk management strategies of the company. It is also accountable for reviewing and recommending to the Board for approval the interim and annual consolidated financial statements, management discussion and analysis disclosures, and financial statements in debt securities offering documents. In addition, the Audit and Finance Committee reviews the internal audit procedures of the company and advises the Board on its auditing practices and procedures, selects and oversees the work of external auditors and obtains assurance that internal controls are adequate. The committee also reviews, at least annually but more frequently if necessary, complaints brought forward under the Code of Business Conduct that relate specifically to inappropriate accounting, internal control or auditing matters. All members of the committee are independent and financially literate as per applicable Canadian securities legislation.

2.3 The Human Resources and Public Policy Committee is responsible for reviewing the appropriateness of current and future organization structures, succession plans for corporate and divisional officers, the appropriateness of the Code of Business Conduct (including any breaches for the preceding year), and the performance and remuneration of senior executives. Also, the committee identifies, assesses and provides advice to the Board on public affairs issues that have significant impact on the company.

2.4 The Regulatory and Environment Committee maintains an up-to-date understanding of regulatory and environmental compliance risks and seeks to ensure that management is effectively managing those risks. The committee is also responsible for reviewing management's regulatory strategy and proposals for transmission and distribution rate applications, as well as the status of outstanding applications. It also plays an advisory role with respect to changes or additions to environmental policies, standards, accountabilities and programs, and recommends such to the Board for approval.

2.5 The Health and Safety Committee is responsible for reviewing and ensuring compliance with occupational health and safety legislation, policies, standards, and programs. They annually review the company's state of readiness to respond to crisis situations, as well as reports of any occupational accidents. They may also review such other health and safety matters, including public health and safety, as appropriate.

2.6 The Business Transformation Committee is responsible for assisting the Board of Directors in its oversight responsibility on matters related to the Enterprise Application Systems Replacement Strategy. The strategy addresses the replacement of existing customized business applications with commercially available software system applications to simplify the information technology infrastructure and improve functionality in business processes.

3.0 SENIOR MANAGEMENT COMMITTEES

Prudent decision-making, operational effectiveness and business transparency are supported by four key senior management committees: Executive Committee, Operations Committee, Pension Committee and Disclosure Committee.

3.1 Executive Committee

This committee is a decision-making body established to review and approve business plans and strategies, capital projects and investments, key operating decisions, regulatory filings, labour strategy, financial and operational performance indicators and other items as required. The Executive Committee also reviews all project approvals prior to going to the Board.

3.2 Operations Committee

This committee provides business coordination between lines of business, including resourcing strategy, alignment of business plans, health and safety policy, support for regulatory filings and implementation of corporate strategies. They also review and coordinate operational issues and review project and program expenditures. Any required changes to project or program schedules are coordinated across all lines of business.

3.3 Pension Committee

The Pension Committee is responsible for approving appropriate pension policies, standards and programs. It is also responsible for ensuring compliance with legislation, policies and standards.

3.4 Disclosure Committee

The Disclosure Committee operates under the principal that communications to the public should be timely, factual and accurate and broadly disseminated in accordance with all applicable legal and regulatory requirements in Canada. The committee meets quarterly to review financial statements and management's discussion and analysis disclosures, offering documents for debt securities, as well as risk assessments prepared for credit rating agencies and government.

4.0 INTERNAL CONTROL FRAMEWORK

Internal controls ensure the company achieves its mission and goals, by enabling management to deal with rapidly changing economic and competitive environments, customer demands and priorities, and restructuring for future growth. Internal controls promote efficiency, reduce risk of asset loss, and help ensure the reliability of financial statements and compliance with laws and regulations.

Hydro One Inc.'s Internal Control Framework has five components, including: the Control Environment, Risk Assessment, Control Activities, Information and Communication, and Monitoring. The framework further addresses the appropriate elements of each component at the entity (Board) level, corporate (senior management) level and operational (local) level. The framework is consistent with accepted external standards and control criteria set out by such standard setting bodies as the Canadian Institute of Chartered Accountants and the US Committee of Sponsoring Organizations (COSO criteria, Internal Control-Integrated Framework). Key components of the framework are described in more detail below:

The "Control Environment" refers to direction and oversight from the top of the organization. The control environment component in the framework captures the notion of ethical and prudent financial management as established by the Board of Directors and senior management (see Section 2.0 above), and sets the tone for all financial and project management policies and practices established at lower levels. Regular education sessions on policies, processes and practices/procedures are also provided.

Hydro One Inc. has a formal Code of Business Conduct and a Disclosure Policy which have been issued to all staff. The Code of Business Conduct requires all management employees at the director level and above to sign an annual compliance form to document that they have read, understood, and complied with the Code, and that all conflicts or potential conflicts of interest have been disclosed. The Corporate Ethics Officer ensures that this process is performed on a timely basis and that a compliance register is maintained and submitted to the President and CEO of Hydro One Inc. And lastly, individual performance contracts capture the understanding between a manager and a direct report as to the results expected and the means by which such results will be achieved.

"Risk Assessment" involves the identification and analysis by management of the key risks to achieving the company's business objectives. Such an assessment is performed, at minimum, annually, and provides the basis for business planning decisions. Programs that mitigate existing risks to acceptable residual levels, or provide mitigation for emerging risks, are captured in business plans. Risk assessment extends to individual investment decisions through the Work Program Prioritization process (see Exhibit A, Tab 14, Schedule 5). This process assesses whether any proposed solutions for a specific operational need will achieve a level of residual risk acceptable to senior management and our shareholder. Projects and programs underway are regularly assessed for new and changing risks. Moreover, at the operational level, extensive emergency and contingency plans exist and are regularly tested and updated.

"Control Activities" refers to the systems, policies and procedures that ensure management's objectives are achieved and risk mitigation plans are carried out. Sets of policies and procedures exist to govern annual, monthly and day to day operations at the business unit and local levels. Many of these policies were imported from Ontario Hydro, and revised to focus on the core activities of transmission and distribution. Each revised policy has an issue date and expected review date. In many locations, policies and procedures are available on internal web sites. More information on Hydro One's policies may be found in Exhibit A, Tab 12, Schedule 1.

One of the foundations of good control is the establishment of appropriate levels of authority for spending and other business decisions. The delegation and exercise of all authorities are governed by 'Guiding Principles', the Code of Business Conduct, and policies and procedures. Authorities are reviewed by Audit and Finance Committee. Business plans, budgets and business cases establish overall spending of the company.

The budgeting and business planning process is also a critical element of effective internal controls. Annually a budget and business plan are prepared and submitted to the Board for approval. The budget and business plan sets the parameters of the company's activities for a specific fiscal period. More information on our planning process may be found in Exhibit A, Tab 14, Schedule 1. Information on our Project and Program approval process and our Work Program Prioritization process may be found in Exhibit A, Tab 14, Schedule 4 and Exhibit A, Tab 14, Schedule 5, respectively.

The Executive Authorities Register (EAR) delegates authorities from the Board to senior management. Organizational Authority Registers (OAR's) exist at subsidiary and business unit levels to delegate authorities from senior management to business unit and local levels.

The Inergi outsourcing agreement further provides approvals assigned by Hydro One to Inergi LP for specific transactions and levels of spending.

"Information and Communication" supports all other control components. Pertinent information must be identified, captured and communicated in a form and timeframe that enables staff to carry out their responsibilities. Regular communication occurs to all staff from the Chief Financial Officer and from the Corporate Controller with respect to new or changed policies and procedures. Presentations on various internal control matters also occur regularly. And, as noted previously, policies and procedures can be found in many locations on internal websites.

"Monitoring" covers the oversight of internal controls by management or independent parties outside the process; or the application of independent methodologies, such as customized procedures or standard checklists, by employees within a process. Monitoring also includes assessing the quality of internal controls over time and implementing required changes.

Quarterly letters of representation and disclosure prepared and submitted by Vice-Presidents provide both assurance and communication with respect to internal controls and validity of financial statements. The Letter of Disclosure addresses issues such as legal claims; changes in accounting policies, practices, systems, and procedures that have occurred in the period; and financial accounting matters that could have a significant impact on financial statements. The Letter of Representation provides assurance that internal control systems, policies and procedures are in place and functioning properly and financial statements are a true representation of the business.

Every month, each line of business is required to conduct a detailed review of financial results by comparing operating results to budgets and responding to discrepancies. Project details with major accounts are reconciled monthly to source sub-systems and suspense accounts are also explained and reconciled. Monthly control reports related to key aspects of operations financial and project activity are prepared centrally and delivered to managers for review and follow-up action as appropriate. A month-end close schedule is established to ensure timely production of financial statements. In addition, annual compliance testing of key financial activities are performed locally by line of business staff.

Compliance monitoring with respect to codes and policies is performed by multiple groups. Regulatory compliance is monitored by Regulatory Affairs (e.g. Affiliate Relationships Code; see Exhibit A, Tab 8, Schedule 3). Internal Audit performs compliance audits and uses a risk-based audit approach for prioritizing such audits. Internal controls are reviewed on a recurring cycle, again linked to level of risk. Furthermore, regular review of all outstanding items from past audits is performed. Annual year-end audits are also conducted by the external auditor.

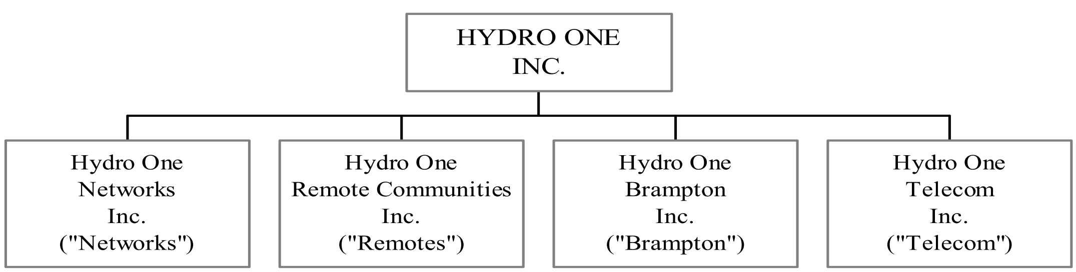
The outsourcing contract with Inergi LP requires that Inergi conduct an independent confirmation of the integrity of financial controls for all Hydro One transactions, and allows for auditing of processes and systems by Hydro One Internal Audit. Such audits are designed to assess the appropriate occurrence, proper measurement, completeness and accuracy of transactions and whether they were classified, described and disclosed in accordance with generally accepted accounting principles.

AFFILIATE SERVICE AGREEMENTS

1.0 INTRODUCTION

In accordance with the Affiliate Relationships Code ("ARC"), when Hydro One Distribution, as a business within Hydro One Networks ("Networks"), provides services to or purchases services from affiliates, it does so in accordance with service agreements. This Exhibit discusses the current agreements between Networks and its active affiliates. Networks and its active affiliates are displayed originally in the corporate organization chart in Exhibit A, Tab 8, Schedule 1 and repeated in Figure 1.0 below for convenience.

Figure 1
Hydro One Inc.



2.0 THE DEVELOPMENT OF THE SERVICE AGREEMENTS

As discussed in Exhibit A, Tab 8, Schedule 1, Hydro One's primary distribution business is "housed" within Networks. Accordingly, representatives from Networks and the various affiliates identify and negotiate the nature of the services being provided or purchased, any specific terms and the prices (or, alternatively, the pricing formula) for these services. This information is incorporated into legal agreements with commercial terms and conditions, then reviewed and approved by each company's CEO or other accountable officer. Two agreements, which focus on the provision of common administrative services from Hydro One Inc. to its subsidiaries and from Networks to its affiliates, are structured as multi-party agreements and accordingly, are reviewed and signed by all parties.

The current agreements between Networks and its affiliates are listed below, in Table 1, which identifies the service provider, the recipient and a brief description of the services.

Table 1
Networks' Service Agreements – 2007

Service Provider	***Recipient(s)***	***Description of Services***
Hydro One Inc. (Appendix A)	Networks Telecom Remotes Brampton Networks	***a) General Counsel and Secretary services*** – Professional legal advice and input as well as guidance on business ethics and support in the form of a business code of conduct. ***b) President / CEO / Chairman services*** – Strategic direction and management. ***c) Chief Financial Office services*** – Review of policies and procedures, investment decisions, treasury operations and tax planning, financial control and reporting.
Networks (Appendix B)	Hydro One Inc. Remotes Telecom Inc. Brampton Networks	***a) General Counsel and Secretary services*** – Professional legal advice and input and services regarding the protection of assets and management of security risks. ***b) Financial services*** -- Financial information, business planning, budgeting and financial reporting as well as other financial services such as treasury/pension/investor relations, taxation, internal audit and risk management, insurance, financial systems and services, cost and inventory accounting, decision support, transaction processing (accounts payable and receivable), and fixed asset and general accounting. ***c) Corporate services*** -- Facility management and support services, human resource services and corporate communications. ***d) Telecommunications-related services*** – Field and engineering, logistics, corporate, construction, telecommunication and information technology services. ***e) Other services*** – Supply procurement, customer services operation and information management.
Networks (Appendix C)	Remotes	***Utility Operations services*** – Provincial lines, forestry, drafting, environmental land assessment and remediation, fleet management, flight safety, training, safety, station maintenance, meter services, approval of plans, drawings and specification of installation work,

Service Provider	*Recipient(s)*	*Description of Services*
		joint use services and engineering and construction services.
Networks (Appendix D)	Remotes	***CEO / President services*** -- Administrative oversight, provision of strategic direction and advice and advocacy of the service recipient's position regarding operational and budgetary issues.
Telecom (Appendix E)	Networks	***Telecommunication services*** -- Monitoring of power system teleprotection, including analogue and digital microwave, PLC, fibre optic, radio and other systems. Monitoring, management and operation of business system telecom services. Provision of alarm based services, coordinated network management services, systems analysis services and carrier/vendor management services.
Remotes (Appendix F)	Networks	***Metering and Lines Services*** -Lines Apprenticeship program instruction services, update, install, reverify and sample meter changes and maintain the services recipient's distribution system.

3.0 TERMS AND CONDITIONS

In accordance with the ARC, the agreements describe the nature of, and the fees payable for, the services and they contain confidentiality, liability and indemnification provisions. They also describe a dispute resolution process to which the parties must adhere in resolving disputes under the agreements. More details on the key clauses are provided below.

3.1 Description of Services

The agreements address Networks' provision of certain common administrative and corporate services and utility operation and maintenance services to its affiliates as well as the receipt by Networks of operating, certain common administrative and corporate and telecommunications services from them. The services are described in detail as a schedule to the agreements.

3.2 Fees Payable

Pursuant to the ARC, where a utility provides a service, resource or product to an affiliate, the utility shall ensure that the sale price is no less than the fair market value of the service, resource or product. In purchasing a service, resource or product, from an affiliate, a utility shall pay no more than the fair market value. Where no fair market value is available for any product, resource or service, a utility shall charge no less than a cost-based price, and shall pay not more than a cost-based price.

Each services agreement specifies the price payable for the specific services described in the agreement and generally, the price is cost-based since no fair market value is available for the said services.

The annual fees payable to Networks by its affiliates for certain common administrative and corporate services for the years 2006, 2007 and 2008 are as specified in the following table. Service agreements are provided for 2007. The amounts for 2008 are planned amounts consistent with the revenue requirements in this Application.

3.3 Dispute Resolution Procedure

If the parties have a dispute under the agreement that cannot be resolved by a director or manager from each party, the dispute will be passed to the parties' respective presidents. If, after five days after receipt of notice of the dispute, the dispute is still unresolved, the matter proceeds to the President of Hydro One Inc. for final resolution.

3.4 Confidentiality

Except as required by law and in certain other circumstances (which exceptions are typical in a confidentiality agreement), each party is to maintain in strict confidence the Agreement and all information received from the other party and shall not copy or disclose the information to any third party without the prior written consent of the disclosing party. No such consent is required for disclosure to the receiving party's representatives who have a need to know. Such information includes personal information and information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator. The agreements also include security safeguards to be adhered to by the party receiving confidential information.

3.5 Intellectual Property

All rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to the service recipient by the service provider vests with the service recipient and the recipient may use, disclose or modify such reports or deliverable in any manner it deems appropriate.

3.6 Indemnification

Each party (the "indemnifying party") shall be liable for and shall indemnify the other party from and against all costs or damages attributable to the indemnifying party's performance and/or non-performance of its obligations under the agreement, whether arising from or based on breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of the agreement, neither party shall be liable for any economic loss, loss of goodwill, loss of profit or for any special, indirect or consequential damages where the said losses or damages are incurred by the other party or by any third party claiming through or under the other party. The obligation to indemnify survives the termination or expiry of the agreement.

4.0 COST-BASED PRICING

As noted above, the fees payable for services delivered between affiliates are cost-based. Such costs may be billed directly, and if this is done, the individual agreement will specify these fees. An alternative is to allocate costs across a number of affiliates, based on the proportion of a given service used by the affiliates or the benefit derived. Where this is done, a cost allocation model is used. The Hydro One cost allocation model is described in Exhibit C1, Tab 5, Schedule 1.

AFFILIATE SERVICE AGREEMENTS

Appendix A

Hydro One Inc.

Service Provision to:

Hydro One Networks Inc.
Hydro One Telecom Inc.
Hydro One Remote Communities Inc.
Hydro One Brampton Networks Inc.

2007

(Legal advice, financial services, strategic direction and management)

THIS AGREEMENT made in duplicate this 1st day of January, 2007 (the "Effective Date").

BETWEEN:

HYDRO ONE INC.
(the "Services Provider")

- and -

HYDRO ONE REMOTE COMMUNITIES INC., HYDRO ONE NETWORKS INC., HYDRO ONE TELECOM INC. and HYDRO ONE BRAMPTON NETWORKS INC.
(individually, the "Services Recipient" and collectively, the "Services Recipients")

1.0 PREFACE

This Agreement is intended to identify the services that are to be provided to each of the Services Recipients by the Services Provider in accordance with the terms and conditions herein. Except as otherwise specified, the term of this Agreement shall be for a period of 1year commencing on the Effective Date.

2.0 SERVICES

The Services Provider shall provide to each of the Services Recipients (as may be required by each of them respectively from time to time during the term of this Agreement) the following services (the "**Services**"), which Services are more particularly described in Schedule "A" attached hereto:

- General Counsel & Secretary (including Corporate Executive Office) services
- President / CEO / Chairman services
- Chief Financial Office services (including Strategic Financial services)
- Use of certain assets by Hydro One Networks Inc.

3.0 FEES PAYABLE

(a) The price for the performance of the Services for each of the Services Recipients shall be as identified in Schedule "A" attached hereto, exclusive of any sales and use taxes, as may be applicable. The relevant price for the Services shall be paid by each of the Services Recipients to the Services Provider by means of monthly electronic journal transfers which shall be reflected in the applicable books and records of each party. In addition, each Services Recipient shall pay for any material costs which the Services Provider, acting reasonably, incurs as a result of resources, services and products that the Services Provider must purchase and that are in addition to the Services Provider's existing resources, services and products, in order to provide the said Services Recipient with specific services it requires and requests.

(b) If at any time during the performance of the Services, a Services Recipient is of the opinion that there are deficiencies in the Services provided to it and/or that the price payable is in any way inaccurate, the said Services Recipient shall pay the entire relevant price payable by it in full and its sole remedy shall be to follow the dispute resolution procedures outlined in Section 6.0 herein to determine what amount, if any, shall be refunded to the said Services Recipient and/or what Services, if any, shall be rectified or redone by the Services Provider.

(c) The parties acknowledge and agree that they qualify as specified members of a closely related group under subsection 156(1) of the Excise Tax Act (Canada), as amended (the "Act") and have jointly executed a Form GST 25, to make an election under subsection 156(2) of the Act to deem the purchase and sale of the Services to be made for nil consideration for Goods and Services Tax purposes.

4.0 REPRESENTATIONS AND WARRANTIES

(a) The Services Provider represents and warrants that:
   (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder;
   (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Provider; and
   (iii) all staff employed in the performance of the Services shall have the qualifications, expertise and experience which could reasonably be expected of staff of a services provider performing work similar to the Services.

(b) Each Services Recipient represents and warrants that:
   (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder; and
   (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Recipient.

5.0 PERFORMANCE OF THE SERVICES

(a) **Compliance with Standards and Applicable Law:** The Services Provider shall perform the Services in a diligent and professional manner and shall comply with the Services Recipient's computer data management and data access protocols contained in the Services Recipient's documents entitled "Corporate Security Standard 600-3 – Information Security Policy" and "Corporate Security Policy 600 – Information Security Policy", both of which are dated January 17, 2000" and any amendments thereto which may be made from time to time by the Services Recipient. The Services Provider shall comply at all times with the statutes, regulations, by-laws, standards and codes, as amended, as may be applicable to the Services Provider in respect of the Services and the performance of its obligations hereunder and it shall, at its own expense, obtain and maintain in good standing all permits and licences required by any authorities having jurisdiction to perform the Services.

(b) **<u>Safety and Security Measures</u>**: When any part of the Services is to be performed at any of the Services Recipients' premises, all of the Services Provider's staff engaged in the performance of the Services at the said premises shall comply with the safety and security requirements and measures in effect at the said premises.

(c) **<u>Meetings</u>**: Each of the Services Recipient and the Services Provider shall, after the Effective Date, meet at least twice during the term of this Agreement to review performance, quality and timeliness of the Services provided by the Services Provider pursuant to this Agreement.

6.0 DISPUTE RESOLUTION PROCEDURES

Any controversy, dispute, difference, question or claim arising between any of the parties in connection with the interpretation, performance, construction or implementation of this Agreement that cannot be resolved by a director or manager from each of the said parties (collectively "Dispute") shall be settled in accordance with this Section. The aggrieved party shall send the other affected party(ies) written notice identifying the Dispute, the amount involved, if any, and the remedy sought, and invoking the procedures of this Section. The Presidents of each affected party shall confer in an effort to resolve the Dispute. If the Presidents are unable to resolve the Dispute within 5 business days after receipt of the written notice of the Dispute, then the affected parties shall submit the Dispute to the President of Hydro One Inc. for resolution.

7.0 CONFIDENTIALITY AND INTELLECTUAL PROPERTY

(a) Confidentiality:

Each party (the "Receiving Party") shall maintain in strict confidence this Agreement and the existence and contents thereof and all information, analysis, conclusions, drawings, reports, specifications or other information, proprietary or otherwise, whether transmitted orally, electronically or in written form, and received in furtherance of this Agreement from any of the other parties (the "Disclosing Party") or any of the Disclosing Party's directors, officers, employees, consultants, agents or legal and other advisors (the "Disclosing Party Representatives") (collectively the "Confidential Information"). Except as permitted herein, the Receiving Party shall not publish, reproduce, or disclose, either directly or indirectly, the said Confidential Information to any third party and shall not use the said Confidential Information for any purpose other than for purposes of this Agreement without the prior written consent of the Disclosing Party. The Receiving Party may disclose the Confidential Information only to its shareholder, directors, officers, employees, consultants, agents or professional advisors (the "Receiving Party Representatives") having a need to know same and who have undertaken a like obligation to maintain its confidentiality.

For greater certainty, Confidential Information includes any and all personal information (as that term is defined in the *Freedom of Information and Protection of Privacy Act* (Ontario) and the *Personal Information Protection and Electronic Documents Act* (Canada), as they may be amended, and any and all information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator, provided by the Disclosing Party to the Receiving Party for purposes of this Agreement, whether or not such information was initially provided prior to the Effective Date.

The Receiving Party undertakes to protect and safeguard all Confidential Information in its possession or under its control and received by the Disclosing Party, in the manner described in Schedule "B" attached hereto. The Disclosing Party may, on reasonable notice, and during regular business hours, audit the information management practices of the Receiving Party to confirm compliance with the terms and conditions of this Section 7.0 and all applicable statutes, regulations, by-laws, standards and codes, as amended.

The Receiving Party undertakes to notify the Disclosing Party immediately upon discovery of any unauthorized use and/or disclosure of any of the Disclosing Party's Confidential Information, to co-operate with the Disclosing Party to help regain possession of such Confidential Information, and to prevent its further unauthorized use and/or disclosure.

The foregoing obligations with respect to confidentiality, use, reproduction, dissemination, publication and non-disclosure herein shall not apply to any information that:

(i) is previously known to or lawfully in the possession of the Receiving Party prior to the date of disclosure as evidenced by the Receiving Party's written record;

(ii) is independently known to or discovered by the Receiving Party, without any reference to the information or material;

(iii) is obtained by the Receiving Party from an arm's length third party having a bona fide right to disclose same and who was not otherwise under an obligation of confidence or fiduciary duty to the Disclosing Party or the Disclosing Party Representatives;

(iv) is or becomes public knowledge through no fault or omission of, or breach of this Agreement by the Receiving Party or the Receiving Party Representatives; or

(iv) is required to be disclosed pursuant to a final judicial or governmental order or other legal process.

Confidential Information (other than this Agreement which shall be jointly owned by the parties) shall remain the sole and exclusive property of the Disclosing Party that has disclosed the Confidential Information, and the Disclosing Party shall retain all right, title and interest in and to the said Confidential Information.

The Receiving Party shall keep a record of written Confidential Information furnished to it by the Disclosing Party in a location separate from those locations where the Receiving Party has stored information in respect of other third parties for which it performs work and it shall advise the Disclosing Party of such location.

All Confidential Information furnished by the Disclosing Party (other than this Agreement), including that portion of the Confidential Information which is contained in analyses, compilations, studies or other documents prepared by the Receiving Party or by the Receiving Party Representatives, is the Disclosing Party's property and will be returned immediately to the Disclosing Party upon its request.

(b) Intellectual Property:

Each of the Services Recipients shall obtain all rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to it by the Services Provider and, subject to applicable legislation and notwithstanding clause 7.0(a) above, the said Services Recipient may use, disclose or modify such reports or deliverable in any manner it deems appropriate. The Services Provider shall not do any act which may compromise or diminish the said Services Recipient's interest as aforesaid.

(c) Survival of Obligations:

This Section 7.0 shall forever survive the termination or expiration of this Agreement.

8.0 LIABILITY

The Services Provider shall indemnify each of the Services Recipients and the Services Recipient's respective successors and assigns, directors, officers, employees, contractors and agents from and against all costs or damages attributable to the Services Provider's performance and/or non-performance of its obligations under this Agreement and any amendments thereto, whether arising from or based upon breach of contract, tort, negligence, strict liability or otherwise. Each Services Recipient shall indemnify the Services Provider and the Services Provider's successors and assigns, directors, officers, employees, contractors and agents from and against all costs or damages attributable to the said Services Recipient's performance and/or non-performance of its obligations under this Agreement and any amendments thereto, whether arising from or based upon breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of this Agreement, no party hereto shall be liable for any economic loss, loss of goodwill, loss of profit or for any special, indirect or consequential damages, where the said losses or damages are incurred by the other parties or any of them or by any third party claiming through or under the other parties or any of them.

This Section 8.0 shall forever survive the termination or expiration of this Agreement.

9.0 AUTHORIZED REPRESENTATIVES

The authorized representatives of the parties hereto for purposes of this Agreement are the following:

HYDRO ONE TELECOM INC.
65 Kelfield Street,
Rexdale, Ontario M9W 5A3

Attention: **Cliff Truax**
Telephone: 416-240-6713
Telecopier: 416-240-6802

Telephone:	(905) 840-6300 ext. 205
Telecopier:	(905) 840-0967

All correspondence, reports, documents and/or other communication concerning this Agreement and the Schedule attached hereto shall be directed to the attention of the authorized representatives noted above and shall be deemed to be sufficiently given if delivered personally, mailed or transmitted by fax to the attention of the authorized representatives at the addresses above, and any notice so given shall be deemed to have been made and received on the date of delivery or on the 5th business day following the day of mailing of same or on the day of transmission if transmitted during normal business hours, otherwise on the next business day, as the case may be.

10.0 CHANGE OF CONTROL

In the event of a change of control of any of the Services Recipients, this Agreement shall immediately terminate as between the said Services Recipient and the Services Provider only. A change of control shall mean, as applicable, a purchase of more than fifty (50) percent of the outstanding capital by a non-affiliate third party.

11.0 ASSIGNMENT

Neither this Agreement nor any rights and obligations shall be assigned by any of the Services Recipients without the prior written consent of the Services Provider and by the Services Provider without the prior written consent of the affected Services Recipient, in either case which consent shall not be unreasonably withheld. Subject to the foregoing, this Agreement shall enure to the benefit of the parties hereto and their respective successors and permitted assigns.

12.0 SCHEDULES

Schedules "A" and "B" attached hereto are to be read with and form part of this Agreement.

13.0 COUNTERPARTS

This Agreement may be executed in counterparts and the counterparts together shall constitute an original.

IN WITNESS THEREOF the parties hereto have caused this Agreement to be executed by their respective representatives duly authorized in that behalf.

Schedule "A"

The annual cost for the performance of the Services to be delivered is summarized as follows:

Services	SERVICES TO BE PROVIDED BY HYDRO ONE INC. TO: (in $Thousands)			
	Hydro One Networks Inc.	Hydro One Remote Communities Inc.	Hydro One Telecom Inc.	Hydro One Brampton Networks Inc.
General Counsel & Secretary (including Corporate Executive Office)	916	25	10	20
President / CEO / Chairman Services	4,080	21	30	43
Chief Financial Office Services (including Strategic Financial services)	953	8	33	45
Totals	5,949	54	73	108

DESCRIPTION OF SERVICES:

General Counsel and Secretary

The Services Provider shall provide the Services Recipient with professional legal advice and input. This advice shall include, but shall not be limited to, interpretation and analysis of legislation and regulations, advice concerning corporate structure and governance, development of regulatory instruments (licences), contracts, and environmental and health and safety issues. The Services Provider will also provide guidance on business ethics and support in the form of a business code of conduct.

President / CEO / Chairman services

The Services Provider shall provide the Services Recipient with strategic direction and management in an attempt to ensure that the Services Recipient's corporate goals are achieved.

Chief Financial Office services (including Strategic Financial services)

The Services Provider shall provide the Services Recipient with strategic direction and management in an attempt to ensure that the Services Recipient's corporate financial goals are achieved.

The Services Provider shall provide the Services Recipient with strategic approval with respect to investment decisions. Services relating to the review of policies and procedures, treasury operations and tax planning, financial control and reporting will also be provided by the Services Provider to the Services Recipient as required by the Services Recipient.

Schedule "B"

Receiving Party Security Safeguards Regarding Confidential Information Received from the Disclosing Party

The Receiving Party shall protect the Confidential Information by security safeguards appropriate to the sensitivity of the information.

1) The Receiving Party shall protect the Confidential Information against such risks as loss or theft, unauthorized access, disclosure, copying, use, modification or destruction, through appropriate security measures, regardless of the format in which it is held.

2) All of the Receiving Party's Representatives with access to the Confidential Information shall be contractually required to respect the confidentiality of that information.

3) The Receiving Party acknowledges and agrees that the nature of the safeguards will vary depending on the sensitivity, amount, distribution and format of the information, and the method of storage. The Receiving Party shall ensure that more sensitive information will be safeguarded by a higher level of protection.

4) The Receiving Party shall ensure that methods of protection will include:

(a) physical measures, for example, locked filing cabinets and restricted access to offices;

(b) organizational measures, for example, controlling entry to data centers and limiting access to information on a "need-to-know" basis;

(c) technological measures, for example, the use of passwords and encryption; and

(d) investigative measures, in cases where the Receiving Party has reasonable grounds to believe that the Confidential Information is being inappropriately collected, used or disclosed by anyone whom in law the Receiving Party is responsible.

AFFILIATE SERVICE AGREEMENTS

Appendix B

Hydro One Networks Inc.

Service Provision to:

Hydro One Inc.
Hydro One Telecom Inc.
Hydro One Remote Communities Inc.
Hydro One Brampton Networks Inc.

2007

(General Counsel/Secretary Services, Financial services, Corporate services, telecommunications services, supply procurement, customer services operation and information management)

THIS AGREEMENT made in duplicate this 1st day of January, 2007 (the "Effective Date").

BETWEEN:

HYDRO ONE NETWORKS INC.
(the "Services Provider")

- and -

HYDRO ONE REMOTE COMMUNITIES INC, HYDRO ONE INC.
HYDRO ONE TELECOM INC., and HYDRO ONE BRAMPTON NETWORKS INC.

(individually, the "Services Recipient" and collectively, the "Services Recipients")

1.0 PREFACE

This Agreement is intended to identify the services that are to be provided to each of the Services Recipients by the Services Provider in accordance with the terms and conditions herein. Except as otherwise specified, the term of this Agreement shall be for a period of 1 year commencing on the Effective Date.

2.0 SERVICES

The Services Provider shall provide to each of the Services Recipients (as may be required by each of them respectively from time to time during the term of this Agreement) the following services (the "**Services**"), which Services are more particularly described in Schedule "A" attached hereto:

- General Counsel and Secretary services
- Financial services
- Corporate services
- Telecommunications Services
- Other services

3.0 FEES PAYABLE

(a) The price for the performance of the Services for each of the Services Recipients shall be as identified in Schedule "A" attached hereto, exclusive of any sales and use taxes, as may be applicable. The relevant price for the Services shall be paid by each of the Services Recipients to the Services Provider by means of monthly electronic journal transfers which shall be reflected in the applicable books and records of each party. In addition, each Services Recipient shall pay for any material costs which the Services Provider, acting reasonably, incurs as a result of resources, services and products that the Services Provider must purchase and that are in addition to the

Services Provider's existing resources, services and products, in order to provide the said Services Recipient with specific services it requires and requests.

(b) If at any time during the performance of the Services, a Services Recipient is of the opinion that there are deficiencies in the Services provided to it and/or that the price payable is in any way inaccurate, the said Services Recipient shall pay the entire relevant price payable by it in full and its sole remedy shall be to follow the dispute resolution procedures outlined in Section 6.0 herein to determine what amount, if any, shall be refunded to the said Services Recipient and/or what Services, if any, shall be rectified or redone by the Services Provider.

c) The parties acknowledge and agree that they qualify as specified members of a closely related group under subsection 156(1) of the Excise Tax Act (Canada), as amended (the "Act") and have jointly executed a Form GST25, to make an election under subsection 156(2) of the Act to deem the purchase and sale of the Services to be made for nil consideration for Goods and Services Tax purposes.

4.0 REPRESENTATIONS AND WARRANTIES

(a) The Services Provider represents and warrants that:
- (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder;
- (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Provider; and
- (iii) all staff employed in the performance of the Services shall have the qualifications, expertise and experience which could reasonably be expected of staff of a services provider performing work similar to the Services.

(b) Each Services Recipient represents and warrants that:
- (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder; and
- (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Recipient.

5.0 PERFORMANCE OF THE SERVICES

(a) **Compliance with Standards and Applicable Law:** The Services Provider shall perform the Services in a diligent and professional manner and shall comply with the Services Recipient's computer data management and data access protocols contained in the Services Recipient's documents entitled "Corporate Security Standard 600-3 – Information Security Policy" and "Corporate Security Policy 600 – Information Security Policy", both of which are dated January 17, 2000 and any amendments thereto which may be made from time to time by the Services Recipient. The Services Provider shall comply at all times with the statutes, regulations, by-laws, standards and codes, as amended, as may be applicable to the Services Provider in respect of the Services and the performance of its obligations hereunder and it shall, at its own expense, obtain and maintain in good standing all permits and licences required by any authorities having jurisdiction to perform the Services.

(b) **Safety and Security Measures**: When any part of the Services is to be performed at any of the Services Recipients' premises, all of the Services Provider's staff engaged in the performance of the Services at the said premises shall comply with the safety and security requirements and measures in effect at the said premises.

(c) **Meetings**: Each of the Services Recipient and the Services Provider shall, after the Effective Date, meet at least twice during the term of this Agreement to review performance, quality and timeliness of the Services provided by the Services Provider pursuant to this Agreement.

6.0 DISPUTE RESOLUTION PROCEDURES

Any controversy, dispute, difference, question or claim arising between any of the parties in connection with the interpretation, performance, construction or implementation of this Agreement that cannot be resolved by a director or manager from each of the said parties (collectively "Dispute") shall be settled in accordance with this Section. The aggrieved party shall send the other affected party(ies) written notice identifying the Dispute, the amount involved, if any, and the remedy sought, and invoking the procedures of this Section. The Presidents of each affected party shall confer in an effort to resolve the Dispute. If the Presidents are unable to resolve the Dispute within 5 business days after receipt of the written notice of the Dispute, then the affected parties shall submit the Dispute to the President of Hydro One Inc. for resolution.

7.0 CONFIDENTIALITY AND INTELLECTUAL PROPERTY

(a) Confidentiality:

Each party (the "Receiving Party") shall maintain in strict confidence this Agreement and the existence and contents thereof and all information, analysis, conclusions, drawings, reports, specifications or other information, proprietary or otherwise, whether transmitted orally, electronically or in written form, and received in furtherance of this Agreement from any of the other parties (the "Disclosing Party") or any of the Disclosing Party's directors, officers, employees, consultants, agents or legal and other advisors (the "Disclosing Party Representatives") (collectively the "Confidential Information"). Except as permitted herein, the Receiving Party shall not publish, reproduce, or disclose, either directly or indirectly, the said Confidential Information to any third party and shall not use the said Confidential Information for any purpose other than for purposes of this Agreement without the prior written consent of the Disclosing Party. The Receiving Party may disclose the Confidential Information only to its shareholder, directors, officers, employees, consultants, agents or professional advisors (the "Receiving Party Representatives") having a need to know same and who have undertaken a like obligation to maintain its confidentiality.

For greater certainty, Confidential Information includes any and all personal information (as that term is defined in the *Freedom of Information and Protection of Privacy Act* (Ontario) and the *Personal Information Protection and Electronic Documents Act* (Canada), as they may be amended, and any and all information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator provided by the Disclosing Party to the Receiving Party for purposes of this Agreement, whether or not such information was initially provided prior to the Effective Date.

The Receiving Party undertakes to protect and safeguard all Confidential Information in its possession or under its control and received by the Disclosing Party, in the manner described in Schedule "B" attached hereto. The Disclosing Party may, on reasonable notice, and during regular business hours, audit the information management practices of the Receiving Party to confirm compliance with the terms and conditions of this Section 7.0 and all applicable statutes, regulations, by-laws, standards and codes, as amended.

The Receiving Party undertakes to notify the Disclosing Party immediately upon discovery of any unauthorized use and/or disclosure of any of the Disclosing Party's Confidential Information, to co-operate with the Disclosing Party to help regain possession of such Confidential Information, and to prevent its further unauthorized use and/or disclosure.

The foregoing obligations with respect to confidentiality, use, reproduction, dissemination, publication and non-disclosure herein shall not apply to any information that:

(i) is previously known to or lawfully in the possession of the Receiving Party prior to the date of disclosure as evidenced by the Receiving Party's written record;
(ii) is independently known to or discovered by the Receiving Party, without any reference to the information or material;
(iii) is obtained by the Receiving Party from an arm's length third party having a bona fide right to disclose same and who was not otherwise under an obligation of confidence or fiduciary duty to the Disclosing Party or the Disclosing Party Representatives;
(iv) is or becomes public knowledge through no fault or omission of, or breach of this Agreement by the Receiving Party or the Receiving Party Representatives; or
(v) is required to be disclosed pursuant to a final judicial or governmental order or other legal process.

Confidential Information (other than this Agreement which shall be jointly owned by the parties) shall remain the sole and exclusive property of the Disclosing Party that has disclosed the Confidential Information, and the Disclosing Party shall retain all right, title and interest in and to the said Confidential Information.

The Receiving Party shall keep a record of written Confidential Information furnished to it by the Disclosing Party in a location separate from those locations where the Receiving Party has stored information in respect of other third parties for which it performs work and it shall advise the Disclosing Party of such location.

All Confidential Information furnished by the Disclosing Party (other than this Agreement), including that portion of the Confidential Information which is contained in analyses, compilations, studies or other documents prepared by the Receiving Party or by the Receiving Party Representatives, is the Disclosing Party's property and will be returned immediately to the Disclosing Party upon its request.

(b) Intellectual Property:

Each of the Services Recipients shall obtain all rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to it by the Services Provider and, subject to applicable legislation and notwithstanding clause 7.0(a) above, the said Services Recipient may use, disclose or modify such reports or deliverable in any manner it deems appropriate. The Services Provider shall not do any act which may compromise or diminish the said Services Recipient's interest as aforesaid.

(c) Survival of Obligations:

The obligations in this Section 7.0 shall forever survive the termination or expiration of this Agreement.

8.0 LIABILITY

The Services Provider shall indemnify each of the Services Recipients and the Services Recipient's respective successors and assigns, directors, officers, employees, contractors and agents from and against all costs or damages attributable to the Services Provider's performance and/or non-performance of its obligations under this Agreement and any amendments thereto, whether arising from or based upon breach of contract, tort, negligence, strict liability or otherwise. Each Services Recipient shall indemnify the Services Provider and the Services Provider's successors and assigns, directors, officers, employees, contractors and agents from and against all costs or damages attributable to the said Services Recipient's performance and/or non-performance of its obligations under this Agreement and any amendments thereto, whether arising from or based upon breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of this Agreement, no party hereto shall be liable for any economic loss, loss of goodwill, loss of profit or for any special, indirect or consequential damages, where the said losses or damages are incurred by the other parties or any of them or by any third party claiming through or under the other parties or any of them.

This Section 8.0 shall forever survive the termination or expiration of this Agreement.

9.0 AUTHORIZED REPRESENTATIVES

The authorized representatives of the parties hereto for purposes of this Agreement are the following:

HYDRO ONE TELECOM INC.
65 Kelfield Street,

All correspondence, reports, documents and/or other communication concerning this Agreement and the Schedule attached hereto shall be directed to the attention of the authorized representatives noted above and shall be deemed to be sufficiently given if delivered personally, mailed or transmitted by fax to the attention of the authorized representatives at the addresses above, and any notice so given shall be deemed to have been made and received on the date of delivery or on the 5th business day following the day of mailing of same or on the day of transmission if transmitted during normal business hours, otherwise on the next business day, as the case may be.

10.0 CHANGE OF CONTROL

In the event of a change of control of the Services Provider, this Agreement shall immediately terminate as between each of the Services Recipients and the Services Provider. A change of control shall mean, as applicable, a purchase of more than fifty (50) percent of the outstanding capital by a non-affiliate third party.

11.0 ASSIGNMENT

Neither this Agreement nor any rights and obligations shall be assigned by any of the Services Recipients without the prior written consent of the Services Provider and by the Services Provider without the prior written consent of the affected Services Recipient, in either case which consent shall not be unreasonably withheld. Subject to the foregoing, this Agreement shall enure to the benefit of the parties hereto and their respective successors and permitted assigns.

12.0 SCHEDULES

Schedules “A” and “B” attached hereto are to be read with and form part of this Agreement.

13.0 COUNTERPARTS

This Agreement may be executed in counterparts and the counterparts together shall constitute an original.

IN WITNESS THEREOF the parties hereto have caused this Agreement to be executed by their respective representatives duly authorized in that behalf.

Schedule "A"

The annual cost for the performance of the Services to be delivered is summarized as follows:

	SERVICES TO BE PROVIDED BY HYDRO ONE NETWORKS INC. TO: (in $Thousands)			
SERVICES	**Hydro One Inc.**	**Hydro One Remote Communities Inc.**	**Hydro One Telecom Inc.**	**Hydro One Brampton Networks Inc.**
General Counsel and Secretary Services	68	198	68	136
Financial Services	112	201	389	240
Corporate Services		79	106	45
Telecommunication Services		126	202	
Other Services		481	920	
Totals	180	1085	1685	421

DESCRIPTION OF SERVICES:

The following provides a generic description of all Services to be provided by the Services Provider.

GENERAL COUNSEL AND SECRETARY SERVICES

The Services Provider shall provide the Services Recipient with professional legal advice and input which shall include, but not be limited to, interpretation and analysis of legislation and regulations, advice concerning corporate structure and governance, development of regulatory instruments (licenses), contracts, and environmental and health and safety issues. The Services Provider will also provide services regarding the protection of assets and management of security risks.

FINANCIAL SERVICES

The Services Provider shall provide financial services support to the Services Recipient by providing timely and reliable financial information. The Services Provider will also provide services relating to business planning, budgeting and financial reporting. As required, services relating to treasury/pension/investor relations, taxation, internal audit and risk management, insurance, financial systems and services, cost and inventory accounting and decision support will also be provided. Other financial services such as transaction processing (accounts payable and receivable), and fixed asset and general accounting will also be provided.

CORPORATE SERVICES

The Services Provider shall provide corporate services in three main areas:

- facility management and support services – management services related to acquisition, maintenance, protection and disposal of the Services Recipient's portfolio of land holdings as well as facilities and buildings management, including office accommodation and all related support and services; services related to the appraisal, negotiation and acquisition of real estate rights including: full ownership, easements, leases, licenses, and permits, as well as special projects.
- human resource services – provision of human resource policy, strategy and standards to meet legal and other requirements. This includes staff planning, leadership development, succession planning and change management, as well as labour relations services, pay equity, diversity, health services and performance management, compensation, health and benefits programs and administration of payroll, benefits plans and incentive programs.
- corporate communications – provision of strategy, program and support for corporate communications, public affairs and media relations, as well as corporate and shareholder relations and strategy and programs related to internal communications.

TELECOMMUNICATIONS SERVICES

The Services Provider shall provide the Services Recipient with various telecommunications-related services including field and engineering, logistics, corporate, construction, telecommunication and information technology services.

OTHER SERVICES

The Services Provider shall provide the Services Recipient with:

- Supply Procurement – provision of demand planning, management and procurement, vendor and inventory management, process development, data management, warehousing, waste management and investment recovery.
- Customer Services Operation – provision of bill production and dispatch and settlements service, as well as data services related to field-based service orders.
- Information Management – provision of infrastructure operations, including a variety of activities such as system testing and integration, Internet and database management services, as well as services related to mainframe infrastructure operations, end user and desk-top support.

Schedule "B"

Receiving Party Security Safeguards Regarding Confidential Information Received from the Disclosing Party

The Receiving Party shall protect the Confidential Information by security safeguards appropriate to the sensitivity of the information.

1) The Receiving Party shall protect the Confidential Information against such risks as loss or theft, unauthorized access, disclosure, copying, use, modification or destruction, through appropriate security measures, regardless of the format in which it is held.

2) All of the Receiving Party's Representatives with access to the Confidential Information shall be contractually required to respect the confidentiality of that information.

3) The Receiving Party acknowledges and agrees that the nature of the safeguards will vary depending on the sensitivity, amount, distribution and format of the information, and the method of storage. The Receiving Party shall ensure that more sensitive information will be safeguarded by a higher level of protection.

4) The Receiving Party shall ensure that methods of protection will include:

(a) physical measures, for example, locked filing cabinets and restricted access to offices;

(b) organizational measures, for example, controlling entry to data centers and limiting access to information on a "need-to-know" basis;

(c) technological measures, for example, the use of passwords and encryption; and

(d) investigative measures, in cases where the Receiving Party has reasonable grounds to believe that the Confidential Information is being inappropriately collected, used or disclosed by anyone whom in law the Receiving Party is responsible.

AFFILIATE SERVICE AGREEMENTS

Appendix C

Hydro One Networks Inc.

Service Provision to:

Hydro One Remote Communities Inc.

2007

(Utility operations services, including line maintenance, forestry, station maintenance, meter services, safety and environment, etc.)

THIS MASTER AGREEMENT made in duplicate as of the 1st day of January, 2007 (the "Effective Date").

BETWEEN:

HYDRO ONE NETWORKS INC.

- and -

HYDRO ONE REMOTE COMMUNITIES INC.

1.0 PREFACE

This Master Agreement and the subsequent individual contracts hereunder are intended to identify the services (collectively, the "Services") that are to be provided to Hydro One Remote Communities Inc. (hereinafter referred to as the "Services Recipient") by Hydro One Networks Inc. (hereinafter referred to as the "Services Provider") in accordance with the terms and conditions herein.

This Master Agreement serves to provide the general commercial terms and conditions that will govern each individual contract (the "Contract") to be agreed upon and executed by the Services Recipient and the Services Provider. Each Contract shall be uniquely numbered, shall specifically describe the individual Services that shall be provided by the Services Provider to the Services Recipient, reference performance targets and reporting requirements and may specify supplementary or different commercial terms and conditions, such as remedies for default, that take precedence over the terms and conditions of this Master Agreement.

Subject to the termination rights in the immediately following paragraph and in Section 6.0 herein, this Master Agreement and the Contracts executed hereunder (except as may be otherwise provided in any of the said Contracts) shall be effective as of the Effective Date and shall continue in full force and effect for a period of 2 years thereafter. In the event that the parties agree to extend the term of a Contract beyond the 2-year period contemplated herein, this Master Agreement shall continue to be in full force and effect for such extended period for purposes of the said Contract.

In the event that either party decides to cease carrying on the business of performing the type of work activities that constitute any portion of the Services under any Contract, it shall provide the other party with 6 months' prior written notice and on the first business day after expiry of the said 6-month period, all Contracts pertaining to the type of work activities which the said party has decided to cease carrying on shall be deemed to be terminated and the Services Recipient shall have no further obligation to the Services Provider other than to pay the Services Provider any monies then due and owing to the Services Provider because of any performance of the Services Provider's obligations completed up to the effective date of such termination plus reasonable costs incurred by the Services Provider as may be agreed upon by the parties, provided that the Services Recipient's liability under this paragraph shall not exceed the price to be paid for the Services as stipulated in the said Contract.

2.0 DEFINITIONS

In the Contracts and this Master Agreement, including the recitals and Schedules hereto, in addition to terms defined elsewhere in this Master Agreement or the Contracts, unless there is something in the subject matter or context inconsistent therewith, the following words shall have the following meanings:

(a) **"Contract Time"** means the time stipulated in any Contract from commencement of the Services to Substantial Performance of the Services.

(b) **"Substantial Performance of the Services"** means the point at which the Services are ready for use or are being used by the Services Recipient for the purpose intended.

(c) **"Total Performance"** means the point at which all of the following have occurred, where applicable:
- Project Completion Report has been received by the Services Recipient from the Services Provider;
- Test Certificate and Permits have been provided by the Services Provider to the Services Recipient;
- the Services Provider has updated the drawings for the Services to "AS BUILT" and has provided the said updated drawings to the Services Recipient.

3.0 SERVICES

The Services Provider shall provide the Services Recipient with the following Services as may be required by the Services Recipient from time to time and as may be agreed upon by both parties in a Contract, which Contract shall be in the form attached hereto as Schedule "C":

- Provincial Lines services
- Forestry services
- Drafting services
- Environmental Land Assessment and Remediation services
- Fleet services
- Flight Safety services
- Safety services
- Training services
- Meter services
- Station Maintenance: Technical Support services
- Approval of plans, drawings and specification of installation work
- Engineering and Construction Services
- Joint Use services

4.0 FEES PAYABLE

(a) The price for the performance of the Services described in each Contract shall be as specified in the relevant Contract and shall include any sales and use taxes as may be applicable, which taxes shall be shown separately in the said Contract. In the event that the parties agree that the Services Recipient shall pay the Services Provider for the Services on a time and materials basis, such time and materials basis shall be in accordance with the Services Provider's 2007-2008 hourly rates by job category and fleet rates, which hourly rates and fleet rates may be amended from time to time by mutual agreement of the parties. The parties acknowledge and agree that the Services Recipient has received the Services Provider's 2007-2008 hourly and fleet rates from the Services Provider.

The parties agree that the price for the Services described in each Contract shall be paid by the Services Recipient to the Services Provider by means of monthly electronic journal transfers which shall be reflected in the applicable books and records of each party or by direct time reporting through Hydro One Inc.'s payroll system.

The parties acknowledge and agree that some Contracts may contain holdback provisions that may be based upon performance or other criteria as may be agreed upon, as well as provisions dealing with bonuses and/or penalties.

(b) The parties acknowledge and agree that they qualify as specified members of a closely related group under subsection 156(1) of the *Excise Tax Act (Canada)*, as amended (the "Act") and have jointly executed a Form GST25, to make an election under subsection 156(2) of the Act to deem the purchase and sale of the Services under the Contracts to be made for nil consideration for Goods and Services Tax purposes.

5.0 REPRESENTATIONS AND WARRANTIES

(a) The Services Provider represents and warrants that:

(i) it has all the necessary corporate power, authority and capacity to enter into this Master Agreement and to perform its obligations hereunder;

(ii) the execution of this Master Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Provider;

(iii) all staff employed in the performance of the Services shall have the qualifications, expertise and experience which could reasonably be expected of staff of a services provider performing work similar to the Services; and

(iv) all material, tools, machinery and equipment provided by the Services Provider to the Services Recipient as part of the Services shall be new and of a quality best suited to the purpose required and their use subject to the approval of the Services Recipient.

(b) The Services Recipient represents and warrants that:

(i) it has all the necessary corporate power, authority and capacity to enter into this Master Agreement and to perform its obligations hereunder; and

(ii) the execution of this Master Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Recipient.

6.0 PERFORMANCE OF THE SERVICES

(a) **Access to Site:** The Services Recipient shall provide the Services Provider with an opportunity to visit and examine the site at which the Services are to be performed prior to the execution of any Contract for the said Services. Upon execution of any Contract, the Services Provider shall be deemed to have represented and warranted, along with the representations and warranties in Section 5.0(a) above, that the Services Provider has visited and examined the site at which the Services are to be performed under the said Contract and that the Services Provider has satisfied itself as to the form and nature of the site, the quantities and nature of the Services to be performed, the labour conditions existing in the area for the Services involved, facilities present on site, access to the site, the seasonal conditions limiting access to the site, the materials necessary for the performance of the Services, and any restrictions or barriers present at the site that would impact the performance of the Services and which the Services Provider was able to reasonably detect upon examination of the site.

(b) **Compliance with Standards, Specifications and Applicable Law:** The Services Provider shall perform the Services in a diligent and professional manner and shall comply with the Services Recipient's computer data management and data access protocols contained in the Services Recipient's documents entitled "Corporate Security Standard 600-3 – Information Security Policy" and "Corporate Security Policy 600 – Information Security Policy", both of which are dated January 17, 2000 and any amendments thereto which may be made from time to time by the Services Recipient. The Services Provider shall comply at all times with all statutes, regulations, by-laws, standards and codes as may be applicable to the Services Provider in respect of the Services and the performance of its obligations hereunder and it shall, at its own expense, obtain and maintain in good standing all permits and licences required by any authorities having jurisdiction to perform the Services identified in each Contract.

The Services Provider shall also comply with the General Standards and Specifications set out in Schedule "A" attached hereto in its performance of the Services, as may be applicable.

The Services Provider shall be responsible for coordinating all related work activities to be performed under all the Contracts.

(c) **Input from Services Recipient:** The Services Recipient shall cooperate and provide any required input as might be requested by the Services Provider, on a timely basis, to facilitate the performance of the Services by the Services Provider. In addition, the Services Recipient shall disclose to the Services Provider on a timely basis any information within the Services Recipient's possession or control which may reasonably affect the ability of the Services Provider to meet its obligations under this Master Agreement and the Contracts.

(d) **Constructor:** Unless otherwise specified in any executed Contract, the parties acknowledge and agree that the Services Provider shall be the "Constructor" of the Services performed under any executed Contract within the meaning of the Occupational Health and Safety Act, R.S.O. 1990, c. 0.1, as amended and the regulations thereunder and shall have all of the responsibilities and liabilities of a "Constructor".

(e) **Safety and Security Measures:** When any part of the Services under any Contract is to be performed at the Services Recipient's premises, all of the Services Provider's staff engaged in the performance of the Services at the said premises shall comply with the safety and security requirements and measures in effect at the said premises.

(f) **Cleanup:** The Services Provider shall maintain the location at which the Services are performed in a tidy condition and free from the accumulation of waste products and debris, other than that caused by the Services Recipient, its contractors or their respective employees. Upon completion of the Services, the Services Provider shall remove the material, tools, machinery and equipment and waste products and debris, other than those resulting from the work of the Services Recipient, its contractors and their respective employees.

(g) **Review and Inspection of the Services:** The Services Recipient shall have access to the Services at all times. The Services Provider shall provide sufficient, safe, and proper facilities at all times for the review of the Services by the Services Recipient. The Services Recipient may order any portion or portions of the Services to be examined to confirm that such work is in accordance with the requirements of this Master Agreement and the relevant Contract. If the work is not in accordance with the requirements of this Master Agreement and the relevant Contract, the Services Provider shall correct the work and pay the cost of examination and correction. If the work is in accordance with the requirements of this Master Agreement and the relevant Contract, the Services Recipient shall pay the cost of examination and restoration. No payment by the Services Recipient under the relevant Contract shall constitute an acceptance of any portion of the Services which are not in accordance with the requirements of this Master Agreement and the relevant Contract.

(h) **Defective Services:** The Services Provider shall promptly remove from the site at which the Services have been performed and replace or re-execute defective work that has been rejected by the Services Recipient as failing to conform to this Master Agreement and/or the relevant Contract whether or not the defective work has been incorporated in the Services and whether or not the defect is the result of poor workmanship, use of defective products, or damage through carelessness or other act or omission of the Services Provider. The Services Provider shall promptly make good other contractors' work destroyed or damaged by such removals or replacements at the Services Provider's expense. If, in the reasonable opinion of the Services Recipient it is not expedient to correct defective work or work not performed as provided in this Master Agreement and/or the relevant Contract, the Services Recipient may deduct from the amount otherwise due to the Services Provider the difference in value between the work as performed and that called for by this Master Agreement and the relevant Contract. If the Services Provider and Services Recipient do not agree on the difference in value, they shall follow the dispute resolution procedures outlined in Section 8.0 herein.

(i) **Meetings:** The parties agree to meet quarterly after the Effective Date to review performance, quality and timeliness of the Services provided by the Services Provider pursuant to each Contract.

(j) **Right to Terminate Contract:** The Services Recipient may terminate any Contract, without cause and without any penalty to it, at any time by providing written notice to the Services Provider. Upon termination in accordance with this clause, the Services Recipient shall have no further obligation to the Services Provider other than to pay the Services Provider any monies then due and owing to the Services Provider because of any performance of the Services Provider's obligations completed up to the effective date of such termination plus reasonable costs incurred by the Services Provider as may be agreed upon by the parties, provided that the Services Recipient's liability under this clause shall not exceed the price to be paid for the Services as stipulated in the said Contract.

(k) **Emergency Priority:** Upon determination by the Services Recipient that the Services Recipient is in an emergency situation, the Services Provider shall give first priority to responding to the said emergency, in priority over any emergency response commitments that the Services Provider may have to a third party.

7.0 CHANGES TO SERVICES

Either party may request a change to the scope of work specified in each Contract including work already in progress in accordance with this Section.

If either party desires a change in the work described in any individual Contract, it shall complete and submit to the other party's Contract manager identified in the relevant Contract, a Contract Change Notification Form (the "CCNF") in the form attached hereto as Schedule "B". The CCNF shall identify the reasons and impact (cost and schedule) of the change. The other party shall respond to the CCNF no later than 10 business days after receipt thereof. In the event that the parties agree with the change in the scope of work, price and/or time for completion, the parties shall execute the CCNF and the executed CCNF shall be attached to the relevant Contract as a schedule thereto.

In the event that the parties agree on the change in the scope of work but do not agree on a revised price for the changed scope of work, the price shall be fixed on a time and materials basis in accordance with the Services Provider's 2007-2008 hourly rates and fleet rates as may be amended pursuant to this Agreement and the CCNF shall be executed by the parties accordingly. The Services Provider shall provide the Services Recipient with an invoice for the said changed scope of work that is payable on a time and materials basis and the invoice shall include a description of the work performed, a breakdown of the number of hours worked and applicable hourly rates. The Services Provider shall also provide to the Services Recipient such other information and supporting documentation as the Services Recipient may reasonably require. Such invoices, information and supporting documentation shall at all reasonable times be open to audit, inspection and copying by the Services Recipient and shall be preserved and kept available by the Services Provider for audit by the Services Recipient until the expiration of two years from the completion date of the changed scope of work.

Unless otherwise specified in the relevant Contract, the Services Provider shall not be obligated to carry out any change in the scope of work and the Services Recipient shall not be obligated to pay for any change in the scope of work unless and until the relevant CCNF has been executed.

8.0 DISPUTE RESOLUTION PROCEDURES

Any controversy, dispute, difference, question or claim arising between the parties in connection with the interpretation, performance, construction or implementation of this Master Agreement or any Contract that cannot be resolved by a Director from each party (collectively "Dispute"), other than a Dispute regarding any change to the scope of work activities processed under Section 7.0 above, shall be settled in accordance with this Section. The aggrieved party shall send the other party written notice identifying the Dispute, the amount involved, if any, and the remedy sought, and invoking the procedures of this Section. The Presidents from each party shall confer in an effort to resolve the Dispute. If the Presidents are unable to resolve the Dispute within 5 business days after receipt of the written notice of the Dispute, then the parties shall submit the Dispute in writing to the President of Hydro One Inc. for resolution.

9.0 CONFIDENTIALITY AND INTELLECTUAL PROPERTY

(a) **Confidentiality**: Each party (the "Receiving Party") shall maintain in strict confidence this Master Agreement, the Contracts and the existence and contents thereof respectively and all information, analysis, conclusions, drawings, reports, specifications or other information, proprietary or otherwise, whether transmitted orally, electronically or in written form, and received in furtherance of this Master Agreement and/or the Contracts from the other party (the "Disclosing Party") or any of the Disclosing Party's directors, officers, employees, consultants, agents or legal, financial or professional advisors (the "Disclosing Party Representatives") (collectively the "Confidential Information"). Except as permitted herein, the Receiving Party shall not publish, reproduce, or disclose, either directly or indirectly, the said Confidential Information to any third party and shall not use the said Confidential Information for any purpose other than for purposes of this Agreement without the prior written consent of the Disclosing Party. The Receiving Party may disclose the Confidential Information only to its shareholder, directors, officers, employees, consultants, agents or professional advisors (the "Receiving Party Representatives") having a need to know same and who have undertaken a like obligation to maintain its confidentiality.

For greater certainty, Confidential Information includes any and all personal information (as that term is defined in the Freedom of Information and Protection of Privacy Act (Ontario) and the Personal Information Protection and Electronic Documents Act (Canada), as they may be amended) and any and all information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator, provided by the Disclosing Party to the Receiving Party for purposes of this Agreement, whether or not such information was initially provided prior to the Effective Date.

The Receiving Party undertakes to protect and safeguard all Confidential Information in its possession or under its control and received by the Disclosing Party, in the manner described in Schedule "F" attached hereto. The Disclosing Party may, on reasonable notice, and during regular business hours, audit the information management practices of the Receiving Party to confirm compliance with the terms and conditions of this Section 9.0 and all applicable statutes, regulations, by-laws, standards and codes, as amended. The Receiving Party undertakes to notify the Disclosing Party immediately upon discovery of any unauthorized use and/or disclosure of any of the Disclosing Party's Confidential Information, to co-operate with the Disclosing Party to help regain possession of such Confidential Information, and to prevent its further unauthorized use and/or disclosure.

The foregoing obligations with respect to confidentiality, use, reproduction, dissemination, publication and non-disclosure herein shall not apply to any information that:

(i) is previously known to or lawfully in the possession of the Receiving Party prior to the date of disclosure as evidenced by the Receiving Party's written record;

(ii) is independently known to or discovered by the Receiving Party, without any reference to the information or material;

(iii) is obtained by the Receiving Party from an arm's length third party having a bona fide right to disclose same and who was not otherwise under an obligation of confidence or fiduciary duty to the Disclosing Party or the Disclosing Party Representatives;

(iv) is or becomes public knowledge through no fault or omission of, or breach of this Master Agreement or the Contracts by, the Receiving Party or the Receiving Party Representatives; or

(v) is required to be disclosed pursuant to a final judicial or governmental order or other legal process, including, without limitation, an order of or legal process involving a regulatory authority such as the Ontario Energy Board.

The parties acknowledge and agree that the Confidential Information (other than this Master Agreement and the Contracts which shall be jointly owned by the parties) shall remain the sole and exclusive property of the Disclosing Party that has disclosed the Confidential Information, and the Disclosing Party shall retain all right, title and interest in and to the Confidential Information it has disclosed to the Receiving Party.

The Receiving Party agrees that it shall keep a record of written Confidential Information furnished to it by the Disclosing Party in a location separate from those locations where the Receiving Party has stored information in respect of other third parties for which it performs work and it shall advise the Disclosing Party of such location.

All Confidential Information furnished by the Disclosing Party (other than this Master Agreement and the Contracts), including that portion of the Confidential Information which is contained in analyses, compilations, studies or other documents prepared by the Receiving Party or by the Receiving Party Representatives, is the Disclosing Party's property and will be returned immediately to the Disclosing Party upon its request.

(b) **Intellectual Property:** Unless otherwise agreed, the Services Recipient shall obtain all rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to the Services Recipient by the Services Provider in accordance with any Contract and, subject to applicable legislation, and notwithstanding clause 9.0(a) above, the Services Recipient may use, disclose or modify such reports or deliverable in any manner it deems appropriate. The Services Provider shall not do any act which may compromise or diminish the Services Recipient's interest as aforesaid.

(c) **Survival of Obligations:** The obligations in this Section 9.0 shall forever survive the termination or expiration of this Master Agreement and the Contracts.

10.0 INSURANCE

The Services Provider shall maintain in full force and effect during the term of any executed Contract and with financially responsible insurance carriers, the following insurance coverage and the insurance coverage specified in Schedule "E" attached hereto as may be applicable for any Services and as shall be specified in the relevant Contract for the said Services:

(i) Workers Compensation as required by *the Ontario Workplace Safety and Insurance Act, 1997,* S.O. 1997, c.16, Schedule A, as amended or similar applicable legislation covering all persons employed by the Services Provider for the Services performed under any executed Contract. For U.S. employees, appropriate State Workers Compensation must be carried including Employer's Liability for a minimum limit of $5,000,000 U.S., with a Foreign Coverage Endorsement and, to the extent applicable, Jones Act and U.S. Longshoreman's and Harbor Workers coverage and FELA. To achieve the desired limit, umbrella or excess liability insurance may be used. A waiver of subrogation shall be provided by the insurers to the Services Recipient.

(ii) Automobile Liability Insurance, covering all licensed motor vehicles owned, rented or leased and used in connection with the Services to be performed by the Services Provider under any executed Contract covering Bodily Injury and Property Damage Liability to a combined inclusive minimum limit of $5,000,000 and mandatory Accident Benefits. To achieve the desired limit, umbrella or excess liability insurance may be used.

(iii) Commercial General and Excess Liability Insurance with limits of $5,000,000 inclusive for both bodily injury, including death, personal injury and damage to property, including loss of use thereof, for each occurrence. To achieve the desired limit, umbrella or excess liability insurance may be used. This coverage shall specifically include, but not be limited to, the following:

a. Blanket Contractual Liability;
b. Damage to property of the Owner including loss of use thereof;
c. Pollution Liability coverage on at least a Sudden and Accidental basis;
d. Products & Completed Operations to be continuously maintained through the operational liability insurance.
e. Employer's Liability;
f. Non-Owned Automobile Liability; and,
g. Broad Form Property Damage

Prior to the commencement of the performance of the Services under any executed Contract, the Services Provider shall provide to the Services Recipient's representative and address noted immediately below, evidence of the minimum coverages required under this Section 10.0 in the form attached hereto as Schedule "D", noting the policy number and term and executed by a duly authorized representative of their respective insurers.

Manager, Risk and Insurance, Hydro One Networks Inc. 483 Bay Street, South
Tower TCT 08, Toronto, Ontario M5G 2P5

With the exception of subparagraph (ii) above, all insurance coverages noted above shall specify that it is primary coverage and not contributory with or in excess of any other insurance that may be maintained by the Services Recipient.

The Services Recipient shall be included as a Named Insured subject to the Sole Agent provision under coverages noted in subparagraph (iii) above, but only to the extent to which the Services Provider is liable to the Services Recipient for breach of its obligations under the relevant

Contract. In addition, the parties acknowledge and agree that the insurance coverages noted in subparagraph (iii) above shall contain a cross liability clause and a severability of interests clause.

The parties further acknowledge and agree that the Insurance coverage described in this Section and provided for the Services Provider shall not be invalidated by actions or inactions of others.

11.0 LIABILITY

Unless otherwise agreed in writing, each party shall indemnify the other party and that other party's successors and assigns, directors, officers, employees, contractors and agents from and against all direct costs or damages attributable to the indemnifying party's performance and/or non-performance of its obligations under this Master Agreement and the Contracts and any amendments or additions thereto that are mutually agreed to in writing, whether arising from or based on breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of this Master Agreement, neither party shall be liable for any special, indirect or consequential damages or for economic loss, incurred by the other or by any third party claiming through or under the other.

The foregoing paragraph shall forever survive the termination or expiration of this Master Agreement and the Contracts.

12.0 AUTHORIZED REPRESENTATIVES

The authorized representatives of the parties hereto for purposes of this Master Agreement are the following:

HYDRO ONE REMOTE COMMUNITIES INC.
483 Bay St.
North Tower, 14th Floor, A8
Toronto, Ontario
M5G 2P5
Attention: Una O'Reilly
Telephone: (416) 345-6698
Telecopier: (416) 345-6356

HYDRO ONE NETWORKS INC.
483 Bay St.
South Tower, 8th Floor, G3
Toronto, Ontario
M5G 2P5
Attention: Greg Van Dusen
Telephone: (416) 345-5722
Telecopier: (416) 345-6833

All correspondence, reports, documents and/or other communication concerning this Master Agreement and the Schedules attached hereto shall be directed to the attention of the authorized representatives noted above and all correspondence, reports, documents and/or other communication concerning any Contract and the Services to be performed thereunder shall be directed to the attention of the Contract Managers specified in the relevant Contract. Any notice permitted or required to be given hereunder and/or pursuant to any Contract shall be deemed to be sufficiently given if delivered personally, mailed or transmitted by fax to the attention of the authorized representatives at the addresses above, and any notice so given shall be deemed to have been made and received on the date of delivery or on the 5th business day following the day of mailing of same or on the day of transmission if transmitted during normal business hours, otherwise on the next business day, as the case may be.

13.0 FORCE MAJEURE

Except for the payment of any monies required hereunder, neither party shall be deemed to be in default of this Master Agreement or any Contract where the failure to perform or the delay in performing any obligation is due to a cause beyond its reasonable control, including, but not limited to, an act of God, act of any federal, provincial, municipal or government action, or order of court or administrative or regulatory authority, civil commotion, strikes, lockouts and other labour disputes, fires, floods, sabotage, earthquakes, storms, ice storms and epidemics. As soon as a party anticipates that a force majeure event may occur which will delay or prevent it from performing any of its obligations under this Master Agreement or any Contract, it shall promptly notify the other party and shall exercise all reasonable efforts to mitigate or limit the effect on the other party.

Once a party becomes subject to such an event of force majeure, it shall promptly notify the other party of its inability to perform, or of any delay in performing, due to an event of force majeure and shall provide an estimate, as soon as practicable, as to when the obligation will be performed. The party subject to the force majeure event shall also continue to furnish timely reports to the other party with respect to the force majeure event during the continuation of the said event and the said party shall exercise all reasonable efforts to mitigate or limit damages to the other party. The party subject to the force majeure event shall use its best efforts to continue to perform its obligations under this Master Agreement or any Contract, as the case may be, and to correct or cure the event or condition excusing performance and when the said party is able to resume performance of its obligations thereunder, it shall give the other party written notice to that effect and shall promptly resume performance thereunder. The time for performing the obligation shall be extended for a period equal to the time during which the party was subject to the event of force majeure. The parties shall explore all reasonable avenues available to avoid or resolve events of force majeure in the shortest time possible.

Notwithstanding the two preceding paragraphs, the settlement of any strike, lockout, restrictive work practice or other labour disturbance constituting a force majeure event shall be within the sole discretion of the party involved in such strike, lockout, restrictive work practice or other labour disturbance and nothing in the two preceding paragraphs shall require the said party to mitigate or alleviate the effects of such strike, lockout, restrictive work practice or other labour disturbance.

14.0 ASSIGNMENT

Neither this Master Agreement nor any Contract nor the rights and obligations under each thereof shall be assigned by either party hereto without the prior written consent of the other, which consent shall not be unreasonably withheld. Subject to the foregoing, this Master Agreement and each Contract shall enure to the benefit of the parties hereto and their respective successors and permitted assigns.

15.0 AMENDMENTS

Any amendment, modification or supplement to this Master Agreement shall not be valid or binding unless set out in writing and executed by the parties with the same degree of formality as the execution of this Master Agreement. Notwithstanding the foregoing, the parties acknowledge and agree that the Services Recipient shall be entitled to unilaterally change the General Standards and Specifications attached hereto as Schedule "A" provided however that the parties shall negotiate in good faith the effect of any such changes to the scope of work in any relevant Contract, time for completion of the said scope of work and the price therefor, in accordance with the process outlined in Section 7.0 above.

16.0 ENTIRE AGREEMENT

This Master Agreement, together with Schedules "A", "B", "C", "D", "E" and "F" attached hereto, represents the entire agreement between the parties hereto respecting the subject matter hereto and supersedes all prior agreements, understandings, discussions, negotiations, representations and correspondence made by or between them respecting the subject matter hereto.

17.0 CONFLICTS

In the event of any conflict between this Master Agreement and Schedules "A", "B", "C", "D", "E" and "F", the provisions of the former shall prevail. In the event of any conflict between this Master Agreement and any executed Contract, the provisions of the latter shall prevail. In the event of any conflict amongst the Schedules, then the Schedules shall take precedence in the following order: (i) Schedule "C", (ii) Schedule "D"; (iii) Schedule "B"; (iv) Schedule "A"; (v) Schedule "E" and (vi) Schedule "F".

18.0 GOVERNING LAW

This Master Agreement and the Contracts shall be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein.

19.0 SCHEDULES

Schedules "A", "B", "C", "D", "E" and "F" attached hereto are to be read with and form part of this Agreement.

20.0 COUNTERPARTS

This Master Agreement and the Contracts may be executed in counterparts and the counterparts together shall constitute an original.

IN WITNESS THEREOF the parties hereto have caused this Master Agreement to be executed by their respective representatives duly authorized in that behalf.

GENERAL STANDARDS AND SPECIFICATIONS

REVISION HISTORY

Date	Revision No.	Modification	Comments

TABLE OF CONTENTS

GSS #1 USED, REUSABLE AND WASTE MATERIALS

1.1 DEFINITIONS

1.1.1 Reusable Material

Where practical, the Services Provider shall reuse and re-deploy all material that is removed from service, provided such material is still in good operating condition and satisfies the criteria indicated in this GSS #1.

1.1.2 Waste Material

All other material that is removed from service will be considered to be waste material.

1.1.3 Recycling

Recycling means using waste material for purposes other than those for which the material was originally intended: it does not include destruction (such as incineration or burning as a supplementary fuel) or use as land fill.

1.2 EXPECTATIONS

Costs for the management of used material that is associated with capital projects, including the disposition of such material for re-deployment, re-use and/or disposal, shall be identified in each Contract, where applicable (e.g. the cost to pickup, transport and dispose of PCB fluids and contaminated waste).

The Services Provider shall handle all reusable material removed from service in a manner that is consistent with the Contract (where identified) and in accordance with applicable legislation, statutes, by-laws, codes, guidelines, regulations, and Hydro One procedures. Such material shall be stored in a safe and secure manner to minimize any risk of physical damage and/or of environmental or health and safety impacts associated with such damage, pending re-deployment or shipment to storage.

The Services Provider shall manage and dispose of waste material in a manner that is consistent with the Contract (where identified) and in accordance with applicable legislation, statutes, by-laws, codes, guidelines, regulations, and Hydro One procedures. Preference will be given, where practical, to disposal options that maximize the potential for recycling.

1.3 CRITERIA FOR USED MATERIALS

Material	Criteria and Action
Poles	• Distribution poles shall be less than 16 years old • Transmission poles shall be less than 12 year old • Penta-treated poles shall not be reused • All wood poles no longer required by the Services Recipient shall be returned to the appropriate service/operations centre. • All wood poles no longer required by the Services Recipient shall be disposed of appropriately.

Material	Criteria and Action
Pole-Mounted Transformers	• Must be no older than 1974 • If less than 200ppm PCB, a pole-mounted transformer shall be drained, refilled and re-tested after 2 years • If bushings are side-mounted they shall be recycled • Pole-Mounted Transformers shall be visually inspected (remove cover). If the inspection indicates no damage to the coil, they shall be returned for repair • If a transformer fails inspection and is over 50ppm PCB, it shall be scrapped as PCB-contaminated waste
Pad-mount Transformers	• All such transformers shall be returned for repair • If less than 200ppm PCB, a pad-mounted transformer shall be drained, refilled and re-tested after 2 years • Pad-mounted transformers shall be visually inspected. If the inspection indicates no damage to the coil, they shall be returned for repair • If a transformer fails inspection and is over 50ppm PCB, it shall be scrapped as PCB-contaminated waste
Line Voltage Regulators	• This includes any 50A line regulator retained for parts; all others shall be returned for repair • If less than 200ppm PCB, line voltage regulators shall be drained, refilled and re-tested after 2 years • Line voltage regulators shall be visually inspected (remove cover). If the inspection indicates no damage to the coil, they shall be returned for repair • If a regulators fails inspection and is over 50ppm PCB, it shall be scrapped as PCB-contaminated waste
Oil Circuit Reclosers	• If less than 200ppm PCB, the reclosers shall be drained, refilled, and re-tested after 2 years • Reclosers shall be visually inspected (remove cover). If the inspection indicates that there is no damage, they shall be returned for repair • If a recloser fails inspection and is over 50ppm PCB, it shall be scrapped as PCB-contaminated waste
Metering Transformers / Units	• If less than 200ppm PCB, the units shall be drained, refilled and re-tested after 2 years • The units shall be visually inspected (remove cover). If the inspection indicates no damage to the coil, it shall be returned for repair • If a unit fails inspection and is over 50ppm PCB, it shall be scrapped as PCB-contaminated waste
Capacitors	• No PCB or Dielektrol I- or II-filled capacitors shall be reused • Capacitors shall not have an unknown PCB content unless permission is obtained from the Services Recipient. Some capacitors manufactured before January 1981 may contain PCB over 50 ppm.
Primary Conductors	• If less than 3/0, primary conductors shall be reused for extensions where the main line is of the same size • Before reusing, #2 shall be inspected for deterioration in the core • All other conductors shall be reused
Secondary Conductors/ Underground Cable	• Secondary Conductors/Underground Cables shall be reused if they pass an asset condition test • The units must contain no splices (in the underground cable) that test greater than 50 mg/kg PCB. In addition, end sections must not have come from terminations that test greater than 50 mg/kg PDB. • All secondary conductors shall be reused • No underground cables shall be reused if they are more than 10 years old
Submarine Cable	• No submarine cable shall be used if it is more than 5 years old

Material	Criteria and Action
Insulators	• All single piece porcelain pin insulators shall be reused (not other porcelain insulators): the intent is to replace insulators with silicone (polymer) types on 115 kv and 230 kv, where practical • Epac insulators shall not be reused • Cob porcelain post insulators shall not be reused
Cross-arms	***Distribution:*** • Cross-arms shall be reused if no apparent cracking or excessive aging is evident
	Transmission: • All wooden cross-arms shall be removed and disposed • All steel cross-arms shall be reused
Spool Bolts	• All spool bolts shall be reused
Switches	***Distribution:*** • No Kearney switches nor rigid polymeric insulator-type switches shall be reused
	Transmission: • All shall be 115 kV & 230 kV in-line polymeric switches • Only those switches that have tested satisfactorily shall be reused
Insulating Oil	• All insulating oil is required to meet specification for Voltesso 35 Category "B" oil OR have the potential to be upgraded to meet this specification • Insulating oil must contain less than 50 mg/kg PCB by laboratory test

1.4 FINANCIAL TREATMENT OF USED MATERIAL

The Services Provider shall report all units removed from service. When used materials are reused for capital or maintenance work, the materials shall be charged to the work as if the material was new.

1.5 INFORMATION REQUIREMENTS

The Services Provider shall record and report the following information to the Services Recipient according to a schedule specified in the applicable Contract(1).

- Transformer Units by MVA/kVA and voltage, whether installed, salvaged or disposed as waste (new or used material)
- Regulator/Rabbit Units by kVA and voltage, whether installed, salvaged or disposed as waste (new or used material)
- Recloser Units by voltage and interrupting rating
- Switches by manufacturer type and voltage rating
- Capacitor Units by total MVA/kVAR, including voltage, number of phases and control type, whether installed, salvaged or disposed as waste (new or used material)
- Transmission line structures and distribution pole units by type (steel or wood pole), height, age, ownership (Hydro/Bell Canada/MEU), Bell Canada I.D. (exchange, route and pole number), structure number
- Conductor Units by size, type and length, whether installed, salvaged or disposed as waste (new or used material)
- Cable size, type, length and voltage, whether installed, salvaged or disposed as waste (new or used material)
- Record or retained material, including volumes scrapped, reused or repaired and reused.

(1) Note: The information listed above is required for accounting purposes at the plant.

1.6 WASTE MATERIAL

For waste material that is classified as either hazardous or as liquid industrial, the Services Provider shall follow specific requirements. These requirements are detailed in the appropriate legislation (e.g., *Environmental Protection Act, Occupational Health & Safety Act*) and internal policies/standards/procedures (e.g., Waste Management Manual). Records of hazardous waste volumes shipped to disposal shall be reported to the Services Recipient and such records shall be maintained according to established records management. All hazardous waste material shall be handled and managed with due regard for worker and public health and safety.

GSS #2 ENVIRONMENT, HEALTH & SAFETY REQUIREMENTS

2.1 GENERAL STATEMENT OF COMPLIANCE AND REQUIREMENTS

The Services Recipient expects to receive the same level of compliance, where applicable, for services provided under all Contracts. As a minimum, the Services Provider shall comply with the following:

- Federal and Provincial legislation;
- Municipal by-laws;
- The Services Recipient's Safety Rules and Policies;
- All legacy Ontario Hydro policies, procedures and standards still applicable to the Services Recipient;
- Policies approved by the Services Recipient's Board of Directors;
- The Services Recipient's Environment, Health & Safety Management policies, procedures and associated standards; and
- The Services Recipient's Policy for Health & Safety Incident Management.

2.2 ENVIRONMENTAL REQUIREMENTS

2.2.1 General Requirements for Management of the Environment

For managing the environment, the Services Provider shall abide by the following:

a) The Services Provider shall design, construct, operate, maintain and decommission the Services Recipient's facilities in accordance with standards to be developed by the Services Recipient and made available to the Services Provider.

b) The Services Provider shall perform all work on behalf of the Services Recipient in a manner that is consistent with the principles of an environmental management system including, as a minimum:
   - Assigning and communicating individual accountability and responsibility for the environment;
   - Engaging qualified employees and agents (i.e. with respect to knowledge, training and experience to perform the work assigned) to perform the work;
   - Having emergency preparedness and response capability suitable to the range of issues that could be encountered during the course of the work detailed in the Contract;
   - Inspecting, maintaining and monitoring equipment, facilities and employees during the course of providing the Contracted services;
   - Reporting environmental incidents, performing incident investigations and implementing corrective actions in response to an incident; and
   - Periodically reviewing environmental management processes and making improvements, as necessary.

c) The Services Provider shall consider the environmental implications of all work and integrate environmental considerations into its plans for all work that could have an adverse effect on the environment.

d) In performing the services, the Services Provider shall:
   - Use materials, products and equipment that are government-approved, industry-accepted and sustainable (i.e., from environmental, economical, social perspectives). The Services provider shall give preference, where practical, to materials and products that have low toxicity and do not contain substances that are included on Schedule 1 (List of Toxic Substances) of the *Canadian Environmental Protection Act* or on the Priority Substances Lists 1 and 2.
   - Maximize the efficient use of resources;
   - Be energy efficient; and
   - Conserve heritage resources.

e) The Services Provider shall, when included in the project scope, prepare and implement project-specific environmental specifications when the prevention or mitigation of predicted environmental impacts can only be assured by the application of a specific damage prevention or mitigation approach. Such environmental management specifications will be consistent with applicable standards.

f) The Services Provider shall prepare and provide to the Services Recipient, project-specific, As-Constructed Reports for all projects that require any one or more of the following, where the Services Recipient and the Services Provider shall mutually determine which environmental authorities or industry or legislative standards shall be used in developing such reports:

- Environmental permits;
- Environmental considerations or special commitments;
- Access agreements, construction property agreements and special conditions that contain a record of the final environmental state of the project;
- Documentation of significant environmental situations or activities; and
- Property rights summaries.

g) The Services Provider shall provide to the Services Recipient, the records identified in (b), (e) and (f).

2.2.2 Environmental Incident Management

The Services Provider shall consistently respond and report environmental incidents and ensure that all such incidents involving Distribution or Transmission assets and lands are managed effectively. Included as “environmental incidents” are:

- Vandalism, natural events (such as lightning, ice, and wind) and animal activity;
- Accidental or inadvertent public contact with electrical system assets or equipment (such as motor vehicle accidents, ladders into lines);
- Mechanical/electrical failure for no apparent reason or unknown cause;
- Asset management standards that are subsequently shown to have contributed to the incident; and
- Operation or maintenance activities in accordance with accepted standards that would not normally be expected to cause leaking, equipment failure or malfunction.

The Services Provider shall document all environmental incidents (such as spills and fires) involving the Services Recipient’s assets and/or lands (owned or easement) (e.g., complete a Hydro One Environmental Incident Report). The Services provider shall enter this information into the Web Environmental Incident Collector (WebEIC) database and/or any other similar database, as directed by the Services Recipient.

The Services Provider shall consistently respond to, and report, environmental incidents. The Services Provider shall also ensure that all environmental incidents involving the Service Recipient’s assets and land are managed effectively.

2.3 HEALTH & SAFETY

2.3.1 Potential Hazards

There are two significant hazards associated with work on the Services Recipient’s assets:

- Hazards inherent to working in proximity to electrical equipment; and
- Hazards inherent to working at heights.

The Services Provider may also work in buildings or at sites where hazardous substances are present. Inventories and assessments of potentially hazardous or hazardous substances have been completed for the majority of the Services Recipient’s sites; they are available to the Services Provider on request. All requests should be made locally.

The Services Provider shall manage all hazards associated with all Contracts with the Services Recipient.

2.3.2 General Requirements for the Management of Health & Safety

The Services Provider shall perform all work on behalf of the Services Recipient in a manner that is consistent with the principles of a health and safety management system including, as a minimum:

(a) Assigning and communicating individual accountability and responsibility for health and safety;

(b) Engaging qualified employees and agents (i.e. with respect to knowledge, training and experience to perform the work assigned) to perform the work;

(c) Having emergency preparedness and response capability suitable to the range of issues that could be encountered during the course of the work detailed in the Contract;

(d) Inspecting, maintaining and monitoring equipment, facilities and employees during the course of providing the Contracted services;

(e) Reporting safety events, performing event investigations and implementing corrective actions in response to an event;
(f) Periodically reviewing health and safety management processes periodically and making improvements, as necessary; and
(g) Submitting the records identified in (e) and (f) to the Services Recipient.

The Services Provider shall ensure the protection of the public in the performance of all work for the Services Recipient.

2.3.3 Health & Safety Event Management

The Services Provider shall consistently respond and report all health and safety events involving the Services Recipient staff and/or members to the Services Recipient. Included as health and safety events are:

- Vandalism, natural events (such as lightning, ice, and wind) and animal activity;
- Accidental or inadvertent public contact with electrical system assets or equipment (such as motor vehicle accidents, ladders into lines);
- Mechanical/electrical failure for no apparent reason or unknown cause;
- Asset management standards that are subsequently shown to have contributed to the event; and
- Operation or maintenance activities in accordance with accepted standards that would not normally be expected to cause leaking, equipment failure or malfunction.

Schedule "E"

ADDITIONAL INSURANCE COVERAGES

1.01 Commercial General Liability and Excess Liability Insurance on an occurrence basis in an amount not less than $5,000,000 inclusive for both bodily injury, including death, personal injury and damage to property, including loss of use thereof, for each occurrence. To achieve the desired limit, umbrella or excess liability insurance may be used.

Coverage shall specifically include, but not be limited to, the following

i) Blasting, pile driving, caisson work, underground work;
ii) Products & Completed Operations including a provision that such coverage to be maintained for a period not less than 24 months post Final Performance;
iii) Errors and omissions integral to the operation of the Insured;
iv) Tenant's Legal Liability;
iv) Pesticide Liability; and
v) Rail Liability.

1.02 Contractor's Equipment Insurance covering equipment and tools, owned, rented or leased for the full replacement cost of such equipment on an "All Risks" basis including marine based risk subject to normal exclusions.

1.03 Pollution Liability Insurance: When remediation or abatement is included in the work, the Services Provider shall purchase a policy with limits of not less than $5,000,000 per occurrence covering bodily injury and property damage claims, including cleanup costs as a result of pollution conditions arising from the Services Provider's and/or its subcontractors' operations and completed operations. Completed operations coverage will remain in effect for no less than 3 years after final completion. The policy will have a retroactive date before the start of the work. To achieve the desired limit, umbrella or excess liability insurance may be used.

1.04 Errors & Omissions Insurance: Engineering, Architectural, Design or other Professionals or Consultants and the EPCM (Engineering, Procurement, Construction and Maintenance). The Services Provider shall, at all times, maintain in full force and effect professional liability insurance in an amount not less than $10,000,000 aggregate limit covering the period from start of conceptual design through to completion of the project and for a further discovery period of 5 years from the issuance of the certificate of Final Completion.

1.05 Transit insurance (including loading, unloading and storage during the course of transit including storage at secondary processing facilities) against All Risks of physical damage to the property of the Services Recipient in the Services Provider's care, custody and control until such property is received on the Services Recipient's site.

1.06 Aircraft and watercraft liability insurance with respect to owned or non-owned aircraft and watercraft if used directly or indirectly in the performance of the Services, including use of additional premises, shall be subject to limits of not less than $5,000,000.00 inclusive per occurrence for bodily injury, death and damage to property including loss of use thereof and limits of not less than $5,000,000.00 for aircraft passenger hazard. Such insurance shall be in a form acceptable to the Services Recipient. The policies shall be endorsed to provide the Services Recipient with not less than 15 days' notice in writing in advance of cancellation, change, or amendment restricting coverage. To achieve the desired limit, umbrella or excess liability insurance may be used.

1.07 Such other insurance as is mutually agreed upon between the Services Recipient and the Services Provider.

Where any of the above coverages are required for any Contract, the Services Provider shall be bound by and comply with the following:

1. Prior to the commencement of the performance of the Services, the Services Provider shall provide the Services Recipient with a certificate of insurance completed by a duly authorized representative of its insurer certifying that at least the minimum coverages required here are in effect and that the coverages will not be cancelled, nonrenewed, or materially changed by endorsement or otherwise so as to restrict or reduce coverage, without 30 days' advance written notice by registered mail, or courier, receipt required, to:

    Manager, Risk & Insurance Department, Hydro One Remote Communities Inc. 483 Bay Street, TCT8, South Tower , Toronto, Ontario. M5G 2P5

   If any of the coverages are required to remain in force after final payment, an additional certificate evidencing continuation of such coverage will be submitted with the Services Provider's final invoice.

2. All deductibles shall be to the account of the Services Provider.

3. All insurance noted above shall specify that it is primary coverage and not contributory with or in excess of any other insurance that may be maintained by the Services Recipient.

4 A waiver of subrogation shall be provided by the insurers to the Services Recipient for coverages 1.02 (Contractor's Equipment).

6. The Services Recipient shall be included as a Named Insured under coverages noted in 1.03 (Pollution Liability) subject to Sole Agent provisions.

7. Coverages noted in 1.03 (Pollution Liability) shall contain a Cross Liability clause and a Severability of Interests clause.

8. Coverage provided for shall not be invalidated by actions or inactions of others.

Schedule "F"

Receiving Party Security Safeguards Regarding Confidential Information Received from the Disclosing Party

The Receiving Party shall protect the Confidential Information by security safeguards appropriate to the sensitivity of the information.

1) The Receiving Party shall protect the Confidential Information against such risks as loss or theft, unauthorized access, disclosure, copying, use, modification or destruction, through appropriate security measures, regardless of the format in which it is held.

2) All of the Receiving Party's Representatives with access to the Confidential Information shall be contractually required to respect the confidentiality of that information.

3) The Receiving Party acknowledges and agrees that the nature of the safeguards will vary depending on the sensitivity, amount, distribution and format of the information, and the method of storage. The Receiving Party shall ensure that more sensitive information will be safeguarded by a higher level of protection.

4) The Receiving Party shall ensure that methods of protection will include:

(a) physical measures, for example, locked filing cabinets and restricted access to offices;

(b) organizational measures, for example, controlling entry to data centers and limiting access to information on a "need-to-know" basis;

(c) technological measures, for example, the use of passwords and encryption; and

(d) investigative measures, in cases where the Receiving Party has reasonable grounds to believe that the Confidential Information is being inappropriately collected, used or disclosed by anyone whom in law the Receiving Party is responsible.

AFFILIATE SERVICE AGREEMENTS

Appendix D

Hydro One Networks Inc.

Service Provision to:

Hydro One Remote Communities Inc.

2007

(President and CEO services)

THIS AGREEMENT made in duplicate this 1st day of January, 2007 (the "Effective Date").

BETWEEN:

HYDRO ONE NETWORKS INC.
(the "Services Provider")

- and -

HYDRO ONE REMOTE COMMUNITIES INC.
(the "Services Recipient")

1.0 PREFACE

This Agreement is intended to identify the services that are to be provided to the Services Recipient by the Services Provider in accordance with the terms and conditions herein. The term of this Agreement shall be for a period of 1 year commencing on the Effective Date.

2.0 SERVICES

The Services Provider shall provide chief and executive office and president services to the Services Recipient, which collectively constitute the Services and which are more particularly described in Schedule "A" attached hereto, as may be required by the Services Recipient from time to time during the term of this Agreement.

3.0 FEES PAYABLE

(a) The annual price for the performance of the Services for the Services Recipient shall be $80,000.00, exclusive of any sales and use taxes, as may be applicable. The said annual price for the Services shall be paid by the Services Recipient to the Services Provider by means of monthly electronic journal transfers which shall be reflected in the applicable books and records of each party In addition, each Services Recipient shall pay for any material costs which the Services Provider, acting reasonably, incurs as a result of resources, services and products that the Services Provider must purchase and that are in addition to the Services Provider's existing resources, services and products, in order to provide the said Services Recipient with specific services it requires and requests.

(b) If at any time during the performance of the Services, the Services Recipient is of the opinion that there are deficiencies in the Services provided to it and/or that the price payable is in any way inaccurate, the Services Recipient shall pay the entire relevant price payable by it in full and its sole remedy shall be to follow the dispute resolution procedures outlined in Section 6.0 herein to determine what amount, if any, shall be refunded to the Services Recipient and/or what Services, if any, shall be rectified or redone by the Services Provider.

c) The parties acknowledge and agree that they qualify as specified members of a closely related group under subsection 156(1) of the Excise Tax Act (Canada), as amended (the "Act") and have jointly executed a Form GST25, to make an election under subsection 156(2) of the Act to deem the purchase and sale of the Services to be made for nil consideration for Goods and Services Tax purposes.

4.0 REPRESENTATIONS AND WARRANTIES

(a) The Services Provider represents and warrants that:

- (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder;
- (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Provider; and
- (iii) all staff employed in the performance of the Services shall have the qualifications, expertise and experience which could reasonably be expected of staff of a services provider performing work similar to the Services.

(b) The Services Recipient represents and warrants that:

- (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder; and
- (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Recipient.

5.0 PERFORMANCE OF THE SERVICES

(a) **Compliance with Standards and Applicable Law**: The Services Provider shall perform the Services in a diligent and professional manner and shall comply with the Services Recipient's computer data management and data access protocols contained in the Services Recipient's documents entitled "Corporate Security Standard 600-3 – Information Security Policy" and "Corporate Security Policy 600 – Information Security Policy", both of which are dated January 17, 2000 and any amendments thereto which may be made from time to time by the Services Recipient. The Services Provider shall comply at all times with the statutes, regulations, by-laws, standards and codes, as amended, as may be applicable to the Services Provider in respect of the Services and the performance of its obligations hereunder and it shall, at its own expense, obtain and maintain in good standing all permits and licences required by any authorities having jurisdiction to perform the Services.

(b) **Safety and Security Measures**: When any part of the Services is to be performed at any of the Services Recipient's premises, all of the Services Provider's staff engaged in the performance of the Services at the said premises shall comply with the safety and security requirements and measures in effect at the said premises.

(c) **Meetings**: The parties shall, after the Effective Date, meet at least twice a year during the term of this Agreement to review performance, quality and timeliness of the Services provided by the Services Provider pursuant to this Agreement."

6.0 DISPUTE RESOLUTION PROCEDURES

Any controversy, dispute, difference, question or claim arising between any of the parties in connection with the interpretation, performance, construction or implementation of this Agreement that cannot be resolved by a director or manager from each of the said parties (collectively "Dispute") shall be settled in accordance with this Section. The aggrieved party shall send the other affected party(ies) written notice identifying the Dispute, the amount involved, if any, and the remedy sought, and invoking the procedures of this Section. The Presidents of each affected party shall confer in an effort to resolve the Dispute. If the Presidents are unable to resolve the Dispute within 5 business days after receipt of the written notice of the Dispute, then the affected parties shall submit the Dispute to the President of Hydro One Inc. for resolution.

7.0 CONFIDENTIALITY AND INTELLECTUAL PROPERTY

(a) Confidentiality:

Each party (the "Receiving Party") shall maintain in strict confidence this Agreement and the existence and contents thereof and all information, analysis, conclusions, drawings, reports, specifications or other information, proprietary or otherwise, whether transmitted orally, electronically or in written form, and received in furtherance of this Agreement from any of the other parties (the "Disclosing Party") or any of the Disclosing Party's directors, officers, employees, consultants, agents or legal and other advisors (the "Disclosing Party Representatives") (collectively the "Confidential Information"). Except as permitted herein, the Receiving Party shall not publish, reproduce, or disclose, either directly or indirectly, the said Confidential Information to any third party and shall not use the said Confidential Information for any purpose other than for purposes of this Agreement without the prior written consent of the Disclosing Party. The Receiving Party may disclose the Confidential Information only to its shareholder, directors, officers, employees, consultants, agents or professional advisors (the "Receiving Party Representatives") having a need to know same and who have undertaken a like obligation to maintain its confidentiality.

For greater certainty, Confidential Information includes any and all personal information (as that term is defined in the Freedom of Information and Protection of Privacy Act (Ontario) and the Personal Information Protection and Electronic Documents Act (Canada), as they may be amended, and any and all information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator, provided by the Disclosing Party to the Receiving Party for purposes of this Agreement, whether or not such information was initially provided prior to the Effective Date.

The Receiving Party undertakes to protect and safeguard all Confidential Information in its possession or under its control and received by the Disclosing Party, in the manner described in Schedule "B" attached hereto. The Disclosing Party may, on reasonable notice, and during regular business hours, audit the information management practices of the Receiving Party to confirm compliance with the terms and conditions of this Section 7.0 and all applicable statutes, regulations, by-laws, standards and codes, as amended.

The Receiving Party undertakes to notify the Disclosing Party immediately upon discovery of any unauthorized use and/or disclosure of any of the Disclosing Party's Confidential Information, to co-operate with the Disclosing Party to help regain possession of such Confidential Information, and to prevent its further unauthorized use and/or disclosure.

The foregoing obligations with respect to confidentiality, use, reproduction, dissemination, publication and non-disclosure herein shall not apply to any information that:

(i) is previously known to or lawfully in the possession of the Receiving Party prior to the date of disclosure as evidenced by the Receiving Party's written record;
(ii) is independently known to or discovered by the Receiving Party, without any reference to the information or material;
(iii) is obtained by the Receiving Party from an arm's length third party having a bona fide right to disclose same and who was not otherwise under an obligation of confidence or fiduciary duty to the Disclosing Party or the Disclosing Party Representatives;
(iv) is or becomes public knowledge through no fault or omission of, or breach of this Agreement by the Receiving Party or the Receiving Party Representatives; or
(v) is required to be disclosed pursuant to a final judicial or governmental order or other legal process.

Confidential Information (other than this Agreement which shall be jointly owned by the parties) shall remain the sole and exclusive property of the Disclosing Party that has disclosed the Confidential Information, and the Disclosing Party shall retain all right, title and interest in and to the said Confidential Information.

The Receiving Party shall keep a record of written Confidential Information furnished to it by the Disclosing Party in a location separate from those locations where the Receiving Party has stored information in respect of other third parties for which it performs work and it shall advise the Disclosing Party of such location.

All Confidential Information furnished by the Disclosing Party (other than this Agreement), including that portion of the Confidential Information which is contained in analyses, compilations, studies or other documents prepared by the Receiving Party or by the Receiving Party Representatives, is the Disclosing Party's property and will be returned immediately to the Disclosing Party upon its request.

(b) Intellectual Property:

The Services Recipient shall obtain all rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to it by the Services Provider and, subject to applicable legislation and notwithstanding clause 7.0(a) above, the said Services Recipient may use, disclose or modify such reports or deliverable in any manner it deems appropriate. The Services Provider shall not do any act which may compromise or diminish the Services Recipient's interest as aforesaid.

(c) Survival of Obligations:

The obligations in this Section 7.0 shall forever survive the termination or expiration of this Agreement.

8.0 LIABILITY

Unless otherwise agreed in writing, each party shall indemnify the other party and that other party's successors and assigns, directors, officers, employees, contractors and agents from and against all direct costs or damages attributable to the indemnifying party's performance and/or non-performance of its obligations under this Agreement and any amendments or additions thereto that are mutually agreed to in writing, whether arising from or based on breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of this Agreement, neither party shall be liable for any economic loss, loss of goodwill, loss of profit or for any special, indirect or consequential damages, where the said losses or damages are incurred by the other or by any third party claiming through or under the other.

This Section 8.0 shall forever survive the termination or expiration of this Agreement.

9.0 AUTHORIZED REPRESENTATIVES

The authorized representatives of the parties hereto for purposes of this Agreement are the following:

HYDRO ONE REMOTE COMMUNITIES INC.
483 Bay Street,
North Tower, 14th Floor
Toronto, Ontario M5G 2P5
Attention: **Una O'Reilly**
TCT 14
Telephone: 416-345-6698
Telecopier: 416-345-6356

HYDRO ONE NETWORKS INC.
483 Bay St.
South Tower, 8th Floor
Toronto, Ontario M5G 2P5
Attention: **Greg Van Dusen**
Telephone: (416) 345-5722
Telecopier: (416) 345-6833

All correspondence, reports, documents and/or other communication concerning this Agreement and the Schedule attached hereto shall be directed to the attention of the authorized representatives noted above and shall be deemed to be sufficiently given if delivered personally, mailed or transmitted by fax to the attention of the authorized representatives at the addresses above, and any notice so given shall be deemed to have been made and received on the date of delivery or on the 5th business day following the day of mailing of same or on the day of transmission if transmitted during normal business hours, otherwise on the next business day, as the case may be.

10.0 CHANGE OF CONTROL

In the event of a change of control of the Services Provider, this Agreement shall immediately terminate. A change of control shall mean, as applicable, a purchase of more than fifty (50) percent of the outstanding capital by a non-affiliate third party.

11.0 ASSIGNMENT

Neither this Agreement nor any rights and obligations shall be assigned by either party without the prior written consent of the other party, which consent shall not be unreasonably withheld. Subject to the foregoing, this Agreement shall enure to the benefit of the parties hereto and their respective successors and permitted assigns.

12.0 RELATIONSHIP OF PARTIES:

Nothing in this Agreement creates the relationship of principal and agent, employer and employee, partnership or joint venture between the parties. The parties agree that they are and will at all times remain independent and are not and shall not present themselves to be the agent, employee, partner or joint venturer of the other. No representations will be made or acts taken by either party which could establish any apparent relationship of agency, employment, joint venture or partnership and neither party shall be bound in any manner whatsoever by any agreements, warranties or representations made by the other party to any other person nor with respect to any other action of the other party.

13.0 SCHEDULES

Schedules "A" and "B" attached hereto are to be read with and form part of this Agreement.

14.0 COUNTERPARTS

This Agreement may be executed in counterparts and the counterparts together shall constitute an original.

IN WITNESS THEREOF the parties hereto have caused this Agreement to be executed by their respective representatives duly authorized in that behalf.

HYDRO ONE NETWORKS INC.

Maureen Wareham

Name: Maureen Wareham
Title: Acting Secretary
I have authority to bind the corporation

HYDRO ONE REMOTE COMMUNITIES INC.

Name: Myles D'Arcey
Title: President & CEO
have authority to bind the corporation.

Schedule "A"

DESCRIPTION OF SERVICES:

The Services Provider shall provide the Services Recipient with the following services:

- Provide administrative services related to Corporate record-keeping, and signing of contracts and corporate documents that require strategic approval;
- Communicate Hydro One Inc.'s strategic goals, direction and policies to the Services Recipient and ensure that the Services Recipient adheres to these policies, goals and directions; and
- Advocate for the Services Recipient at the Hydro One Inc. level for budgetary items, operational issues and performance goals, and ensure that the Services Recipient's business is understood and communicated at the parent company level.

Schedule "B"

Receiving Party Security Safeguards Regarding Confidential Information Received from the Disclosing Party

The Receiving Party shall protect the Confidential Information by security safeguards appropriate to the sensitivity of the information.

1) The Receiving Party shall protect the Confidential Information against such risks as loss or theft, unauthorized access, disclosure, copying, use, modification or destruction, through appropriate security measures, regardless of the format in which it is held.

2) All of the Receiving Party Representatives with access to the Confidential Information shall be contractually required to respect the confidentiality of that information.

3) The Receiving Party acknowledges and agrees that the nature of the safeguards will vary depending on the sensitivity, amount, distribution and format of the information, and the method of storage. The Receiving Party shall ensure that more sensitive information will be safeguarded by a higher level of protection.

4) The Receiving Party shall ensure that methods of protection will include:

(a) physical measures, for example, locked filing cabinets and restricted access to offices;

(b) organizational measures, for example, controlling entry to data centers and limiting access to information on a "need-to-know" basis;

(c) technological measures, for example, the use of passwords and encryption; and

(d) investigative measures, in cases where the Receiving Party has reasonable grounds to believe that the Confidential Information is being inappropriately collected, used or disclosed by anyone whom in law the Receiving Party is responsible.

AFFILIATE SERVICE AGREEMENTS

Appendix E

Hydro One Telecom Inc.

Service Provision to:

Hydro One Networks Inc.

2007

(Telecommunications services)

TELECOMMUNICATIONS SERVICES AGREEMENT

THIS AGREEMENT made this 4th day of December, 2006 (the "Effective Date").

BETWEEN:

HYDRO ONE TELECOM INC.
("HOTelecom")

- and -

HYDRO ONE NETWORKS INC.
("HONI")

1.0 PREFACE

This Agreement is intended to identify certain telecommunications services that are to be provided to HONI by HOTelecom with respect to HONI's electricity distribution and transmission system (the "Power System") and HONI's business system (the "Business System") in accordance with the terms and conditions herein.

This Agreement, together with Schedules "A", "B" and "C" attached hereto, represents the entire agreement between the parties respecting the subject matter hereto and supersedes all prior agreements, understandings, discussions, negotiations, representations and correspondence made by or between them respecting the subject matter hereto.

2.0 TERM AND SERVICES

(a) Term:

Subject to the termination rights provided elsewhere in this Agreement and except as otherwise specified, this Agreement shall be effective as of the Effective Date and shall continue in full force and effect until December 31, 2008 . Clause 2.0(b), Section 3.0 and Sections 5.0 to 8.0 inclusive shall be effective as of January 1, 2007 and shall continue to be of full force and effect until such time that this Agreement is terminated in accordance with the terms and conditions herein (the "Term").

(b) Services:

Subject to the terms and conditions of this Agreement, HOTelecom shall provide to HONI and HONI shall acquire from HOTelecom, if and when required by HONI during the Term, the following services, which collectively constitute the Services and which are more particularly described in the following Schedules attached hereto:

- Schedule "A" – Power System – Operation of Telecommunications Services
- Schedule "B" – Business System – Operation of Telecommunications Services

3.0 FEES PAYABLE

(a) The price for the performance of each of the Services shall be as identified in each of the applicable Schedules attached hereto, exclusive of any sales and use taxes, as may be applicable. Except as may be specified otherwise in the applicable Schedules attached hereto, the relevant price for the Services shall be paid by HONI to HOTelecom by means of monthly electronic journal transfers which shall be reflected in the applicable books and records of each party. In addition, HONI shall pay for any material costs which HOTelecom, acting reasonably, incurs as a result of resources, services and products that HOTelecom must purchase and that are in addition to HOTelecom's existing resources, services and products, in order to provide HONI with specific services it requires and requests beyond those specified in applicable Schedules.

(b) The parties shall meet and review the volume and scope of each of the Services identified in the Schedules attached hereto in the second quarter of the second year of the Term in an attempt to arrive at estimated prices for any possible extension or renewal of this Agreement.

(c) If at any time during the performance of the Services, HONI is of the opinion that there are deficiencies in the Services provided to it and/or that the price payable is in any way inaccurate, HONI shall pay the entire relevant price payable by it in full and its sole remedy shall be to follow the dispute resolution procedures outlined in Section 6.0 herein to determine what amount, if any, shall be refunded to HONI and/or what Services, if any, shall be rectified or redone by HOTelecom.

(d) The parties acknowledge and agree that they qualify as specified members of a closely related group under subsection 156(1) of the *Excise Tax Act* (Canada), as amended (the "Act") and have jointly executed a Form GST25, to make an election under subsection 156(2) of the Act to deem the purchase and sale of the Services to be made for nil consideration for Goods and Services Tax purposes.

4.0 REPRESENTATIONS AND WARRANTIES

(a) HOTelecom represents and warrants that:
   - (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder;
   - (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of HOTelecom; and
   - (iii) all staff employed in the performance of the Services shall have the qualifications, expertise and experience which could reasonably be expected of staff of a services provider performing work similar to the Services.
   - (iv) that the prices for the Services to be performed as specified in Schedules "A" and "B" attached hereto are no more than the fair market value of the Services and where a fair market value is not available for any of the Services, the prices are cost-based prices.

(b) HONI represents and warrants that:
   - (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder; and

(ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of HONI.

5.0 PERFORMANCE OF THE SERVICES

(a) **Compliance with Standards and Applicable Law:** HOTelecom shall perform the Services in a diligent and professional manner and shall comply with HONI's computer data management and data access protocols contained in HONI's documents entitled "Corporate Security Standard 600-3 – Information Security Policy" and "Corporate Security Policy 600 – Information Security Policy", both of which are dated January 17, 2000 and any amendments thereto which may be made from time to time by HONI. HOTelecom shall comply at all times with the statutes, regulations, by-laws, standards and codes, as amended, as may be applicable to HOTelecom in respect of the Services and the performance of its obligations hereunder and it shall, at its own expense, obtain and maintain in good standing all permits and licences required by any authorities having jurisdiction to perform the Services.

(b) **Safety and Security Measures**: When any part of the Services is to be performed at HONI's premises, all of HOTelecom's staff engaged in the performance of the Services at the said premises shall comply with the safety and security requirements and measures in effect at the said premises.

(c) **Meetings**: HONI and HOTelecom shall meet at least once a month to review performance, quality and timeliness of the Services and to discuss operational issues of the Services provided by HOTelecom pursuant to this Agreement.

6.0 DISPUTE RESOLUTION PROCEDURES

Any controversy, dispute, difference, question or claim arising between any of the parties in connection with the interpretation, performance, construction or implementation of this Agreement that cannot be resolved by a director or manager from each of the said parties (collectively "Dispute") shall be settled in accordance with this Section. The aggrieved party shall send the other party written notice identifying the Dispute, the amount involved, if any, and the remedy sought, and invoking the procedures of this Section. One Senior Manager of each party shall confer in an effort to resolve the Dispute. If the Senior Managers are unable to resolve the Dispute within 5 business days after receipt of the written notice of the Dispute, then the parties shall submit the Dispute to the President of Hydro One Inc. for resolution.

7.0 CONFIDENTIALITY AND INTELLECTUAL PROPERTY

(a) Confidentiality:

Each party (the "Receiving Party") shall maintain in strict confidence this Agreement and the existence and contents thereof and all information, analysis, conclusions, drawings, reports, specifications or other information, proprietary or otherwise, whether transmitted orally, electronically or in written form, and received in furtherance of this Agreement from the other party (the "Disclosing Party") or any of the Disclosing Party's directors, officers, employees, consultants, agents or legal and other advisors (the "Disclosing Party Representatives") (collectively the "Confidential Information"). Except as permitted herein, the Receiving Party shall publish, reproduce or disclose, either directly or indirectly, the said Confidential Information to any third party and shall not use the said Confidential Information for any purpose other than for purposes of this Agreement without the prior written consent of the Disclosing Party. The Receiving Party may disclose the Confidential Information only to its shareholder, directors, officers, employees, consultants, agents or professional advisors (the "Receiving Party Representatives") having a need to know same and who have undertaken a like obligation to maintain its confidentiality.

For greater certainty, Confidential Information includes any and all personal information (as that term is defined in the *Freedom of Information and Protection of Privacy Act* (Ontario) and the *Personal Information Protection and Electronic Documents Act* (Canada), as they may be amended, and any and all information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator provided by the Disclosing Party to the Receiving Party for purposes of this Agreement, whether or not such information was initially provided prior to the Effective Date.

The Receiving Party undertakes to protect and safeguard all Confidential Information in its possession or under its control and received by the Disclosing Party, in the manner described in Schedule "C" attached hereto. The Disclosing Party may, on reasonable notice, and during regular business hours, audit the information management practices of the Receiving Party to confirm compliance with the terms and conditions of this Section 7.0 and all applicable statutes, regulations, by-laws, standards and codes, as amended.

The Receiving Party undertakes to notify the Disclosing Party immediately upon discovery of any unauthorized use and/or disclosure of any of the Disclosing Party's Confidential Information, to co-operate with the Disclosing Party to help regain possession of such Confidential Information, and to prevent its further unauthorized use and/or disclosure.

The foregoing obligations with respect to confidentiality, use, reproduction, dissemination, publication and non-disclosure herein shall not apply to any information that:

(i) is previously known to or lawfully in the possession of the Receiving Party prior to the date of disclosure as evidenced by the Receiving Party's written record;
(ii) is independently known to or discovered by the Receiving Party, without any reference to the information or material;
(iii) is obtained by the Receiving Party from an arm's length third party having a bona fide right to disclose same and who was not otherwise under an obligation of confidence or fiduciary duty to the Disclosing Party or the Disclosing Party Representatives;
(iv) is or becomes public knowledge through no fault or omission of, or breach of this Agreement by the Receiving Party or the Receiving Party Representatives; or
(v) is required to be disclosed pursuant to a final judicial or governmental order or other legal process.

Confidential Information (other than this Agreement which shall be jointly owned by the parties) shall remain the sole and exclusive property of the Disclosing Party that has disclosed the Confidential Information, and the Disclosing Party shall retain all right, title and interest in and to the said Confidential Information.

The Receiving Party shall keep a record of written Confidential Information furnished to it by the Disclosing Party in a location separate from those locations where the Receiving Party has stored information in respect of other third parties for which it performs work and it shall advise the Disclosing Party of such location.

All Confidential Information furnished by the Disclosing Party (other than this Agreement), including that portion of the Confidential Information which is contained in analyses, compilations, studies or other documents prepared by the Receiving Party or by the Receiving Party Representatives, is the Disclosing Party's property and will be returned immediately to the Disclosing Party upon its request.

(b) Intellectual Property:

HONI shall obtain all rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to it by HOTelecom and, subject to applicable legislation and notwithstanding clause 7.0(a) above, HONI may use, disclose or modify such reports or deliverable in any manner it deems appropriate. HOTelecom shall not do any act which may compromise or diminish HONI's interest as aforesaid.

(c) Survival of Obligations:

The obligations in this Section 7.0 shall forever survive the termination or expiration of this Agreement.

8.0 LIABILITY

Each party (the "Indemnifying Party") shall indemnify the other party (the "Indemnified Party") and the Indemnified Party's successors and assigns, directors, officers, employees, contractors and agents from and against all costs or damages attributable to the Indemnifying Party's performance and/or non-performance of its obligations under this Agreement and any amendments thereto, whether arising from or based on breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of this Agreement, neither party hereto shall be liable for any economic loss, loss of goodwill, loss of profit or for any special, indirect or consequential damages, where the said losses or damages are incurred by the other party or by any third party claiming through or under the other party.

This Section 8.0 shall forever survive the termination or expiration of this Agreement.

9.0 AUTHORIZED REPRESENTATIVES

The authorized representatives of the parties hereto for purposes of this Agreement are the following:

HYDRO ONE TELECOM INC.
175 Sandalwood Parkway West
Brampton, Ontario
L7A 1E81
Attention: Paul Marchant
Telephone: (905) 840- 0585 ext. 3340
Telecopier: (905) 840-1339

HYDRO ONE NETWORKS INC.

(a) 483 Bay Street
North Tower, 14h Floor
Toronto, Ontario
M5G 2P5
Attention: Ian Bradley
Telephone: (416) 345-6707
Telecopier: (416) 345-5424

-and-

(b) 483 Bay Street
South Tower, 8th Floor
Toronto, Ontario
M5G 2P5
Attention: Sandy Struthers
Telephone: (416) 345-6140
Telecopier: (416) 345-5695

All correspondence, reports, documents and/or other communication concerning this Agreement and the Schedules attached hereto shall be directed to the attention of the authorized representatives noted above and shall be deemed to be sufficiently given if delivered personally, mailed or transmitted by fax to the attention of the authorized representatives at the addresses above, and any notice so given shall be deemed to have been made and received on the date of delivery or on the 5th business day following the day of mailing of same or on the day of transmission if transmitted during normal business hours, otherwise on the next business day, as the case may be.

10.0 ASSIGNMENT AND CHANGE OF CONTROL

Assignment:

(a) Except as otherwise specified in this Agreement, neither this Agreement nor any rights, remedies, liabilities or obligations arising under it or by reason of it shall be assigned by either party without the prior written consent of the other party, which consent may be unreasonably withheld. Subject to the foregoing, this Agreement shall enure to the benefit of the parties hereto ad their respective successor and permitted assigns.

Change of Control:

(b) In the event of a change of control of either party, the parties shall negotiate in good faith for a period of 30 days after the effective date of the change of control with a view to executing a new agreement for the Services that were being performed by HOTelecom hereunder immediately prior to the effective date of said change of control. In the event that the parties cannot agree to a new agreement, this Agreement shall immediately terminate. A change of control shall mean, as applicable, a purchase of more than fifty (50) percent of the outstanding capital by a non-affiliate third party.

11.0 SCHEDULES

Schedules "A", "B" and "C" attached hereto are to be read with and form part of this Agreement.

12.0 COUNTERPARTS

This Agreement may be executed in counterparts and the counterparts together shall constitute an original.

IN WITNESS THEREOF the parties hereto have caused this Agreement to be executed by their respective representatives duly authorized in that behalf.

HYDRO ONE TELECOM INC.

Name: Paul Marchant
Title: President and CEO
I have authority to bind the corporation.

HYDRO ONE NETWORKS INC.

Name: Laura Formusa
Title: Secretary
I have authority to bind the corporation.

POWER SYSTEM - OPERATION OF TELECOMMUNICATION SERVICES

1. BACKGROUND

HOTelecom acknowledges the importance of teleprotection in order for HONI to maintain the reliability and integrity of HONI's electricity transmission and distribution systems (collectively, the "Electrical Network") in Ontario and its interactions with bordering networks. Teleprotection for an electric grid encompasses detailed utility policies and operating procedures which HOTelecom will effectively support. HOTelecom, through the Integrated Technology Management Center (ITMC), shall monitor teleprotection of HONI's Electrical Network and provides various Services, as defined in this Schedule, which Services are also collectively referred to as the "Power System Telecom Services" or "PSTS".

HONI has a vast number of systems that form the overall teleprotection of its Electrical Network. HOTelecom shall perform the Services described herein for the following components of HONI's teleprotection network:

- Analogue Microwave System
- Digital Microwave System
- Power Line Carrier (PLC) System
- Fibre Optic Transmission System
- HONI's Metallic Cable Systems
- Cable Protection Systems (neutralizing transformers, optical isolators)
- Provincial Mobile Radio System (Excludes mobile radios and control units)
- DOMC Mobile Radio System
- Teleprotection (CPE) Systems
- Telecom Management System (the ITMC operations and the backup ITMC facilities)
- Telemetering and control services
- Leased Power System Telecommunications Facilities

The vast number of systems results in hundreds of network elements that must be monitored. When the integrity and/or reliability of the above systems are impacted, the Services provided by HOTelecom as described in this Schedule form an integral part of the restoration effort that is ultimately controlled by HONI's Ontario Grid Control Centre (OGCC).

In performing the Services described in this Schedule, HOTelecom shall comply with HONI's policies and standards as may be applicable to HOTelecom in respect of the said Services and which policies and standards have been provided by HONI to HOTelecom on the Effective Date of the Agreement. In addition, HOTelecom will support HONI in its efforts to maintain compliance with North American Electric Reliability Council (NERC) requirements, specifically in the areas of security and auditability of the Power System Telecom Services. The parties acknowledge and agree that HONI shall be entitled to unilaterally amend the provisions of the said policies and standards or create new policies and standards throughout the Term of the Agreement that may be applicable to the Services described herein and HONI shall provide HOTelecom with 30 days' written notice of any such amendments and/or new policies and standards prior to the implementation of said amendments and/or new policies and standards and such amendments and HOTelecom shall comply with said amendments and/or new policies and standards commencing on the 31st day after the date of the notice referred herein.

2. DESCRIPTION OF SERVICES

HOTelecom shall perform the following Services related to the monitoring, management and operation of PSTS, as may be required by HONI:

1. Alarm Based Services
2. Coordinated Network Management Services
3. Systems Analysis Services
4. Carrier/Vendor Management Services

2.1 ALARM BASED SERVICES

2.1.1 Network Monitoring

- Monitor alarms from PSTS equipment and systems on a 24 hours / 7 day basis utilizing the ITMC or as required through the HOTelecom back-up control centre.
- Create trouble reports for alarms that require corrective action based on the following categorization of alarms:

SEVERITY LEVEL	DEFINITION	TIME DURING WHICH EVENT RESPONSE MUST BE MADE
1	**An incident or problem causing total loss of critical services such as Teleprotection or SCADA service**	7 X 24
2	**An incident or problem causing partial degradation or loss of redundancy for critical services**	7 X 24
3	**An incident or problem causing minor impact on network services**	Business Hours
4	**An incident or problem causing no impact on network services.**	Business Hours

- Restore failed or degraded telecommunications services remotely if possible.
- Assess, troubleshoot or co-ordinate troubleshooting, including engagement of second/third level engineering support, to restore PSTS services, as well as provide status updates to HONI designated personnel with respect to the restoration efforts.

2.1.2 Support for Trouble Calls & Corrective Maintenance

- Provide operational support, on a 24 hour / 7 day basis, for trouble calls and corrective maintenance activities on all failed or degraded telecom services and equipment - this Includes operational acceptance of replacement equipment or systems associated with trouble calls and corrective maintenance activities.
- Provide technical expertise to identify root causes, formulate corrective action plans and take charge of implementing the plan.
- Provide technical support and coordination, to the dispatched (internal or external) technical resources, in restoring failed or degraded services and effectively manage, in concert with HONI, the technical resources to achieve the following HONI designated restoration targets:

Severity Level	Service Restoration Target
1	Less than 4 hours
2	Less than 8 hours
3	More than 8 hours
4	More than 8 hours

- Perform analysis of, and prepare reports for, all PSTS "Severity Level 1 Incidents".

2.1.3 Notification and Reports

- Provide notification to the appropriate regulatory authorities with regard to lamps failures within HONI's microwave tower system.
- Monitor the actions of HONI's various third party telecommunications vendors as well as the broader Canadian and US telecommunications industry and advise HONI of any issues that may impact the PSTS.

2.1.4 Emergency Response Planning & Execution

- Assist, as requested by HONI, in the planning for large scale emergency situations affecting a large portion of or, in a worst case situation, the entire HONI Electrical Network.
- Having regard to HONI's emergency response plans, provide operational support for large scale critical situations which result in HONI activating its Incident Command Centre (ICC) and/or its Emergency Operations Centre (EOC).
- Activate the telecommunications component of the ICC to provide updates to HONI with respect to the resolution of the large scale critical situations until achievement of the resolution.
- Provide HONI with an on-call single point of contact at a senior management level to interact with HONI's ICC and/or EOC.
- Work with HONI to test the various emergency response plans as scheduled by HONI.
- Review the test results of the emergency response plans with HONI, identify any deficiencies and update the said plans as required by HONI.

2.1.5 Additional Deliverables: Alarm Based Service

- Provide real-time email distribution of all Severity 1 incidents trouble tickets to a HONI-provided distribution list.
- Within 5 business days of a Severity 1 incident, draft an "Incident Investigation Report" which will include a description of the incident, sequence of events, root cause analysis and corrective actions taken. In consultation with HONI, the format of this report may be modified as required by HONI.
- Ensure that HOTelecom's Senior Management, including the President, will be available on-call to deal with escalation or emergency situations.
- HOTelecom will notify HONI of any meetings HOTelecom has scheduled with third party carriers to discuss substandard service and assist in developing recommendations to improve the overall reliability of the service delivery to enable HONI to attend if it deems desirable.
- As required by HONI, HOTelecom will participate in HONI meetings to report on ITMC activity levels.

2.2 COORDINATED NETWORK MANAGEMENT SERVICES

2.2.1 Change Management

- Provide HONI with technical expertise to assist HONI in formulating change plans and in implementing the changes.
- Develop and maintain change management processes and measures that facilitate timely and controlled change for PSTS infrastructure.
- Ensure that standard telecommunications industry methods and techniques are used for efficient handling of changes, so that change related problems are prevented. Change management activities include acceptance, classification, assessment and planning, coordination and evaluation.
- Review all changes that are introduced into HONI's environment to ensure they are engineered, tested, commissioned and supported according to jointly defined HONI and HOTelecom standards for quality and performance.
- Input change records into HONI systems (i.e. NOMS – Network Outage Management System).
- Establish and chair regular Change Advisory Board (CAB) meetings with affected stakeholders who want to attend such meeting.
- HOTelecom will document and review with HONI all changes to HONI's teleprotection system. The documentation will specify the reason for the change, impacts of the

change, risks associated with the change, testing done, back-out plans, technical assessment, and management/risk assessment.
- Develop and maintain release management processes and measures that facilitate timely and controlled change (through regular meetings).
- Determine release strategies, controls, and co-ordinate the release of network hardware and software into the live environment.
- Coordinate operational acceptance and commissioning of new or replacement equipment/systems associated with minor projects.

2.2.2 Configuration Management

- Maintain and update configuration parameters and elements of each element of the HONI teleprotection network.
- Maintain up-to-date configuration documentation for every change implemented.
- Ensure configuration changes including drawings are documented in order to maintain the capability to enable re- configuration of services to maintain adequate operational control of infrastructure systems and components.
- Provide regular back-ups for the element configuration parameters and elements of the teleprotection network.

2.2.3 ITMC Support for Preventative Maintenance Program

- Provide support for HONI's teleprotection network hardware and software preventative maintenance program, including assistance in supporting business cases to justify expenditures.
- Recommend vendor upgrades and patches, and perform such upgrades and patches as directed by HONI.
- Provide First Level (Incident Management), Second Level (Problem Management) and Third Level (Vendor Management) technical support that includes on- site deployment of staff or management of vendor personnel necessary to resolve problems.
- Manage hardware and software maintenance for PSTS-related applications; work with hardware and software vendors and co-ordinate the installation, upgrade and maintenance of hardware and software; monitor vendors' service and performance to confirm compliance with the vendors' respective SLA; perform hardware and software maintenance outside of vendor support contracts.
- Provide corrective maintenance and repair for warranty and non-warranty components of the PSTS network; take necessary actions to coordinate repair of the failed component of the PSTS network to working order.

2.2.4 Operating Support System (OSS)

- HONI contributed and therefore has access to the development of the HOTelecom Operating Support System (OSS) which has four elements:
  - An inventory management system (Granite) for the BSTS wide-area network (HWAN)
  - Outside Plant (OSP)/fibre inventory system (Telcordia Network Engineer)
  - Network management system for HWAN and voice switches (HP Openview)
  - Service Management system (HP Service Desk) as adopted by PSTS and HOTelecom's commercial network for the HWAN. This includes incident management through trouble tickets, problem management, and change management functions.
- The OSS is vital to support the day-to-day ITMC operational functions including updating of fibre inventory, management and updating of network alarms, management of incidents [trouble tickets], and outage and change requests.

2.2.5 Additional Deliverables: Coordinated Network Management

- Due to the dynamic nature of telecom, coordinate, as required by HONI, meetings with third party service providers and stakeholders in HONI (such as E&CS Telecom

Engineering, and Grid Operations) to review overall roles and accountabilities to maximize an integrated approach to power system telecom operations.

- Provide HOTelecom's Change Management process, deliverables and documentation to HONI upon HONI's request.
- Maintain the OSS system applicable to the PSTS with current software releases and provide appropriate access, to designated HONI personnel.

2.3 SYSTEMS ANALYSIS SERVICES

2.3.1 Fibre Restoration Plan Management

- Provide on-going support for HONI's fibre optic network restoration capability plan.
- Participate in annual reviews of this plan with HONI's Engineering Service and Maintenance Service Providers.

2.3.2 Software Release Management

- Recommend software releases on all SONET fibre electronics to HONI
- Manage the upgrade of the software on SONET fibre electronics as required

2.3.3 Asset Performance Assessment

- Provide on-going trend analysis on telecom equipment failures and long duration and chronic outages with analysis and recommendations for corrective action.

2.3.4 NERC System Analysis Service

- Provide ongoing analysis and support in the areas of system security to HONI in response to NERC queries.
- Participate in the implementation of system security features as required by HONI to demonstrate compliance with NERC requirements.

2.3.5 Additional Deliverables: System Analysis Services

- Provide ongoing software release recommendations to the designated HONI contact and upon HONI's acceptance of the recommendations, report on any resulting activity.
- Provide an annual asset performance assessment report in consultation with HONI for the PSTS Severity 1 incidents including historical trend analysis.

2.4 CARRIER/VENDOR MANAGEMENT SERVICES

With the numerous teleprotection systems and the extent of HONI's various networks spread across its vast operating territory, there are numerous third party carriers who provide various telecommunications and equipment services to HONI. HOTelecom will be the single-point of contact for management of the third party providers.

2.4.1 Carrier Contract Management

- HOTelecom will negotiate, on behalf of HONI, best commercial terms and conditions governing all carrier contracts for HONI circuits
- HOTelecom will manage the contracts during the term of the contracts
- HOTelecom will attempt to leverage all of HONI's telecommunications purchases to obtain the best possible price to achieve the desired HONI telecommunication solution. This may include recommendations such as the use of alternative carriers and/or product solutions.

2.4.2 Carrier Circuit Management

- HOTelecom will be HONI's single-point of management for all PSTS requirements for third party telecommunications circuit services. HONI will direct HOTelecom with regard to what circuits are to be procured and HOTelecom will interact with the various HONI approved carriers in an effort to execute the following:

- Circuit ordering
- Circuit out-ordering
- Coordination of the carrier invoice payment and reconciliation
- Cost allocation and distribution to HONI directed end-accounts/projects
- Investigating any billing discrepancy and taking corrective action against any errors in billing by third party providers
- Liaise with third party providers to claim any applicable service credits
- Maintenance of records of service billing and payment history
- Provide support for billing and cost inquiries on specific leased circuits when requested by HONI

2.4.3 Provincial Mobile Radio ("PMR") Management

- As directed by HONI, HOTelecom will coordinate the payment of all microwave radio licenses.
- As directed by HONI, HOTelecom will coordinate the payment of all provincial mobile base station frequency licenses.
- Coordinate renewal of tower space lease agreements for the PMR network.
- Negotiate and administer HONI's contracts with third party providers, including resolving billing issues, violations of service level agreements, application for and collection of credits, and monitoring of delivery performance.
- Coordinate "lessons learned" meetings with third party providers to assess performance and make recommendations for service improvement.
- Liaise with the appropriate HONI personnel as designated by HONI in the field to facilitate implementation of work packages.
- Assist HONI in developing policies and procedures to effectively facilitate third party providers' support of HONI's mobile radio network.

2.4.4 Third Party Maintenance Contract Management

- HONI has various third party contracts with vendors of equipment that form the third level of support when resolving incidence that affects HONI's various networks. Some of these contracts include: Significant Event Notifications System, Voice Recorders at the OGCC, and UPS Maintenance contracts.
- As directed by HONI, HOTelecom will negotiate these support contracts and coordinate the payment of the contracts.

2.4.5 Additional Deliverables: Carrier/Vendor Management Services

- HOTelecom will administer meetings with third party carriers when determined necessary by HOTelecom. HOTelecom will draft, and provide to HONI, minutes of the meetings describing invoicing errors under investigation and resolution steps with the third party carrier.
- HOTelecom will provide a monthly report to HONI of the current month and year to date costs of all HONI circuit purchases and identify if any specified HONI account is over a HONI defined variance threshold. HOTelecom shall ensure that such reports will show a breakdown of costs by services and vendors will and will be distributed to the HONI provided distribution list.
- HOTelecom will provide status reports regarding the third party Maintenance contracts.

3. Pricing

The prices for the performance of the Services to be performed under this Schedule are as follows:

	2007	2008
Alarm Based Services	$1,747,128	$1,817,014
Coordinated Network Management Services	$1,477,605	$1,536,709
Systems Analysis Services	$394,990	$410,789
Carrier/Vendor Management Services	$835,594	$869,018
Total PSTS Charge	**$4,455,317**	**$4,633,530**

BUSINESS SYSTEM - OPERATION OF TELECOMMUNICATION SERVICES

1. Background

HONI maintains various technical and administrative locations throughout the Province of Ontario. Within HONI, the Corporate Services group is responsible for the connectivity of the various locations. In particular, the CIO's IT department is focused on the information technology needs and information management of HONI. HONI's telecommunications infrastructure provides the linkage for HONI's information needs and HONI has engaged the services of HOTelecom to provide various services in regard to the procurement and monitoring of telecommunication services.

HOTelecom recognizes that HONI's IT department helps form an integral part of HONI's ability to provide a reliable electricity network in the Province of Ontario. The monitoring of HONI's Power System Telecom Services ("PSTS") is dependant on HONI's IT department's voice and data network which is commonly referred to as the "Business System Telecom Services" (or "BSTS"). In addition, the BSTS is essential to maintain a high availability of HONI's mission critical business applications. HOTelecom shall provide the Services described herein through the Integrated Technology Management Center ("ITMC").

In performing the Services described in this Schedule, HOTelecom shall comply with HONI's policies and standards as may be applicable to HOTelecom in respect of the said Services and which policies and standards have been provided by HONI to HOTelecom on the Effective Date of the Agreement. The parties acknowledge and agree that HONI shall be entitled to unilaterally amend the provisions of the said policies and standards or create new policies and standards throughout the Term of the Agreement that may be applicable to the Services described herein and HONI shall provide HOTelecom with 30 days' written notice of any such amendments and/or new policies and standards prior to the implementation of said amendments and/or new policies and standards and such amendments and HOTelecom shall comply with said amendments and/or new policies and standards commencing on the 31st day after the date of the notice referred herein.

2. DESCRIPTION OF SERVICES

HOTelecom shall perform the following Services related to the monitoring, management and operation of BSTS, as may be required by HONI:

1. Alarm Based Services
2. Coordinated Network Management
3. Systems Analysis Services
4. Carrier/Vendor Management Services

2.1 ALARM BASED SERVICES

2.1.1 Network Monitoring

- Monitor alarms from BSTS equipment and systems on a 24 hours / 7 day basis utilizing the ITMC or as required through the HOTelecom back-up control centre.
- Create trouble reports for alarms that require corrective action based on the following categorization of alarms:

SEVERITY LEVEL	DEFINITION	EVENT RESPONSE
1	**An incident or problem causing total loss or severe degradation of network services.**	7 X 24
2	**An incident or problem causing partial degradation to network services**	7 X 24
3	**An incident or problem causing minor impact to network services.**	Business Hours
4	**An incident or problem causing no impact to network services.**	Business Hours

- Restore failed or degraded telecommunications services remotely if possible.

- Assess, troubleshoot or co-ordinate troubleshooting, including engagement of second/third level engineering support, to restore BSTS services, as well as provide status updates to HONI designated personnel with respect to the restoration efforts.

2.1.2 Support for Trouble Calls & Corrective Maintenance

- Provide operational support, on a 24 hour / 7 day basis, for trouble calls and corrective maintenance activities on all failed or degraded telecom services and equipment. Includes operational acceptance of replacement equipment or systems associated with trouble calls and corrective maintenance activities.
- Provide technical expertise to identify root causes, formulate corrective action plans and take charge of implementing the plan.
- Provide technical support and coordination, to the dispatched (internal or external) technical resources, in restoring failed or degraded services and effectively manage the technical resources to achieve the following HONI designated service restoration targets:

Severity Level	Service Restoration Target
1	Less than 4 hours
2	Within 8 business hours
3	Within 5 business days
4	Within 10 business days

- The severity rating of a problem ticket may be increased at the request of an authorized HONI representative in order to support business requirements.
- Perform analysis of, and prepare reports for, all BSTS "Severity Level 1 Incidents".

2.1.3 Notification

- Monitor the actions of HONI's various third party telecommunications vendors as well as the broader Canadian and US telecommunications industry and advise HONI of any issues that may impact the BSTS.

2.1.4 Emergency Response Planning & Execution

- Assist, as requested by HONI, in the planning for large scale emergency situations affecting a large portion of or, in a worst case situation, the entire HONI Electrical Network.
- Having regard to HONI's emergency response plans, provide operational support for large scale critical situations which result in HONI activating its Incident Command Centre (ICC) and/or its Emergency Operations Centre (EOC).
- Activate the telecommunications component of the ICC to provide updates to HONI with respect to the resolution of the large scale critical situations until achievement of the resolution.
- Provide HONI with an on-call single point of contact at a senior management level to interact with HONI's ICC and/or EOC.
- Work with HONI to test the various emergency response plans as scheduled by HONI.
- Review the test results of the emergency response plans with HONI, identify any deficiencies and update the said plans as required by HONI.

2.1.5 Additional Deliverables: Alarm Based Service

- Provide real-time email distribution of all Severity 1 incidents trouble tickets to a HONI-provided distribution list.
- Within 5 business days of a Severity 1 incident, draft an "Incident Investigation Report" which will include a description of the incident, sequence of events, root cause analysis and corrective actions taken. In consultation with HONI, the format of this report may be modified as required by HONI.

- Ensure that HOTelecom's Senior Management, including the President, will be available on-call to deal with escalation or emergency situations.
- HOTelecom will notify HONI of any meetings HOTelecom has scheduled with third party carriers to discuss substandard service and assist in developing recommendations to improve the overall reliability of the service delivery to enable HONI to attend if it deems desirable.
- As required by HONI, HOTelecom will participate in HONI meetings to report on ITMC activity levels.

2.2 COORDINATED NETWORK MANAGEMENT

2.2.1 Change Management

- Provide HONI with technical expertise to assist HONI in formulating change plans and in implementing the changes.
- Develop and maintain change management processes and measures that facilitate timely and controlled change for BSTS infrastructure.
- Ensure that standard telecommunications industry methods and techniques are used for efficient handling of changes, so that change related problems are prevented. Change management activities include acceptance, classification, assessment and planning, coordination and evaluation.
- Review all changes that are introduced into HONI's environment to ensure they are engineered, tested, commissioned and supported according to jointly defined HONI and HOTelecom standards for quality and performance.
- Establish and chair regular Change Advisory Board (CAB) meetings with affected stakeholders who want to attend such meetings.
- HOTelecom will document and review with HONI all changes to HONI's teleprotection system. The documentation will specify the reason for the change, impacts of the change, risks associated with the change, testing done, back-out plans, technical assessment, and management/risk assessment.
- Develop and maintain release management processes and measures that facilitate timely and controlled change (through regular meetings).
- Determine release strategies, controls, and co-ordinate the release of network hardware and software into the live environment.
- Coordinate operational acceptance and commissioning of new or replacement equipment/systems associated with minor projects.
- Perform twenty-four (24) site/network move/add/changes per year in conjunction with Inergi/Bell staff.

2.2.2 Configuration Management

- Maintain and update configuration parameters and elements of each element of the BSTS network.
- Maintain up-to-date configuration documentation for every change implemented.
- Ensure configuration changes including drawings are documented in order to maintain the capability to enable re- configuration of services to maintain adequate operational control of infrastructure systems and components.
- Provide regular back-ups for the element configuration parameters and elements of the BSTS network.

2.2.3 ITMC Support for Preventative Maintenance Program

- Provide support for HONI's BSTS network hardware and software preventative maintenance program, including assistance in writing business cases to justify expenditures.
- Recommend vendor upgrades and patches, and perform such upgrades and patches as directed by HONI.

- Provide First Level (Incident Management), Second Level (Problem Management) and Third Level (Vendor Management) technical support that includes on- site deployment of staff or management of vendor personnel necessary to resolve problems.
- Manage hardware and software maintenance for BSTS-related applications; work with hardware and software vendors and co-ordinate the installation, upgrade and maintenance of hardware and software; monitor vendors' service and performance to confirm compliance with the vendors' respective SLA; perform hardware and software maintenance outside of vendor support contracts.
- Provide corrective maintenance and repair for warranty and non-warranty components of the BSTS network; take necessary actions to coordinate repair of the failed component of the BSTS network to working order.

2.2.4 Operating Support System (OSS)

- HONI contributed and therefore has access to the development of the HOTelecom Operating Support System (OSS) which has four elements:
  - An inventory management system (Granite) for the BSTS wide-area network (HWAN)
  - Outside Plant (OSP)/fibre inventory system (Telcordia Network Engineer)
  - Network management system for HWAN and voice switches (HP Openview)
  - Service Management system (HP Service Desk) as adopted by PSTS and HOTelecom's commercial network for the HWAN. This includes incident management through trouble tickets, problem management, and change management functions.
- The OSS is vital to support the day-to-day ITMC operational functions including management and updating of network alarms, management of incidents [trouble tickets], and outage and change requests.

2.2.5 Additional Deliverables: Coordinated Network Management

- Due to the dynamic nature of telecom, coordinate on an as-need basis meetings with third party service providers and stakeholders in HONI to review overall roles and accountabilities to maximize an integrated approach to BSTS operations.
- Provide Change Management process, deliverables and documentation to HON upon their request.
- Maintain the OSS system applicable to the BSTS (does not include the OSP) with current software releases and provide appropriate access, to designated HONI personnel.

2.3 SYSTEMS ANALYSIS SERVICES

2.3.1 Security Management

- HOTelecom will familiarize itself with the current HONI IT security policies, and any subsequent updates provided by HONI to HOTelecom, and adhere to and follow the said policies.
- Provide security management services that include monitoring, reporting, and support incident resolution and escalation.
- React to, and resolve, network security incidents caused by viruses, hardware and software failures, or hackers.
- Provide HONI Corporate Security with copies of HOTelecom's security reports as requested by HONI, including reports dealing with long distance call records.
- Rectify security incidents or audit reports that identify gaps in security as required by HONI.
- Takes corrective actions with regard to security incidents, as required and directed by HONI.
- Escalates problems as they are identified to HONI's Corporate Security.

- Provide HONI security personnel with access to the BSTS to investigate specific security incidents and or security breaches.
- Carry out virus scanning and anti-spam filtering of incoming internet mail.
- Deploy and/or upgrade security-related network components in accordance with HONI's Infrastructure requirements. This includes enhance port security for Bill 198 Compliance.
- Provide ongoing maintenance and support to HONI deployed VPN concentrators.
- Proactively check vendor WEB sites and download and apply network security patches as provided by vendors.
- Intrusion Detection Service – detect unauthorized network access (e.g. INET)

2.3.2 LAN/WAN Services

- Manage HONI's LAN/WAN infrastructure including: providing support for audits, providing corrective service updates, and interfacing with vendors to ensure service quality.
- Establish operating practices used to support the provision of LAN/WAN services.
- Manage network hardware maintenance; work with hardware vendors and co-ordinate the installation, upgrade and maintenance of (existing) hardware.

2.3.3 Software Release Management

- Make recommendations to HONI with regard to software releases on all routers, switches and firewalls
- Manage the upgrade of the software on all routers, switches and firewalls as directed by HONI.

2.3.4 Performance Management

- Provide operational monitoring of system parameters, such as link capacity, collect performance statistics and system logs to determine historical and trend analysis.
- Assist HONI in developing recommendations and plans with regard to the BSTS capacity and performance issues.
- Provide HONI with a reactive data collection, analysis and make recommendations with respect to the BSTS's capability to deal with unexpected system capacity or performance issues.

2.3.5 Internet Services (IP Address Management)

- Provide Public IP address management
- Provide commissioning, managing, monitoring, and maintenance of firewalls and log files
- Manage external WWW access (blocking and monitoring)
- Operate and administer HONI's network components that provide the Internet Services, LAN/WAN interface, mail relay and WWW proxy services
- Manage hardware maintenance; work with hardware vendors, and co-ordinate the installation, upgrade and maintenance of hardware
- Assist HONI in establishing operating practices and infrastructure used to provide the Internet Services.
- Perform Backup and Recovery services, user account Management, Security and Access Controls, as well as performance management.
- Perform virus scanning for Internet emails and spam blocking

2.3.6 Additional Deliverables: System Analysis Services

- Provide monthly activity reports with regard to the Intrusion Detection System ("IDS") and firewall.

- Provide software release recommendations to the designated HONI contact and upon HONI's acceptance of the recommendations provide HONI with a written report on any resulting activity.
- Provide, as required by HONI, Performance Management reports.

2.4 CARRIER/VENDOR MANAGEMENT SERVICES

With the numerous components in the BSTS system and the extent of HONI's various networks spread across its vast operating territory, there are numerous third party carriers who provide various telecommunications and equipment services to HONI. HOTelecom will be the single-point of contact for management of the third party providers.

2.4.1 Carrier Contract Management

- HOTelecom will negotiate, on behalf of HONI, best commercial terms and conditions governing all carrier contracts for HONI circuits
- HOTelecom will manage the contracts during the term of the contracts
- HOTelecom will attempt to leverage all of HONI's telecommunications purchases to obtain the best possible price to achieve the desired HONI telecommunication solution. This may include recommendations such as the use of alternative carriers and/or product solutions.

2.4.2 Carrier Circuit Management

- HOTelecom will be HONI's single-point of management for all BSTS requirements for third party telecommunications circuit services. HONI will direct HOTelecom with regard to what circuits are to be procured and HOTelecom will interact with the various HONI approved carriers in an effort to execute the following:
    - Circuit ordering
    - Circuit out-ordering
    - Coordination of the carrier invoice payment and reconciliation
    - Cost allocation and distribution to HONI directed end-accounts/projects
    - Investigating any billing discrepancy and taking corrective action against any errors in billing by third party providers
    - Liaise with third party providers to claim any applicable service credits
    - Maintenance of records of service billing and payment history
    - Provide support for billing and cost inquiries on specific leased circuits when requested by HONI

2.4.3 3rd party Maintenance Contract Management

- HONI has various third party contracts with vendors of equipment that form the third level of support when resolving incidence that affects HONI's various networks. Some of these contracts include: Significant Event Notifications System, Voice Recorders at the OGCC, and UPS Maintenance contracts.
- As directed by HONI, HOTelecom will negotiate these support contracts and coordinate the payment of the contracts.

2.4.4 Bell Field Services

- Participate on HONI's designated committee's (Operations and Executive) overseeing the implementation of the outsourcing initiative to Bell Canada.
- Negotiate and administer HONI's contracts with third party providers, including resolving billing issues, violations of service level agreements, application for and collection of credits, and monitoring of delivery performance.
- Coordinate "lessons learned" meetings with third party providers to assess performance and make recommendations for service improvement.
- Liaise with the appropriate HONI personnel as designated by HONI in the field to facilitate implementation of work packages.

- Assist HONI in developing policies and procedures to effectively facilitate third party providers' delivery of the contracted services.

2.4.5 Additional Deliverables: Carrier/Vendor Management Services

- HOTelecom will administer meetings with third party carriers when determined necessary by HOTelecom. HOTelecom will draft, and provide to HONI, minutes of the meetings describing invoicing errors under investigation and resolution steps with the third party carrier.
- HOTelecom will provide a monthly report to HONI of the current month and year to date costs of all HONI circuit purchases and identify if any specified HONI account is over a HONI defined variance threshold. HOTelecom shall ensure that such reports will show a breakdown of costs by services and vendors will and will be distributed to the HONI provided distribution list.
- HOTelecom will provide status reports regarding the third party Maintenance contracts.

3. Pricing

The services listed in this Schedule have been priced as follows:

	2007	2008
Alarm Based	$1,861,038	$1,935,480
Coordinated Network Management	$774,766	$805,757
Systems Analysis Services	$609,552	$633,934
Carrier/Vendor Management Services	$954,965	$993,163
Total BSTS Charge	**$4,200,321**	**$4,368,334**

Schedule "C"

Receiving Party Security Safeguards Regarding Confidential Information Received from the Disclosing Party

The Receiving Party shall protect the Confidential Information by security safeguards appropriate to the sensitivity of the information.

1) The Receiving Party shall protect the Confidential Information against such risks as loss or theft, unauthorized access, disclosure, copying, use, modification or destruction, through appropriate security measures, regardless of the format in which it is held.

2) All of the Receiving Party's Representatives with access to the Confidential Information shall be contractually required to respect the confidentiality of that information.

3) The Receiving Party acknowledges and agrees that the nature of the safeguards will vary depending on the sensitivity, amount, distribution and format of the information, and the method of storage. The Receiving Party shall ensure that more sensitive information will be safeguarded by a higher level of protection.

4) The Receiving Party shall ensure that methods of protection will include:

(a) physical measures, for example, locked filing cabinets and restricted access to offices;

(b) organizational measures, for example, controlling entry to data centers and limiting access to information on a "need-to-know" basis;

(c) technological measures, for example, the use of passwords and encryption; and

(d) investigative measures, in cases where the Receiving Party has reasonable grounds to believe that the Confidential Information is being inappropriately collected, used or disclosed by anyone whom in law the Receiving Party is responsible.

AFFILIATE SERVICE AGREEMENTS

Appendix F

Hydro One Remote Communities Inc.

Service Provision to:

Hydro One Networks Inc.

2007

(Metering and lines services)

THIS AGREEMENT made in duplicate this 1st day of January, 2007 (the "Effective Date").

BETWEEN:

HYDRO ONE REMOTE COMMUNITIES INC.
(the "Services Provider")

- and -

HYDRO ONE NETWORKS INC.
(the "Services Recipient")

1.0 PREFACE

This Agreement is intended to identify the services that are to be provided to the Services Recipient by the Services Provider in accordance with the terms and conditions herein. The term of this Agreement shall be for a period of 1 year commencing on the Effective Date.

2.0 SERVICES

Subject to the Services Provider's availability of personnel and resources, which availability shall be determined by the Services Provider in its sole discretion, the Services Provider shall provide metering work, lines work and training for lines work to the Services Recipient, which collectively constitute the Services and which are more particularly described in Schedule "A" attached hereto, as may be required by the Services Recipient from time to time during the term of this Agreement.

3.0 FEES PAYABLE

(a) The price for the performance of the Services shall be on a time and materials basis in accordance with the Services Provider's 2007-2008 hourly rates by job category, which rates may be amended from time to time by mutual agreement of the parties. The parties acknowledge and agree that the Services Recipient has received the Services Provider's 2007-2008 hourly rates from the Services Provider.

(b) The parties agree that the price for the Services shall be paid by the Services Recipient to the Services Provider by direct time reporting through Hydro One Inc.'s payroll system.

(c) In addition, the Services Recipient shall pay for any material costs which the Services Provider, acting reasonably, incurs as a result of resources, services and products that the Services Provider must purchase and that are in addition to the Services Provider's existing resources, services and products, in order to provide the said Services Recipient with specific services it requires and requests.

(d) If at any time during the performance of the Services, the Services Recipient is of the opinion that there are deficiencies in the Services provided to it and/or that the price payable is in any way inaccurate, the Services Recipient shall pay the entire relevant price payable by it in full and its sole remedy shall be to follow the dispute resolution procedures outlined in Section 6.0 herein to determine what amount, if any, shall be refunded to the Services Recipient and/or what Services, if any, shall be rectified or redone by the Services Provider.

(e) The parties acknowledge and agree that they qualify as specified members of a closely related group under subsection 156(1) of the Excise Tax Act (Canada), as amended (the "Act") and have jointly executed a Form GST25, to make an election under subsection 156(2) of the Act to deem the purchase and sale of the Services to be made for nil consideration for Goods and Services Tax purposes.

4.0 REPRESENTATIONS AND WARRANTIES

(a) The Services Provider represents and warrants that:
   (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder;
   (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Provider; and
   (iii) all staff employed in the performance of the Services shall have the qualifications, expertise and experience which could reasonably be expected of staff of a services provider performing work similar to the Services.

(b) The Services Recipient represents and warrants that:
   (i) it has all the necessary authority and capacity to enter into this Agreement and to perform its obligations hereunder; and
   (ii) the execution of this Agreement and compliance with and performance of the terms, conditions, and covenants contemplated herein have been duly authorized by all necessary corporate action on the part of the Services Recipient.

5.0 PERFORMANCE OF THE SERVICES

(a) **Compliance with Standards and Applicable Law**: The Services Provider shall perform the Services in a diligent and professional manner and shall comply with the Services Recipient's computer data management and data access protocols contained in the Services Recipient's documents entitled "Corporate Security Standard 600-3 – Information Security Policy" and "Corporate Security Policy 600 – Information Security Policy", both of which are dated January 17, 2000 and any amendments thereto which may be made from time to time by the Services Recipient. The Services Provider shall comply at all times with the statutes, regulations, by-laws, standards and codes, as amended, as may be applicable to the Services Provider in respect of the Services and the performance of its obligations hereunder and it shall, at its own expense, obtain and maintain in good standing all permits and licences required by any authorities having jurisdiction to perform the Services.

(b) **Safety and Security Measures**: When any part of the Services is to be performed at any of the Services Recipient's premises, all of the Services Provider's staff engaged in the performance of the Services at the said premises shall comply with the safety and security requirements and measures in effect at the said premises.

(c) **Meetings**: The parties shall, after the Effective Date, meet at least once during the term of this Agreement to review performance, quality and timeliness of the Services provided by the Services Provider pursuant to this Agreement.

6.0 DISPUTE RESOLUTION PROCEDURES

Any controversy, dispute, difference, question or claim arising between any of the parties in connection with the interpretation, performance, construction or implementation of this Agreement that cannot be resolved by a director or manager from each of the said parties (collectively "Dispute") shall be settled in accordance with this Section. The aggrieved party shall send the other affected party(ies) written notice identifying the Dispute, the amount involved, if any, and the remedy sought, and invoking the procedures of this Section. The Presidents of each affected party shall confer in an effort to resolve the Dispute. If the Presidents are unable to resolve the Dispute within 5 business days after receipt of the written notice of the Dispute, then the affected parties shall submit the Dispute to the President of Hydro One Inc. for resolution.

7.0 CONFIDENTIALITY AND INTELLECTUAL PROPERTY

(a) Confidentiality:

Each party (the "Receiving Party") shall maintain in strict confidence this Agreement and the existence and contents thereof and all information, analysis, conclusions, drawings, reports, specifications or other information, proprietary or otherwise, whether transmitted orally, electronically or in written form, and received in furtherance of this Agreement from any of the other parties (the "Disclosing Party") or any of the Disclosing Party's directors, officers, employees, consultants, agents or legal and other advisors (the "Disclosing Party Representatives") (collectively the "Confidential Information"). Except as permitted herein, the Receiving Party shall not publish, reproduce, or disclose, either directly or indirectly, the said Confidential Information to any third party and shall not use the said Confidential Information for any purpose other than for purposes of this Agreement without the prior written consent of the Disclosing Party. The Receiving Party may disclose the Confidential Information only to its shareholder, directors, officers, employees, consultants, agents or professional advisors (the "Receiving Party Representatives") having a need to know same and who have undertaken a like obligation to maintain its confidentiality.

For greater certainty, Confidential Information includes any and all personal information (as that term is defined in the Freedom of Information and Protection of Privacy Act (Ontario) and the Personal Information Protection and Electronic Documents Act (Canada), as they may be amended, and any and all information regarding a consumer, retailer, wholesale buyer, wholesale supplier, or a generator, provided by the Disclosing Party to the Receiving Party for purposes of this Agreement, whether or not such information was initially provided prior to the Effective Date.

The Receiving Party undertakes to protect and safeguard all Confidential Information in its possession or under its control and received by the Disclosing Party, in the manner described in Schedule "B" attached hereto. The Disclosing Party may, on reasonable notice, and during regular business hours, audit the information management practices of the Receiving Party to confirm compliance with the terms and conditions of this Section 7.0 and all applicable statutes, regulations, by-laws, standards and codes, as amended.

The Receiving Party undertakes to notify the Disclosing Party immediately upon discovery of any unauthorized use and/or disclosure of any of the Disclosing Party's Confidential Information, to co-operate with the Disclosing Party to help regain possession of such Confidential Information, and to prevent its further unauthorized use and/or disclosure.

The foregoing obligations with respect to confidentiality, use, reproduction, dissemination, publication and non-disclosure herein shall not apply to any information that:

(i) is previously known to or lawfully in the possession of the Receiving Party prior to the date of disclosure as evidenced by the Receiving Party's written record;
(ii) is independently known to or discovered by the Receiving Party, without any reference to the information or material;
(iii) is obtained by the Receiving Party from an arm's length third party having a bona fide right to disclose same and who was not otherwise under an obligation of confidence or fiduciary duty to the Disclosing Party or the Disclosing Party Representatives;
(iv) is or becomes public knowledge through no fault or omission of, or breach of this Agreement by the Receiving Party or the Receiving Party Representatives; or
(v) is required to be disclosed pursuant to a final judicial or governmental order or other legal process.

Confidential Information (other than this Agreement which shall be jointly owned by the parties) shall remain the sole and exclusive property of the Disclosing Party that has disclosed the Confidential Information, and the Disclosing Party shall retain all right, title and interest in and to the said Confidential Information.

The Receiving Party shall keep a record of written Confidential Information furnished to it by the Disclosing Party in a location separate from those locations where the Receiving Party has stored information in respect of other third parties for which it performs work and it shall advise the Disclosing Party of such location.

All Confidential Information furnished by the Disclosing Party (other than this Agreement), including that portion of the Confidential Information which is contained in analyses, compilations, studies or other documents prepared by the Receiving Party or by the Receiving Party Representatives, is the Disclosing Party's property and will be returned immediately to the Disclosing Party upon its request.

(b) Intellectual Property:

The Services Recipient shall obtain all rights, title and interests, including copyright ownership, to any reports and any other deliverable that is to be produced and delivered to it by the Services Provider and, subject to applicable legislation and notwithstanding clause 7.0(a) above, the said Services Recipient may use, disclose or modify such reports or deliverable in any manner it deems appropriate. The Services Provider shall not do any act which may compromise or diminish the Services Recipient's interest as aforesaid.

(c) Survival of Obligations:

The obligations in this Section 7.0 shall forever survive the termination or expiration of this Agreement.

8.0 LIABILITY

Unless otherwise agreed in writing, each party shall indemnify the other party and that other party's successors and assigns, directors, officers, employees, contractors and agents from and against all direct costs or damages attributable to the indemnifying party's performance and/or non-performance of its obligations under this Agreement and any amendments or additions thereto that are mutually agreed to in writing, whether arising from or based on breach of contract, tort, negligence, strict liability or otherwise. Notwithstanding any other provision of this Agreement, neither party shall be liable for any economic loss, loss of goodwill, loss of profit or for any special, indirect or consequential damages, where the said losses or damages are incurred by the other or by any third party claiming through or under the other.

This Section 8.0 shall forever survive the termination or expiration of this Agreement.

9.0 AUTHORIZED REPRESENTATIVES

The authorized representatives of the parties hereto for purposes of this Agreement are the following:

HYDRO ONE REMOTE COMMUNITIES INC.
483 Bay Street,
North Tower, 14th Floor
Toronto, Ontario M5G 2P5
Attention: **Una O'Reilly**
TCT 14
Telephone: 416-345-6698
Telecopier: 416-345-6356

HYDRO ONE NETWORKS INC.
483 Bay St.
South Tower, 8th Floor
Toronto, Ontario M5G 2P5
Attention: **Greg Van Dusen**
Telephone: (416) 345-5722
Telecopier: (416) 345-6833

All correspondence, reports, documents and/or other communication concerning this Agreement and the Schedule attached hereto shall be directed to the attention of the authorized representatives noted above and shall be deemed to be sufficiently given if delivered personally, mailed or transmitted by fax to the attention of the authorized representatives at the addresses above, and any notice so given shall be deemed to have been made and received on the date of delivery or on the 5th business day following the day of mailing of same or on the day of transmission if transmitted during normal business hours, otherwise on the next business day, as the case may be.

10.0 CHANGE OF CONTROL

In the event of a change of control of the Services Provider, this Agreement shall immediately terminate. A change of control shall mean, as applicable, a purchase of more than fifty (50) percent of the outstanding capital by a non-affiliate third party.

11.0 ASSIGNMENT

Neither this Agreement nor any rights and obligations shall be assigned by either party without the prior written consent of the other party, which consent shall not be unreasonably withheld. Subject to the foregoing, this Agreement shall enure to the benefit of the parties hereto and their respective successors and permitted assigns.

12.0 RELATIONSHIP OF PARTIES:

Nothing in this Agreement creates the relationship of principal and agent, employer and employee, partnership or joint venture between the parties. The parties agree that they are and will at all times remain independent and are not and shall not present themselves to be the agent, employee, partner or joint venturer of the other. No representations will be made or acts taken by either party which could establish any apparent relationship of agency, employment, joint venture or partnership and neither party shall be bound in any manner whatsoever by any agreements, warranties or representations made by the other party to any other person nor with respect to any other action of the other party.

13.0 SCHEDULES

Schedules "A" and "B" attached hereto are to be read with and form part of this Agreement.

14.0 COUNTERPARTS

This Agreement may be executed in counterparts and the counterparts together shall constitute an original.

IN WITNESS THEREOF the parties hereto have caused this Agreement to be executed by their respective representatives duly authorized in that behalf.

Schedule "A"

DESCRIPTION OF SERVICES:

Subject to the Services Provider's availability of personnel and resources, which availability shall be determined by the Services Provider in its sole discretion, the Services Provider shall provide the Services Recipient with the following services as may be required by the Services Recipient from time to time during the term of this Agreement:

a. Metering/Technician Work:

- update, install, reverify and sample meters
- Smart meter change-outs
- line layout, estimating and staking
- voltage/current surveys and responding to voltage/current complaints

b. Lines Work:

- maintain the Services Recipient's transmission and distribution system in Northwestern Ontario by providing the following activities, as may be requested by the Services Recipient:
- power line maintenance, construction and repair
- trouble Call Response, power restoration and storm damage repairs

c. Training:

- Provide lines apprenticeship program instruction services

Schedule "B"

Receiving Party Security Safeguards Regarding Confidential Information Received from the Disclosing Party

The Receiving Party shall protect the Confidential Information by security safeguards appropriate to the sensitivity of the information.

1) The Receiving Party shall protect the Confidential Information against such risks as loss or theft, unauthorized access, disclosure, copying, use, modification or destruction, through appropriate security measures, regardless of the format in which it is held.

2) All of the Receiving Party Representatives with access to the Confidential Information shall be contractually required to respect the confidentiality of that information.

3) The Receiving Party acknowledges and agrees that the nature of the safeguards will vary depending on the sensitivity, amount, distribution and format of the information, and the method of storage. The Receiving Party shall ensure that more sensitive information will be safeguarded by a higher level of protection.

4) The Receiving Party shall ensure that methods of protection will include:

(a) physical measures, for example, locked filing cabinets and restricted access to offices;

(b) organizational measures, for example, controlling entry to data centers and limiting access to information on a "need-to-know" basis;

(c) technological measures, for example, the use of passwords and encryption; and

(d) investigative measures, in cases where the Receiving Party has reasonable grounds to believe that the Confidential Information is being inappropriately collected, used or disclosed by anyone whom in law the Receiving Party is responsible.

DISTRIBUTION FINANCIAL STATEMENTS AND UTILITY INCOME – HISTORIC YEARS (2004, 2005, AND 2006) AND BRIDGE YEAR (2007)

Included in this exhibit are the Historic Distribution Financial Statements as follows:

Attachment 2: 2005 Distribution Financial Statements
Attachment 3: 2006 Distribution Financial Statements
Attachment 4: 2007 Distribution Financial Statements

HYDRO ONE NETWORKS INC.

DISTRIBUTION BUSINESS

FINANCIAL STATEMENTS

FOR THE YEAR ENDED

DECEMBER 31, 2004

HYDRO ONE NETWORKS INC.
DISTRIBUTION BUSINESS
AUDITORS' REPORT

To the Directors of
Hydro One Networks Inc.

We have audited the balance sheets of the Distribution Business (a business of Hydro One Networks Inc.), as at December 31, 2004 and the statements of operations and cash flows of the Distribution Business for the year then ended. These financial statements are the responsibility of the management of the Distribution Business. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these financial statements present fairly, in all material respects, the financial position of the Distribution Business of Hydro One Networks Inc. as at December 31, 2004 and the results of its operations and its cash flows for the year then ended, in accordance with Canadian generally accepted accounting principles.

The Distribution Business has no separate legal status or existence (See Note 1).

1. STATUS OF DISTRIBUTION BUSINESS AND DESCRIPTION OF BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

Hydro One Networks Inc. (Hydro One Networks or the Company) was incorporated on March 4, 1999 under the *Business Corporations Act* (Ontario) and is a wholly owned subsidiary of Hydro One. Hydro One Networks acquired and assumed the assets, liabilities rights and obligations of the electricity distribution business of Ontario Hydro on April 1, 1999.

Hydro One Networks' regulated distribution business (Distribution Business) operates a low-voltage electrical distribution network that distributes electricity from the transmission system, or directly from generators, to customers within Ontario. Distribution customers include small local distribution companies and large industrial customers with loads of less than 5 MW. The Distribution Business is comprised of the distribution business of Hydro One Networks.

2. SIGNIFICANT ACCOUNTING POLICIES

Basis of Accounting

The financial statements have been prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP). The financial statements have been prepared for the specific use of the OEB. Consolidated financial statements of Hydro One for the year ended December 31, 2004 have been prepared and are publicly available.

The financial statements have been prepared primarily through specific identification of assets, liabilities (other than debt), revenues and expenses that relate to the Distribution Business. Debt was allocated to the Distribution Business effective April 1, 1999, based on a formula of 60% of assigned assets minus liabilities (other than debt). Shared functions and services costs have been allocated to the Distribution Business on a fully allocated cost basis.

Rate-Setting

The rates of the Distribution Business are subject to regulation by the OEB. The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing gives rise to the recognition of regulatory assets and liabilities. The Distribution Business's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded a regulatory liability that represents an amount incurred in a different period than would be the case had the Company been unregulated. Specific regulatory assets and liability recognized at December 31, 2004 are disclosed in Note 8.

On December 9, 2004, the OEB issued its decision on the prudence of various regulatory deferral accounts incurred prior to December 31, 2003, plus related interest. As a result of the OEB's decision, the proportion of the Company's regulatory assets subject to potential future OEB disallowance has been significantly reduced. However, regulatory asset amounts included in approved accounts that were recognized after December 31, 2003 have not yet been reviewed by the OEB. Similarly, the Company's deferred distribution-related pension expenditures have not yet been reviewed by the OEB for prudence. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liability into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Revenue Recognition

Revenue attributable to the delivery of electricity is based on OEB-approved distribution tariff rates and is recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2004 amounted to $318 million (2003 - $281 million).

Revenue also includes an amount relating to rate protection for rural residential customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential customers by reducing the electricity rates that would otherwise apply.

Revenue also includes revenue related to sales of services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, Hydro One Networks is required to make payments in lieu of corporate taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act, 1998* and related regulations.

The Distribution Business provides for its share of the Company's payments in lieu of corporate income taxes using the taxes payable method as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from distribution customers at that time.

Inter-Company Demand Facility

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries and, implicitly, by the regulated businesses of these subsidiaries. The inter-company demand facility represents the cumulative net effect of all deposits and withdrawals made by the Distribution Business to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost, which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the approved allowance for funds used during construction applicable to capital construction activities. Fixed assets in service consist of distribution assets, communication, administration and service assets and easements.

During 2003, Hydro One adopted the Canadian Institute of Chartered Accountants' (CICA) Handbook Section 3110, *Asset Retirement Obligations*. This new accounting standard requires the Company to determine the fair value of the future expenditures required to settle legal obligations to remove fixed assets. If reasonably estimable, a liability is recognized equal to the present value of the estimated future removal expenditures. An equivalent amount is capitalized as an inherent cost of the associated fixed asset.

Some distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations. The majority of these easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of any related asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of removing assets that the Company is legally required to remove, an asset retirement obligation will be recognized at that time.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication, Administration and Service

Communication, administration and service assets include telecommunications equipment, towers, associated buildings, administrative buildings, major computer systems, personal computers, transport and work equipment, and tools, vehicles and minor fixed assets.

Easements

Easements include amounts incurred for easements and other access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis. Financing costs are capitalized on fixed assets under construction based on the allowance for funds used during construction (2004 – 7.0%; 2003 – 7.4%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment and personal computers, which are depreciated on a declining balance basis.

Depreciation rates for the various classes of assets are based on their estimated service lives. The average estimated remaining service lives and service life ranges of fixed assets are:

	Estimated service lives (years)	
	Range	Average
Distribution	15 - 75	41
Communication, administration and service	5 - 50	30

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets where an asset retirement obligation, as defined in CICA Handbook Section 3110, has been recognized.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising out of such a review are implemented on a remaining service life basis from the year the changes can first be reflected in distribution rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Under CICA Handbook Section 3062, *Goodwill and Other Intangible Assets*, goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit's net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against the results of operations.

The Company has determined that the goodwill of its Distribution Business is not impaired.

Deferred debt costs

Deferred debt costs include the unamortized amounts of debt issuance costs. Deferred debt costs are amortized on an annuity basis over the period to maturity of the debt.

Discounts, Premiums and Hedging

Allocated discounts, premiums and hedging gains and losses are amortized over the period of the related debt and are presented net with allocated long-term debt.

Employee Future Benefits

Employee future benefits for all employees of Hydro One and its subsidiaries include pension, group life insurance, health care, and long-term disability.

In accordance with the OEB's rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management's best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

The Distribution Business has recognized a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. The Company reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province of Ontario (the Province).

3. REGULATORY RECOVERY

The *Electricity Pricing, Conservation and Supply Act, 2002,* suspended a previously approved rate increase related to annual low-voltage services costs for embedded local distribution companies and direct customers. The associated costs are charged annually to the Distribution Business' results of operations. Subject to future OEB approval, the *Electricity Pricing, Conservation and Supply Act, 2002* also allowed for establishment of a regulatory deferral account to record suspended low voltage services amounts to be recovered from future customers. Due to uncertainty of recovery, amounts recorded in this regulatory deferral account between May 1, 2002 and December 9, 2004 were not previously recognized as regulatory assets. Similarly, the Company did not reflect certain other costs, such as interest, as regulatory assets in prior years' financial statements.

On May 31, 2004, Hydro One applied for recovery of approximately $156 million in various regulatory deferral accounts prior to December 31, 2003. The requested recovery primarily included the low voltage amounts not previously recognized as regulatory assets, as well as interest on all of the requested balances. As a result of the oral and written evidence submitted by the Company, the OEB issued a decision on December 9, 2004 regarding the prudence of the distribution-related deferral account balances included in the application. The OEB approved all but approximately $12 million of the requested amount for recovery over the period ending April 30, 2008. As a result of this successful regulatory recovery, the Distribution Business has recorded an increase in its regulatory asset balance, which primarily reflects future recovery of costs that had been previously charged to results of operations without recognition of corresponding revenue.

The regulatory recovery consists of the following components:

Year ended December 31 (Canadian dollars in millions)	**2004**
Low voltage services – 2002	17
Low voltage services – 2003	25
Low voltage services – 2004	23
Interest accretion	18
Other	19
	102

4. DEPRECIATION AND AMORTIZATION

Year ended December 31 (Canadian dollars in millions)	**2004**	**2003**
Depreciation of fixed assets in service	143	129
Fixed asset removal costs	22	24
Amortization of regulatory and other assets	51	53
	216	206

5. FINANCING CHARGES

Year ended December 31 (Canadian dollars in millions)	**2004**	**2003**
Interest on long-term debt payable	127	128
Interest on inter-company demand facility	2	5
Less: Interest capitalized on construction in progress	(4)	(5)
	125	128

6. PROVISION FOR PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rate is provided as follows:

Year ended December 31 (Canadian dollars in millions)	**2004**	**2003**
Income before provision for PILs	203	86
Federal and Ontario statutory income tax rate	36.12%	36.62%
Provision for PILs at statutory rate	73	32
(Decrease) increase resulting from:		
Net temporary differences:		
Regulatory recovery	(37)	-
Pension contribution in excess of pension expense	(19)	-
Depreciation and amortization in excess of capital cost allowance	14	11
Retail settlements variance accounts	11	(4)
Employee future benefits other than pension expense in excess of cash payments	5	5
Environmental expenditures	(3)	(6)
Interest capitalized for accounting purposes but deducted for tax purposes	(2)	(2)
Charge for staff reduction program lower than cash payments	(1)	(4)
Other	(9)	-
Net temporary differences	(41)	-
Net permanent differences:		
Large corporations tax	6	7
Other	1	1
Net permanent differences	7	8
Provision for PILs	39	40
Effective income tax rate	19.21%	46.51%

Future income taxes have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2004, future income tax liabilities of $59 million (2003 - $23 million), based on substantively enacted income tax rates, have not been recorded.

7. FIXED ASSETS

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2004				
Distribution	4,696	1,732	53	3,017
Communication, administration and service	506	302	-	204
Easements	8	3	-	5
	5,210	2,037	53	3,226
2003				
Distribution	4,456	1,652	60	2,864
Communication, administration and service	463	248	4	219
Easements	8	3	-	5
	4,927	1,903	64	3,088

Financing costs are capitalized on fixed assets under construction using the allowance for funds used during construction and were $4 million in 2004 (2003 - $5 million).

8. REGULATORY ASSETS AND LIABILITY

Regulatory assets and liabilities arise as a result of the ratemaking process. The Distribution Business has recorded the following regulatory assets and liability (see Notes 2 and 3):

December 31 (Canadian dollars in millions)	**2004**	**2003**
Regulatory assets:		
Regulatory asset recovery account	121	102
Employee future benefits other than pension	94	118
Environmental	50	57
Pension	34	-
Low voltage services	26	-
Other	5	-
Total regulatory assets	330	277
Regulatory liability:		
Retail settlement variance accounts	25	-
Total regulatory liability	25	-

Regulatory assets

Regulatory asset recovery account (RARA)

On December 9, 2004 the OEB issued a decision on the prudence of the distribution-related deferral account balances sought by the Company in its May 31, 2004 application. Recoverable amounts represent balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved balances be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. The RARA includes distribution business low voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest.

Employee future benefits other than pension

Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 the Company recorded a regulatory asset, with an original balance of $226 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of 4 years (2003 - 5 years) and does not earn a return.

Environmental

The Company provides for estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized the net present value of these estimated future environmental expenditures as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. During 2003, the Company reduced, by $64 million, its estimated long-term liability and offsetting regulatory asset for the management of polychlorinated biphenyls (PCBs). This reduction was due to expected revisions to draft regulations proposed by Environment Canada. The OEB has the discretion to examine and assess the prudence and the timing of recovery of Hydro One's future regulatory expenditures.

Pension

In a July 14, 2004 decision, the OEB approved the Company's establishment of a regulatory deferral account to record the Company's distribution-related pension contributions that would otherwise have been charged to 2004 results of operations. The regulatory asset will also include amounts payable to Inergi LP commencing 2005 in respect of a risk sharing agreement related to the imbalance between pension fund assets and liabilities in respect of transferred staff. The amount related to the distribution business, as determined at December 31, 2004, was approximately $16 million. In its decision, the OEB concluded that prudently incurred expenditures of this type are generally recoverable as part of a general rate application. The Company will include its request for recovery as part of its next general distribution rate application during 2005.

Low voltage services

The OEB's December 9, 2004 decision allows for delayed recovery of previously approved low voltage services amounts, within the RARA, for the period up to December 31, 2003. Given this decision, the Company has determined that it was highly probable that, at some future date, the OEB will also approve recovery of the low voltage amount attributable to 2004, plus interest. As a result, the Company has recognized a regulatory asset reflecting this probable future recovery.

Regulatory liability

Retail settlement variance accounts

The Company has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's *Accounting Procedures Handbook*. The OEB's December 9, 2004 decision allows for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA. The Company anticipates that the OEB will include the net balance of this regulatory account attributable to 2004 activity in future rates.

9. DEBT

December 31 (Canadian dollars in millions)	**2004**	**2003**
Long-term debt payable within one year	192	186
Long-term debt	1,694	1,636
Net unamortized premiums	10	7
Unamortized hedging losses	(3)	(4)
Long-term debt	1,893	1,825

Debt represents various notes payable by Hydro One Networks to Hydro One. All notes are denominated in Canadian dollars and were notionally allocated to the Distribution Business based on 60% of the allocated net assets. This notional debt is summarized by years to maturity in the following table:

Years to Maturity	Principal Outstanding *(Canadian dollars in millions)*	Weighted Average Interest Rate *(per cent)*
1 year	192	7.6
2 years	179	10.3
3 years	105	8.6
4 years	210	4.0
5 years	88	4.0
	774	7.0
6 – 10 years	522	6.2
Over 10 years	590	6.8
	1,886	6.7

10. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of long-term debt, based on year-end quoted market prices for same or similar debt of the same remaining maturities, is provided in the following table:

December 31 (Canadian dollars in millions)	**2004**		**2003**	
	Carrying Value	Fair Value	Carrying Value	Fair Value
Long-term debt[1]	1,886	2,009	1,822	1,988

[1] The carrying value of long-term debt represents the par value of the notes.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2004, there were no significant concentrations of credit risk with respect to any class of financial assets. The revenue of the Distribution Business is earned from a broad base of customers. The Distribution Business did not earn a significant amount of its revenue from any single customer. As at December 31, 2004, there were no significant balances of accounts receivable due from any single customer.

11. EMPLOYEE FUTURE BENEFITS

Pension

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. Employees at Hydro One Brampton participate in the Ontario Municipal Employees Retirement System (OMERS), a multi-employer public sector fund.

The Hydro One Pension Plan does not segregate assets in a separate account for individual subsidiaries, nor is the cost of the benefit plans allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these financial statements, the pension plan is accounted for as a defined contribution plan and no deferred pension asset or liability is recorded.

Hydro One's pension plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are fully indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed on September 22, 2004, effective for December 31, 2003, Hydro One contributed $80 million to its pension plan in respect of 2004, payable one month in arrears, and will contribute a further $80 million in respect of 2005 and 2006 to satisfy minimum funding requirements. A significant portion of these contributions will be attributed to the Distribution Business. All of the contributions are expected to be in the form of cash. Hydro One has previously not been required to contribute to the pension plan because the contribution level, which was established from the last actuarial valuation at December 31, 2000 indicated that the plan had a surplus. Contributions after 2006 will be based on actuarial valuations as at December 31, 2006 and will depend on future investment returns, and changes in actuarial assumptions.

For Hydro One, the actuarial present value at December 31, 2004 of the accrued pension benefits, based on a projection of the valuation at December 31, 2004, was estimated to be $4,862 million (2003 - $4,323 million). Pension plan assets available for these benefits were $4,243 million (2003 - $3,939 million).

Employee Future Benefits other than Pension

During the year ended December 31, 2004, $32 million of employee future benefits other than pension costs were charged to the results of operations of the Distribution Business (2003 - $29 million), and $22 million was capitalized as part of the cost of fixed assets (2003 - $21 million). Benefits paid were $19 million (2003 - $18 million). The liability associated with employee future benefits other than pension for the Distribution Business at December 31, 2004 was $378 million (2003 - $343 million), including the current portion.

A detailed description of employee future benefits is provided in Note 11 of the Consolidated Financial Statements of Hydro One for the year ended December 31, 2004.

12. ENVIRONMENTAL LIABILITIES

December 31 (Canadian dollars in millions)	**2004**	**2003**
Environmental liabilities, January 1	57	130
Interest accretion	1	7
Expenditures	(8)	(16)
Revaluation adjustment *(Note 8)*	-	(64)
Environmental liabilities, December 31	50	57
Less: current portion	(9)	(10)
	41	47

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2004 and in total thereafter are as follows: 2005 - $9 million; 2006 - $8 million; 2007 - $7 million; 2008 - $7 million; 2009 - $6 million; and thereafter - $30 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. Hydro One continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

13. RELATED PARTY TRANSACTIONS

The Province and Successor Corporations of Ontario Hydro

The Province, OEFC, Ontario Power Generation Inc. (OPG) and the IESO are related parties of Hydro One Networks' Distribution Business. Transactions between these parties and the Distribution Business were as follows:

The Distribution Business receives amounts for rural rate protection from the IESO. Revenue for 2004 include $127 million (2003 - $127 million) related to this program, of which $2 million (2003 - $2 million) was paid to local distribution companies in respect of annexation agreements.

The Distribution Business purchased power from the IESO-administered spot market in the amount of $1,752 million in 2004 (2003 - $1,646 million).

Hydro One Networks has service level agreements with Ontario Hydro's successor corporations, primarily OPG. These services include field and engineering, logistics, corporate, telecommunications and information technology services. Revenues related to the provision of services to the other successor corporations were $nil in 2004 (2003 - $1 million) and operation, maintenance and administration costs related to the purchase of services from the other successor corporations were less than $1 million in 2004 and 2003.

The provision for payments in lieu of corporate income taxes was paid or payable to the OEFC.

Subsidiaries of Hydro One Inc.

Hydro One Networks provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its subsidiaries are settled through the inter-company demand facility.

Hydro One Networks has entered into various agreements with Hydro One and its subsidiaries related to the provision of corporate functions and services, supply management, computer support and operational services such as environmental, forestry and line services. Revenues include $1 million (2003 - $1 million) related to the provision of services to Hydro One and its subsidiaries and operation, maintenance and administration costs include $1 million (2003 - $1 million) related to the purchase of services from Hydro One and its subsidiaries.

The debt of the Distribution Business is due to Hydro One. Financing charges include interest expense on this debt in the amount of $127 million (2003 - $128 million). In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One. Financing charges of the Distribution Business include interest expense on this facility in the amount of $2 million (2003 - $5 million).

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 (Canadian dollars in millions)	**2004**	**2003**
Accounts receivable	3	11
Accounts payable and accrued charges	179	175

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $179 million (2003 - $149 million).

14. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 (Canadian dollars in millions)	**2004**	**2003**
Accounts receivable (increase) decrease	(50)	14
Materials and supplies (increase) decrease	(1)	7
Accounts payable and accrued charges increase	4	30
Accrued interest increase	2	-
Employee future benefits other than pension increase	33	33
Long-term accounts payable and accrued charges decrease	(13)	-
Other	(27)	(21)
	(52)	63

15. CONTINGENCIES

Hydro One Networks is a wholly owned subsidiary of Hydro One. As such, the Distribution Business and its assets are available for the satisfaction of the debts, contingent liabilities and commitments of Hydro One Networks and Hydro One.

16. COMMITMENTS

Hydro One Networks has numerous commitments. These commitments have not been specifically allocated to the Distribution Business. However, the net assets of the Distribution Business are available to satisfy these commitments.

17. COMPARATIVE FIGURES

The comparative financial statements have been reclassified from statements previously presented to conform to the presentation of the December 31, 2004 financial statements.

HYDRO ONE NETWORKS INC.

DISTRIBUTION BUSINESS

FINANCIAL STATEMENTS

FOR THE YEAR ENDED

DECEMBER 31, 2005

HYDRO ONE NETWORKS INC.
DISTRIBUTION BUSINESS
AUDITORS' REPORT

To the Directors of Hydro One Networks Inc.

We have audited the balance sheets of the Distribution Business (a business of Hydro One Networks Inc.), as at December 31, 2005 and December 31, 2004 and the statements of operations, and cash flow of the Distribution Business for the year then ended. These financial statements are the responsibility of the management of the Distribution Business. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these financial statements present fairly, in all material respects, the financial position of the Distribution Business of Hydro One Networks Inc. as at December 31, 2005 and 2004 and the results of its operations and its cash flows for the years then ended, in accordance with Canadian generally accepted accounting principles.

The Distribution Business has no separate legal status or existence (See Note 1).

1. DESCRIPTION OF THE DISTRIBUTION BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

Hydro One Networks Inc. (Hydro One Networks or the Company) was incorporated on March 4, 1999 under the *Business Corporations Act* (Ontario) and is a wholly owned subsidiary of Hydro One. The Company owns and operates Hydro One's regulated transmission and distribution businesses. The regulated distribution business (Distribution Business) operates a low-voltage electrical distribution network that distributes electricity from the transmission system, or directly from generators, to customers within Ontario. Distribution customers include small local distribution companies and large industrial customers with loads of less than 5 MW.

In prior years, the results of the Company's Sentinel Light operations had not been included in the Distribution Business financial statements as these assets were considered to be unregulated. In August 2005, the Company filed its distribution rate application on a basis that included sentinel lights within the definition of the regulated Distribution Business. While the OEB has not rendered a decision as at the date of the financial statements, OEB approval of the inclusion of sentinel lights as part of the regulated Distribution Business is considered probable. As a result, the Balance Sheets, Statements of Operations and Statements of Cash Flows of the Distribution Business now reflect Sentinel Lights. The prior year comparative figures have been restated to reflect this change in business definition. The impact of the restatement on the financial position and results of operations of the Distribution Business was not significant.

2. SIGNIFICANT ACCOUNTING POLICIES

Basis of Accounting

The financial statements have been prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP). The financial statements have been prepared for the specific use of the OEB. Consolidated financial statements of Hydro One for the year ended December 31, 2005 have been prepared and are publicly available.

The financial statements have been prepared primarily through specific identification of assets, liabilities (other than debt), revenues and expenses that relate to the Distribution Business. The Company's long-term debt is allocated based on the respective borrowing requirements of the Company's Transmission Business and Distribution Business. A portion of the Company's shared functions and services costs are allocated to the Distribution Business on a fully allocated cost basis.

Rate-setting

The rates of the Distribution Business are subject to regulation by the OEB. The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing gives rise to the recognition of regulatory assets and liabilities. The Distribution Business's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded a regulatory liability for a variance account balance expected to be disposed of in the favour of Distribution Business customers. The specific regulatory assets and liabilities recognized at December 31, 2005 are disclosed in Note 9.

The Company's distribution rates are based on a revenue requirement that includes a rate of return. Current distribution rates are based on a cost of service rate regulation model, which also includes a targeted return of 9.88% on deemed common equity. In August 2005, the Company filed a distribution rate application seeking approval for a $160 million increase in the 2006 revenue requirement for its Distribution Business. This revenue requirement is based on achieving a 9.00% return on equity, consistent with the OEB's guidance for setting 2006 rates. An oral hearing occurred in January 2006 and the OEB decision is expected to render its decision in the second quarter of 2006.

On December 9, 2004, the OEB issued its decision on the prudence of various regulatory deferral accounts incurred prior to December 31, 2003, including related interest. As a result of the OEB's December 9, 2004 decision, the proportion of the Company's regulatory assets subject to potential future OEB disallowance has been significantly reduced. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liability into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Revenue Recognition

Revenues attributable to the delivery of electricity are based on OEB-approved distribution tariff rates and are recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2005 amounted to $344 million (2004 - $318 million).

Revenue also includes an amount relating to rate protection for rural residential customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential customers by reducing the electricity rates that would otherwise apply.

Revenues also include revenue related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, the Company is required to make payments in lieu of corporate income taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act, 1998,* and related regulations.

The Distribution Business provides for its share of the Company's payments in lieu of corporate income taxes using the taxes payable method, as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from Distribution Business customers at that time.

Inter-Company Demand Facility

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries and, implicitly, by the regulated businesses of these subsidiaries. The inter-company demand facility represents the cumulative net effect of all deposits and withdrawals made by the Distribution Business to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost, which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the approved allowance for funds used during construction applicable to capital construction activities. Fixed assets in service consist of: distribution assets; communication, administration and service assets; and easements.

Some distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of any related asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of removing assets that the Company is legally required to remove, an asset retirement obligation will be recognized at that time.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication, Administration and Service

Communication, administration and service assets include telecommunications equipment, towers, associated buildings, administrative buildings, major computer systems, personal computers, transport and work equipment, and tools, vehicles and minor fixed assets.

Easements

Easements include amounts incurred for easements and other access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis. Financing costs are capitalized on fixed assets under construction based on the allowance for funds used during construction (2005 – 6.8%; 2004 – 7.0%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment and personal computers, which are depreciated on a declining balance basis.

Depreciation rates for the various classes of assets are based on their estimated service lives. The average estimated remaining service lives and service life ranges of fixed assets are:

	Estimated service lives (years)	
	Range	Average
Distribution	15 - 75	41
Communication, administration and service	5 - 50	30

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and are not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets where an asset retirement obligation has been recognized.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising out of such a review are implemented on a remaining service life basis from the year the changes can first be reflected in distribution rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies (LDCs) in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Under Canadian Institute of Chartered Accountants Handbook Section 3062, *Goodwill and Other Intangible Assets*, goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit's net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against the results of operations.

The Company has determined that the Distribution Business' goodwill is not impaired.

Deferred Debt Costs

Deferred debt costs include the unamortized amounts of debt issuance costs incurred by Hydro One and allocated to its subsidiaries and their regulated businesses based on the Company's share of Hydro One's debt issue amount. Deferred debt costs are amortized on an annuity basis over the period to maturity of the debt.

Derivative Financial Instruments

Hydro One periodically uses interest rate swap contracts to manage interest rate risks. Payments and receipts under interest rate swap contracts are recognized as adjustments to interest expense on an accrual basis and are allocated to Hydro One subsidiaries and their regulated businesses. Hydro One formally designates its hedges, documents all hedging relationships and formally assesses hedge effectiveness. In the event a hedging relationship is extinguished or the relationship is found to be ineffective, realized or unrealized gains or losses are recognized in results of operations. Hydro One does not engage in derivative trading or speculative activities.

Discounts, Premiums and Hedging

The Distribution Business share of the Company's allocated discounts, premiums and hedging gains and losses are amortized over the period of the related debt and are presented net with long-term debt.

Employee Future Benefits

Employee future benefits provided by Hydro One and its subsidiaries include pension, group life insurance, health care and long-term disability.

In accordance with the OEB's rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management's best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

The Distribution Business recognizes a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. The Distribution Business reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province.

3. ELECTRICITY CREDITS

Under a new regulation issued in October 2005, Regulated Price Plan customers received a one-time credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and purchased power costs were each reduced by $129 million. The application of the one-time credit did not result in any adjustment to net income in the current or previously reported periods.

4. REGULATORY RECOVERY

The *Electricity Pricing, Conservation and Supply Act, 2002,* suspended a previously approved rate increase related to annual low-voltage services costs for embedded LDCs and direct customers. The associated costs are charged annually to the Distribution Business' results of operations. Subject to future OEB approval, the *Electricity Pricing, Conservation and Supply Act, 2002* also allowed for establishment of a regulatory deferral account to record suspended low voltage services amounts to be recovered from future customers. Due to uncertainty of recovery, amounts recorded in this regulatory deferral account between May 1, 2002 and December 9, 2004 were not previously recognized as regulatory assets. Similarly, the Company did not reflect certain other costs, such as interest, as regulatory assets in prior years' financial statements.

On May 31, 2004, Hydro One applied for recovery of approximately $156 million included within various regulatory deferral accounts prior to December 31, 2003. The requested recovery primarily included the low voltage amounts not previously recognized as regulatory assets, as well as interest on all of the requested balances. As a result of the oral and written evidence submitted by the Company, the OEB issued a decision on December 9, 2004 regarding the prudence of the distribution-related deferral account balances included in the application. The OEB approved all but approximately $12 million of the requested amount for recovery over the period ending April 30, 2008. As a result of this successful regulatory recovery, the Distribution Business recorded an increase in its regulatory asset balance, which primarily reflects future recovery of costs that had been previously charged to results of operations without recognition of corresponding revenue.

The 2004 regulatory recovery attributable to the Distribution Business consisted of the following components:

Year ended December 31 (Canadian dollars in millions)	**2004**
Low voltage services – 2002	17
Low voltage services – 2003	25
Low voltage services – 2004	23
Interest accretion	18
Other	19
	102

5. DEPRECIATION AND AMORTIZATION

Year ended December 31 (Canadian dollars in millions)	**2005**	**2004**
Depreciation of fixed assets in service	144	144
Fixed asset removal costs	24	22
Amortization of regulatory and other assets	51	51
	219	217

6. FINANCING CHARGES

Year ended December 31 (Canadian dollars in millions)	**2005**	**2004**
Interest on long-term debt payable	130	127
Interest on inter-company demand facility	2	2
Less: Interest capitalized on regulatory assets	(11)	-
Interest capitalized on construction in progress	(4)	(4)
	117	125

7. PROVISION FOR PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rate is provided as follows:

Year ended December 31 (Canadian dollars in millions)	**2005**	**2004**
Income before provision for PILs	152	205
Federal and Ontario statutory income tax rate	36.12%	36.12%
Provision for PILs at statutory rate	55	74
(Decrease) increase resulting from:		
Net temporary differences:		
Regulatory recovery	-	(37)
Pension contribution in excess of pension expense	(21)	(19)
Depreciation and amortization in excess of capital cost allowance	20	14
Retail settlements variance accounts	6	11
Interest capitalized for accounting purposes but deducted for tax purposes	(6)	(2)
Employee future benefits other than pension expense in excess of cash payments	5	5
Environmental expenditures	(3)	(3)
Other	(6)	(10)
Net temporary differences	(5)	(41)
Net permanent differences:		
Large corporations tax	5	6
Other	1	1
Net permanent differences	6	7
Provision for PILs	56	40
Effective income tax rate	36.84%	19.51%

Future income taxes have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2005, future income tax liabilities of $64 million (2004 - $59 million), based on substantively enacted income tax rates, have not been recorded. In the absence of rate regulated accounting, the Company's provision for PILs would have been recognized on an accrual basis rather than under the taxes payable method. As a result, the provision for PILs would have been higher by approximately $5 million.

8. FIXED ASSETS

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2005				
Distribution	4,934	1,828	80	3,186
Communication, administration and service	551	345	-	206
Easements	8	3	-	5
	5,493	2,176	80	3,397
2004				
Distribution	4,710	1,742	53	3,021
Communication, administration and service	506	302	-	204
Easements	8	3	-	5
	5,224	2,047	53	3,230

Financing costs capitalized on fixed assets under construction using the allowance for funds used during construction were $4 million in 2005 (2004 - $4 million).

9. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the ratemaking process. The Distribution Business has recorded the following regulatory assets and liabilities (see Notes 2 and 4):

December 31 (Canadian dollars in millions)	**2005**	**2004**
Regulatory assets:		
Regulatory asset recovery account	88	121
Pension	76	34
Employee future benefits other than pension	71	94
Low voltage services	53	26
Environmental	52	50
Other	4	5
	344	330
Regulatory liability:		
Retail settlement variance accounts	41	25
	41	25

Regulatory assets

Regulatory asset recovery account (RARA)

On December 9, 2004, the OEB issued a decision on the prudence of the distribution-related deferral account balances sought by the Company in its May 31, 2004 application (see Note 4). Recoverable amounts represent balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved balances be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. The RARA includes distribution business low-voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest. In the absence of rate regulated accounting, amortization expense in 2005 would have been lower by approximately $20 million. In addition, related financing charges would have been higher by $7 million.

Pension

In a July 14, 2004 decision, the OEB approved the Company's establishment of a regulatory deferral account to record distribution-related pension contributions that would otherwise have been charged to 2004 results of operations. The regulatory asset also includes amounts payable to Inergi LP commencing 2005 in respect of a risk sharing agreement related to the imbalance between pension fund assets and liabilities in respect of transferred staff. In its decision, the OEB concluded that prudently incurred expenditures of this type are generally recoverable as part of a general rate application. The Company has included its request for recovery as part of its distribution rate application currently under review by the OEB. In the absence of rate regulated accounting, the Company's pension expense would have been recognized on an accrual basis rather than on a cash basis. As a result, operation, maintenance and administration expense would have been higher by approximately $38 million, assuming no regulatory deferral of distribution and Inergi pension-related amounts. In addition, related financing charges would have been higher by $4 million.

Employee future benefits other than pension

Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 the Distribution Business recorded a regulatory asset, with an original balance of $226 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of 3 years (2003 - 4 years) and does not earn a return. In the absence of rate regulated accounting, amortization expense in 2005 would have been lower by approximately $23 million.

Low voltage services

The OEB's December 9, 2004 decision allows for delayed recovery of previously approved low voltage services amounts, within the RARA, for the period up to December 31, 2003. Given this decision, the Company has determined that it was highly probable that, at some future date, the OEB will also approve recovery of the low voltage amount attributable to 2004 and 2005, plus interest. As a result, the Company has recognized a regulatory asset reflecting this probable future recovery.

Environmental

The Company provides for estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized the net present value of these estimated future environmental expenditures as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. During 2005, the Company increased its estimated long-term liability and offsetting regulatory asset in respect of future estimated land assessment and remediation costs by $6 million. In the absence of rate regulated accounting, amortization expense in 2005 would have been lower and operation, maintenance and administration expense would have been higher by $7 million. The OEB has the discretion to examine the prudence and the timing of the Company's future environmental expenditures.

Regulatory liability

Retail settlement variance accounts

The Company has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's *Accounting Procedures Handbook*. The OEB's December 9, 2004 decision allows for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA. The Company anticipates that the OEB will include the net balance of this regulatory account in future rates.

10. DEBT

December 31 (Canadian dollars in millions)	**2005**	**2004**
Long-term debt payable within one year	179	192
Long-term debt	1,804	1,694
	1,983	1,886
Net unamortized premiums	10	10
Unamortized hedging losses	(5)	(3)
	1,988	1,893

Debt represents the Distribution Business share of various notes payable by Hydro One Networks to Hydro One. This allocated debt is summarized by the number of years to maturity in the following table:

Years to Maturity	Principal Outstanding *(Canadian dollars in millions)*	Weighted Average Interest Rate *(percent)*
1 year	179	10.3
2 years	105	8.6
3 years	210	4.0
4 years	133	4.0
5 years	122	7.2
	749	6.7
6 – 10 years	546	5.6
Over 10 years	688	6.7
	1,983	6.4

11. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of derivative financial instruments reflects the estimated amount that the Company, if required to settle an outstanding contract, would have been required to pay or would be entitled to receive at year end. The fair value of long-term debt, based on year end quoted market prices for the same or similar debt of the same remaining maturities, is provided in the following table:

December 31 (Canadian dollars in millions)	**2005**		**2004**	
	Carrying Value	Fair Value	Carrying Value	Fair Value
Long-term debt[1]	1,983	2,222	1,886	2,009

[1] The carrying value of long-term debt represents the par value of the notes.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2005, there were no significant concentrations of credit risk with respect to any class of financial assets. The revenue of the Distribution Business is earned from a broad base of customers. The Distribution Business did not earn a significant amount of its revenue from any single customer. As at December 31, 2005, there were no significant balances of accounts receivable due from any single customer.

12. EMPLOYEE FUTURE BENEFITS

Pension

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. The Hydro One Pension Plan does not segregate assets in a separate account for individual subsidiaries, nor is the cost of the benefit plans allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these financial statements, the pension plan is accounted for as a defined contribution plan and no deferred pension asset or liability is recorded.

Hydro One's pension plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for Society of Energy Professionals' represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed on September 22, 2004, effective for December 31, 2003, Hydro One contributed $83 million to its pension plan in respect of 2005 (2004 - $74 million), all of which will satisfy minimum funding requirements. Contributions are payable one month in arrears. A significant portion of these contributions are attributed to the Distribution Business. All of the contributions are expected to be in the form of cash. Prior to 2004, Hydro One was not required to contribute to the pension plan because the last actuarial valuation at December 31, 2000 indicated that the plan had a surplus. Contributions after 2006 will be based on an actuarial valuation no later than December 31, 2006 and will depend on future investment returns, and changes in benefits or actuarial assumptions.

For Hydro One, the actuarial present value at December 31, 2005 of the accrued pension benefits was estimated to be $5,355 million (2004 - $4,862 million). Pension plan assets available for these benefits were $4,713 million (2004 - $4,243 million).

Employee Future Benefits other than Pension

During the year ended December 31, 2005, $33 million of employee future benefits other than pension costs was charged to the results of operations of the Distribution Business (2004 - $32 million), and $23 million was capitalized as part of the cost of fixed assets (2004 - $22 million). Benefits paid were $20 million (2004 - $19 million). The liability associated with employee future benefits other than pension for the Distribution Business at December 31, 2005 was $414 million (2004 - $378 million), including the current portion.

A detailed description of employee future benefits is provided in Note 12 of the Consolidated Financial Statements of Hydro One for the year ended December 31, 2005.

13. ENVIRONMENTAL LIABILITIES

December 31 (Canadian dollars in millions)	**2005**	**2004**
Environmental liabilities, January 1	50	57
Interest accretion	3	3
Expenditures	(7)	(10)
Revaluation adjustment *(Note 9)*	6	-
Environmental liabilities, December 31	52	50
Less: current portion	(9)	(9)
	43	41

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2005 and in total thereafter are as follows: 2006 - $9 million; 2007 - $8 million; 2008 - $7 million; 2009 - $7 million; 2010 - $6 million and thereafter - $31 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. The Company continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

14. RELATED PARTY TRANSACTIONS

The Province and Successor Corporations of Ontario Hydro

The Province, OEFC, Ontario Power Generation Inc. (OPG) and the IESO are related parties of Hydro One Networks' Distribution Business. In addition, the OEB is related to the Company by virtue of its status as a Provincial Crown Corporation. Transactions between these parties and the Distribution Business were as follows:

The Distribution Business received amounts for rural rate protection from the IESO. Revenues for 2005 include $125 million (2004 - $125 million) related to this program.

In 2005, the Distribution Business purchased power in the amount of $1,809 million (2004 - $1,716 million) from the IESO-administered electricity market and $36 million (2004 - $36 million) from OPG.

The Company has service level agreements with Ontario Hydro's successor corporations, primarily OPG. These services include field and engineering, logistics, corporate, telecommunications and information technology services. Operation, maintenance and administration costs related to the purchase of services from these successor corporations were less than $1 million in 2005 and 2004.

Under the Ontario Energy Board Act, 1998, the OEB is required to recover all of its annual operating costs from gas and electricity distributors and electricity transmitters. In 2005, the Distribution Business incurred $5 million (2004 - $3 million) in OEB fees.

The provision for payments in lieu of corporate income taxes was paid or payable to the OEFC.

Subsidiaries of Hydro One Inc.

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its subsidiaries related to the provision of corporate functions and services, supply management, computer support and operational services such as environmental, forestry and line services. Revenues include $1 million (2004 - $1 million) related to the provision of services to Hydro One and its subsidiaries and operation, maintenance and administration costs include $2 million (2004 - $1 million) related to the purchase of services from Hydro One and its subsidiaries.

The Company's debt, including the portion allocated to the Distribution Business, is due to Hydro One. Financing charges include interest expense on this debt in the amount of $130 million (2004 - $127 million). In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One. Financing charges of the Distribution Business include interest expense on this facility in the amount of $2 million (2004 - $2 million).

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 (Canadian dollars in millions)	**2005**	**2004**
Accounts receivable	1	3
Accounts payable and accrued charges	211	179

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $183 million (2004 - $179 million).

15. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 (Canadian dollars in millions)	**2005**	**2004**
Accounts receivable decrease (increase)	60	(50)
Materials and supplies increase	(6)	(1)
Accounts payable and accrued charges increase	50	4
Accrued interest increase	1	2
Employee future benefits other than pension increase	36	33
Long-term accounts payable and accrued charges decrease	(1)	(13)
Other	(26)	(29)
	114	(54)

16. CONTINGENCIES

The Company is a wholly owned subsidiary of Hydro One. As such, the assets of the Company's Distribution Business are available for the satisfaction of the debts, contingent liabilities and commitments of the Company and Hydro One.

17. COMMITMENTS

The Company and Hydro One have numerous commitments. These commitments have not been specifically allocated to the Distribution Business. However, the net assets of the Distribution Business are available to satisfy these commitments.

18. COMPARATIVE FIGURES

The comparative financial statements have been reclassified from statements previously presented to conform to the presentation of the December 31, 2005 financial statements. More specifically, the 2004 statements have been restated to reflect the inclusion of the Sentinel Lights operation of the Distribution Business (see Note 1).

HYDRO ONE NETWORKS INC.

DISTRIBUTION BUSINESS

FINANCIAL STATEMENTS

FOR THE YEAR ENDED

DECEMBER 31, 2006

HYDRO ONE NETWORKS INC.
DISTRIBUTION BUSINESS
AUDITORS' REPORT

To the Directors of Hydro One Networks Inc.

We have audited the balance sheets of the Distribution Business (a business of Hydro One Networks Inc.), as at December 31, 2006 and December 31, 2005 and the statements of operations, and cash flows of the Distribution Business for the years then ended. These financial statements are the responsibility of the management of the Distribution Business. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these financial statements present fairly, in all material respects, the financial position of the Distribution Business of Hydro One Networks Inc. as at December 31, 2006 and 2005 and the results of its operations and its cash flows for the years then ended in accordance with Canadian generally accepted accounting principles. These financial statements are solely for the information and use of the Directors of Hydro One Networks Inc. for filing with the Ontario Energy Board. These financial statements are not intended to be and should not be used by anyone other than the specified users or for any other purpose.

The Distribution Business has no separate legal status or existence (See Note 1).

HYDRO ONE NETWORKS INC.
DISTRIBUTION BUSINESS
NOTES TO FINANCIAL STATEMENTS

1. DESCRIPTION OF THE DISTRIBUTION BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

Hydro One Networks Inc. (Hydro One Networks or the Company) was incorporated on March 4, 1999 under the *Business Corporations Act* (Ontario) and is a wholly owned subsidiary of Hydro One. The Company owns and operates Hydro One's regulated transmission and distribution businesses. The regulated distribution business (the Distribution Business) operates a low-voltage electrical distribution network that distributes electricity from the transmission system, or directly from generators, to customers within Ontario. Distribution customers include small local distribution companies and large industrial customers with loads of less than 5 MW.

2. SIGNIFICANT ACCOUNTING POLICIES

Basis of Accounting

The financial statements have been prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP). The financial statements have been prepared for the specific use of the OEB. Consolidated financial statements of Hydro One for the year ended December 31, 2006 have been prepared and are publicly available.

These financial statements have been prepared on a carve-out basis to provide the financial position, results of operations, changes in the excess of assets over liabilities and cash flows of the Company's regulated Distribution Business on a basis approved by the OEB. The financial statements are considered by management to be a reasonable representation, prepared on a rational, systematic and consistent basis, of the financial results of that business. As a result of this basis of accounting, these financial statements may not necessarily be identical to the financial position and results of operations that would have resulted had the Distribution Business historically operated on a stand-alone basis.

The financial statements have been constructed primarily through specific identification of assets, liabilities (other than debt), revenues and expenses that relate to the Distribution Business. The Company's long-term debt is allocated based on the respective borrowing requirements of the Company's transmission and distribution businesses. A portion of the Company's shared functions and services costs are allocated to the Distribution Business on a fully allocated cost basis, consistent with OEB-approved independent studies. Payments in lieu of corporate income taxes have been recorded at effective rates based on income taxes as reported in the Statements of Operations as though the Distribution Business was a separate tax paying entity. Certain other amounts presented in these financial statements represent allocations subject to review and approval by the OEB.

Rate-setting

The rates of the Distribution Business are subject to regulation by the OEB. The Company's distribution rates are based on a revenue requirement that includes a rate of return. Current distribution rates are based on a cost of service rate regulation model, which also includes a targeted return on deemed common equity. The targeted return was originally set in 1999 at 9.88%. In August 2005, the Company filed a distribution rate application seeking approval for a $160 million increase in the 2006 revenue requirement for its Distribution Business.

This revenue requirement is based on achieving a 9.00% return on equity, consistent with the OEB's guidance for setting 2006 rates. An oral hearing occurred in January 2006 and on April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the Company's Distribution Business. On the basis of the written and oral evidence submitted, the OEB approved the requested increase in the revenue requirement based on a reduction in the approved rate of return, from a targeted 9.88% to 9.00%, effective May 1, 2006.

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing gives rise to the recognition of regulatory assets and liabilities. The Distribution Business's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities, which represents amounts incurred in different periods than would be the case had the Company been unregulated. The specific regulatory assets and liabilities recognized at December 31, 2006 are disclosed in Note 8.

The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Revenue Recognition

Revenues attributable to the delivery of electricity are based on OEB-approved distribution tariff rates and are recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2006 amounted to $359 million (2005 - $344 million).

Revenue also includes an amount relating to rate protection for rural residential customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential customers by reducing the electricity rates that would otherwise apply.

Revenues also include amounts related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, the Company is required to make payments in lieu of corporate income taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act, 1998,* and related regulations.

The Distribution Business provides for its share of the Company's payments in lieu of corporate income taxes using the taxes payable method as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from Distribution Business customers at that time.

Inter-Company Demand Facility

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries and, implicitly, by the regulated businesses of these subsidiaries. The inter-company demand facility represents the cumulative net effect of all deposits and withdrawals made by the Distribution Business to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost, which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the approved allowance for funds used during construction applicable to capital construction activities. Fixed assets in service consist of: distribution assets; communication, administration and service assets; and easements.

Some distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of any related asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of removing assets that the Company is legally required to remove, an asset retirement obligation will be recognized at that time.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication, Administration and Service

Communication, administration and service assets include telecommunications equipment, towers, associated buildings, administrative buildings, major computer systems, personal computers, transport and work equipment, and tools, vehicles and minor fixed assets.

Easements

Easements include amounts incurred for easements and other access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis. Financing costs are capitalized on fixed assets under construction based on the allowance for funds used during construction (2006 – 6.32%; 2005 – 6.79%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment and personal computers, which are depreciated on a declining balance basis.

Depreciation rates for the various classes of assets are based on their estimated service lives. The average estimated remaining service lives and service life ranges of fixed assets are:

	Estimated service lives (years)	
	Range	Average
Distribution	15 - 75	41
Communication, administration and service	5 - 50	30

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and are not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets where an asset retirement obligation has been recognized.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising out of such a review are implemented on a remaining service life basis from the year the changes can first be reflected in distribution rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit’s net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against the results of operations.

The Company has determined that the Distribution Business’ goodwill is not impaired.

Deferred Debt Costs

Deferred debt costs include the unamortized amounts of debt issuance costs incurred by Hydro One and allocated to its subsidiaries and their regulated businesses based on the Company's share of Hydro One’s debt issue amount. Deferred debt costs are amortized on an annuity basis over the period to maturity of the debt.

Financial Instruments

Hydro One periodically uses interest rate swap contracts to manage interest rate risks. Payments and receipts under interest rate swap contracts are recognized as adjustments to interest expense on an accrual basis and are allocated to Hydro One subsidiaries and their regulated businesses. Hydro One formally designates its hedges, documents all hedging relationships and formally assesses hedge effectiveness. In the event a hedging relationship is extinguished or the relationship is found to be ineffective, realized or unrealized gains or losses are recognized in results of operations. Hedging gains and losses are amortized over the period of the related debt. Hydro One does not engage in derivative trading or speculative activities.

Discounts, Premiums and Hedging

The Distribution Business share of the Company's allocated discounts, premiums and hedging gains and losses are amortized over the period of the related debt and are presented net with long-term debt.

Employee Future Benefits

Employee future benefits provided by Hydro One and its subsidiaries include pension, group life insurance, health care and long-term disability.

In accordance with the OEB's rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management's best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

The Distribution Business recognizes a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. The Distribution Business reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province.

3. ELECTRICITY CREDITS

Under a regulation issued in October 2005, Regulated Price Plan customers received a credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and purchased power costs were each reduced by $129 million. The application of the credit did not result in any adjustment to net income.

4. DEPRECIATION AND AMORTIZATION

Year ended December 31 (Canadian dollars in millions)	**2006**	**2005**
Depreciation of fixed assets in service	148	144
Fixed asset removal costs	30	24
Amortization of regulatory and other assets	71	51
	249	219

5. FINANCING CHARGES

Year ended December 31 (Canadian dollars in millions)	**2006**	**2005**
Interest on long-term debt payable	127	130
Amortization of premiums and hedges	2	-
Interest on inter-company demand facility	2	2
Less: Interest capitalized on regulatory assets	(11)	(11)
Interest capitalized on construction in progress	(5)	(4)
	115	117

6. PROVISION FOR PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rate is provided as follows:

Year ended December 31 (Canadian dollars in millions)	**2006**	**2005**
Income before provision for PILs	172	152
Federal and Ontario statutory income tax rate	36.12%	36.12%
Provision for PILs at statutory rate	62	55
Increase (decrease) resulting from:		
Net temporary differences:		
Depreciation and amortization in excess of capital cost allowance	19	20
Recovery of PILs related to prior years	(14)	-
Pension contribution in excess of pension expense	(12)	(21)
Employee future benefits other than pension expense in excess of cash payments	8	5
Retail settlements variance accounts	7	6
Interest capitalized for accounting purposes but deducted for tax purposes	(6)	(6)
Overhead capitalized for accounting but deducted for tax purposes	(5)	(5)
Environmental expenditures	(4)	(3)
Other	(8)	(1)
Net temporary differences	(15)	(5)
Net permanent differences:		
Large corporations tax	-	5
Other	(1)	1
Net permanent differences	(1)	6
Provision for PILs	46	56
Effective income tax rate	26.74%	36.84%

In 2006, the Distribution Business recognized a tax benefit of approximately $14 million in respect of Hydro One's recovery of PILs from prior years following a successful appeal allowing a deduction for certain overhead costs that had been previously capitalized.

Future income taxes have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2006, future income tax liabilities of $72 million (2005 - $64 million), based on substantively enacted income tax rates, have not been recorded. In the absence of rate regulated accounting, the Company's provision for PILs would have been recognized using the liability method rather than the taxes payable method. As a result, the provision for PILs would have been higher by approximately $8 million (2005 - $5 million) including the impact of a rate change in substantively enacted tax rates.

7. FIXED ASSETS

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2006				
Distribution	5,247	1,948	87	3,386
Communication, administration and service	612	378	-	234
Easements	8	3	-	5
	5,867	2,329	87	3,625
2005				
Distribution	4,934	1,828	80	3,186
Communication, administration and service	551	345	-	206
Easements	8	3	-	5
	5,493	2,176	80	3,397

Financing costs capitalized on fixed assets under construction using the allowance for funds used during construction were $5 million in 2006 (2005 - $4 million).

8. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the ratemaking process. The Distribution Business has recorded the following regulatory assets and liabilities (see Notes 2 and 4):

December 31 (Canadian dollars in millions)	**2006**	**2005**
Regulatory assets:		
Regulatory asset recovery account I	55	88
Regulatory asset recovery account II	87	92
Employee future benefits other than pension	47	71
Environmental	45	52
Smart meters	10	-
Other	1	-
Total regulatory assets	245	303
Regulatory liabilities:		
Retail settlement variance accounts	2	-
Other	3	-
Total regulatory liabilities	5	-

Regulatory assets

Regulatory asset recovery account I (RARA I)

On December 9, 2004, the OEB issued a decision on the prudence of the distribution-related deferral account balances sought by the Company in its May 31, 2004 application. Amounts for which recovery was approved represented balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved balances be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. The RARA I includes distribution business low-voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest. In the absence of rate regulated accounting, amortization expense in 2006 would have been lower by approximately $20 million (2005 - $20 million). In addition, related financing charges would have been higher by $3 million (2005 - $7 million).

Regulatory asset recovery account II (RARA II)

On April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the distribution business of Hydro One Networks. As part of this decision, the OEB also approved the distribution-related deferral account balances sought by Hydro One. The OEB ordered that the approved balances be recovered on a straight-line basis over a four year period from May 1, 2006 to April 30, 2010. The RARA II includes retail settlement and cost variance amounts and distribution low-voltage service amounts, plus accrued interest. In the absence of rate regulated accounting, amortization expense in 2006 would have been lower by approximately $16 million. In addition, related financing charges would have been higher by $5 million.

Employee future benefits other than pension

Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 the Distribution Business recorded a regulatory asset, with an original balance of $236 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of 2 years (2005 - 3 years) and does not earn a return. In the absence of rate regulated accounting, amortization expense in 2006 would have been lower by approximately $24 million (2005 - $23 million).

Environmental

The Company records a liability for the estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized an equivalent amount as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. The OEB has the discretion to examine and assess the prudence and the timing of recovery of all of the Company's future regulatory expenditures. In the absence of rate regulated accounting, amortization expense in 2006 would have been lower and operation, maintenance and administration expense would have been higher by $12 million (2005 - $7 million).

Smart meters

On March 21, 2006, the OEB approved the establishment of deferral accounts for smart meter related expenditures and a monthly customer charge of thirty cents per residential customer was reflected in Hydro One's revenue requirement. Consistent with the OEB's direction and pending further guidance, the Company has recognized a regulatory asset consisting of the net balance of capital and operating expenditures for smart meters less recoveries received from customers. In the absence of rate regulated accounting, the Company's operation, maintenance and administration expense would have been higher by $4 million and revenues would have been higher by $2 million.

Regulatory liabilities

Retail settlement variance accounts

The Company has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's *Accounting Procedures Handbook*. The OEB's December 9, 2004 decision allowed for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA I. The OEB's April 12, 2006 decision allowed for recovery of retail settlement variance amounts accumulated since January 1, 2004 and forecasted through to April 30, 2006, inclusive of interest, within the RARA II. The Company has accumulated a net liability in its retail settlement variance accounts since May 1, 2006 and anticipates that the OEB will include the net balance of this regulatory account in future rates.

9. DEBT

December 31 (Canadian dollars in millions)	**2006**	**2005**
Long-term debt payable within one year	105	179
Long-term debt	1,986	1,804
	2,091	1,983
Net unamortized premiums	8	10
Unamortized hedging losses	(4)	(5)
	2,095	1,988

Debt represents the Distribution Business share of various notes payable by Hydro One Networks to Hydro One. This allocated debt is summarized by the number of years to maturity in the following table:

Years to Maturity	Principal Outstanding *(Canadian dollars in millions)*	Weighted Average Interest Rate *(percent)*
1 year	105	8.6
2 years	210	4.0
3 years	133	4.0
4 years	122	7.2
5 years	76	6.4
	646	5.6
6 – 10 years	650	5.2
Over 10 years	795	6.4
	2,091	5.8

10. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of derivative financial instruments reflects the estimated amount that the Company, if required to settle an outstanding contract, would have been required to pay or would be entitled to receive at year end. The fair value of long-term debt, based on year end quoted market prices for the same or similar debt of the same remaining maturities, is provided in the following table:

December 31 (Canadian dollars in millions)	2006		2005	
	Carrying Value	Fair Value	Carrying Value	Fair Value
Long-term debt[1]	2,091	2,301	1,983	2,222

[1] The carrying value of long-term debt represents the par value of the notes.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2006, there were no significant concentrations of credit risk with respect to any class of financial assets. The revenue of the Distribution Business is earned from a broad base of customers. The Distribution Business did not earn a significant amount of its revenue from any single customer. As at December 31, 2006, there were no significant balances of accounts receivable due from any single customer.

11. EMPLOYEE FUTURE BENEFITS

Pension

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. The Hydro One Pension Plan does not segregate assets in a separate account for individual subsidiaries, nor is the cost of the benefit plans allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these financial statements, the pension plan is accounted for as a defined contribution plan and no deferred pension asset or liability is recorded.

Hydro One's pension plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for Society of Energy Professionals' represented staff hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed on September 22, 2004, effective for December 31, 2003, Hydro One contributed $86 million to its pension plan in respect of 2006 (2005 - $83 million), all of which will satisfy minimum funding requirements. Contributions are payable one month in arrears. A portion of these contributions are attributed to the Remote Communities business. All of the contributions are expected to be in the form of cash. Prior to 2004, Hydro One was not required to contribute to the pension plan because the last actuarial valuation at December 31, 2000 indicated that the plan had a surplus. Contributions after 2006 will be based on an actuarial valuation no later than December 31, 2006 and will depend on future investment returns, and changes in benefits or actuarial assumptions.

For Hydro One, the actuarial present value at December 31, 2006 of the accrued pension benefits, based on a projection of the valuation at December 31, 2006, was estimated to be $5,411 million (2005 - $5,355 million). Pension plan assets available for these benefits were $5,123 million (2005 - $4,713 million).

Employee Future Benefits other than Pension

During the year ended December 31, 2006, $39 million of employee future benefits other than pension costs was charged to the results of operations of the Distribution Business (2005 - $33 million), and $27 million was capitalized as part of the cost of fixed assets (2005 - $23 million). Benefits paid were $18 million (2005 - $19 million). The liability associated with employee future benefits other than pension for the Distribution Business at December 31, 2006 was $462 million (2005 - $414 million), including the current portion.

A detailed description of employee future benefits is provided in Note 11 of the Consolidated Financial Statements of Hydro One for the year ended December 31, 2006.

12. ENVIRONMENTAL LIABILITIES

December 31 (Canadian dollars in millions)	**2006**	**2005**
Environmental liabilities, January 1	52	50
Interest accretion	3	3
Expenditures	(12)	(7)
Revaluation adjustment	2	6
Environmental liabilities, December 31	45	52
Less: current portion	(8)	(9)
	37	43

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2006 and in total thereafter are as follows: 2007 - $8 million; 2008 - $7 million; 2009 - $6 million; 2010 - $5 million; 2011 - $4 million and thereafter - $15 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. The Company continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

13. ISSUANCE OF PREFERRED SHARES

Hydro One Networks is authorized to issue an unlimited number of preferred shares and common shares. On November 21, 2005, the Company issued an additional 1,955,720 preferred series A shares to Hydro One. The Distribution Business' share of the issuance was approximately $38 million. The 5.5% series A cumulative preferred shares have a redemption value of $25.00 per share.

14. RELATED PARTY TRANSACTIONS

The Province and Successor Corporations of Ontario Hydro

The Province, OEFC, IESO, and Ontario Power Generation Inc. (OPG) are related parties of Hydro One Networks' Distribution Business. In addition, the OEB is related to the Company by virtue of its status as a Provincial Crown Corporation, although as a self-financing and self-sufficient regulatory organization, it carries out independent regulation for Ontario's energy sector, including Hydro One's regulated Distribution Business. Transactions between these parties and the Distribution Business were as follows:

The Distribution Business received amounts for rural rate protection from the IESO. Revenues for 2006 include $125 million (2005 - $125 million) related to this program.

In 2006, the Distribution Business purchased power in the amount of $1,916 million (2005 - $1,809 million) from the IESO-administered electricity market and $38 million (2005 - $36 million) from OPG.

Under the Ontario Energy Board Act, 1998, the OEB is required to recover all of its annual operating costs from gas and electricity distributors and electricity transmitters. In 2006, the Distribution Business incurred $4 million (2005 - $5 million) in OEB fees.

The Company has service level agreements with Ontario Hydro's successor corporations, primarily OPG. These services include field and engineering, logistics, corporate, telecommunications and information technology services. Operation, maintenance and administration costs related to the purchase of services from these successor corporations were less than $1 million in 2006 and 2005.

The provision for payments in lieu of corporate income taxes was paid or payable by the Company to the OEFC.

Subsidiaries of Hydro One Inc.

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its subsidiaries related to the provision of corporate functions and services, supply management, computer support and operational services such as environmental, forestry and line services. Revenues include $1 million (2005 - $1 million) related to the provision of services to Hydro One and its subsidiaries and operation, maintenance and administration costs include $3 million (2005 - $2 million) related to the purchase of services from Hydro One and its subsidiaries.

The Company's debt, including the portion allocated to the Distribution Business, is due to Hydro One. Financing charges include interest expense on this debt in the amount of $127 million (2005 - $130 million). In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One. Financing charges of the Distribution Business include interest expense on this facility in the amount of $2 million (2005 - $2 million).

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 (Canadian dollars in millions)	**2006**	**2005**
Accounts receivable	2	1
Accounts payable and accrued charges	(181)	(211)

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $175 million (2005 - $183 million).

15. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 (Canadian dollars in millions)	**2006**	**2005**
Accounts receivable (increase) decrease	(140)	62
Materials and supplies increase	(1)	(6)
Other current assets decrease	3	1
Accounts payable and accrued charges (decrease) increase	(50)	48
Accrued interest (decrease) increase	(2)	1
Employee future benefits other than pension increase	48	36
Long-term accounts payable and accrued charges increase (decrease)	2	(1)
Other	-	(27)
	(140)	114

16. CONTINGENCIES

The Company is a wholly owned subsidiary of Hydro One. As such, the assets of the Company's Distribution Business are available for the satisfaction of the debts, contingent liabilities and commitments of the Company and Hydro One.

17. COMMITMENTS

The Company and Hydro One have numerous commitments. These commitments have not been specifically allocated to the Distribution Business. However, the net assets of the Distribution Business are available to satisfy these commitments.

18. SUBSEQUENT EVENT

On March 13, 2007, Hydro One issued additional notes under the Company's medium term note program. The issue was comprised of medium term notes with a principal amount of $400 million having a 30-year term with a coupon rate of 4.91%. The notes are due March 13, 2037. The Distribution business's proportion of the issue was $160 million.

19. COMPARATIVE FIGURES

The comparative financial statements have been reclassified from statements previously presented to conform to the presentation of the December 31, 2006 financial statements.

HYDRO ONE NETWORKS INC.

DISTRIBUTION BUSINESS

FINANCIAL STATEMENTS

FOR THE YEAR ENDED

DECEMBER 31, 2007

HYDRO ONE NETWORKS INC.
DISTRIBUTION BUSINESS
AUDITORS' REPORT

To the Directors of Hydro One Networks Inc.

We have audited the Balance Sheets of the Distribution Business (a business of Hydro One Networks Inc.), as at December 31, 2007 and December 31, 2006 and the Statements of Operations, and Cash Flows of the Distribution Business for the years then ended. These financial statements are the responsibility of the management of the Distribution Business. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these financial statements present fairly, in all material respects, the financial position of the Distribution Business of Hydro One Networks Inc. as at December 31, 2007 and 2006 and the results of its operations and its cash flows for the years then ended, in accordance with Canadian generally accepted accounting principles. These financial statements are solely for the information and use of the Directors of Hydro One Networks Inc. for filing with the Ontario Energy Board. These financial statements are not intended to be and should not be used by anyone other than the specified users or for any other purpose.

The Distribution Business has no separate legal status or existence (See Note 1).

1. DESCRIPTION OF THE DISTRIBUTION BUSINESS

Hydro One Inc. (Hydro One) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

Hydro One Networks Inc. (Hydro One Networks or the Company) was incorporated on March 4, 1999 under the *Business Corporations Act* (Ontario) and is a wholly owned subsidiary of Hydro One. The Company owns and operates Hydro One's regulated transmission and distribution businesses. The regulated distribution business (the Distribution Business) operates a low-voltage electrical distribution network that distributes electricity from the transmission system, or directly from generators, to customers within Ontario. Distribution customers include small local distribution companies and large industrial customers with loads of less than 5 MW.

2. SIGNIFICANT ACCOUNTING POLICIES

Basis of Accounting

The financial statements have been prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP). The financial statements have been prepared for the specific use of the OEB. Consolidated financial statements of Hydro One for the year ended December 31, 2007 have been prepared and are publicly available.

These financial statements have been prepared on a carve-out basis to provide the financial position, results of operations, changes in the excess of assets over liabilities and cash flows of the Company's regulated Distribution Business on a basis approved by the OEB. The financial statements are considered by management to be a reasonable representation, prepared on a rational, systematic and consistent basis, of the financial results of that business. As a result of this basis of accounting, these financial statements may not necessarily be identical to the financial position and results of operations that would have resulted had the Distribution Business historically operated on a stand-alone basis.

The financial statements have been constructed primarily through specific identification of assets, liabilities (other than debt), revenues and expenses that relate to the Distribution Business. The Company's long-term debt is allocated based on the respective borrowing requirements of the Company's transmission and distribution businesses. A portion of the Company's shared functions and services costs are allocated to the Distribution Business on a fully allocated cost basis, consistent with OEB-approved independent studies. Payments in lieu of corporate income taxes have been recorded at effective rates based on income taxes as reported in the Statements of Operations as though the Distribution Business was a separate tax paying entity. Certain other amounts presented in these financial statements represent allocations subject to review and approval by the OEB.

Rate-setting

The rates of the Distribution Business are subject to regulation by the OEB. Current distribution rates are based on a cost of service rate regulation model, which also includes a targeted return on deemed common equity. On April 12, 2006, the OEB announced its decision regarding the Company's most recent rate application. On the basis of the written evidence submitted, the OEB approved the requested increase in the revenue requirement based on a reduction in the approved rate of return, from a targeted 9.88% to 9.00%, effective May 1, 2006.

In 2006, the OEB commenced a process of establishing an Incentive Regulation Mechanism (IRM) for the years 2007 to 2010. The process includes a formulaic approach to establishing 2007 rates with a rate rebasing approach to be staggered across all Ontario distributors between 2008 and 2010. The Company applied for marginal distribution rate adjustments in February 2007, based on an OEB-approved formula that considers inflation, efficiency targets and significant events outside the control of management. In April 2007, the OEB approved the Company's submissions on the basis of its cost of capital and second generation IRM policies, and the revised rates were implemented effective May 1, 2007.

The Company submitted the revenue requirement portion of its 2008 cost of service application in accordance with the OEB's multi-year distribution rate-setting plan on August 15, 2007. This application seeks the approval of a revenue requirement of $1,067 million based on a return of 8.64% for 2008. On December 18, 2007, the Company filed the details of its cost allocation and rate design proposals, which include a plan to reduce the number of rate classes for its customers and consolidate or harmonize the rates for its existing rate classes to the new proposed rate classes. Based on the OEB's processing guidelines, a decision is anticipated in the Fall of 2008.

The OEB has the general authority to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing gives rise to the recognition of regulatory assets and liabilities. The Distribution Business' regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities, which represents amounts incurred in different periods than would be the case had the Company been unregulated. The specific regulatory assets and liabilities recognized at December 31, 2007 are disclosed in Note 7.

The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made.

Revenue Recognition

Revenues attributable to the delivery of electricity are based on OEB-approved distribution tariff rates and are recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2007 amounted to $382 million (2006 - $359 million).

Revenue also includes an amount relating to rate protection for rural residential customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential customers by reducing the electricity rates that would otherwise apply.

Revenues also include amounts related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, the Company is required to make payments in lieu of corporate income taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act, 1998,* and related regulations.

The Distribution Business provides for its share of the Company's payments in lieu of corporate income taxes using the taxes payable method as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from Distribution Business customers at that time.

Inter-Company Demand Facility

Hydro One maintains pooled bank accounts for its use and for the use of its subsidiaries and, implicitly, by the regulated businesses of these subsidiaries. The inter-company demand facility represents the cumulative net effect of all deposits and withdrawals made by the Distribution Business to and from the pooled cash accounts. Interest is earned on positive inter-company balances based on the average of the bankers' acceptance rate at the beginning and end of the month, less 0.02%. Interest is charged on overdraft inter-company balances based on the same bankers' acceptance rate, plus 0.15%.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost, which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the approved allowance for funds used during construction applicable to capital construction activities. Fixed assets in service consist of: distribution assets; communication, administration and service assets; and easements.

Some distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of any related asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of removing assets that the Company is legally required to remove, an asset retirement obligation will be recognized at that time.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication, Administration and Service

Communication, administration and service assets include telecommunications equipment, towers, associated buildings, administrative buildings, major computer systems, personal computers, transport and work equipment, and tools, vehicles and minor fixed assets.

Easements

Easements include amounts incurred for easements and other access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology. Financing costs are capitalized on fixed assets under construction based on the OEB's approved allowance for funds used during construction (2007 – 4.95%; 2006 – 6.32%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment, which is depreciated on a declining balance basis.

Effective January 1, 2007, the Company prospectively revised its fixed asset depreciation rates resulting from a periodic external review required by the OEB. The estimated impact of the change in rates is a reduction in depreciation expense of approximately $4 million per annum. A summary of the new rates for the various classes of assets is included below:

	Depreciation rates (%)	
	Range	Average
Distribution	1% - 5%	2%
Communication, Administration and Service	1% - 15%	8%
Easements	1% - 1%	1%

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and are not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising out of such a review are implemented on a remaining service life basis consistent with their inclusion in rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit's net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against results of operations.

The Company has determined that goodwill is not impaired.

Discounts and Premiums on Debt

Discounts and premiums are amortized over the period of the related debt using the effective interest rate method.

Financial Instruments

Hydro One periodically uses interest rate swap contracts to manage interest rate risks. Payments and receipts under interest rate swap contracts are recognized as adjustments to interest expense on an accrual basis and are allocated to Hydro One subsidiaries and their regulated businesses. Hydro One does not engage in derivative trading or speculative activities.

Effective January 1, 2007, the Company adopted four new accounting standards comprising the Canadian Institute of Chartered Accountants' (CICA) Handbook Sections 1530, *Comprehensive Income*; 3855, *Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation;* and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that are recorded in opening accumulated other comprehensive income (AOCI) as described below, consistent with the CICA Handbook sections. The principal changes in the accounting for financial instruments and hedges due to the adoption of these accounting standards are described below.

Comprehensive Income

Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date. The impact of this amortization is immaterial to the Statement of Operations.

Financial Assets and Liabilities

Under the new standards, all financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. All financial instruments, including derivatives, are carried at fair value on the consolidated balance sheet except for loans and receivables, held-to-maturity investments and other financial liabilities, which are measured at amortized cost. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in financing charges in the period which they arise. Available-for-sale financial instruments are measured at fair value with revaluation gains and losses included in OCI until the instrument is derecognized or impaired. The Company has classified its financial instruments as follows:

Long-term accounts receivable	Loans and receivables
Inter-company demand facility	Other liabilities
Long-term debt	Other liabilities
$40 million note due May 15, 2008	Designated as held-for-trading

The $40 million note is a step-up coupon note with extendable maturity dates up to 2011.

Where there is an economic hedge, as in the case of the $40 million note and associated interest rate swap, the Company has applied the fair value option without hedge accounting. The impact was not material.

All financial instrument transactions are recorded at trade date.

Derivatives and Hedge Accounting

All derivative instruments, including embedded derivatives, are carried at fair value on the Balance Sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. The impact of the change in the accounting policy related to embedded derivatives was not material.

Hydro One periodically develops hedging strategies for execution taking into account risk management objectives. At the inception of a hedging relationship, Hydro One documents the relationship between the hedging instrument and the hedged item. This would include linking all derivatives to specific assets and liabilities on the consolidated balance sheet or to specific firm commitments or forecasted transactions. Hydro One would also assess, both at the inception of the hedge and on an ongoing basis, whether the derivatives that are used are effective in offsetting changes in fair values or cash flows of hedged items.

Upon adoption of the new standards, the Company reclassified allocated unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to accumulated other comprehensive income, which is included as a component of excess of assets over liabilities. The hedging losses are amortized through OCI using the effective interest method over the term of the hedged debt.

Transaction Costs

Transaction costs for financial assets and liabilities that are other than held-for-trading, are added to the carrying value of the asset or liability and then amortized over the expected life of the instrument using the effective interest method. The impact of the change in amortization method from an annuity basis to the effective interest method was not material.

Employee Future Benefits

Employee future benefits provided by Hydro One and its subsidiaries include pension, group life insurance, health care and long-term disability.

In accordance with the OEB’s rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management’s best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management’s best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

The Distribution Business recognizes a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. The Distribution Business reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province.

3. DEPRECIATION AND AMORTIZATION

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Depreciation of fixed assets in service	153	148
Fixed asset removal costs	28	30
Amortization of regulatory and other assets	73	71
	254	249

4. FINANCING CHARGES

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Interest on long-term debt payable	122	127
Amortization of premiums and hedges	2	2
Interest on inter-company demand facility	4	2
Less: Interest accreted on regulatory accounts	(3)	(11)
Interest capitalized on construction in progress	(5)	(5)
	120	115

5. PROVISION FOR PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rate is provided as follows:

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Income before provision for PILs	164	172
Federal and Ontario statutory income tax rate	36.12%	36.12%
Provision for PILs at statutory rate	59	62
Increase (decrease) resulting from:		
Net temporary differences:		
Depreciation and amortization in excess of capital cost allowance	14	19
Retail settlement variance accounts	13	7
Pension contribution in excess of pension expense	(8)	(12)
Overheads capitalized for accounting but deducted for tax purposes	(5)	(5)
Employee future benefits other than pension expense in excess of cash payments	4	8
Interest capitalized for accounting purposes but deducted for tax purposes	(3)	(6)
Environmental expenditures	(3)	(4)
Recovery of PILs related to prior years	-	(14)
Other	5	(8)
Net temporary differences	17	(15)
Net permanent differences	1	(1)
Provision for PILs	77	46
Effective income tax rate	46.95%	26.74%

In 2006, the Distribution Business recognized a tax benefit of approximately $14 million in respect of Hydro One's recovery of PILs from prior years following a successful appeal allowing a deduction for certain overhead costs that had been previously capitalized.

Future income taxes have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2007, future income tax liabilities of $50 million (2006 - $72 million), based on substantively enacted income tax rates, have not been recorded. In the absence of rate regulated accounting, the Company's provision for PILs would have been recognized using the liability method rather than the taxes payable method. As a result, the provision for PILs would have been lower by approximately $22 million (2006 – higher by $8 million) including the impact of a rate change in substantively enacted tax rates.

6. FIXED ASSETS

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2007				
Distribution	5,476	1,926	110	3,660
Communication, administration and service	614	376	40	278
Easements	8	3	-	5
	6,098	2,305	150	3,943
2006				
Distribution	5,247	1,948	83	3,382
Communication, administration and service	612	378	4	238
Easements	8	3	-	5
	5,867	2,329	87	3,625

Financing costs capitalized on fixed assets under construction using the allowance for funds used during construction were $5 million in 2007 (2006 - $5 million).

7. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the ratemaking process. The Distribution Business has recorded the following regulatory assets and liabilities:

December 31 (Canadian dollars in millions)	**2007**	**2006**
Regulatory assets:		
Regulatory asset recovery account II	66	87
Environmental	41	45
Employee future benefits other than pension	24	47
Regulatory asset recovery account I	18	55
Smart meters	5	10
Other	4	1
Total regulatory assets	158	245
Less: current portion	73	94
	85	151
Regulatory liabilities:		
Retail settlement variance accounts	42	2
Other	6	3
Total regulatory liabilities	48	5

Regulatory assets

Regulatory asset recovery account II (RARA II)

On April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the Distribution Business. As part of this decision, the OEB also approved the distribution-related deferral account balances sought by Hydro One Networks. The OEB ordered that the approved balances be recovered on a straight-line basis over a four year period from May 1, 2006 to April 30, 2010. The RARA II includes retail settlement and cost variance amounts and distribution low-voltage service amounts, plus accrued interest. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by approximately $23 million (2006 - $16 million). In addition, related financing charges would have been higher by $3 million (2006 - $5 million).

Environmental

The Company records a liability for the estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized an equivalent amount as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. The OEB has the discretion to examine and assess the prudence and the timing of recovery of all of the Company's future regulatory expenditures. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $6 million (2006 - $12 million).

Employee future benefits other than pension

Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 the Distribution Business recorded a regulatory asset, with an original balance of $236 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of 1 year (2006 - 2 years) and does not earn a return. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $24 million (2006 - $24 million).

Regulatory asset recovery account I (RARA I)

On December 9, 2004, the OEB issued a decision on the prudence of the distribution-related deferral account balances sought by the Company in its May 31, 2004 application. Amounts for which recovery was approved represented balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved balances be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. The Company has requested an extension of the period for the RARA I recovery, until such time as new rates are implemented. The RARA I includes distribution business low-voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest. Any over or under recovery of the RARA I due to the continuance of the rate rider will be tracked for disposition at a future date. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by approximately $20 million (2006 - $20 million). In addition, related financing charges would have been higher by $1 million (2006 - $3 million).

Smart meters

On March 21, 2006, the OEB approved the establishment of regulatory deferral accounts for smart meter-related expenditures and a monthly customer charge of 27 cents per metered customer was reflected in the Company's revenue requirement. Consistent with the OEB's direction and pending further guidance, the Company recognized a regulatory asset consisting of the net balance of capital and operating expenditures for smart meters less recoveries received from customers. In April 2007, as part of its decision regarding the Company's 2007 distribution rate applications, the OEB increased the monthly customer charge effective May 1, 2007 to 93 cents per metered customer.

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine recoverability of expenditures incurred by distributors. Expenditures associated with the minimum functionality for advanced metering infrastructure incurred by the Company were approved for recovery. As a result of this decision, smart meter expenditures are no longer deferred as regulatory assets. Such expenditures are now classified as capital or are charged to results of operations consistent with the Company's standard accounting practices. Expenditures determined to be above the minimum functionality have been brought forward for review in the Company's cost of service rate application filed in 2007.

The OEB decision also required that related revenues be based upon a calculated revenue requirement specific to smart meters. As a result, the carrying value of the smart meter regulatory asset account represents the difference between revenue recorded on this basis and actual recoveries received under existing rate adders. In the absence of rate regulated accounting, year-to-date operation, maintenance and administration expense would have been lower by $3 million (2006 – higher by $4 million) and revenues would have been lower by $2 million (2006 – higher by $2 million).

Regulatory liabilities

Retail settlement variance accounts

The Company has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's Accounting Procedures Handbook. The OEB's December 9, 2004 decision allowed for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA I. The OEB's April 12, 2006 decision allowed for recovery of retail settlement variance amounts accumulated since January 1, 2004 and forecasted through to April 30, 2006, inclusive of interest, within the RARA II. The Company has accumulated a net liability in its RSVA since May 1, 2006 which was taken into consideration in the revenue requirement of the Company as part of the 2008 distribution rate application filed with the OEB in December 2007.

8. DEBT

December 31 (Canadian dollars in millions)	**2007**	**2006**
Long-term debt payable within one year	224	105
Long-term debt	1,865	1,986
	2,089	2,091
Net unamortized premiums	8	8
Unamortized hedging losses[1]	-	(4)
Unamortized transaction costs	(9)	(9)
	2,088	2,086

[1] Unamortized net losses relating to settled swap agreements were reclassified to AOCI on January 1, 2007 without prior year reclassification.

Debt represents the Distribution Business share of various notes payable by Hydro One Networks to Hydro One. This allocated debt is summarized by the number of years to maturity in the following table:

Years to Maturity	Principal Outstanding *(Canadian dollars in millions)*	Weighted Average Interest Rate *(percent)*
1 year	224	4.1
2 years	132	4.0
3 years	122	7.2
4 years	76	6.4
5 years	324	5.8
	878	5.3
6 – 10 years	255	4.8
Over 10 years	956	6.2
	2,089	5.6

9. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of derivative financial instruments reflects the estimated amount that the Company, if required to settle an outstanding contract, would have been required to pay or would be entitled to receive at year end. The fair value of long-term debt, based on year end quoted market prices for the same or similar debt of the same remaining maturities, is provided in the following table:

December 31 (Canadian dollars in millions)	**2007**		**2006**	
	Carrying Value	Fair Value	Carrying Value	Fair Value
Long-term debt[1]	2,089	2,230	2,091	2,301

[1] The carrying value of long-term debt represents the par value of the notes.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2007, there were no significant concentrations of credit risk with respect to any class of financial assets. The revenue of the Distribution Business is earned from a broad base of customers. The Distribution Business did not earn a significant amount of its revenue from any single customer. As at December 31, 2007, there were no significant balances of accounts receivable due from any single customer.

Hydro One may enter into derivative agreements to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. These transactions are accounted for as cash flow hedges of anticipated transactions. Upon issuance of the related debt, Hydro One records the net gain or loss as other comprehensive income and amortizes it over the life of the related debt. At the same time, Hydro One Networks issues notes payable to Hydro One for equal amounts and allocates the related other comprehensive income to the businesses of Hydro One Networks.

In the third quarter of 2007, Hydro One entered into two forward starting pay fixed interest rate swap agreements to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. The transactions, with notional amounts of $150 million and $50 million respectively, were used to fix the interest rate of a forecasted debt issuance planned for later in the year and were accounted for as cash flow hedges of a forecasted transaction. In October 2007, upon issuance of debt under its medium term note program, Hydro One terminated the two forward interest rate swap agreements. The resulting net gain from these transactions was $0.4

million, of which $0.1 million pertained to the Distribution Business and has been recorded in other comprehensive income. In late 2007, Hydro One entered into two new forward starting pay fixed interest rate swap agreements with a notional amount of $140 million.

10. EMPLOYEE FUTURE BENEFITS

Pension

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. The Hydro One Pension Plan does not segregate assets in a separate account for individual subsidiaries, nor is the cost of the benefit plans allocated to, or funded separately by, entities within the consolidated group. Accordingly, for purposes of these financial statements, the pension plan is accounted for as a defined contribution plan and no deferred pension asset or liability is recorded.

The Company's pension plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed on September 20, 2007, effective for December 31, 2006, the Company contributed $95 million to its pension plan in respect of 2007 (2006 - $86 million), all of which is required to satisfy minimum funding requirements. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash. Contributions after 2009 will be based on actuarial valuation effective December 31, 2009 and will depend on future investment returns, and changes in benefits or actuarial assumptions.

For Hydro One, the actuarial present value at December 31, 2007 of the accrued pension benefits, based on a projection of the valuation at December 31, 2007, was estimated to be $5,077 million (2006 - $5,411 million). Pension plan assets available for these benefits were $5,100 million (2006 - $5,123 million).

Employee Future Benefits other than Pension

During the year ended December 31, 2007, $33 million of employee future benefits other than pension costs was charged to the results of operations of the Distribution Business (2006 - $39 million), and $22 million was capitalized as part of the cost of fixed assets (2006 - $27 million). Benefits paid were $22 million (2006 - $18 million). The liability associated with employee future benefits other than pension for the Distribution Business at December 31, 2007 was $495 million (2006 - $462 million), including the current portion.

A detailed description of employee future benefits is provided in Note 10 of the Consolidated Financial Statements of Hydro One for the year ended December 31, 2007.

11. ENVIRONMENTAL LIABILITIES

December 31 (Canadian dollars in millions)	**2007**	**2006**
Environmental liabilities, January 1	45	52
Interest accretion	3	3
Expenditures	(6)	(12)
Revaluation adjustment	(1)	2
Environmental liabilities, December 31	41	45
Less: current portion	(7)	(8)
	34	37

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2007 and in total thereafter are as follows: 2008 - $7 million; 2009 - $7 million; 2010 - $6 million; 2011 - $4 million; 2012 - $4 million and thereafter - $28 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. The Company continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

12. HYDRO ONE NETWORKS' SHARE CAPITAL

Hydro One Networks is authorized to issue an unlimited number of preferred shares and common shares.

13. RELATED PARTY TRANSACTIONS

The Province and Successor Corporations of Ontario Hydro

The Province, OEFC, IESO, Ontario Power Authority (OPA) and Ontario Power Generation Inc. (OPG) are related parties of Hydro One Networks' Distribution Business. In addition, the OEB is related to the Company by virtue of its status as a Provincial Crown Corporation, although as a self-financing and self-sufficient regulatory organization, it carries out independent regulation for Ontario's energy sector, including Hydro One's regulated Distribution Business. Transactions between these parties and the Distribution Business were as follows:

The Distribution Business received amounts for rural rate protection from the IESO. Revenues for 2007 include $125 million (2006 - $125 million) related to this program.

In 2007, the Distribution Business purchased power in the amount of $1,937 million (2006 - $1,916 million) from the IESO-administered electricity market and $27 million (2006 - $38 million) from OPG.

Under the Ontario Energy Board Act, 1998, the OEB is required to recover all of its annual operating costs from gas and electricity distributors and electricity transmitters. In 2007, the Distribution Business incurred $5 million (2006 - $4 million) in OEB fees.

The Company has service level agreements with Ontario Hydro's successor corporations, primarily OPG. These services include field and engineering, logistics, corporate, telecommunications and information technology services. Operation, maintenance and administration costs related to the purchase of services from these successor corporations were less than $1 million in each of 2007 and 2006.

Consistent with the OPA mandate, the OPA is responsible for some of the Company's Conservation Demand Management (CDM) programs. The funding includes program costs, incentives and management fees and bonuses. In 2007, the Company received $3 million (2006 – $nil) from the OPA in respect of the CDM programs and had a net accounts receivable of $3 million (2006 – $nil).

The provision for payments in lieu of corporate income taxes was paid or payable by the Company to the OEFC.

Subsidiaries of Hydro One Inc.

The Company provides services to, and receives services from, Hydro One and its other subsidiaries. Amounts due to and from Hydro One and its subsidiaries are settled through the inter-company demand facility.

The Company has entered into various agreements with Hydro One and its subsidiaries related to the provision of corporate functions and services, supply management, computer support and operational services such as environmental, forestry and line services. Revenues include $1 million (2006 - $1 million) related to the provision of services to Hydro One and its subsidiaries and operation, maintenance and administration costs include $3 million (2006 - $3 million) related to the purchase of services from Hydro One and its subsidiaries.

The Company's debt, including the portion allocated to the Distribution Business, is due to Hydro One. Financing charges include interest expense on this debt in the amount of $122 million (2006 - $127 million). In addition, balances payable or receivable under the inter-company demand facility are due to or from Hydro One. Financing charges of the Distribution Business include interest expense on this facility in the amount of $4 million (2006 - $2 million).

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 (Canadian dollars in millions)	**2007**	**2006**
Accounts receivable	3	2
Accounts payable and accrued charges	(181)	(181)

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $179 million (2006 - $175 million).

14. STATEMENTS OF CASH FLOWS

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Accounts receivable decrease (increase)	14	(140)
Materials and supplies increase	(5)	(1)
Other current assets (increase) decrease	(4)	3
Accounts payable and accrued charges increase (decrease)	37	(50)
Accrued interest decrease	-	(2)
Employee future benefits other than pension increase	31	48
Long-term accounts payable and accrued charges (decrease) increase	(1)	2
Other	(9)	3
	63	(137)

15. CONTINGENCIES

The Company is a wholly owned subsidiary of Hydro One. As such, the assets of the Company's Distribution Business are available for the satisfaction of the debts, contingent liabilities and commitments of the Company and Hydro One.

16. COMMITMENTS

The Company and Hydro One have numerous commitments. These commitments have not been specifically allocated to the Distribution Business. However, the net assets of the Distribution Business are available to satisfy these commitments.

17. SUBSEQUENT EVENTS

Effective March 1, 2002, Hydro One began receiving a range of services from Inergi LP, including information technology, customer care, supply chain and certain human resources and financial services. In connection with this agreement, the Company transferred approximately 770 regular employees to Inergi LP. On March 10, 2008, the Company was granted consent from the Financial Services Commission of Ontario to transfer pension assets for affected employees from the Hydro One Pension Plan to the Inergi LP Pension Plan. The pension asset transfer will occur in the second quarter.

On March 3, 2008, Hydro One issued additional notes under the Company's medium term note program. On the same date Hydro One Networks issued notes payable to Hydro One Inc. in the amounts of $300 million and $250 million with maturity dates of October 18, 2017 and March 3, 2011, respectively. The Distribution Business' share of the notes payable by Hydro One Networks to Hydro One are $180 million and $150 million, respectively. Upon issuance of these notes, Hydro One terminated three forward interest rate swaps, having a total notional principal amount of $200 million, entered into in the fourth quarter of 2007($140 million) and first quarter of 2008 ($60 million).

On April 11, 2008, the OEB ordered that existing 2007 Distribution rates be declared interim as of May 1, 2008. The Board also noted that it will allow Hydro One to track in a variance account the difference between revenue based on current rates and the distribution 2008 revenue requirement to be approved later this year for the period from May 1, 2008 until such time as final rates are implemented. The disposition of any such balance will be decided when the Board issues its 2008 rate decision.

On April 11, 2008, Hydro One gave notice that it will not extend the maturity date of its $40 million extendible step-up note beyond its current maturity date of May 15, 2008. The notes will be redeemed at that time at a redemption price equal to the principal amount plus any accrued and unpaid interest. The principal attributable to the Distribution Business is $14 million.

18. COMPARATIVE FIGURES

The comparative financial statements have been reclassified from statements previously presented to conform to the presentation of the December 31, 2007 financial statements.

The Hydro One Family of Companies

Hydro One Inc.
Is a holding company with subsidiaries that operate in the business areas of electricity transmission and distribution and telecom. The subsidiaries are necessary to meet legislative and regulatory requirements.

Hydro One Networks Inc.
Represents the significant majority of our business, which is regulated by the Ontario Energy Board. It is involved in the planning, construction, operation and maintenance of our transmission and distribution networks.

Hydro One Brampton Networks Inc.
Distributes electricity to one of the fastest growing urban centres in Canada, just 30 kilometres outside of Toronto.

Hydro One Remote Communities Inc.
Operates and maintains the generation and distribution assets used to supply electricity to 20 remote communities across northern Ontario that are not connected to the province's electricity transmission grid.

Hydro One Telecom Inc.
Markets our fibre-optic capacity to business customers and represents less than 1% of our total assets.

Hydro One's 2006 accomplishments

Our power at work

Customer satisfaction continued to climb in 2006, with

86%

of our Large Transmission Customers saying they were satisfied with our level of service. This is a 4% increase from last year and is moving steadily towards our goal of 90% customer satisfaction. Our Large Industrial Customer satisfaction improved 11% this year, hitting the 90% mark.

The North American Electric Reliability Council (NERC) awarded our transmission operations facilities, work processes and staff a grading of excellence for our ability to reliably operate and maintain Ontario's electricity transmission system. NERC's audit singled out our industry-leading physical security procedures, infrastructure and communication systems.

During a two-month period, three intense storms tested Ontario and knocked out power to more than 400,000 of our customers. The excellence of our restoration efforts earned us a prestigious *Emergency Recovery Award* from the Edison Electric Institute. This is the first time this award has gone to a utility based outside of the United States.

The Ontario Energy Board approved an increase of approximately

$160M

in our annual distribution revenue requirement. This decision demonstrates the OEB's confidence in our ability to maintain and operate Ontario's electricity system. The increased funds will enable us to make important investments we need in our distribution system.

Message from our Chair, Rita Burak

Ensuring that Ontario continues to have the electricity delivery system that it needs and deserves.

This year, Hydro One successfully operated and maintained Ontario's transmission and largest distribution system, expertly meeting the operational challenges posed by multiple severe storms that affected many of our customers. The company embarked on several large projects to ensure the delivery of safe, reliable electricity to the people of Ontario.

The company's net income in 2006 decreased by $28 million, or 6%, to $455 million compared to 2005. This decrease primarily reflects increased expenditures required to operate and maintain our transmission and distribution systems, particularly as a result of the damaging storms we experienced this year, and lower transmission tariff revenues resulting from lower demand and changes to transmission regulations.

As Chair of Hydro One, I understand that the good governance of Hydro One is essential to our shareholder, the Province of Ontario, our bond holders and the people of Ontario who depend upon Hydro One's electricity delivery system. Hydro One was focused on new securities regulations this year and is now fully compliant with the strict new financial control and disclosure requirements.

We take our financial obligations seriously and our financial controls and disclosure practices are solid and undergo regular external scrutiny. We operate in a highly transparent manner. Hydro One has embraced all 13 recommendations of Ontario's Auditor General to improve compliance with our internal policies and procedures.

Hydro One made critical investments both in transmission and in distribution infrastructure as well as in maintenance programs designed to ensure the reliability of the system. Hydro One spent $1.7 billion in 2006 in total capital and operation, maintenance and administrative expenditures.

Our ability to arrange sufficient and cost-effective financing supports our improving long-term credit rating. This is vital to our ability to refinance maturing debt, fund capital expenditures and address other requirements. In particular, Hydro One has access to long-term funding that better matches our debt to our long-lived assets. The upgrades to our credit ratings reflect the confidence of the rating agencies and investors in the performance and management of the company.

The Board expects continued strong, stable financial performance and is confident in the management team's ability to meet the challenges in the coming year. In the past two years Hydro One has begun a major new construction phase and this will continue in the years ahead. Major projects vital to the economic well-being of Ontario are underway, including a new interconnection with Quebec, transmission upgrades in Toronto and the connection of new sources of generation as they become available across Ontario.

Hydro One paid its shareholder, the Province of Ontario, dividends of $350 million. Hydro One recorded $179 million of payments in lieu of income taxes, which helps reduce the legacy-stranded debt held by the Province.

On behalf of the Board of Directors, I would like to thank Hydro One's management and employees for their valued contribution and their dedication to their vital role. The Board looks forward to continuing the work of Hydro One in providing a safe, reliable electricity delivery system for the people of Ontario.

Rita Burak
Chair

Message from our President and CEO (Acting), Laura Formusa

Our work is complex, but the reason we do it is simple: Ontario depends upon Hydro One to deliver the electricity needed to put power to work.

Hydro One exists to ensure that the people, businesses, industries and communities of Ontario have the electricity they need to put power to work for them. Our transmission system represents more than 96% of Ontario's capacity.

We understand that our customers and other stakeholders expect Hydro One to be managed in a responsible manner, respecting the public trust placed in us to ensure the safe and reliable delivery of electricity at reasonable cost.

We take this trust seriously and believe that our performance and achievements of this past year bear this out.

Serving our customers drives everything we do. And our customers are diverse. From industrial giants like mining company Inco, Ontario's largest electricity consumer, to greenhouse operations in Leamington, to summer camps in Deep River and family homes in every corner of the province, we deliver electricity to a wide range of consumers.

In 2006, our customers told us that our service was better than ever. We made an honest appraisal of how we could do a better job of meeting our customers' needs, which enabled us to make major advances in improving our relationships. We have seen double-digit increases in customer satisfaction levels and we aim to reach customer satisfaction levels of 90%, on average, across all customer segments.

NERC gave our transmission operations facilities, work processes and staff a grading of excellence for our ability to reliably operate and maintain Ontario's electricity transmission system. The report singled out our industry-leading physical security procedures, infrastructure and program management as well as our innovative and fully integrated, multi-functional communications system.

We became the first utility based outside of the United States to receive the prestigious Edison Electric Institute *Emergency Recovery Award* recognizing the company's outstanding efforts in restoring power to more than 400,000 customers following three severe storms.

Our financial performance in 2006 was strong, with a net income of $455 million, and we paid our shareholder a healthy dividend.

As stewards of this province's massive and complex electricity transmission and delivery systems, we made significant progress on a number of critical system investment initiatives. We signed an agreement with Hydro-Québec TransÉnergie Inc. for construction of state-of-the-art power transmission equipment including new circuits across the Ottawa River connecting the two provincial high-voltage power systems. This $124 million investment will add an important new connection between the two grids and increase Ontario's ability to access electricity generated through renewable resources.

In November 2006, construction crews restored the Ontario to Michigan interconnection in the Sarnia area with the transmission operator in Michigan. This interconnection improves overall supply reliability in Ontario by increasing electricity import/export capacity and maximizes the effectiveness of the existing high-voltage transmission system. This circuit will increase our import and export capacity by about 400MW and 200MW respectively.

We completed the excavation of a 2.2-kilometre tunnel beneath the streets of Toronto. This innovative $45 million investment will carry an array of electricity transmission lines to tie the east and west sides of the city together with minimal disruption. This work will let power flow more freely across the city, giving Toronto increased flexibility, reliability and supply.

In 2006, we launched several new conservation and demand management programs in line with the Province's goal to create a culture of conservation in Ontario. Our programs mirror our customer base; some help Ontario families save electricity and money, while others use innovative technology to allow our larger customers to ease strain on the provincial electricity grid during peak demand periods.

While we're proud of our accomplishments, our main focus is on the challenges facing Ontario's electricity transmission system. Meeting these challenges by constructing the necessary transmission infrastructure will require cooperation with all of our stakeholders.

As guardians of the province's electricity transmission system, we have a number of key investment initiatives that require our utmost attention in the year ahead. Most significant of those initiatives is the proposed construction of a new 500-kV transmission line to deliver additional electricity to southern Ontario. We are undertaking consultations with the public and other interested groups about the routing of the line as well as its benefits and impacts.

We will continue to seek approvals for a number of other major projects which are geared to improving the reliability of supply to local areas within Ontario.

My management team and I will continue to ensure that Hydro One works efficiently, effectively and in the best interests of the people of Ontario. I am enthusiastic about the challenges that lie ahead of us and proud of our record of past achievements.

I'd like to thank Hydro One's employees for working safely and with the utmost commitment to our customers. We rely on the work our employees do every day to make sure that the people of Ontario can put power to work.

L Formusa

Laura Formusa
President and Chief Executive Officer (Acting)

Stephanie Oatway, Energy Analyst, CVRD Inco, Sudbury

Power on demand

"Power is useless unless it is there when you need it. That is why reliable transmission is so critical to our business," says Stephanie Oatway, Energy Analyst, CVRD Inco.

When Ontario's largest single-point electricity user speaks, Hydro One listens. Every year Inco's Ontario operations represent about ¾ of 1% of Ontario's total electricity consumption. How much is that? 1,400 Gigawatt hours, enough to power a city the size of Barrie.

While Inco generates about 20% of the electricity that it needs, it depends on the reliability of Hydro One's transmission system to keep it operating safely and profitably. With as many as 2,000 people working as far as two kilometres underground, having a secure, stable source of electricity is a serious matter.

And with today's on-demand supply management systems and the booming nickel market, losing time to electricity failures is unacceptable.

Stephanie Oatway is responsible for making sure Inco has the electricity it needs to produce the 275 million pounds of nickel per year plus copper and other precious metals. As a representative of our largest customer, she is in constant contact with Hydro One to make sure we deliver on our promises.

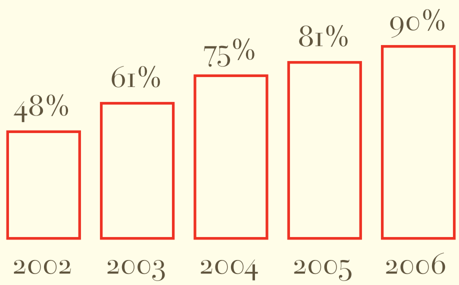
Last year our customers, big and small, told us we were doing better than ever on communicating and meeting our commitments to them.

275

MILLION POUNDS,

the amount of nickel Inco's Sudbury operations produce per year.

Large Industrial Customer Satisfaction



Customer satisfaction continued to climb in 2006, with 86% of our Large Transmission Customers saying they were satisfied with our level of service. This is a 4% increase from last year and is moving steadily towards our goal of 90% customer satisfaction. Our Large Industrial Customer satisfaction improved 11% this year, hitting the 90% mark.

Transmission reliability is a big reason our customers are more satisfied than ever before. The North American Electric Reliability Council awarded our transmission operations facilities, work processes and staff a grading of excellence for our ability to reliably operate and maintain Ontario's electricity transmission system. NERC's extensive audit singled out our industry-leading physical security procedures, infrastructure and communication systems.

Hydro One's senior management team devotes time and energy to getting to know our Large Customers' businesses. Each member of the senior management team has direct relationships with our customers. They meet on a regular basis and are available any time if a customer has a question or an issue.

"Hydro One's people have taken the time to understand our business and they know what's at stake for us. They get it," Oatway says.

Inco uses 1,400 Gigawatt hours of electricity per year to power its operations – making it Ontario's largest single-point user.

Camp Lau-Ren, Deep River

The buzz of camp

Shortly after dinner on July 17, dark clouds filled the sky over Camp Lau-Ren on the edge of the Ottawa River.

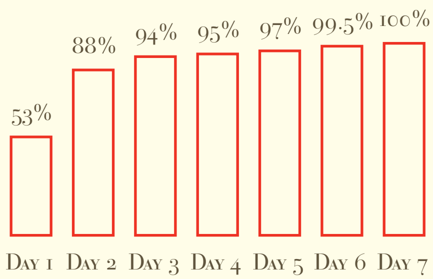
"The winds came right through the camp toppling trees and knocking down power lines. It was a matter of seconds and the power was out," says Nicky Nel, a volunteer counsellor for the last 15 years with Camp Lau-Ren. "We rushed around and made sure everyone was safe and after it was all done our first question was, 'Can camp happen without electricity?'"

The campers at Camp Lau-Ren weren't the only people asking that question.

Across Ontario, 170,000 Hydro One customers lost electricity. With tens of thousands of trees down, more than a thousand power poles broken and hundreds of kilometres of electricity line buried beneath trees snapped like matchsticks, it was the worst damage we'd seen since the 1998 Ice Storm. It would be more than a week until everyone had their power back on.

Storm Recovery

(Percentage of 170,000 affected customers restored)



120 KM/h

winds during three major storms and eight tornadoes pounded Ontario in the summer of 2006.

Hydro One responded to this storm by mobilizing our highly trained workforce, bringing in partners from other utilities and working long days to safely return electricity service to our customers. Our fleet of helicopters filled the sky and crews worked tirelessly to rebuild Ontario's electricity delivery system. In the first 24 hours, we restored electricity to 90,000 of the customers that had been affected.

For our work on this storm and two others in a two-month period, the Edison Electric Institute awarded Hydro One the *Emergency Recovery Award*, the first time this honour has been bestowed on a utility based outside of the United States.

While recognition from our peers as one of the best in the business at storm recovery means a lot, it pales in comparison to the way our customers responded. After four days of sharing two outhouses between 60 people, with no electricity, no flush toilets, no electric lights and no running water, Hydro One trucks were treated to a hero's welcome when they finally pulled into Lau-Ren.

"When we saw the trucks, we knew Hydro One had reached us," Nicky says. "The campers were yelling and greeting them with signs. It was a great moment. I think for a lot of the campers, they had a whole new appreciation for electricity."

Hydro One deployed more than 1,000 workers, who worked 16-hour days to restore electricity and repair the worst damage since the 1998 Ice Storm.

Cole Cacciavillani of CF Group Greenhouses, Leamington

Green power blooms

Keeping a greenhouse's climate at the perfect temperature and humidity depends upon electricity. The summer heat inside the greenhouse is so great that without the electric fans, the plants would never survive to bloom. During Ontario's coldest months, without electricity there'd be no flowers for Valentine's Day.

Backup electricity generation for Ontario's greenhouse industry is truly a matter of life and death.

"If we lose power, we're out of business," says Cole Cacciavillani, whose father Floyd started the family business with a single greenhouse in the 1950s.

In the last decade, CF Group Greenhouses (CF Group) has grown enough potted plants to cover Ontario. It's also developed generator technology to help greenhouses and other critical electricity users meet their own urgent power needs.

"All greenhouses invest in backup generation, but we only need it in emergencies. With help from Hydro One, we've connected that generation to the grid to put it to work for the rest of Ontario," says Cacciavillani.

Working with Hydro One, Cacciavillani has connected close to 4 MW of power that Ontario can call on when it needs more supply. The connection contributes to Ontario's supply reliability, takes stress off of Hydro One's transmission system and helps Ontario greenhouses turn a backup system into an asset.

4,000

Number of old, energy-sapping refrigerators, freezers and room air conditioners collected from our customers.

880,000

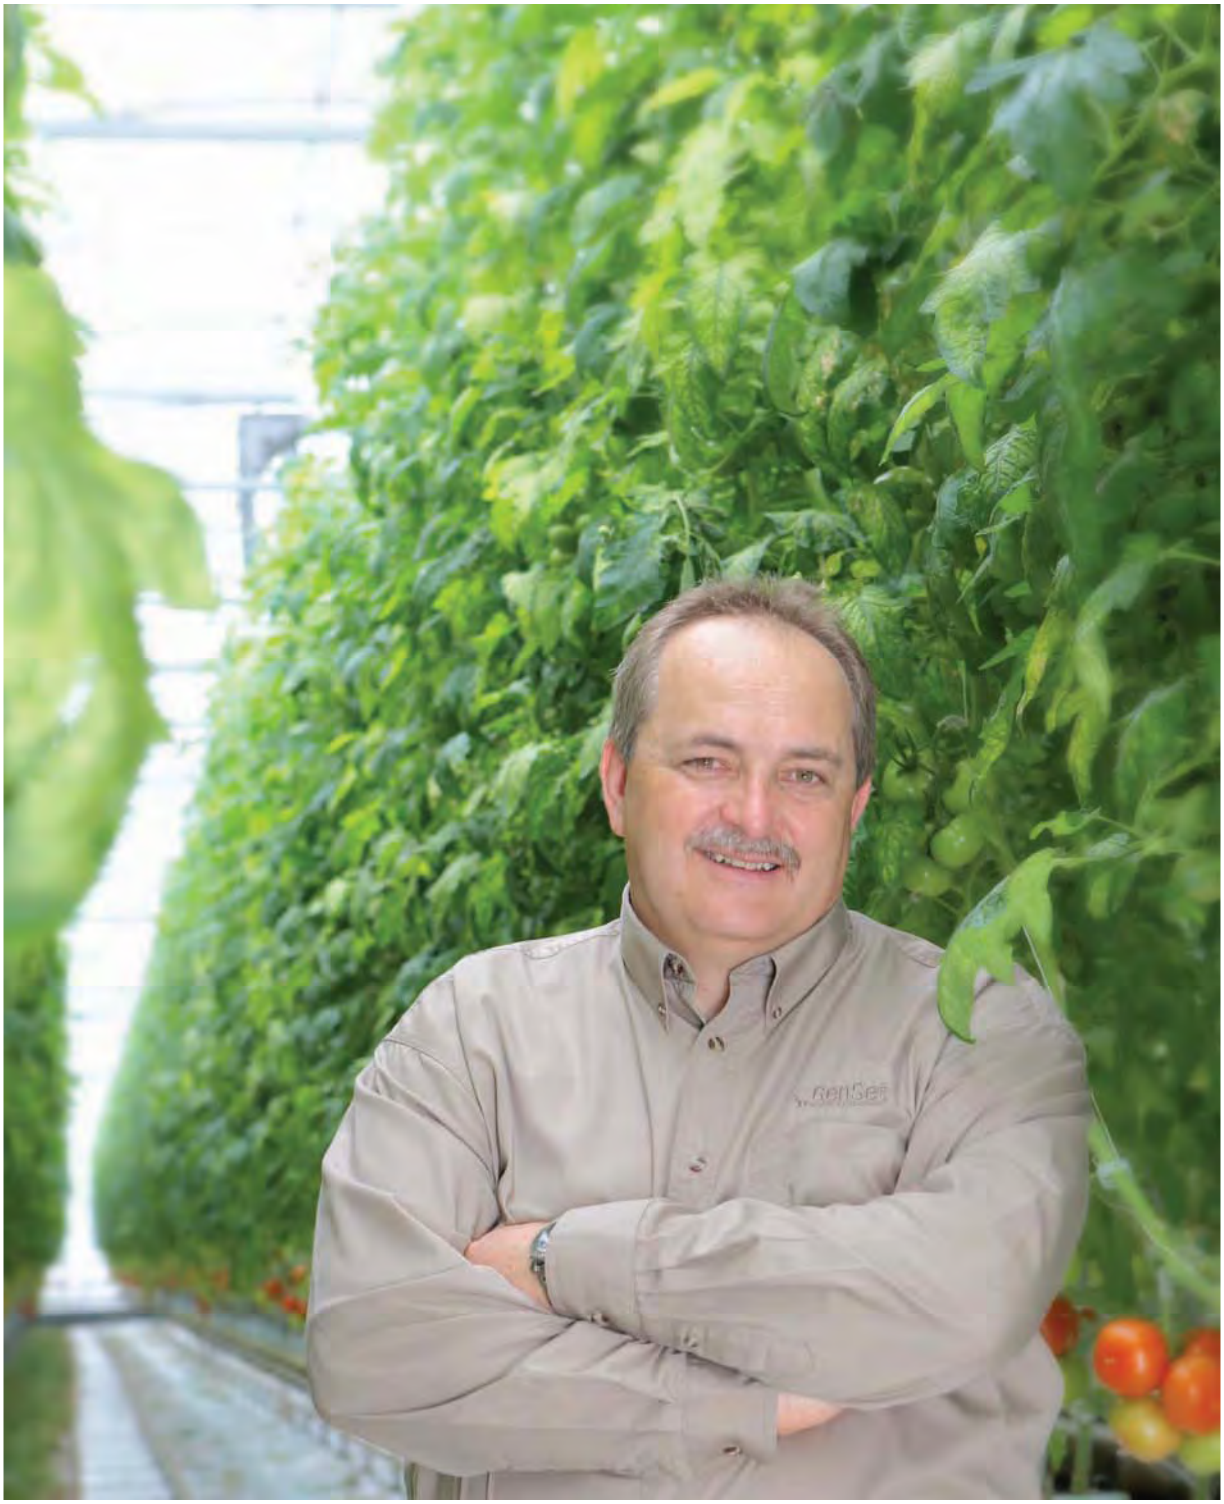
Number of our customers who participated in one of our conservation and demand management programs.

Ontario's greenhouses not only contribute about $2 billion a year to the province's economy, the network of generators managed by the CF Group and connected to Hydro One's grid now contributes about 4 MW of electricity, enough to power 1,300 homes.

Finding new ways for customers to use electricity wisely is the goal of Hydro One's Conservation and Demand Management group. In 2006, Hydro One not only helped enterprises like greenhouses and wind farms connect to the grid, we worked with our approximately 1.3 million residential customers to reduce peak demand.

Programs like SmartStat, the PowerCost Monitor and Appliance Retirement made a concrete difference to the amount of electricity Hydro One customers used. Our team removed more than 4,000 energy-hogging refrigerators from the grid. Our Power$aver tour, in conjunction with Home Depot, travelled the province and provided customers with vital information on ways to reduce electricity usage and offered advice on energy efficient products.

By working together and encouraging innovation, Hydro One and Ontario energy users and generators can meet future challenges.



Hydro One helped CF Group Greenhouses connect about 4 MW of electricity to the grid, enough to power about 1,300 homes in times of short supply.

Hydro One's 2006

accomplishments

Hydro One has signed an agreement with Hydro-Québec TransÉnergie Inc. for construction of state-of-the-art power transmission equipment including new circuits across the Ottawa River connecting the two provincial high-voltage power systems.

The $124 million investment for Hydro One will add an important new connection between the two grids. The first phase of the project – the new connection with Ontario – will come into service in early 2009, and will have a capacity of 900 MW. The second phase – the addition of a reinforcement line – will be brought into service in the spring of 2010, and will increase the connection's capacity to 1,250 MW.

In 2006, Hydro One completed digging a 2.2-kilometre tunnel beneath the streets of Toronto. This innovative project will carry an array of electricity transmission lines to tie the east and west halves of the city together, with minimal disruption to traffic or residents. Expanding the links between east and west by running new transmission lines through the $45 million investment will let power flow more freely across the city, giving Toronto increased flexibility, reliability and supply.

The project is scheduled for completion late next year with the new 230-kV circuit expected to be operational by early 2008.

Highly Rated

Dominion Bond Rating Service raised our long-term debt rating to A (high), with a stable trend, from A with a positive trend. In addition, our short-term debt rating was upgraded to R-1 (middle) from R-1 (low).

Construction crews rebuilt the interconnection in the Sarnia area with the transmission operator in Michigan. This connection improves overall supply reliability in Ontario by increasing electricity import/export capacity and maximizes the effectiveness of our existing high-voltage transmission system.

Hydro One is reinforcing the high-voltage transmission system in the Niagara region which will help significantly in meeting electricity needs in Southern Ontario during high-demand periods.

These upgrades will increase power import capacity from New York State up to 800 megawatts – enough power to meet the needs of about 260,000 homes – and accommodate additional power supplied by Ontario Power Generation's Sir Adam Beck stations after completion of a third tunnel at Niagara Falls.

Close to

100

MILLION kWh,

enough electricity to power 8,200 homes for one year, were saved by Hydro One's customers through our conservation and demand management programs.

In August, the Kleinburg Training Centre opened its doors to teach Ontario's future electricity workers.

The need for the facility was clear with the number of apprentices needing training doubling from 176 in 2003 to close to 400 in 2006.

This facility allows us to give the next generation of line maintainers, meter readers, distribution technicians, protection and control trainees hands-on experience in a safe environment.

The centre not only provides vital training to Hydro One apprentices, it's a Ministry of Training, Colleges and Universities certified facility. Apprentices from utilities across the province come here to put spurs on for the first time and take those tentative first steps up a wooden pole.

Customers told us the old system for checking outages on our website was cumbersome, so we improved it. Our redesigned online Power Outage Notification system improves communications between Hydro One and the public and provides real-time information to the media during major storms or other outage situations. The new system paints a very accurate picture of the status of our electricity transmission and distribution system.

$807,728

was raised by Hydro One employees for charities of their choice in 2006.

Management's Discussion and Analysis

We prepare our financial statements in Canadian dollars and in accordance with accounting principles generally accepted in Canada. The following discussion is based upon our Consolidated Financial Statements for the years ended December 31, 2006 and 2005.

Overview

We are wholly owned by the Province of Ontario (the Province) and our transmission and distribution businesses are regulated by the Ontario Energy Board (OEB). We are the leading electricity transmitter and distributor in Ontario, delivering power safely and reliably to homes and businesses. As stewards of this province's massive and complex transmission and delivery system, our mission is to be an efficient and dynamic transmission and distribution company that is best in North America in the areas of safety, customer service and reliability, while focusing on the development and retention of our employees and creating shareholder value. In 2006, we continued our focus on our core businesses, substantially maintained and improved our performance in various key areas of the business, and made important contributions to the rebuilding of Ontario's core infrastructure.

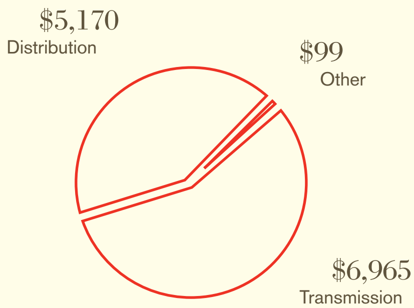
Transmission

Substantially all of Ontario's electricity transmission system is owned and operated by our company. In 2006, we earned total transmission revenues of $1,245 million primarily by transmitting approximately 151 TWh of electricity, directly or indirectly, to more than 4 million customers. Our transmission system is one of the largest in North America, and is linked to five adjoining jurisdictions through 26 interconnections. Through these interconnections, we can accommodate imports of about 4,000 MW and exports of approximately 5,800 MW of electricity. In terms of assets, our transmission business is our largest segment, representing approximately 60% of our total assets.

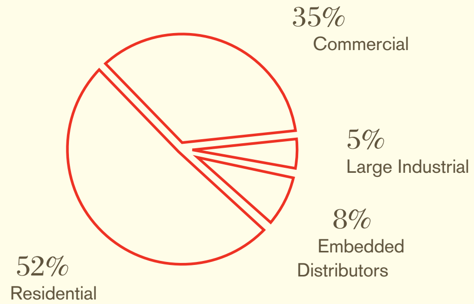
Distribution

Our distribution system is the largest in Ontario and spans roughly 75% of the province, serving approximately 1.3 million rural and urban customers, and 48 large industrial customers. We also operate small, regulated generation and distribution systems in a number of remote communities across Northern Ontario that are not connected to Ontario's electricity grid. As illustrated in the accompanying chart, over half of our distribution revenues are earned from our residential customers.

Total Assets
December 31, 2006
(Cdn $ millions)



2006 Distribution Revenues



Other

Our other business segment contributed revenues of $27 million in 2006 and has assets of about $99 million, which constitute less than 1% of our total assets. This segment primarily represents the operations of our wholly owned subsidiary, Hydro One Telecom Inc., which markets fibre-optic capacity to telecommunications carriers and commercial customers with broadband network requirements.

Our Strategy

In 2006, we maintained our strategic focus on our core operations and built upon our accomplishments. Our goals are to be recognized by our customers as their best service provider, by our peers as their benchmark for excellence, and by our shareholder as delivering superior value, while striving to attract, develop and retain productive employees.

We seek to achieve these goals by continuing to implement the following strategies:

— *Safety:* Create and maintain an injury-free workplace with a concentrated focus on elimination of serious injury and "near misses" in high potential harm categories of work.

— *Customers:* Become a leading customer-focused company. We intend to maintain our focus and commitment to improving our customers' level of satisfaction. We strive to strengthen relationships with our large and mid-sized customers acknowledging their commercial requirements. For residential customers, our key focus is on improving the quality of customer services such as billing, call handling, outage management, and meter reading. We also aim to make positive contributions in communities across Ontario through our corporate citizenship programs.

— *Reliability:* Enhance the reliability of our transmission and distribution systems. In transmission, we have assumed a proactive leadership role in developing the system to meet Ontario's power needs. Within distribution, we are focused on reliability while recognizing the challenges in operating a system with low customer density and vast geography.

— *Financial:* Ensure our actions contribute towards maximizing the value of our company, while maintaining effective access to funds on a long-term basis at reasonable rates and delivering appropriate financial returns to our shareholder.

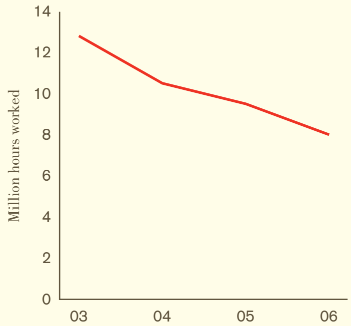
— *Employees:* Manage the challenges of labour demographics by attracting, developing and retaining productive employees.

Performance Measures and Targets

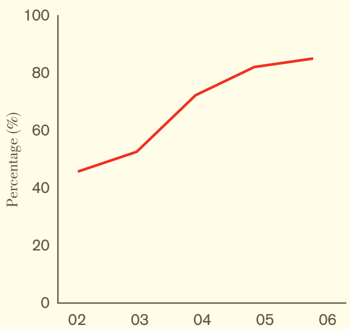
We measure and target our performance in all of the above strategic areas, ensuring that we are recognizing the needs of all of our key stakeholders. We substantially met or exceeded our challenging 2006 objectives, improving in a number of areas over 2005, and are moving towards achieving our strategic goals.

The potentially hazardous nature of our business requires a strong focus on safety. Consequently, one of our goals is to achieve a record of no serious injuries and no serious near misses. Accordingly, we measure our high Maximum Reasonable Potential for Harm (MRPH) incidents rate to identify possible problems or situations that may increase the risk of injury. As shown in the accompanying chart, we had eight high MRPH incidents per million hours worked in 2006, which is 16% lower than 2005, 24% lower than 2004, and 38% lower than 2003.

High MRPHs



Large Transmission Customer Satisfaction



We also maintain our focus on serious incidents in high risk areas including electrical contacts, preventable motor vehicle accidents and work equipment operations, among others. The number of serious incidents declined from about nine incidents per million hours worked in 2003, to approximately five in 2006. Going forward, we will continue to stress the importance of safety through a sustained cultural change, with emphasis on human factors and the role of human traits in determining safe work performance. Planned initiatives include increased facility and site assessments, development of a learning management system and further use of decision analysis tools to reduce human error and its consequences.

Customer satisfaction is also vital to our success. As shown in the accompanying chart, our Large Transmission Customer Satisfaction Survey results improved from 83% to 86% satisfied as compared to 2005. Moreover, we have seen continuous improvement over the last five years. We also continue to be conscious of the needs of our Residential and Small Business Customers and survey results show an increase in the level of satisfaction to 83% satisfied from 81% last year. While our 2006 Generator satisfaction level of 74% was acceptable, it was slightly below our annual target, and addressing the concerns identified will be an area of focus in 2007. We will continue to focus on improving the level of customer satisfaction across all customer segments by targeting our responses to the unique requirements of each segment.

Weather patterns and generation constraints require exemplary performance from both our transmission and our distribution systems. We are conscious that businesses of all sizes require reliable service and consequently, we focus on achieving top-quartile reliability in relation to other comparable systems. In 2006, we met our annual reliability targets and achieved some improvements over 2005. We did so while managing the impacts of a number of devastating storms throughout the year, including the back-to-back storms experienced over the summer. We enhanced our storm response and communication, including improving processes, improving our website and providing "real time" information through emails and faxes. Subsequent to year end, the Edison Electric Institute (EEI) honoured us with an emergency recovery award for our outstanding efforts to restore electricity service during these storms. This is the first time this prestigious award has been won by a utility outside of the U.S.

Meeting our shareholder requirements is an integral part of our business focus. Strong financial performance was again characterized by our 2006 results and we maintained or improved credit ratings on both our short-term and long-term debt. On June 23, 2006, Dominion Bond Rating Service Inc. raised our short-term debt rating to R-1 (middle) and our long-term debt rating to A (high), as a result of key factors including their expectation that our financial profile will remain strong over the medium to long term.

Regulation

Our electricity transmission and distribution businesses are licensed and regulated by the OEB. The OEB sets rates following oral or written public hearings. Our transmission revenues primarily include our transmission tariff, which is based on the uniform province-wide transmission rates approved by the OEB for all transmitters across Ontario. Our distribution revenues primarily include our distribution tariff, which is also based on OEB-approved rates, and the recovery of the cost of purchased power used by our customers. Consequently, our distribution business does not have commodity price risk. Transmission and distribution tariff rates are set based on an approved revenue requirement that provides cost recovery and includes a return on deemed common equity. In addition, the OEB approves rate riders to allow for the recovery or disposition of specific regulatory assets and liabilities over a specified timeframe.

Under the current market structure, low-volume and designated consumers pay electricity rates established through the Regulated Price Plan (RPP) and wholesale electricity consumers pay a blend of regulated, contract and wholesale spot market prices. The OEB sets prices for RPP customers based on a two-tiered electricity pricing structure with seasonal consumption thresholds. Unexpected shortfalls or overpayments associated with the RPP are financed by the Ontario Power Authority (OPA). The OEB sets prices at least every 12 months, or more frequently, and may upon review, reset prices over the next 12 months to better reflect the cost of supply. The OEB currently plans to review the need to reset prices every six months. Customers who are not eligible for the RPP, or wholesale customers, pay the market price for electricity adjusted for the difference between market prices and prices paid to generators under the *Electricity Restructuring Act, 2004*. The Independent Electricity System Operator (IESO) is responsible for overseeing and operating the wholesale market, as well as ensuring the reliability of the integrated power system.

In addition to the oversight role of the OEB and the market monitoring and coordination role of the IESO, the OPA was created through the *Electricity Restructuring Act, 2004* to ensure the long-term supply of electricity, facilitate load management and conservation, and to assist with the stability of rates for RPP customers, among others. As part of its mandate to ensure the adequate long-term supply of electricity, and consistent with the Province's direction regarding supply mix, the OPA is in the process of developing the Integrated Power System Plan (IPSP), which must be submitted for review and approval to the OEB which will conduct public hearings and consultation. The OPA currently expects to submit the IPSP to the OEB in March 2007. As part of the IPSP process, the OPA has issued a number of discussion papers for comment by stakeholders. Of the papers issued to date, two are most important to the transmission business and influence our capital expenditures; "Discussion Paper 5 – Transmission" and "Discussion Paper 7: Integrating the Elements – A Preliminary Plan" (See "Future Capital Expenditures" on page 29).

The OPA is also responsible for coordinating the delivery and funding of conservation and demand management (CDM) programs. This coordination will further initiatives undertaken by individual local distribution companies (LDCs), including our distribution business, as a result of distribution rate increases approved in 2005. Some of the funds associated with this increase were required to be used on CDM programs. Our programs amounted to approximately $43 million over the period 2005 to 2007, consistent with this direction. The overall goal of the CDM programs is to reduce provincial demand by 6,300 MW by 2025. The OPA issued "Discussion Paper 3 – Conservation & Demand Management" and is expected to submit a CDM plan as part of the IPSP.

The *Energy Conservation Responsibility Act, 2006* furthers the broad objectives of CDM by providing the framework for the installation of 800,000 smart meters in Ontario homes and businesses by the end of 2007, with installation in all homes and businesses to be completed by the end of 2010. These meters will be capable of measuring and reporting usage over predetermined periods, being read remotely and providing customers with access to information about their consumption. A new entity will oversee the communications systems and technologies, collect and manage data, and facilitate meter procurement. LDCs, including our distribution businesses, will own, install, operate and maintain their own meters. We are currently deploying smart meters under our program (See "Future Capital Expenditures" on page 29).

Transmission Rates

The IESO remits payments to us based on the uniform transmission rates approved by the OEB for all transmitters across Ontario. In 2000, the OEB approved a transmission revenue requirement that provides for cost recovery and includes a return on deemed common equity targeted to be 9.88%.

In October 2005, the OEB initiated a proceeding to review our transmission rates and revenue requirements for 2006, 2007, and 2008. On February 21, 2006, the OEB announced a decision to apply an earnings sharing mechanism to equally share, between our shareholder and customers, any transmission earnings in excess of the approved rate of return of 9.88% for the period January 1, 2006 until new transmission rates are set.

In September 2006, we filed a transmission rate application through our subsidiary, Hydro One Networks Inc. (Hydro One Networks), seeking approval of a revenue requirement of $1,263 million for 2007 and $1,298 million for 2008, subject to minor updates in the normal course. This application is based on achieving a 10.5% return on equity and an increase in the common equity component of the capital structure from 36% to 40%. The proposed rate increases are 4.3% in 2007 and 2.7% in 2008, with the impact on an average customer's total bill estimated to be less than 0.5% in both years. Consistent with the OPA discussion papers, the application includes funding to enable new generation and ensure the adequacy of area supply, as well as the continued reliability of aging transmission assets. We believe the proposed regulated return, in conjunction with capital structure, supports the financial metrics underlying an A credit rating category, facilitating access to capital markets at reasonable rates.

On December 8, 2005, the OEB adjusted the revenue allocation factors for the Province's electricity transmitters. As a result, our share of overall provincial transmission revenue decreased by approximately $13 million per year, beginning in 2006.

Distribution Rates

As a distributor, we are responsible for delivering electricity and billing our customers for approved distribution rates, purchased power costs, and other approved regulatory charges. Our distribution rates were initially approved by the OEB in 2000 to provide for cost recovery and a return on deemed common equity targeted to be 9.88%. Related distribution rate increases were phased in over a number of years, with the final installment approved by the OEB in March 2005. In August 2005, we filed a distribution rate application seeking approval for a $160 million increase in the 2006 revenue requirement for our distribution business operated through Hydro One Networks. On April 12, 2006, the OEB announced its decisions regarding this application and that of our distribution business conducted by Hydro One Brampton Networks Inc. (Hydro One Brampton). On the basis of the written and oral evidence submitted, the OEB approved the requested increases in the revenue requirements based on an approved rate of return of 9.00%, effective May 1, 2006.

While current distribution rates are based on a cost of service rate regulation model, the OEB is in the process of establishing an Incentive Regulation Mechanism (IRM) for the years 2007–2010. Consistent with OEB guidelines, we plan to apply for distribution rate adjustments in February 2007, with minimal impact anticipated on the total customer bill. This application is based on an OEB-approved formula that considers inflation, efficiency targets and significant events outside the control of management.

On March 21, 2006, the OEB approved a monthly rate of 30 cents per residential customer, effective May 1, 2006, as initial funding for the required investment in smart meters. The distribution rate application, to be filed with the OEB in February 2007, will include a request to increase this level of smart meter funding. Expenditures in excess of recoveries are currently being recorded as a regulatory asset, with disposition to be established at a later date.

Results of Operations

Revenues

Year ended December 31

(Canadian dollars in millions)	2006	2005	$ Change	% Change
Transmission	1,245	1,310	(65)	(5)
Distribution	3,273	3,085	188	6
Other	27	21	6	29
	4,545	4,416	129	3
Average annual Ontario 60-minute peak demand *(MW)* [1]	22,650	23,074	(424)	(2)
Distribution – units distributed to customers *(TWh)* [1]	29.0	29.7	(0.7)	(2)

[1] System-related statistics include preliminary figures for December.

Transmission

Transmission revenues consist predominantly of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate maximum expected demand, which is primarily influenced by weather as well as economic conditions. Transmission revenues also include minor amounts of ancillary revenues which are primarily attributable to maintenance services provided to generators and secondary use of our land rights-of-way.

Transmission revenues decreased by $65 million, or 5% in 2006, compared to last year, reflecting two recent OEB decisions. On February 21, 2006, the OEB applied an earnings sharing mechanism to any transmission earnings in excess of our approved rate of return of 9.88% for the period January 1, 2006 until new rates are set. Consequently, 50% of excess earnings recovered from customers are deferred as a regulatory liability. This decision had the effect of reducing transmission revenues by $33 million for the year. On December 8, 2005, the OEB adjusted revenue allocation factors for all of the Province's electricity transmitters, reducing 2006 transmission revenues by $13 million.

In addition, 2006 monthly peak demands were generally lower than last year. While there were a few exceptions, notably the all-time record peak demand of 27,005 MW set on August 1 and the May record peak demand of 24,857 MW, our average annual Ontario 60-minute peak demand was 424 MW lower and the overall related load was 5,083 MW lower than last year, resulting in lower revenues of $26 million. The impact of these reductions was partially offset by a marginal increase in ancillary revenues related to revenues earned from the secondary use of our land rights-of-way.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are influenced by our distribution rates, the amount of electricity we distribute and the cost of purchased power. Distribution revenues also include minor ancillary services revenues, such as rental fees charged to telecommunications and cable television companies for the use of our poles, and miscellaneous charges such as those made for late payments.

Distribution revenues increased by $188 million, or 6%, in 2006 compared to last year, primarily as a result of two OEB-approved distribution tariff rate increases that became effective April 1, 2005 and May 1, 2006. The April 1, 2005 increase was originally scheduled to be effective March 1, 2003, and was subsequently suspended for all LDCs by the *Electricity Pricing Conservation and Supply Act, 2002*. On April 12, 2006, after reviewing our evidence, the OEB approved increases in distribution tariff rates for our distribution businesses conducted by Hydro One Networks and Hydro One Brampton, effective on May 1, 2006. We also received OEB approval for low-voltage rates for services provided to LDCs that are embedded within our service territory. These tariff rate increases support the maintenance and investment requirements of our distribution system, enabling the safe and reliable delivery of electricity to our customers throughout Ontario, and resulted in higher distribution revenues of $105 million compared to last year.

Distribution revenues also include the recovery of increased purchased power costs of $90 million, as described below under "Purchased Power." The impact of the increases in tariff rates and purchased power costs was partially offset by lower distribution tariff revenues of $5 million associated with lower demand, as well as marginally lower ancillary revenues.

Purchased Power

Purchased power costs incurred by our distribution business represent the cost of electricity delivered to customers within our distribution service territory. These costs consist of the wholesale commodity cost of electricity, the IESO's wholesale market service charges, and transmission charges levied by the IESO. From April 1, 2004 to March 31, 2005, for certain low-volume and designated customers, the commodity price of electricity was based on an interim two-tiered pricing structure. This structure was subsequently replaced by the OEB's RPP, which consists of a two-tiered pricing structure with threshold amounts adjusted twice annually. Customers who are not eligible for the RPP continue to pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the interim pricing plan and RPP affecting the two-year period 2005 and 2006 is provided below.

Summary of Interim Pricing Plan & RPP

		Tier Threshold (kWh/month)		Tier Rates (cents/kWh)	
Price Plan	Effective Date	Residential	Non-Residential	First Tier	Second Tier
Interim	April 1, 2004	750	750	4.7	5.5
RPP	April 1, 2005	750	750	5.0	5.8
RPP	November 1, 2005	1,000	750	5.0	5.8
RPP	May 1, 2006	600	750	5.8	6.7
RPP	November 1, 2006	1,000	750	5.5	6.4

Purchased power costs increased in 2006 by $90 million, or 4%, to $2,221 million compared to last year. Our increased purchased power costs were primarily due to higher costs of $189 million associated with the OEB's RPP for residential and other eligible customers, combined with the 2005 impact of providing the *Ontario Price Credit* to RPP customers in accordance with a regulation issued in October 2005. This $140 million credit was provided to RPP customers in 2005 to recognize a lower cost of power than the fixed commodity price for the period April 1, 2004 to March 31, 2005. These increases were partially offset by lower wholesale commodity prices of $137 million for customers who are not eligible for the RPP, and lower wholesale market service charges levied by the IESO of $55 million. The remaining $47 million reduction was due to a lower demand for electricity.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

Year ended December 31 (Canadian dollars in millions)	2006	2005	$ Change	% Change
Transmission	390	353	37	10
Distribution	460	413	47	11
Other	30	26	4	15
	880	792	88	11

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way increased by $37 million, or 10%, in 2006 compared to last year. Within our work programs, we continued to make the investments necessary to ensure the safe and reliable operation of our installed transmission system, with particular focus on the assets that are critical to generation and to the unrestricted supply of electricity to our customers. We experienced increased work program requirements of approximately $32 million this year, primarily related to increased station maintenance expenditures, including our focus on our 750 MVA autotransformers, higher employee benefit costs attributable to a lower discount rate for actuarially determined benefit costs, economic increases in materials and fuel costs and the impact of a labour disruption in 2005. Other support costs increased marginally by $5 million in 2006 compared to the previous year. Higher information technology requirements this year, combined with the impact of last year's recoveries associated with insurance settlements and bad debt recoveries, were substantially offset by this year's cost reduction associated with a negotiated property tax settlement.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage distribution system increased by $47 million, or 11%, compared to last year. We experienced increased work program requirements of approximately $50 million, primarily within our lines and customer care work programs. These increases reflect our recovery efforts following a series of destructive storms, particularly in the third quarter. In 2006, we experienced 10 significant storm events, compared to 4 in 2005. Consequently, our storm-related repair and maintenance expenditures for our distribution business increased by approximately $13 million to $21 million. In addition, our annual work program expenditures were impacted by higher fuel costs, the same economic increases that we experienced within our transmission business, and the effects of last year's labour disruption. Other costs incurred to support our distribution work programs declined by about $3 million, primarily as a result of our reassignment of resources to support our larger capital program this year, partially offset by the impact of higher information technology requirements.

Depreciation and Amortization

Depreciation and amortization expense increased by $28 million, or 6%, to $515 million this year. Depreciation expense was higher by $10 million relative to 2005, primarily as a result of the placement of new assets in service, consistent with our ongoing capital work program. Year-over-year, amortization of regulatory and other assets increased by $18 million. This increase was attributable to increased amortization of our regulatory assets as a result of the OEB's April 12, 2006 decision to approve recovery of certain regulatory assets.

Financing Charges

Financing charges declined by $30 million, or 9%, to $295 million compared to last year. Approximately $25 million of this decrease was due to a lower average effective interest rate on our outstanding long-term debt. In addition, we capitalized approximately $5 million more interest this year, primarily as a result of a higher level of capital expenditures.

Provision for Payments in Lieu of Corporate Income Taxes

We make payments in lieu of corporate income taxes to the Ontario Electricity Financial Corporation (OEFC) in accordance with the *Electricity Act, 1998* and on the same basis as if we were subject to federal and provincial corporate taxes. In providing for payments in lieu of corporate income taxes relating to our regulated businesses, the taxes payable method is used, whereas the liability method is used in computing the tax provision for our unregulated businesses.

The provision for payments in lieu of corporate income taxes declined by $19 million, or 10%, to $179 million in 2006 compared to 2005. Approximately $17 million of this reduction was due to this year's lower taxable income. The tax benefit of approximately $30 million that was recognized in the first quarter of 2006 pertaining to the recovery of prior years' corporate income taxes, was partially offset by the impact of last year's second quarter tax benefit in the amount of $21 million, which pertained to prior period tax losses of one of our subsidiaries. Payments in lieu of corporate income taxes were also reduced by tax changes enacted in the second quarter of 2006 relating to the elimination of the federal large corporations tax and higher capital cost allowance rates. These impacts were partially offset by taxes payable on transmission amounts received but not recognized for accounting purposes, primarily due to the OEB's earnings sharing mechanism.

Net Income

Net income of $455 million was lower by $28 million, or 6%, compared to 2005 results. Our net income for the year reflects higher expenditures required to operate and maintain our transmission and distribution systems, particularly as a result of the damaging storms we experienced this year, combined with lower transmission tariff revenues resulting from lower demand and the effects of the OEB's earnings sharing mechanism. The impact of these factors was partially offset by higher distribution tariff revenues associated with OEB-approved tariff rate increases and a marginal reduction in our effective tax rate. This tax rate reduction primarily resulted from the relative sizes of the tax benefits recognized in the first quarter of 2006 and in the second quarter of 2005.

Quarterly Results of Operations

The following table sets forth unaudited quarterly information for each of the eight quarters from March 31, 2005 through December 31, 2006. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)				2006				2005
Quarter ended	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**	Dec. 31	Sep. 30	Jun. 30	Mar. 31
Total revenues [1,2]	**1,142**	**1,165**	**1,078**	**1,160**	1,025	1,179	1,018	1,194
Net income [1,2]	**101**	**103**	**99**	**152**	104	133	115	131
Net income to common shareholder [1,2]	**96**	**99**	**94**	**148**	99	129	110	127

[1] The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and net income, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

[2] Under a new regulation issued in October 2005, RPP customers received a one-time credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and cost of power were both reduced by approximately $140 million. The application of the one-time credit did not result in any adjustment to net income.

Liquidity and Capital Resources

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These sources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, and payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash

Year ended December 31

(Canadian dollars in millions)	2006	2005
Operating activities	896	1,169
Financing activities		
Long-term debt issued	775	500
Long-term debt retired	(589)	(648)
Short-term notes payable	60	(40)
Dividends paid	(350)	(291)
Investing activities		
Capital expenditures	(823)	(691)
Other financing and investing activities	11	1
Net change in cash and cash equivalents	(20)	–

Operating Activities

Net cash from operating activities decreased by $273 million to $896 million, compared to 2005 results. This reduction primarily reflects the impact on our working capital requirements of providing RPP customers with the $140 million *Ontario Price Credit* early in 2006, funding for which was received by us from the IESO in late 2005. Our working capital requirements were also impacted by higher electricity prices charged to RPP customers in 2006, changes in the timing of tax payments and changes in trade accounts payable balances related to our work programs.

Financing Activities

Short-term liquidity is provided through funds from operations and our commercial paper program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. The commercial paper program is supported by a $750 million committed revolving credit facility with a syndicate of banks which matures in August 2007 and which has a two-year extension option. As at December 31, 2006, we had $60 million in short-term notes outstanding. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. At December 31, 2006, we had $5,270 million in long-term debt outstanding, including the current portion. Long-term financing is provided by our access to the debt markets, including our medium-term note program. Our notes and debentures mature between 2007 and 2046. We currently plan to refinance maturing debt principally through our medium-term note program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million, of which $1,725 million is remaining and is currently available until July 2007.

During 2006, Dominion Bond Rating Service Inc. raised our long-term debt rating to A (high), with a stable trend, from A with a positive trend. Our short-term debt rating was upgraded to R-1 (middle) from R-1 (low). Our credit ratings are:

	Rating	
Rating Agency	Short-term Debt	Long-term Debt
Standard & Poor's Ratings Services Inc.	A-1	A
Dominion Bond Rating Service Inc.	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3

We have customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement that supports our $750 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations.

During 2006, we issued $775 million in long-term debt under our medium-term note program and we repaid $589 million in maturing long-term debt. In comparison, during 2005 we issued $500 million in debt under our medium-term note program and we repaid $648 million in maturing long-term debt. In 2006, we increased our short-term notes by $60 million compared to a reduction of $40 million in 2005.

In 2006, we paid dividends to the Province in the amount of $350 million, consisting of $332 million in common dividends and $18 million in preferred dividends. In the comparative period, we paid common dividends of $273 million and preferred dividends of $18 million. In 2006, cash dividends per common share were $3,320 compared to $2,730 per common share in 2005. Cash dividends per preferred share were $1.375 in both 2006 and 2005.

Common dividends are declared at the sole discretion of our Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice, shareholder expectations, the level of net income and timing. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

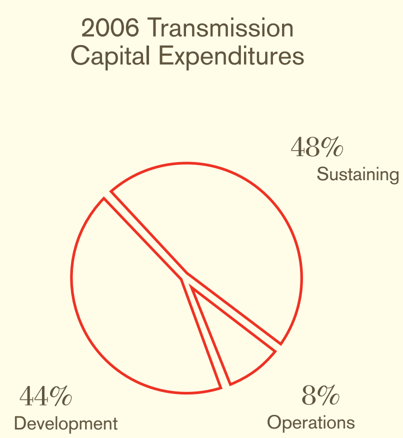
Cash used for investing activities, primarily representing capital expenditures to enhance and reinforce our transmission and distribution infrastructure in the public interest, was as follows:

Year ended December 31 (Canadian dollars in millions)	**2006**	2005	$ Change	% Change
Transmission	**402**	349	53	15
Distribution	**417**	338	79	23
Other	**4**	4	–	–
	823	691	132	19

Transmission

Transmission capital expenditures increased by $53 million in 2006 to $402 million, compared to 2005. Expenditures to expand and reinforce the transmission system were $179 million, $54 million higher than last year. These increased development investments primarily reflect higher required generation and load customer connection expenditures in this year. Our generation-related expenditures included a major reconfiguration of our Lambton Transformer Station, to enable the connection of new gas-fired generation. Increased load customer connection work included construction of a new transformer station to accommodate growth in Simcoe Region and work on transformer station improvements in Durham Region. Our development expenditures also included two critical projects to improve the flow of electricity in recognition of growing needs: the Niagara Reinforcement Project, which will reinforce the transmission system in the Niagara region and provide access to new sources of generation; and our Downtown Toronto Cable Project, which involves the construction of two underground cable circuits to reinforce our electricity transmission facilities. Our Niagara Reinforcement Project is essentially complete. Final completion continues to be delayed by the aboriginal land dispute in the Caledonia area and discussions continue between the affected aboriginal peoples and the various government entities involved. Once we regain access and perform a site condition assessment, we expect project completion within six weeks. In 2005, we substantially completed construction of the Parkway Transformer Station and refurbishment of the Cooksville Transformer Station. Both projects were carried out to accommodate the closure of the Lakeview Generating Station.

Our expenditures to sustain the existing transmission system were $192 million, representing a marginal decrease of $1 million compared to last year. Additional sustainment expenditures were made to replace storm-damaged equipment and to purchase new transformers. The impact of these requirements, together with the impact of last year's labour disruption, were substantially offset by reduced engineering and construction expenditures related to the refurbishment and replacement of end-of-life lines, stations and telecommunications assets. Other transmission capital expenditures were $31 million, unchanged from last year.

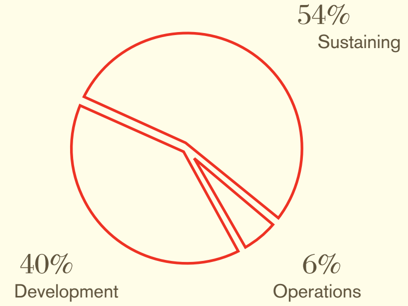


Distribution

Distribution capital expenditures increased by $79 million to $417 million in 2006, compared to the prior year. Expenditures to sustain our low-voltage distribution system were $225 million, an increase of $63 million over 2005. This increase was primarily a result of higher storm-related expenditures to replace damaged assets. Year-over-year capital expenditures for storm restoration were $62 million, an increase of $36 million. As a result of the significant storm activity this year, we replaced more than 1,600 distribution poles and more than 200 kilometres of line. Increased sustainment expenditures also reflect higher planned replacements of end-of-life assets, unplanned asset replacements and line relocations, as well as the impact of last year's labour disruption.

Capital expenditures to expand and reinforce our distribution network were $167 million, an increase of $20 million compared to last year. This increase primarily reflects our deployment of smart meters during the year. Our other distribution capital expenditures decreased by $4 million to $25 million.

2006 Distribution Capital Expenditures



Future Capital Expenditures
(Cdn $ millions)

Future Capital Expenditures

Our capital expenditures in 2007 are budgeted at about $1.25 billion, an increase of over $400 million from 2006 levels. The 2007 capital budgets for our transmission and distribution businesses are about $700 million and $500 million, respectively. Capital expenditures, as shown in the accompanying chart, are expected to be approximately $1.35 billion in 2008 and $1.5 billion in 2009, primarily reflecting increasing investments in necessary transmission infrastructure. The overall investment levels reflect transmission infrastructure requirements consistent with the OPA's discussion papers and the needs of our aging transmission system under continued challenging conditions of tight generation supply. These investments will facilitate an adequate and reliable supply of electricity in the public interest. The investment levels also reflect the mass deployment of smart meters within our distribution businesses beginning in 2007. The replacement of critical information technology systems is also contemplated. Capital expenditures of our other business segment are budgeted at about $20 million in 2007, largely due to the implementation of a dedicated optical network to provide secure, high capacity connectivity across numerous health care locations in Ontario.

Transmission

Transmission system capital expenditures are anticipated to be significant over the period 2007 to 2009, amounting to almost $2.4 billion. Our investment plan will address new development and supply enhancement initiatives, including system expansion, generation requirements and load connections. The transmission program also continues the focus on "mission critical" assets, which are those assets critical to generation facilities and the unrestricted transmission of energy to our customers.

The development component of our investment plan for transmission includes enhancements to the transmission system in the Bruce Peninsula to accommodate new wind generation and redeveloped nuclear generation; transmission reinforcements in the Greater Toronto Area (GTA), Southern Georgian Bay, Woodstock and Midtown Toronto; and a new interconnection between Ontario and Quebec. Initiatives taken by the Province and the OPA have led to many new generation developments and we are undertaking investments to connect many of these to the transmission system. Major connections include large new gas generators in Sarnia, the west GTA and downtown Toronto, and several large new wind farms. Several projects have need dates that cannot be met if approvals are delayed beyond the release of the IPSP. As such, we have initiated the processes required to file Leave-to-Construct applications with the OEB and to receive other approvals as required.

The investment plan also includes increased program expenditures to manage the replacement and refurbishment of our aging transmission infrastructure. Investments in mission critical assets ensure a reliable supply of energy throughout the province. Through targeted replacement programs for components such as gas insulated switchgear, air blast circuit breakers, and 750 MVA autotransformers, improved performance is anticipated, which should reduce system integrity risks.

At the local level, we continue to proactively address supply needs with our customers in order to meet load growth. For projects required to provide reliable delivery of electricity to communities, the participation and support of the affected LDCs as partners in joint planning studies and throughout the consultation and approval processes, continues to be essential. Examples of projects initiated to meet the growing needs of our customers include new transformer stations to serve Essex County and Simcoe County, and expansions of transformer stations serving Brampton, Kingston and Red Lake. Targeted investments in customer delivery point performance, power quality and our 115kV and 230kV systems will lead to improved reliability.

The timing of many development projects is uncertain as they are dependent upon the final IPSP and, in some instances, require approvals from various regulatory bodies, as well as negotiations and consultations with customers, neighbouring utilities and other stakeholders. We will not undertake large capital expenditures without a reasonable expectation of recovering them in our rates.

Distribution

Consistent with our approved 2006 distribution rate applications, capital expenditures for the period 2007 to 2009 are budgeted at approximately $1.7 billion. This amount includes core development and sustainment work as well as our smart meter program. Our core work will focus on new load connections, trouble calls and storm damage, wood pole replacement, and system capability reinforcement. Given initiatives to encourage renewable energy technologies, we also anticipate increased connection of new generators which could trigger the need for larger system modifications.

Our distribution investment plan includes the mass rollout of the smart meter program. Over the period 2007 to 2010, we anticipate installing over 1 million meters throughout our service territory. Consistent with the government policy, all homes and small businesses are to receive a smart meter by 2010. Total project costs are anticipated to be significant. In 2007, we plan to invest approximately $75 million under our smart meter program and install 240,000 meters. At the Province's request, we will review our implementation plan and associated costs for the period 2008 to 2010.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations, as well as other major commercial commitments:

December 31, 2006

(Canadian dollars in millions)	Total	2007	2008/2009	2010/2011	After 2011
Contractual obligations (due by year):					
Short-term note payable	60	60	–	–	–
Long-term debt – principal repayments	5,270	395	900	650	3,325
Long-term debt – interest payments	4,769	291	524	448	3,506
Inergi LP (Inergi) outsourcing agreement [1]	496	110	192	178	16
Operating lease commitments	16	5	9	1	1
Total contractual obligations	10,611	861	1,625	1,277	6,848
Other commercial commitments (by year of expiry):					
Bank line [2]	750	750	–	–	–
Letters of credit [3]	118	118	–	–	–
Guarantees [3]	275	275	–	–	–
Pension [4]	8	8	–	–	–
Total other commercial commitments	1,151	1,151	–	–	–

[1] On March 1, 2002, Inergi began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

[2] As a backstop to our commercial paper program, we have a $750 million, 364-day revolving standby credit facility with a syndicate of banks that matures in August 2007, with a two-year extension option.

[3] We currently have bank letters of credit of $93 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO as required by the Market Rules, using a combination of bank letters of credit of $22 million and parental guarantees of $275 million. Currently, the amount of prudential support that we provide in the form of bank letters of credit to the IESO is based on our highest long-term credit rating which is in the "Aa" category. The amount of bank letters of credit provided would need to increase if our highest credit rating deteriorated. For example, if our credit rating declined to the "A" category, the amount of bank letters of credit required to meet our prudential support obligation would be 1.7 times our current amount, and if our credit ratings declined to "BBB" category, the amount of bank letters of credit required to meet our prudential support obligation would be 3.3 times the current amount. The remaining amounts included in letters of credit pertain to operating letters of credit and to surety bonds.

[4] Contributions to the pension fund are made one month in arrears. Contributions after 2006 will be based on an actuarial valuation effective December 31, 2006 and will depend on future investment returns, changes in benefits or actuarial assumptions. Based on current factors, we currently estimate our annual pension contributions for 2007 and beyond to be up to $100 million.

The long-term debt amounts in the above table are not charged to our results of operations, but are reflected on our Balance Sheet and Statement of Cash Flows. Interest associated with this debt is recorded under financing charges on our Statement of Operations or within our capital expenditures. Payments in respect of operating leases and our outsourcing agreement with Inergi are recorded under operation, maintenance and administration costs on our Statement of Operations or within our capital expenditures.

Related Party Transactions

Related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder, the Province. The year-over-year changes in these amounts are described more fully in our discussion of our transmission revenues and purchased power costs. Other significant related party transactions include our dividends, which are paid to the Province, and our payments in lieu of corporate income taxes, which are paid or payable to the OEFC.

Risk Management and Risk Factors

We have an enterprise risk management program that aims at balancing business risks and returns. An enterprise-wide approach enables regulatory, strategic, operational and financial risks to be managed and aligned with our strategic business objectives.

While our philosophy is that risk management is the responsibility of all employees, the Audit and Finance Committee of our Board of Directors annually reviews our company's risk tolerances, our risk profile and the status of our internal control framework. Our President and Chief Executive Officer has ultimate accountability for risk management. Our Leadership Team, comprising direct reports to the President and Chief Executive Officer, provides senior management oversight of risk in our company. Our Chief Risk Officer is responsible for the ongoing monitoring and review of our risk profile and practices and our Chief Financial Officer for ensuring that the risk management program is an integral part of our business strategy, planning and objective setting. Each of our subsidiaries, as well as key specialist functions and field services, is required to complete a formal risk assessment and to develop a risk mitigation strategy.

The Audit and Finance Committee, the President and Chief Executive Officer, and the Chief Financial Officer are supported by our Chief Risk Officer. This support includes coordinating risk policies and programs, establishing risk tolerances, preparing risk assessments and profiles and assisting line and functional managers in fulfilling their responsibilities. Our internal audit staff is responsible for performing independent reviews of the effectiveness of risk management policies, processes and systems.

Ownership by the Province of Ontario

The Province owns all of our outstanding shares. Accordingly, the Province has the power to determine the composition of our Board of Directors and appoint the Chair, and thus influence major business and corporate decisions. Conflicts of interest may arise as a result of the Province's obligation to act in the best interests of the residents of Ontario in a broad range of matters, including the regulation of Ontario's electricity industry and environmental matters, any future sale or other transaction by the Province with respect to its ownership interest in our company and the determination of the amount of dividend or proxy tax payments. We may not be able to resolve potential conflicts with the Province on terms satisfactory to us.

Regulatory Risk

We are subject to regulatory risks, including the approval by the OEB of rates for our transmission and distribution businesses that permit a reasonable opportunity to recover the estimated costs of providing service on a timely basis and to earn the approved rates of return.

On September 12, 2006, Hydro One Networks filed, with the OEB, its application and evidence in support of its 2007 and 2008 transmission revenue requirements based on a capital structure with a higher equity component and a higher return on equity. Our operation, maintenance and administration expense levels have increased over time and our transmission business rate base has increased, reflecting prudent expenditures, since transmission rates were initially established. However, there is the risk that these increases may be disallowed by the OEB. Any disallowed capital expenditures would be charged to the results of operations in the period that the OEB renders its decision. Insufficient funding for our transmission business could adversely impact our financial results and the operating performance of the transmission system.

The OEB approves our transmission and distribution rates based on projected electricity load and consumption levels. If actual load or consumption falls below projected levels, our rate of return for either, or both, of these businesses could be adversely affected. Also, our current revenue requirements for these businesses are based on cost assumptions that may not materialize. There is no assurance that the OEB would allow rate increases sufficient to offset unfavourable financial impacts from unanticipated changes in electricity demand or in our costs.

Our load could also be negatively impacted by successful CDM programs. Current requirements for CDM call for a 5% reduction in Ontario's projected peak electricity demand by 2007, which could significantly reduce our revenues, particularly transmission. The OEB has recognized the need to compensate utilities for such lost revenue, but the approach, level and timing of such compensation is yet to be determined. We are also subject to risk of revenue loss from other factors. For example, recent revisions to the OEB's *Transmission System Code* have resulted in customers gaining the right to bypass some of our transmission facilities by constructing their own assets under certain conditions.

There is also a risk we could be required to invest in large-scale transmission infrastructure projects, to incur unexpected capital expenditures to maintain or improve our assets, and to connect new third-party generation assets. The Province has passed regulations authorizing us to procure smart meters but we are only currently authorized to recover 30 cents of the associated costs in rates. While we expect all of our expenditures to be fully recoverable after OEB review, any future regulatory decision to disallow or limit the recovery of such costs would lead to potential charges to our results of operations.

Asset Condition

We continually maintain our assets to provide reliable service and to accommodate customer needs. However, our installed asset base is aging to the point where the assets require increased maintenance, major refurbishment or replacement. Executing these activities is also becoming more challenging as the opportunities to remove equipment from service to accommodate work are becoming increasingly limited. Consequently, we may not be able to complete the necessary repairs and replacements on a cost-effective or timely basis, which could affect transmission reliability and our ability to deliver sufficient electricity.

Risk Associated with Transmission Projects

Significant investments are needed to increase transmission capacity and enable the delivery of reliable electricity from existing and new generation sources to Ontario consumers. These investments are, in most cases, subject to OEB approvals, which can include expropriation, and where required, environmental approvals and consultation and possibly accommodation with First Nations. The ability to make such investments may also be impacted by public opposition. If we are unable to make these necessary investments, the reliability of our transmission system and our ability to deliver sufficient electricity could be materially adversely affected.

Work Force Demographic Risk

Approximately 25% of our employees will be eligible for retirement by 2008. We expect the skilled labour market for our industry to remain highly competitive in the future. Consequently, we must continue to advance our training and apprenticeship programs and succession plans to ensure that our future operational staffing needs will be met. If we are unable to attract and retain qualified personnel, our operations could be adversely affected.

Labour Relations Risk

The substantial majority of our employees are represented by either the Power Workers' Union or the Society of Energy Professionals. Existing collective agreements with the Power Workers' Union and the Society of Energy Professionals expire on March 31, 2008. We face financial risks related to our ability to negotiate collective agreements consistent with our rate orders. In the event of a labour dispute, we could face some degree of operational risk related to continued compliance with our licence requirements of providing service to customers.

Environmental Risk

We are subject to extensive environmental regulation and failure to comply could subject us to fines and other penalties. In addition, the presence or release of hazardous or other substances could lead to claims by third parties and/or governmental orders requiring us to take specific actions such as investigating, controlling and remediating the effects of these substances. We are currently undertaking a voluntary land assessment and remediation program covering most of our stations and service centres. There is also risk associated with obtaining governmental approvals, permits, or renewals of existing approvals and permits related to constructing or operating facilities. This may require environmental assessment or result in the imposition of conditions, or both, which could mean delays and cost increases.

Future changes in environmental regulations may result in material changes to our estimates of future expenditures to complete this work. On November 4, 2006, Environment Canada published new draft regulations governing the management of polychlorinated biphenyls (PCBs). It is expected that these draft regulations will be finalized later in 2007. We have estimated the non-capital expenditures for complying with these draft regulations to be between $250 million and $375 million in excess of amounts we have already recorded as environmental liabilities on our balance sheet. If required, most of these additional expenditures would be incurred in the 2013 to 2025 period. No obligation has been recorded in the financial statements for these increased expenditures due to continued uncertainty regarding the timing and content of the final regulations. In any case, actual future environmental expenditures may vary materially from the estimates used in the calculation of the environmental liabilities on our balance sheet. We do not have insurance coverage for these environmental expenditures.

Scientists and public health experts have been studying the possibility that exposure to electric and magnetic fields emanating from power lines and other electric sources may cause health problems. If it were to be concluded that electric and magnetic fields present a health risk, we could face litigation, be required to take costly mitigation measures such as relocating some of our facilities or experience difficulties in locating and building new facilities.

Risk of Natural and Other Unexpected Occurrences

Our facilities are exposed to the effects of severe weather conditions, natural disasters and catastrophic events. Although constructed, operated and maintained to withstand such occurrences, our facilities may not do so in all circumstances. We do not have insurance for damage to our assets located outside our transmission and distribution stations. Lost revenues, repair costs, damage and claims from third parties could be substantial. In the event of a large uninsured loss, we would apply to the OEB for the recovery. However, there is no assurance that the OEB would approve such an application.

Risk Associated with Arranging Debt Financing

We expect to borrow to repay our existing indebtedness and to fund capital expenditures. A substantial portion of our existing debt matures between 2007 and 2010. We also plan to incur total capital expenditures of approximately $1.25 billion in 2007 and $1.35 billion in 2008. Cash generated from operations, after the payment of expected dividends, will not be sufficient to fund the repayment of our existing indebtedness and our future capital expenditures. Our ability to arrange sufficient and cost-effective debt financing could be adversely affected by numerous factors, including the regulatory environment in Ontario, our results of operations and financial position, market conditions, the ratings assigned to our debt securities by credit rating agencies and general economic conditions. Any failure or inability on our part to borrow substantial amounts of debt on satisfactory terms could impair our ability to repay maturing debt, fund capital expenditures and meet other obligations and requirements and, as a result, could have a material adverse effect on our business.

Pension Plan Risk

We have a defined benefit registered pension plan for the majority of our employees. Contributions to the pension plan are established by actuarial valuations which are filed with the Financial Services Commission of Ontario on a tri-annual basis. The next valuation will be prepared as at December 31, 2006 and must be filed on or before September 30, 2007. The required level of contributions effective January 1, 2007 will depend on future investment returns, changes in benefits, and changes in actuarial assumptions. Based on current factors, we estimate annual pension contributions for 2007 and beyond to be up to $100 million per annum. Pension costs are subject to approval by the OEB. Failure to attain OEB approval could have an adverse effect on our results of operations.

Risk from Transfer of Assets Located on Indian Lands

The transfer orders by which we acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on lands held for bands or bodies of Indians under the *Indian Act* (Canada). Currently, the OEFC holds these assets. Under the terms of the transfer orders, we are required to manage these assets until we have obtained all consents necessary to complete the transfer of title of these assets to us. We cannot predict the aggregate amount that we may have to pay, either on an annual or one-time basis, to obtain the required consents. However, we anticipate having to pay more than the approximately $850,000 per year that we are currently paying to these Indian bands and bodies. If we cannot obtain consents from the Indian bands and bodies, the OEFC will continue to hold these assets for an indefinite period of time. If we cannot reach a satisfactory settlement, we may have to relocate these assets from the Indian lands to other locations or replace them at a cost that could be substantial. These potential costs could have an adverse effect on our results of operations if we are unable to recover them in future rate orders.

Risk from Provincial Ownership of Transmission Corridors

Although we have the statutory right to use the transmission corridors, we may be limited in our ability to expand our systems. Also, other uses of the transmission corridors in conjunction with the operation our systems may increase safety or environmental risks.

Risk Associated with Information Technology Infrastructure

Our ability to operate effectively in the Ontario electricity market is in part dependent upon us developing, maintaining and managing complex information technology systems that are employed to operate our transmission and distribution facilities, financial and billing systems, capture data and produce timely and accurate information used in our business. System failures could have a material adverse effect on our company.

Risk Associated with Outsourcing Arrangement

Consistent with our strategy of reducing our operating costs, in 2002 we entered into an outsourcing services agreement with Inergi. If this agreement is terminated for any reason, we could be required to incur significant expenses to re-establish all or some of the outsourced functions, which could have an adverse effect on our results of operations.

Market and Credit Risk

Market risk refers primarily to risk of loss related to changes in commodity prices, foreign exchange and interest rates. We do not have commodity risk and our foreign exchange risk is currently insignificant, although we could in future decide to issue foreign currency denominated debt. We are exposed to fluctuations in interest rates as our maturing long-term debt is refinanced. We estimate that a 1% change in interest rates on the refinancing of long-term debt maturing in 2007 and 2008 would have an impact on net income of approximately $2 million and $4 million, respectively. We periodically utilize interest rate swap agreements to mitigate elements of interest rate risk.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. Derivative financial instruments result in exposure to credit risk, since there is a risk of counter-party default. We monitor and minimize credit risk through various techniques, including dealing with highly rated counter-parties, limiting total exposure levels with individual counter-parties, and by entering into master agreements which enable net settlement. We do not trade in any energy derivatives. We currently have one interest rate swap contract outstanding with a notional principal amount of $40 million and an insignificant fair value.

Currently, there are no significant concentrations of credit risk with respect to any class of financial assets. We are required to procure electricity on behalf of competitive retailers and embedded LDCs for resale to their customers. The resulting concentrations of credit risk are mitigated through the use of various security arrangements, including letters of credit, which are incorporated into our service agreements with these retailers in accordance with the OEB's *Retail Settlements Code*.

Critical Accounting Estimates

The preparation of our financial statements requires us to make estimates and judgements that affect the reported amounts of assets, liabilities, revenues and costs, and related disclosures of contingencies. We base our estimates and judgements on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgements about the carrying values of assets and liabilities as well as identifying and assessing our accounting treatment with respect to commitments and contingencies. Actual results may differ from these estimates and judgements under different assumptions or conditions.

We believe the following critical accounting estimates involve the more significant estimates and judgements used in the preparation of our financial statements:

Regulatory Assets and Liabilities

Regulatory assets as at December 31, 2006 amounted to $311 million and principally relate to the regulatory asset recovery accounts (RARAs), employee future benefits other than pension, environmental costs, and expenditures associated with the smart meter program. We have also recorded regulatory liabilities amounting to $473 million as at December 31, 2006. These amounts pertain primarily to pension, export and wheeling fees, and the transmission earnings sharing mechanism. These assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment, as it has for employee future benefits other than pension regulatory asset, the environmental regulatory asset and the RARAs, or if future OEB direction is judged to be probable. Most of our regulatory assets have been reviewed by the OEB and confirmed as recoverable.

To date, our smart meter expenditures and recoveries have been recorded in regulatory asset accounts consistent with OEB guidance. The timing and amount of inclusion of these amounts in our Statement of Operations is currently uncertain and will depend on future OEB decisions as well as other factors.

If management judges that it is no longer probable that the OEB will include a regulatory asset or liability in the setting of future rates, the relevant regulatory asset or liability would be charged or credited to results of operations in the period in which that judgement is made.

Environmental Liabilities

We record liabilities and related assets for the present value of the estimated future expenditures to be made to settle obligations related to legacy environmental contamination inherited upon our demerger from Ontario Hydro in 1999. These liabilities fall into two main categories: the management of PCB-contaminated assets and mineral oils and the assessment and remediation of contaminated lands. In determining the amounts to be recorded as environmental liabilities, we estimate the current cost of completing the work and make assumptions for when the future expenditures will actually be incurred to generate future cash flow information. A long-term inflation assumption of 2% has been used to express current cost estimates as future expenditures. These expenditure amounts have been discounted using a factor of 6.25%. Recording a liability for such long-term future expenditures requires that many other assumptions be made, such as the number of contaminated properties and the extent of contamination, and the number and contamination levels of assets with PCBs. All factors used in deriving our environmental liabilities represent management's best estimates. However, it is reasonably possible that numbers or volumes of contaminated assets, current cost estimates, inflation assumptions and assumed pattern of annual cash flows may differ significantly from our assumptions. Estimated environmental liabilities are reviewed annually or whenever significant changes in regulation occur. Estimate changes are accounted for prospectively.

Employee Future Benefits

We provide employee future benefits to our current and retired employees, including pension, group life insurance, health care and long-term disability.

In accordance with our rate orders, we record pension costs when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Our annual pension contributions are approximately $80 million per year over the period 2004 through to 2006. Contributions after 2006 will be based on an actuarial valuation effective December 31, 2006 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension costs are also disclosed in the notes to the financial statements on an accrual basis. We record employee future benefit costs other than pension on an accrual basis. The accrual costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. The assumptions were determined by management recognizing the recommendations of our actuaries.

The assumed return on pension plan assets of 6.75% per annum is based on expectations of long-term rates of return at the beginning of the fiscal year and reflects a pension asset mix consistent with the Fund's investment policy. During the year the Fund's target asset mix was changed to 62% exposure to equities, 33% to fixed income and 5% in alternative assets consisting of hedge funds and private equity. Returns on the respective portfolios are determined with reference to published Canadian and U.S. stock indices and long-term bond and treasury bill indices. The assumed rate of return on pension plan assets reflects our long-term expectations. We believe that this assumption is reasonable because, with the fund's balanced investment approach, the higher volatility of equity investment returns is offset by the greater stability of fixed income and short-term investment returns. The net result, on a long-term basis, is a somewhat lower return than might be expected by investing in equities alone. The return on pension plan assets exceeded this long-term assumption in 2006.

The weighted-average discount rate used to calculate the accrued benefit obligations is determined each year end by referring to the most recently available market interest rates based on AA corporate bond yields reflecting the duration of the applicable employee future benefit plan. The discount rates at December 31, 2006 increased by 0.25% from those at December 31, 2005 in conjunction with increase in bond yields over this period. The increase in discount rates has resulted in a corresponding reduction in liabilities.

The costs of employee future benefits other than pension are determined at the beginning of the year. The costs are based on assumptions for expected claims experience and future health care cost inflation. A 1% increase in the health care cost trends would result in an increase in service cost and interest cost of about $13 million per year.

Employee future benefits are included in labour costs that are either charged to results of operations or capitalized as part of the cost of fixed assets. Changes in assumptions will affect the accrued benefit obligation of the employee future benefits and the future years' amounts that will be charged to our results of operations or capitalized as a cost of fixed assets.

Goodwill

In assessing the recoverability of goodwill, we must make assumptions regarding estimated future cash flows and other factors to determine the fair value of the distribution reporting unit. If these estimates or their related assumptions change in the future, we may be required to record impairment charges related to goodwill. An impairment review of goodwill was carried out during 2006 and we determined that the carrying value of our goodwill has not been impaired.

Emerging Accounting Pronouncements

Transition to International Financial Reporting Standards (IFRS)

On January 10, 2006, the Canadian Accounting Standards Board (AcSB) ratified a new strategic plan that will significantly affect the way financial reporting will be carried out in Canada. For companies such as ours, the plan entails converging Canadian generally accepted accounting principles (GAAP) with IFRS over a five-year transitional period. The AcSB published an updated detailed implementation plan for achieving convergence in June 2006. The plan calls for the first year of reporting under IFRS to be 2011. At that point, Canadian GAAP will cease to exist as a separate, distinct basis of financial reporting for public companies. Due to the complexity of implementing this new accounting framework, we began our transition preparations in 2006.

Accounting for Rate-Regulated Operations

Following the approval of its new strategic plan to adopt IFRS, the AcSB revisited the scope of its project on rate-regulated accounting in recognition of the fact that that IFRS does not currently provide any special accounting treatment for rate-regulated enterprises. As a result, the AcSB is expected to issue an exposure draft in early 2007 to propose removal of all specific references to rate-regulated accounting from the Handbook of the Canadian Institute of Chartered Accountants (CICA). It is expected that the AcSB will allow qualifying enterprises to apply the relevant U.S. accounting standard, Statement of Financial Accounting Standard 71 *Accounting for the Effects of Certain Types of Rate Regulation* (SFAS 71). Enterprises subject to rate regulation will be qualified to use SFAS 71 as long as they meet the specific criteria found in that accounting standard and as long as they apply it in the manner the U.S. standard setter intended. We believe our company meets these criteria. The future application of SFAS 71 will have an impact on our financial statements. Accrual accounting practices will be followed for payments in lieu of corporate taxes, which are currently accounted for on a cash basis as a result of specific OEB direction. The difference between the accrual and cash basis will be reflected through the recognition of additional regulatory assets and, consequently, the impact on our results of operations is expected to be minimal.

Financial Instruments

In 2005, the CICA issued new accounting standards comprising Handbook Section 3855, *Financial Instruments Recognition and Measurement;* Section 3865, *Hedges and* Section 1530, *Comprehensive Income*, all of which become effective for us on January 1, 2007.

The standards require that all financial assets, including derivatives, be carried at fair value on the balance sheet, with the exception of loans, receivables and investments classified as held to maturity, which will be measured at amortized cost. Similarly, all derivative financial liabilities will be measured at fair value on the balance sheet. Other financial liabilities will be measured at amortized cost.

The standards also revise the existing accounting requirements for hedges and establish guidance for reporting comprehensive income, which includes net income and other comprehensive income. Any hedge ineffectiveness will be recognized immediately in the results of operations. Any changes in the fair value of cash flow hedging instruments, to the extent effective, will be recorded in other comprehensive income until the asset or liability being hedged affects the Statement of Operations, at which time the related change in fair value of the derivative will also be recorded in the Statement of Operations. Unrealized gains and losses on changes in the fair value of cash flow hedging instruments will be recorded as other comprehensive income until recognized in the Statement of Operations. This would include any remaining balance of deferred gain or loss on a cash flow hedge that was discontinued prior to the transition date.

Given the nature of our financial instruments and borrowing programs, we do not believe that the transitional impact of the new accounting standards will have a material financial impact on our company.

Accounting for Pension and Other Post-Retirement Costs

In October 2006, the AcSB commenced a project that is expected to result in a requirement to include the funded status (the difference between the plan assets and obligations) of an entity's post-retirement benefit plans on the balance sheet and to recognize changes in the funded status in comprehensive income in the year in which the changes occur. Current Canadian GAAP only requires disclosure of the funded status in the notes to the financial statements. The project will affect disclosures relating to our pension plan, supplementary pension plan, other post-employment and other post-retirement benefits. In addition, the proposals are expected to have a significant adverse impact on our financial ratios. The proposals, however, are not expected to impact our credit rating. The AcSB expects to publish the exposure draft for public comment in the first quarter of 2007 and it is expected to be effective for our company on December 31, 2007. This timing is expected to allow sufficient time to assess the effects on financial metrics referred to in existing contractual arrangements, including debt covenants.

Disclosure Controls and Internal Controls Over Financial Reporting

As a reporting issuer we are required to comply with the Ontario Securities Commission's Multilateral Instrument 52-109 (Multilateral Instrument) concerning internal control and related certifications, often referred to as Bill 198. In 2004, we initiated a formal project to evaluate our disclosure controls and internal controls over financial reporting. During 2005, we designed and evaluated the effectiveness of our disclosure control procedures. Commencing with our Consolidated Financial Statements for the year ended December 31, 2005, we certified that these disclosure controls and procedures provide reasonable assurance that all information considered necessary for appropriate disclosure has been accumulated and communicated to management on a timely basis.

During 2006 we completed our documentation, evaluation and remediation of internal controls over financial reporting. Our documentation includes flowcharts of key processes, risk matrices, and overviews of test results and remediation activities. The majority of findings related to the evidencing of controls and all remediation was completed during the period. Our focus for 2007 will be the ongoing sustainment of our control environment including communication, evaluation and enhancements, as required to support the certifications of our President and Chief Executive Officer, and Chief Financial Officer (Certifying Officers).

In compliance with the requirements of the Multilateral Instrument, our Certifying Officers have reviewed and certified the Consolidated Financial Statements for the year ended December 31, 2006, together with other financial information included in annual securities filings. Our Certifying Officers have also certified that disclosure controls and procedures have been designed to provide reasonable assurance that material information relating to our company is made known within our company and operated effectively during the period. Further, our Certifying Officers have also certified that internal controls over financial reporting are designed to provide reasonable assurance regarding the reliability of financial reporting and the presentation of financial statements for external purposes in accordance with GAAP. Our Certifying Officers have evaluated the effectiveness of our disclosure controls and procedures and have found them to be effective.

Outlook

To meet our challenge of being the best transmission and distribution company in North America, we will continue to concentrate on our top strategic priorities relating to safety, our customers, system reliability, financial stewardship and our employees. Significant improvements have been made toward achieving our long-term customer satisfaction and safety targets, while we maintain our strong financial profile and reliability performance. In addition, the North American Electric Reliability Council gave our transmission operating facilities, work processes and staff a grading of excellence for our ability to reliably operate and maintain Ontario's electricity transmission system. The EEI has also honoured us with an emergency recovery award, recognizing the outstanding efforts of our staff in restoring electricity service this summer after the significant damage caused by successive storms.

With the approval and implementation of the 2006 distribution rate increase, we are reasonably well positioned to address current distribution work program requirements and to earn the regulated rate of return. This will allow us to further the forestry program and continue initiatives to improve reliability and customer service. We continue to face challenges with regard to funding for our smart meter program. We expect to address some of the shortfall in our February 2007 application and anticipate full funding to be achieved over time.

We remain committed to a prudent and measured approach to distribution rationalization. The Province plans to lift the moratorium on the purchase and sale of electricity distribution assets by Hydro One, with the understanding that any future asset purchases or dispositions help further overall provincial policy interests in the sector. We plan to respond to opportunities, on a voluntary and commercial basis, where they are consistent with strategy. The investment plan does not include any funding for LDC acquisitions or divestitures. In addition, the distribution investment plan does not provide for the implementation of a Smart Network, which would leverage the smart meter technology to enable further internal productivity initiatives through wireless broadband.

Consistent with our continued commitment to the public interest and the Province's energy policies, we are planning significant investments in transmission infrastructure and the continued proactive maintenance of mission critical assets to ensure the system's continued reliability. Our transmission investment plan supports the achievement of supply mix goals, facilitates the development and use of renewable energy resources, promotes system efficiency and congestion reduction, and facilitates the integration of new supply. The OPA has presented the needs and options for reinforcing and expanding Ontario's transmission system, and discussed the specific transmission initiatives forming the basis of the preliminary IPSP. Significant investments in transmission will be required over the 20-year planning horizon of the IPSP, which is expected to be submitted by the OPA to the OEB in March 2007. In September, we filed a transmission cost of service rate application with the OEB that includes the funding required for this necessary transmission infrastructure, which is vital to the Ontario economy. Given the issued schedule, a decision on our rate application is anticipated late in 2007. Our outlook is premised on the successful outcome of this application.

Our investment plan does not include spending for large-scale investments, such as the expansion of the east-west transmission grid. Funding for required infrastructure to accommodate Bruce Peninsula supply continues beyond the planning period to 2011. Completion of the Toronto third supply option, which is expected to cost in the order of $400 million, also extends beyond the current planning horizon. This project is required to mitigate the risks associated with having only two major supply corridors to the City of Toronto and, as such, to maintain reliability.

Through the outlook period, we anticipate that our financial returns will be sufficient to maintain a healthy financial condition, stable credit quality and consistent credit ratings on our long-term debt.

Forward-Looking Statements and Information

Our oral and written public communications, including this Management's Discussion and Analysis (MD&A), often contain forward-looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to statements regarding future capital expenditures; statements about the installation and cost of smart meters; expectations surrounding future pension contributions; statements regarding potential incremental environmental expenditures; and expectations concerning the impact of new accounting standards. Words such as "expect," "anticipate," "intend," "attempt," "may," "plan," "will," "believe," "seek," "estimate," and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward-looking statements, whether written or oral, or whether as a result of new information, future events or otherwise, except as required by law.

These forward-looking statements are based on a variety of factors and assumptions including, but not limited to the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; favourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; and no significant events occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third-party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

— the content of the final IPSP, as approved by the OEB;

— delays or denials of the requisite approvals for planned future capital expenditures;

— regulatory decisions regarding our revenue requirements and tariff rates;

— significant changes to Environment Canada's draft PCB regulations issued on November 4, 2006; and

— future interest rates, inflation, changes in benefits and changes in actuarial assumptions.

We caution the reader that the above list of factors is not exhaustive. Some of these and other factors are discussed in more detail under "Risk Management and Risk Factors" in this Management's Discussion and Analysis. You should review the section entitled "Risk Management and Risk Factors" in detail.

This Management's Discussion and Analysis is dated as at February 14, 2007. Additional information about our company, including our annual information form, is available on SEDAR at www.sedar.com.

Management's Report

The Consolidated Financial Statements, Management's Discussion and Analysis (MD&A) and related financial information presented in this Annual Report have been prepared by the management of Hydro One Inc. ("Hydro One" or the "Company"). Management is responsible for the integrity, consistency and reliability of all such information presented. The Consolidated Financial Statements have been prepared in accordance with accounting principles generally accepted in Canada and applicable securities legislation. The MD&A has been prepared in accordance with National Instrument 51-102, Part 5.

The preparation of the Consolidated Financial Statements and information in the MD&A involves the use of estimates and assumptions based on management's judgement, particularly when transactions affecting the current accounting period cannot be finalized with certainty until future periods. Estimates and assumptions are based on historical experience, current conditions and various other assumptions believed to be reasonable in the circumstances, with critical analysis of the significant accounting policies followed by the Company as described in Note 2 to the Consolidated Financial Statements. The preparation of the Consolidated Financial Statements and the MD&A includes information regarding the estimated impact of future events and transactions. The MD&A also includes information regarding sources of liquidity and capital resources, operating trends, risks and uncertainties. Actual results in the future may differ materially from the present assessment of this information because future events and circumstances may not occur as expected. The Consolidated Financial Statements and MD&A have been properly prepared within reasonable limits of materiality and in light of information up to February 14, 2007.

In meeting the responsibility for the reliability of financial information, management maintains and relies on a comprehensive system of internal control and internal audit. The system of internal control includes a written corporate conduct policy; implementation of a risk management framework; effective segregation of duties and delegation of authorities; and sound and conservative accounting policies that are regularly reviewed. This structure is designed to provide reasonable assurance that assets are safeguarded and that reliable information is available on a timely basis. An internal audit function independently evaluates the effectiveness of these internal controls on an ongoing basis and reports its findings to management and the Audit and Finance Committee of the Hydro One Board of Directors.

The Consolidated Financial Statements have been examined by Ernst & Young LLP, independent external auditors appointed by the Hydro One Board of Directors. The external auditors' responsibility is to express their opinion on whether the Consolidated Financial Statements are fairly presented in accordance with generally accepted accounting principles. The Auditors' Report, which appears on page 45, outlines the scope of their examination and their opinion.

The Hydro One Board of Directors, through its Audit and Finance Committee, is responsible for ensuring that management fulfills its responsibilities for financial reporting and internal controls. The Audit and Finance Committee of Hydro One met periodically with management, the internal auditors, and the external auditors to satisfy itself that each group had properly discharged its respective responsibility and to review the Consolidated Financial Statements before recommending approval by the Board of Directors. The external auditors had direct and full access to the Audit and Finance Committee, with and without the presence of management, to discuss their audit and their findings as to the integrity of the financial reporting and the effectiveness of the system of internal controls.

The Company's President and Chief Executive Officer, and Chief Financial Officer have certified Hydro One's annual Consolidated Financial Statements and annual MD&A filed under provincial securities legislation, and related disclosure controls and procedures, pursuant to Multilateral Instrument 52-109.

On behalf of Hydro One Inc.'s management:

Laura Formusa
President and Chief Executive Officer (Acting)

Beth Summers
Chief Financial Officer

Auditors' Report

To the Shareholder of Hydro One Inc.

We have audited the Consolidated Balance Sheets of Hydro One Inc. (the Company) as at December 31, 2006 and December 31, 2005, and the Consolidated Statements of Operations, Retained Earnings and Cash Flows of the Company for each of the years in the two-year period ended December 31, 2006. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these Consolidated Financial Statements present fairly, in all material respects, the financial position of the Company as at December 31, 2006 and December 31, 2005, the results of its operations and its cash flows for each of the years in the two-year period ended December 31, 2006 in accordance with Canadian generally accepted accounting principles.

Note 1.
Description of the Business

Hydro One Inc. (Hydro One or the Company) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

Note 2.
Significant Accounting Policies

Basis of Consolidation

The Consolidated Financial Statements include the accounts of the Company and its wholly owned subsidiaries: Hydro One Networks Inc. (Hydro One Networks), Hydro One Remote Communities Inc. (Hydro One Remote Communities), Hydro One Brampton Inc., Hydro One Brampton Networks Inc. (Hydro One Brampton), Hydro One Telecom Inc., Hydro One Delivery Services Company Inc., Hydro One Network Services Inc. (Hydro One Network Services), 1316664 Ontario Inc., formerly Ontario Hydro Energy Inc. (Ontario Hydro Energy), and Hydro One Markets Inc. (Hydro One Markets).

Hydro One Brampton Inc. was dissolved on January 30, 2007. Hydro One Network Services will be dissolved pursuant to the *Business Corporations Act* (Ontario) in 2007. The former Ontario Hydro Energy and Hydro One Markets were dissolved during 2005.

Basis of Accounting

The Consolidated Financial Statements are prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP).

Rate Setting

The rates of the Company's electricity transmission and distribution businesses are subject to regulation by the OEB. Existing transmission rates were set in 1999 to provide a targeted return of 9.88% on deemed common equity and were based on cost of service rate regulation. In October 2005, the OEB initiated a proceeding to review Hydro One's transmission rates and to approve revenue requirements for 2006, 2007 and 2008. On February 21, 2006, the OEB announced a decision to apply an earnings sharing mechanism to equally share, between Hydro One's shareholder and its customers, any transmission earnings in excess of the approved rate of return of 9.88% for the period January 1, 2006 until new transmission rates are set. In September 2006, Hydro One Networks filed a transmission rate application. A decision on this application and the resulting revised transmission rates are anticipated in 2007.

The Company's distribution rates are also based on a revenue requirement that includes a rate of return. On April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the distribution business of Hydro One Networks. On the basis of the written and oral evidence submitted, the OEB approved the requested increase in the revenue requirement based on a reduction in the approved rate of return, from a targeted 9.88% to 9.00%, effective May 1, 2006.

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing involves the application of rate-regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities which represent amounts for expenses incurred in different periods than would be the case had the Company been unregulated. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made. Specific regulatory assets and liabilities are disclosed in Note 8.

Revenue Recognition and Allocation

Transmission revenues are collected through OEB-approved rates, which are based on an approved revenue requirement that includes a rate of return. Such revenue is recognized as power is transmitted and delivered to customers.

Distribution revenues attributable to the delivery of electricity are based on OEB-approved distribution rates and are recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2006 amounted to $386 million (2005 – $377 million).

Distribution revenue also includes an amount relating to rate protection for rural residential and remote customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential and remote consumers by reducing the electricity rates that would otherwise apply.

Segment revenues for transmission, distribution and other also include revenue related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, Hydro One is required to make payments in lieu of corporate taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act, 1998*, and related regulations.

The Company provides for payments in lieu of corporate income taxes relating to its regulated businesses using the taxes payable method as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from the customers of Hydro One at that time. The Company provides for payments in lieu of corporate income taxes relating to its unregulated businesses using the liability method.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost, which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the approved allowance for funds used during construction applicable to capital construction activities within regulated businesses, or interest applicable to capital construction activities within unregulated businesses.

Fixed assets in service consist of transmission, distribution, communication, administration and service assets and easements. Fixed assets also include future use assets such as land and capitalized development costs associated with deferred capital projects.

Some of the Company's transmission and distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations, conditional or otherwise. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of most asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of disposing of assets that the Company is legally required to remove, a related asset retirement obligation will be recognized at that time.

Transmission

Transmission assets include assets used for the transmission of high-voltage electricity, such as transmission lines, support structures, foundations, insulators, connecting hardware and grounding systems, and assets used to step up the voltage of electricity from generating stations for transmission and to step down voltages for distribution, such as transformers, circuit breakers and switches.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication

Communication assets include the fibre-optic and microwave radio system, optical ground wire, towers, telephone equipment and associated buildings.

Administration and Service

Administration and service assets include administrative buildings, major computer systems, personal computers, transport and work equipment, tools, vehicles and minor fixed assets.

Easements

Easements include statutory rights of use to transmission corridors and abutting lands granted under the *Reliable Energy and Consumer Protection Act, 2002*, as well as other amounts related to access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis. Financing costs are capitalized on fixed assets under construction based on the allowance for funds used during construction (2006 – 6.39%; 2005 – 6.80%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment and personal computers, which are depreciated on a declining balance basis.

Depreciation rates for the various classes of assets are based on their estimated service lives. The average estimated remaining service lives and service life ranges of fixed assets are:

	Estimated Service Lives (years)	
	Range	Average
Transmission	12–100	55
Distribution	15–75	41
Communication	7–40	19
Administration and service	5–50	39

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and are not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets where an asset retirement obligation has been recognized.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising from such a review are implemented on a remaining service life basis from the year the changes can first be reflected in rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit's net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against the results of operations.

The Company has determined that goodwill is not impaired. All of the goodwill is attributable to the distribution business segment.

Deferred Debt Costs

Deferred debt costs include the unamortized amounts of debt issuance costs. Deferred debt costs are amortized on an annuity basis over the period to maturity of the debt.

Discounts and Premiums on Debt

Discounts and premiums are amortized over the period of the related debt.

Financial Instruments

The Company periodically uses interest rate swap contracts to manage interest rate risks. Payments and receipts under interest rate swap contracts are recognized as adjustments to interest expense on an accrual basis. The Company formally designates its hedges, documents all hedging relationships and formally assesses hedge effectiveness. In the event a hedging relationship is extinguished or the relationship is found to be ineffective, realized or unrealized gains or losses are recognized in results of operations. Hedging gains and losses are amortized over the period of the related debt.

The Company does not engage in derivative trading or speculative activities.

Employee Future Benefits

Employee future benefits provided by Hydro One include pension, group life insurance, health care and long-term disability.

In accordance with the OEB's rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management's best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

Hydro One recognizes a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. Hydro One reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province.

Note 3.
Electricity Credits to Customers

Under a regulation issued in October 2005, Regulated Price Plan customers received a credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and purchased power costs were each reduced by $140 million. The application of the credit did not result in any adjustment to net income.

Note 4.
Depreciation and Amortization

Year ended December 31

(Canadian dollars in millions)	2006	2005
Depreciation of fixed assets in service	379	369
Fixed asset removal costs	41	41
Amortization of regulatory and other assets	95	77
	515	487

Note 5.
Financing Charges

Year ended December 31

(Canadian dollars in millions)	2006	2005
Interest on short-term notes payable	2	1
Interest on long-term debt payable	296	297
Amortization of discount	27	58
Other	9	5
Less: Interest capitalized on construction in progress	(28)	(21)
Interest capitalized on regulatory assets	(7)	(10)
Interest earned on investments	(4)	(5)
	295	325

Note 6.
Provision for Payments in Lieu of Corporate Income Taxes

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rates is provided as follows:

Year ended December 31 (Canadian dollars in millions)	2006	2005
Income before provision for PILs	634	681
Federal and Ontario statutory income tax rate	36.12%	36.12%
Provision for PILs at statutory rate	229	246
(Decrease) increase resulting from:		
Net temporary differences:		
Recovery of PILs related to prior years	(30)	(21)
Pension contribution in excess of pension expense	(16)	(25)
Employee future benefits other than pension expense in excess of cash payments	14	8
Transmission amounts received but not recognized for accounting purposes due to earnings sharing mechanism	12	–
Overhead capitalized for accounting but deducted for tax purposes	(11)	(10)
Interest capitalized for accounting purposes but deducted for tax purposes	(13)	(11)
Environmental expenditures	(6)	(5)
Capital cost allowance (in excess of) less than depreciation and amortization	(3)	1
Other	4	1
Net temporary differences	(49)	(62)
Permanent differences:		
Large corporations tax	–	13
Other	(1)	1
Net permanent differences	(1)	14
Provision for PILs	179	198
Effective income tax rate	28.23%	29.07%

In 2006, Hydro One recognized a tax benefit of approximately $30 million in respect of a recovery of PILs from prior years following a successful appeal allowing a deduction for certain overhead costs that had been previously capitalized. In 2005, Hydro One reached an agreement to settle an outstanding legal claim allowing for the dissolution of one of its subsidiaries. As a result, it was determined to be more likely than not that Hydro One would be able to utilize the subsidiary's accumulated tax losses and a future tax asset of approximately $21 million was recognized. As at December 31, 2006, approximately $2 million of the 2005 amount remains available for use in 2007.

Future income taxes relating to the regulated businesses have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2006, future income tax liabilities of $281 million (2005 – $265 million), based on substantively enacted income tax rates, have not been recorded. In the absence of rate-regulated accounting, the Company's provision for PILs would have been recognized using the liability method rather than the taxes payable method. As a result, the provision for PILs would have been higher by approximately $16 million, including the impact of a change in substantively enacted tax rates.

Note 7.
Fixed Assets

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2006				
Transmission	8,293	3,024	359	5,628
Distribution	5,651	2,129	86	3,608
Communication	822	383	18	457
Administration and service	989	583	5	411
Easements	483	61	–	422
	16,238	6,180	468	10,526
2005				
Transmission	8,124	2,889	233	5,468
Distribution	5,319	1,995	65	3,389
Communication	752	344	46	454
Administration and service	877	530	31	378
Easements	481	60	–	421
	15,553	5,818	375	10,110

Financing costs are capitalized on fixed assets under construction, including allowance for funds used during construction on regulated assets and interest on unregulated assets, and were $28 million in 2006 (2005 – $21 million).

Note 8.
Regulatory Assets and Liabilities

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One has recorded the following regulatory assets and liabilities (see Note 2):

December 31 (Canadian dollars in millions)	2006	2005
Regulatory assets:		
Regulatory asset recovery account I	58	88
Regulatory asset recovery account II	87	92
Employee future benefits other than pension	84	126
Environmental	70	79
Smart meters	10	–
Retail settlement variance accounts	–	11
Other	2	4
Total regulatory assets	311	400
Regulatory liabilities:		
Deferred pension	382	449
Export and wheeling fees	49	32
Transmission earnings sharing	34	–
Retail settlement variance accounts	2	–
Other	6	14
Total regulatory liabilities	473	495

Regulatory Assets

Regulatory Asset Recovery Account I (RARA I)

On December 9, 2004, the OEB issued a decision on the prudence of the distribution-related deferral account balances for which recovery was sought by Hydro One in its May 31, 2004 application. Amounts for which recovery was approved represented balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved amounts be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. The RARA I includes distribution business low-voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest. In the absence of rate-regulated accounting, amortization expense in 2006 would have been lower by approximately $20 million (2005 – $20 million). In addition, related financing charges would have been higher by $3 million (2005 – $7 million).

Regulatory Asset Recovery Account II (RARA II)
On April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the distribution business of Hydro One Networks. As part of this decision, the OEB also approved the distribution-related deferral account balances sought by Hydro One. The OEB ordered that the approved balances be recovered on a straight-line basis over a four-year period from May 1, 2006 to April 30, 2010. The RARA II includes retail settlement and cost variance amounts and distribution low-voltage service amounts, plus accrued interest. In the absence of rate-regulated accounting, amortization expense in 2006 would have been lower by approximately $16 million. In addition, related financing charges would have been higher by $5 million.

Employee Future Benefits Other than Pension
Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 Hydro One recorded a regulatory asset, with an original balance of $419 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of two years (2005 – three years) and does not earn a return. In the absence of rate-regulated accounting, amortization expense in 2006 would have been lower by approximately $42 million (2005 – $42 million).

Environmental
Hydro One records a liability for the estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized an equivalent amount as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. The OEB has the discretion to examine and assess the prudence and the timing of recovery of all of Hydro One's future regulatory expenditures. In the absence of rate-regulated accounting, amortization expense in 2006 would have been lower and operation, maintenance and administration expense would have been higher by $17 million (2005 – $14 million).

Smart Meters
On March 21, 2006, the OEB approved the establishment of deferral accounts for smart meter related expenditures and a monthly customer charge of 30 cents per residential customer was reflected in Hydro One's revenue requirement. Consistent with the OEB's direction and pending further guidance, the Company has recognized a regulatory asset consisting of the net balance of capital and operating expenditures for smart meters less recoveries received from customers. In the absence of rate-regulated accounting, the Company's operation, maintenance and administration expense would have been higher by $4 million and revenues would have been higher by $2 million.

Regulatory Liabilities

Deferred Pension

In accordance with the OEB's 1999 transitional rate order, pension costs are recorded in results of operations when employer contributions are paid to the pension plan. The Company's deferred pension asset represents the cumulative difference between employer contributions and pension costs and the deferred pension regulatory liability results from the Company's recognition, as the result of OEB direction, of revenues and expenses in different periods than would be the case for an unregulated enterprise. In the absence of rate-regulated accounting, the Company's pension expense would have been recognized on an accrual basis rather than on a cash basis. As a result, operation, maintenance and administration expense would have been higher by approximately $12 million (2005 – $38 million), assuming no regulatory deferral of distribution and Inergi LP (Inergi) pension-related amounts. In addition, related financing charges would have been higher by $2 million (2005 – $4 million).

Export and Wheeling Fees

Consistent with the market rules, an export and wheeling fee is collected by the IESO and remitted to Hydro One at the rate of $1 per MWh on electricity exported outside of Ontario. The amounts collected in respect of this export and wheeling fee, plus interest, were taken into consideration in the revenue requirement of Hydro One's transmission business as part of the Company's transmission rate application filed with the OEB in September 2006.

Transmission Earnings Sharing

On February 21, 2006, the OEB issued a decision that established an earnings sharing mechanism in which 50% of any transmission earnings in excess of the approved rate of return of 9.88%, for the period January 1, 2006 until new transmission rates are set, will be equally split between the Company's shareholder and ratepayers. The excess earnings calculation will be based on the 2006 audited financial statements of Hydro One Networks' transmission business. The application of the earning sharing mechanism will be subject to future OEB review and approval. Any changes resulting from this review will be reflected in results of operations when the OEB renders its decision.

Retail Settlement Variance Accounts

Hydro One has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's Accounting Procedures Handbook. The OEB's December 9, 2004 decision allowed for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA I. The OEB's April 12, 2006 decision allowed for recovery of retail settlement variance amounts accumulated since January 1, 2004 and forecasted through to April 30, 2006, inclusive of interest, within the RARA II. The Company has accumulated a net liability in its retail settlement variance accounts since May 1, 2006 and anticipates that the OEB will include the net balance of this regulatory account in future rates.

Note 9.
Debt

6.59% notes due 2043	315	315
5.00% notes due 2046	75	–
	5,270	5,084
Less: Long-term debt payable within one year	(395)	(589)
Net unamortized premiums (discounts)	9	(14)
Unamortized hedging losses	(12)	(15)
Long-term debt	4,872	4,466

[1] Step-up coupon, after year three from 4.10% to 6.40%, extendable to 2011.

Short-term debt represents promissory notes issued pursuant to the Company's commercial paper program. The notes are denominated in Canadian dollars with varying maturities not exceeding 365 days. In 2006, the notes had a weighted-average interest rate of 4.2%.

Hydro One has a $750 million committed and unused revolving credit facility with a syndicate of banks maturing in August 2007, with a two-year extension option. If used, interest on the facility would apply based on Canadian benchmark rates. This credit facility supports the Company's commercial paper program.

The Company issues notes for long-term financing under the medium-term note program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million of which $1,725 million is remaining and is currently available until July 2007.

The long-term debt is subject to covenants that, among other things, limit permissible debt as a percentage of total capitalization, limit ability to sell assets and impose a negative pledge provision, subject to customary exceptions. At December 31, 2006, the Company was in compliance with these covenants.

The long-term debt is unsecured and denominated in Canadian dollars. Such debt is summarized by the number of years to maturity in the following table:

Years to Maturity	Principal Outstanding on Notes and Debentures (Canadian dollars in millions)	Weighted Average Interest Rate (%)
1 year	395	4.4
2 years	500	4.0
3 years	400	4.0
4 years	400	7.2
5 years	250	6.4
	1,945	5.0
6–10 years	1,050	5.3
Over 10 years	2,275	6.4
	5,270	5.7

Note 10.
Fair Value of Financial Instruments and Risk Management

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of derivative financial instruments reflects the estimated amount that the Company, if required to settle an outstanding contract, would have been required to pay or would be entitled to receive at year end. The fair value of long-term debt, based on year end quoted market prices for the same or similar debt of the same remaining maturities, is provided in the following table:

December 31 (Canadian dollars in millions)	2006		2005	
	Carrying Value	**Fair Value**	Carrying Value	Fair Value
Long-term debt[1]	**5,270**	**5,831**	5,084	5,697

[1] The carrying value of long-term debt represents the par value of the notes and debentures.

Hydro One may enter into derivative agreements, such as forward fixed interest rate swap agreements, to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. These transactions are accounted for as cash flow hedges of anticipated transactions. In 2006, Hydro One did not enter into any such derivative agreements. In 2005, Hydro One terminated forward interest rate swap agreements entered into in 2005 and 2004 and having a total notional principal amount of $150 million, resulting in a loss of $10 million. The loss is being amortized on an annuity basis over the 30-year term of the related debt.

As at December 31, 2006, the Company had a pay floating interest rate swap agreement related to a step-up coupon note issuance with an initial maturity date in 2007, and with extended maturity dates up to 2011. The interest rate swap is being accounted for as a fair value hedge. This agreement has a notional principal amount of $40 million and a fair value of $nil (2005 – $nil).

The Company has no significant counter-party credit risk exposure as the fair value of the interest rate swap contracts was not significant in 2006 or in 2005.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2006, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One did not earn a significant amount of revenue from any single customer. As at December 31, 2006, there were no significant balances of accounts receivable due from any single customer.

The Company will continue to use derivative instruments to manage interest rate risk. Derivative financial instruments result in exposure to credit risk, since there is a risk of counter-party default. Hydro One monitors and minimizes credit risk through various techniques including dealing with highly rated counter-parties, limiting total exposure levels with individual counter-parties and entering into master agreements which enable net settlement.

Note 11.
Employee Future Benefits

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. Employees of Hydro One Brampton participate in the Ontario Municipal Employees Retirement System (OMERS), a multi-employer public sector pension fund. Current contributions by Hydro One Brampton are approximately $1 million annually.

Plan Asset Mix

Hydro One's pension plan asset mix at December 31, 2006 and 2005 was as follows:

	% of Plan Assets	
December 31	**2006**	2005
Equity securities	**64.6**	60.6
Debt securities	**32.0**	36.2
Other	**3.4**	3.2
	100.0	100.0

Supplementary Information

The Hydro One pension plan does not hold any direct securities of the Company, but did hold debt securities of the Province of $92 million and $79 million at December 31, 2006 and 2005, respectively.

The Company's pension plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed on September 22, 2004, effective for December 31, 2003, the Company contributed $86 million to its pension plan in respect of 2006 (2005 – $83 million), all of which is required to satisfy minimum funding requirements. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash. Prior to 2004, the Company was not required to contribute to the pension plan because the last actuarial valuation at December 31, 2000 indicated that the plan had a surplus. Contributions after 2006 will be based on actuarial valuation effective December 31, 2006 and will depend on future investment returns, and changes in benefits or actuarial assumptions.

Total cash payments for employee future benefits made in 2006, consisting of cash contributed by the Company to its funded pension plan and cash payments directly to beneficiaries for its unfunded other benefit plans was $122 million in 2006 (2005 – $123 million).

Rate of increase in health care cost trend [4]	**–**	–	**4.40%**	4.40%

[2] The Company follows the cash basis of accounting. During 2006, pension costs of $86 million (2005 – $83 million) were attributed to labour, of which $42 million (2005 – $23 million) was charged to operations, $34 million (2005 – $32 million) was capitalized as part of the cost of fixed assets, and $10 million (2005– $28 million) was attributed to a regulatory asset.

[3] 7.87% in 2006 grading down to 4.40% per annum in and after 2014 (2005 – 8.47% in 2005 grading down to 4.40% per annum in and after 2014).

[4] 8.69% in 2007 grading down to 4.40% per annum in and after 2014 (2005 – 7.87% in 2005 grading down to 4.40% per annum in and after 2014).

Note 12.
Environmental Liabilities

December 31

(Canadian dollars in millions)	2006	2005
Environmental liabilities, January 1	79	89
Interest accretion	5	5
Expenditures	(17)	(14)
Revaluation adjustment	3	(1)
Environmental liabilities, December 31	70	79
Less: current portion	(15)	(15)
	55	64

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2006 and in total thereafter are as follows: 2007 – $15 million; 2008 – $14 million; 2009 – $12 million; 2010 – $10 million; 2011 – $7 million; and thereafter – $31 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. Hydro One continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

Note 13.
Share Capital

Common and Preferred Shares

On March 31, 2000, the Company issued to the Province 12,920,000 5.5% cumulative preferred shares with a redemption value of $25.00 per share, and 99,990 common shares, bringing the total number of outstanding common shares to 100,000. The Company is authorized to issue an unlimited number of preferred and common shares.

The preferred shares are entitled to an annual cumulative dividend of $18 million, which is payable on a quarterly basis. The preferred shares are redeemable at the option of the Province at a price of $25 per share, representing the stated value, plus any accrued and unpaid dividends if the Province sells a number of the common shares which it owns to the public such that the Province's holdings are reduced to less than 50% of the common shares of the Company. Hydro One may elect, without condition, to pay all or part of this redemption price by issuing additional common shares to the Province. If the Province does not exercise its redemption right, the Company would have the ability to adjust the dividend on the preferred shares to produce a yield that is 0.50% less than the then-current dividend market yield for similarly rated preferred shares. The preferred shares do not carry voting rights, except in limited circumstances, and would rank in priority over the common shares upon liquidation.

Dividends

Common dividends are declared at the sole discretion of the Hydro One Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations.

In 2006, preferred dividends in the amount of $18 million (2005 – $18 million) and common dividends in the amount of $332 million (2005 – $273 million) were declared.

Earnings per Share

Earnings per share is calculated as net income during the year, after cumulative preferred dividends, divided by the weighted-average number of common shares outstanding during the year.

Note 14.
Related Party Transactions

The Province, OEFC, IESO and Ontario Power Generation Inc. (OPG) are related parties of Hydro One. In addition the OEB is related to the Company by virtue of its status as a Provincial Crown Corporation. Transactions between these parties and Hydro One were as follows:

Hydro One received revenue for transmission services from IESO, based on uniform transmission rates approved by the OEB. Transmission revenue for 2006 includes $1,206 million (2005 – $1,276 million) related to these services.

Hydro One receives amounts for rural rate protection from the IESO. Distribution revenue for 2006 includes $127 million (2005 – $127 million) related to this program. Hydro One also received revenue related to the supply of electricity to remote northern communities from the IESO. Distribution revenue for 2006 includes $21 million (2005 – $21 million) related to these services.

In 2006, Hydro One purchased power in the amount of $2,183 million (2005 – $2,095 million) from the IESO administered electricity market and $38 million (2005 – $36 million) from OPG.

Under the *Ontario Energy Board Act, 1998*, the OEB is required to recover all of its annual operating costs from gas and electricity distributors and electricity transmitters. In 2006, Hydro One incurred $9 million (2005 – $7 million) in OEB fees.

Hydro One has service level agreements with the other successor corporations. These services include field, engineering, logistics and telecommunications services. Revenues related to the provision of construction and equipment maintenance services to the other successor corporations were $15 million (2005 – $11 million), primarily for the transmission business. Operation, maintenance and administration costs related to the purchase of services from the other successor corporations were less than $1 million in each of 2006 and 2005.

The provision for payments in lieu of corporate income taxes was paid or payable to the OEFC and dividends were paid or payable to the Province (see Note 2).

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 (Canadian dollars in millions)	2006	2005
Accounts receivable	114	116
Accounts payable and accrued charges	(230)	(263)

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $195 million (2005 – $213 million).

Note 15.
Consolidated Statements of Cash Flows

For the purposes of the consolidated statements of cash flows, "cash and cash equivalents" refers to the balance sheet item "bank indebtedness."

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 (Canadian dollars in millions)	2006	2005
Accounts receivable (increase) decrease	(149)	87
Materials and supplies increase	–	(9)
Accounts payable and accrued charges (decrease) increase	(39)	68
Accrued interest increase (decrease)	6	(1)
Long-term accounts payable and accrued charges decrease	(7)	(3)
Employee future benefits other than pension increase	87	62
Other	10	(10)
	(92)	194
Supplementary information:		
Interest paid	302	300
Payments in lieu of corporate income taxes	252	210

Note 16.
Contingencies

Legal Proceedings

Hydro One is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters, except as noted below, will not have a materially adverse effect on the Company's consolidated financial position, results of operations or cash flows.

On March 29, 1999, the Whitesand First Nation Band commenced an action in the Ontario Court (General Division), now the Superior Court Justice, naming as defendants the Province, the Attorney General of Canada, Ontario Hydro, OEFC, OPG and the Company. On May 24, 2001, the Whitesand First Nation Band issued an almost identical claim against the same parties. The reason for the second claim is the procedural defence of the Province that proper notice of the first claim was not given under the *Proceedings Against the Crown Act* (Ontario). These actions seek declaratory relief, injunctive relief and damages in an unspecified amount. The Whitesand Band alleges that since at least the first half of the twentieth century, Ontario Hydro has erected dams, generating stations and other facilities within or affecting the band's traditional lands and that those facilities have caused damage to band members and the lands, including substantial flooding and erosion. The Whitesand Band also claims treaty rights to a share of the profits arising from the activities of these Ontario Hydro facilities, an entitlement to increases in annuity payments established by treaty and for breach of an alleged contract to reimburse the band for negotiation costs with Ontario Hydro. The Whitesand Band asserts multiple causes of action, including trespass, breach of fiduciary duty, nuisance and negligence. The May 24, 2001 case was consolidated in 2004 with a similar claim by Red Rock First Nation Band which commenced on September 7, 2001 as all procedural issues in both matters were the same. There is now one action in which the claims of both Whitesand and Red Rock are set out. The claims relating to activities of Ontario Hydro (i.e., flooding) are the matters for which OPG would have responsibility pursuant to Transfer Orders under the *Electricity Act*, 1998. In the consolidated claim, Whitesand and Red Rock seek to tie Hydro One into the flooding allegations on the alleged basis of the integrated nature of the transmission system with the entire electricity system, which includes the method of generating power. To date, Hydro One has not filed a defence. Hydro One believes that it is unlikely that the outcome of this litigation will have a material adverse effect on its consolidated financial position, results of operations or cash flows.

Transfer of Assets

On April 1, 1999, in connection with the acquisition of its operations, Hydro One acquired and assumed the assets, liabilities, rights and obligations of Ontario Hydro's electricity transmission, distribution and energy services businesses, except for certain transmission, distribution and other assets located on lands held for bands or bodies of Indians under the *Indian Act* (Canada). Transfer of title to these assets did not occur because authorizations originally granted by the Minister of Indian Affairs and Northern Development (Canada) for the construction and operation of these assets could not be transferred without the consent of the Minister and the relevant Indian bands or bodies or, in several cases, because the authorizations had either expired or had never been properly issued. Hydro One manages these assets, which are currently owned by the OEFC.

Hydro One has commenced negotiations with the relevant Indian bands and bodies to obtain the authorizations and consents necessary to complete the transfer of these transmission, distribution and other assets. Hydro One cannot predict the aggregate amount that it may have to pay to obtain the required authorizations and consents. Hydro One expects to pay more than $850,000 per year, which was the amount previously paid to these Indian bands and bodies by Ontario Hydro and which was the total amount of allowed costs in the transitional rate orders. If, after taking all reasonable steps, Hydro One cannot otherwise obtain the authorizations and consents from the Indian bands and bodies, the OEFC will continue to hold these assets for an indefinite period of time. Alternatively, Hydro One may have to relocate these assets from the Indian lands to other locations at a cost that could be substantial, or, in a limited number of cases, to abandon a line and replace it with diesel generation facilities. In such cases, Hydro One would apply to recover these costs in future rate orders.

Note 17.
Commitments

Agreement with Inergi

Effective March 1, 2002, Cap Gemini Canada Inc. began providing services to Hydro One through Inergi. As a result of this initiative, Hydro One receives from Inergi a range of services including information technology, customer care, supply chain and certain human resources and finance services for a 10-year period. The initial service level price ranged between $90 million and $130 million per year, subject to external benchmarking every three years to ensure Hydro One is receiving a defined competitive and continuously improved price. In connection with this agreement, on March 1, 2002 the Company transferred approximately 900 employees to Inergi, including about 130 non-regular employees.

The annual commitments under the agreement in each of the five years subsequent to December 31, 2006, and in total thereafter are as follows: 2007 – $110 million; 2008 – $98 million, 2009 – $94 million; 2010 – $91 million; 2011 – $87 million; and thereafter – $16 million.

Prudential Support

Purchasers of electricity in Ontario, through the IESO, are required to provide security to mitigate the risk of their default based on their expected activity in the market. The IESO could draw on these guarantees if Hydro One Networks or Hydro One Brampton fails to make a payment required by a default notice issued by the IESO. The maximum potential payment is the face value of the bank letters of credit plus the nominal amount of the parental guarantee. As at December 31, 2006, the Company provided prudential support, using a combination of bank letters of credit of $22 million (2005 – $21 million) and parental guarantees of $275 million (2005 – $275 million).

Retirement Compensation Arrangements

Bank letters of credit have been issued to provide security for the Company's liability under the terms of a trust fund established pursuant to the supplementary pension plan for the employees of Hydro One and its subsidiaries. The trustee is required to draw upon the letters of credit if Hydro One is in default of its obligations under the terms of this plan. Such obligations include the requirement to provide the trustee with an annual actuarial report as well as letters of credit sufficient to secure the Company's liability under the plan, to pay benefits payable under the plan and to pay the letter of credit fee. The maximum potential payment is the face value of the bank letters of credit. As at December 31, 2006, Hydro One had bank letters of credit of $93 million (2005 – $82 million) outstanding relating to retirement compensation arrangements.

Operating Leases

The future minimum lease payments under operating leases for each of the five years subsequent to December 31, 2006 and in total thereafter are as follows: 2007 – $5 million; 2008 – $5 million; 2009 – $4 million; 2010 – $1 million; 2011 – $nil; and thereafter – $1 million.

Note 18.
Segment Reporting

Hydro One has three reportable segments:

— The transmission business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;

— The distribution business, which comprises the core business of delivering and selling electricity to customers; and

— The "other" segment, which primarily consists of the telecommunications business.

The designation of segments is based on a combination of regulatory status and the nature of the products and services provided. The accounting policies followed by the segments are the same as those described in the summary of significant accounting policies (see Note 2). Segment information on the above basis is as follows:

Year ended December 31

(Canadian dollars in millions)	Transmission	Distribution	Other	Consolidated
2006				
Segment profit				
Revenues	1,245	3,273	27	4,545
Purchased power	–	2,221	–	2,221
Operation, maintenance and administration	390	460	30	880
Depreciation and amortization	241	269	5	515
Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	614	323	(8)	929
Financing charges				295
Income before provision for payments in lieu of corporate income taxes				634
Capital expenditures	402	417	4	823
2005				
Segment profit				
Revenues	1,310	3,085	21	4,416
Purchased power	–	2,131	–	2,131
Operation, maintenance and administration	353	413	26	792

Operating statistics					
Transmission					
Units transmitted *(TWh)*[5]	151.1	157.0	153.4	151.7	153.2
Ontario 20-minute system peak demand *(MW)*[5]	27,056	26,219	25,204	24,849	25,629
Ontario 60-minute system peak demand *(MW)*[5]	27,005	26,160	24,979	24,753	25,414
Total transmission lines *(circuit-kilometres)*	28,600	28,547	28,643	28,621	28,492
Distribution					
Units distributed to Hydro One customers *(TWh)*[5]	29.0	29.7	28.5	27.9	27.1
Units distributed through Hydro One lines *(TWh)*[5,6]	44.7	45.6	44.8	44.7	45.1
Total distribution lines *(circuit-kilometres)*	122,460	122,118	121,736	121,285	120,767
Customers	1,293,396	1,273,768	1,258,925	1,238,748	1,219,614
Total regular employees	4,295	4,189	4,118	3,967	3,933

1 Operation, maintenance and administration costs for 2002 included a charge of $25 million for a staff reduction program.

2 As a result of the oral and written evidence submitted by Hydro One, on December 9, 2004 the OEB issued a ruling, citing prudence, and approving recovery of amounts previously delayed by the *Electricity Pricing, Conservation and Supply Act, 2002*, relating to regulatory deferral account balances sought by Hydro One in its May 31, 2004 submission. Consequently, a one-time regulatory recovery of $91 million was recorded.

3 The net asset coverage on long-term debt ratio is calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt (including current portion).

4 The earnings coverage ratio has been calculated as the sum of net income, financing charges and provision for payments in lieu of corporate income taxes divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

5 System-related statistics include preliminary figures for December.

6 Units distributed through Hydro One lines represent total distribution system requirements and include electricity distributed to consumers who purchased power directly from the IESO.

Board of Directors (as at December 31, 2006)

Rita Burak[2]
Chair of the Board of Directors, Hydro One Inc.

Sami Bébawi[5,6]
Executive Vice President, Office of the President, President, Socodec Inc., SNC-Lavalin Group Inc.

Murray J. Elston[1,3,5]
President and CEO, Canadian Nuclear Association

Don MacKinnon[5,6]
President, Power Workers' Union

Eileen A. Mercier[1,2,4]*
Corporate Director
Resigned March 16, 2007

Walter Murray[1,3,4]
Corporate Director

Kathleen O'Neill[1,2,3,4]*
Corporate Director
Resigned January 24, 2007

Douglas E. Speers[1,4,6]
Chairman and Director, Emco Corporation

Kenneth D. Taylor[5,6]*
Chair, Taylor and Ryan Inc.
Resigned February 27, 2007

Blake Wallace, Q.C.[2,3,5]*
Vice President and Director, Murray & Company
Resigned February 26, 2007

Board Committees

[1] Audit and Finance Committee
The Audit and Finance Committee oversees the integrity of accounting policies and financial reporting, internal controls, internal audit, significant corporate risk exposures and financial compliance.
The committee met five times in 2006.

[2] Corporate Governance Committee
The Corporate Governance Committee is responsible for the Board's governance of the Company. It recommends issues to be discussed at meetings of the Board of Directors, reviews the mandates of each committee of the Board, conducts Board Assessments, monitors the quality of management's relationship with the Board and recommends suitable nominees for election to the Board of Directors.
The committee met four times in 2006.

[3] Human Resources and Public Policy Committee
The Human Resources and Public Policy Committee is responsible for reviewing the appropriateness of our current and future organizational structure, succession plans for corporate and divisional officers, the code of business conduct, the performance and remuneration of our senior executives, including recommending to the Board the remuneration of the President and CEO, and for identifying, assessing and providing advice to the Board of Directors on public affairs issues that have significant impact on us. The committee met eight times in 2006.

[4] Information Technology Committee
The Information Technology Committee is an advisory committee of the Board established to assist the Board in its oversight responsibility on matters related to the Company's enterprise application systems replacement strategy. The committee met three times in 2006.

[5] Regulatory and Environment Committee
The Regulatory and Environment Committee monitors the Company's compliance with applicable regulatory requirements and environmental legislation. The committee oversees compliance programs, policies, standards and procedures, reviews the Company's proposals for rate applications and reviews compliance actions and reports.
The committee met five times in 2006.

[6] Health and Safety Committee
The Health and Safety Committee is responsible for reviewing occupational health and safety policies, standards, and programs, compliance with occupational health and safety legislation, policies and standards, and public health and safety issues. The committee met four times in 2006.

* Effective March 30, 2007, the following directors were elected to the Board of Directors of Hydro One Inc. by our shareholder: Kathryn Bouey; Laura Formusa; Michael Mueller; Robert Pace; and Gale Rubenstein in place of Eileen Mercier, Kathleen O'Neill, Tom Parkinson, Honourable Bob Rae, Kenneth Taylor and Blake Wallace, who have resigned as members of the Board.
As well, the number of directors of the Corporation was reduced from 12 to 11.

Making life better for electrical burn patients

In 2006, Hydro One, Sunnybrook Health Sciences Centre and St. John's Rehab Hospital announced the Hydro One Chair in Electrical Injury, a permanently endowed fund to support clinical and academic leadership in the field of electrical injury. Over the next five years, Hydro One has committed $500,000 to push forward research and treatment of electrical burn patients.

"Electrical burns are not very well understood and often the damage they do goes unseen and undiagnosed," said Dr. Joel Fish, Medical Director at the Ross Tilley Burn Centre at Sunnybrook Health Sciences Centre. "The research enabled by this funding will do a great deal to improve treatment and rehabilitation for burn patients."

Since 2003, Hydro One and Sunnybrook Health Sciences Centre have worked together to make the expertise of the Ross Tilley Burn Centre available through the hospital's teleconference capability and the NORTH Network telemedicine network to electrical burn patients across Ontario and Canada. Every year, between 600 and 800 workplace electrical burns occur in Canada, the vast majority of them to workers outside of the electricity sector.

The proper care and treatment for electrical burn patients is important not only to those of us in the electrical industry, but also to workers in every sector.

Dr. Joel Fish
Medical Director, Ross Tilley Burn Centre

Partners in Powerful Communities

Light. Hope. Opportunity.

We deliver a lot more than electricity

Annual Report 2007

hydro One

Our mission is to be an efficient and dynamic electricity transmission and distribution company that is best in North America in the areas of safety, customer service and reliability, while focusing on our people and creating shareholder value.

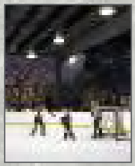
Hydro One Inc.
Is a holding company with subsidiaries that operate in the business areas of electricity transmission and distribution and telecom services.

Hydro One Networks Inc.
Represents the majority of our business, which is regulated by the Ontario Energy Board. It is involved in the planning, construction, operation and maintenance of our transmission and distribution networks.

Hydro One Brampton Networks Inc.
Distributes electricity to one of the fastest growing urban centres in Canada, just 30 kilometres outside of Toronto.

Hydro One Remote Communities Inc.
Operates and maintains the generation and distribution assets used to supply electricity to 20 remote communities across northern Ontario that are not connected to the province's electricity transmission grid.

Hydro One Telecom Inc.
Markets our excess fibre-optic capacity to business customers. This business represents less than 1% of our total assets.



Cover image:
Healthy, powerful communities require a reliable, safe and secure electricity system. Hydro One is working to connect Ontario communities to the electricity necessary for a vibrant and growing economy.

95% satisfaction

Overall customer satisfaction levels for Large Transmission Customers reached 95% this year, an increase of 10% from 2006.

$839,728 raised

Our staff raised $839,728 for charities of their choice, through the 9th Annual Hydro One Employees' and Pensioners' Charity Campaign.

75,044,621 kWh saved

Hydro One customers are saving more than 75 million kWh from energy efficient products purchased during the spring Every Kilowatt Counts program.

Letter from the Chair

Rita Burak
Chair

When I was appointed to the position of Chair in 2003, Ontario's electricity sector was still grappling with the impact of significant restructuring. Five years later, the sector has evolved and matured with a clear mandate and we have a firm understanding of our role in Ontario. We are the stewards of a strategic and vital public asset. We work so that Ontario can.

2007 saw Hydro One deliver on its commitments: earn solid returns for our shareholder, provide exceptional service to our customers and make investments in the electrical infrastructure vital to the continued delivery of safe, reliable electricity to the people of Ontario.

The Company's net income in 2007 decreased by $56 million, or 12%, to $399 million compared to 2006. This decrease reflects lower transmission tariff revenues resulting from changes to transmission tariffs and increased expenditures required to operate and maintain our transmission and distribution systems.

Hydro One made critical investments both in transmission and distribution infrastructure as well as in maintenance programs designed to ensure the reliability of the system. Total capital and operation, maintenance and administrative expenditures for 2007 were $2,086 million.

In the past three years Hydro One has begun a major new construction phase and this will continue in the years and decades ahead. The projects planned with our industry partners at the Ontario Power Authority and the Independent Electricity System Operator are fundamental to delivering the safe, reliable electricity a growing Ontario needs.

We are the stewards of a strategic and vital public asset. We work so that Ontario can.

At this critical juncture, our ability to arrange sufficient and cost-effective financing is vital. This is facilitated by our strong and stable long-term credit rating that reflects the confidence of rating agencies and investors in the performance, management and future of the Company.

In the past few years, all Boards of Directors have spent tremendous energy on the governance and compliance functions; the Hydro One Board has also made these issues a top priority. The good governance of Hydro One is essential to our shareholder, the Province of Ontario, our bond holders and the people of Ontario who depend upon Hydro One to operate in their interest. We take our financial obligations seriously. Our financial controls and disclosure practices are solid and under regular external scrutiny. My fellow Board members and I are more focused than ever on ensuring that the Company operates in a way that delivers maximum value to the people of Ontario.

While we've steadfastly carried out our oversight function, we have also put strong emphasis on making a strategic contribution to ensure that the Company benefits from the Board's collective skills and experience.

The Board will continue to provide sound, strategic direction to the Company and is confident in the management team's ability. Hydro One paid its shareholder, the Province of Ontario, dividends of $325 million and recorded $205 million of payments in lieu of income taxes, which helps reduce the legacy-stranded debt held by the Province.

On behalf of the Board of Directors, I would like to thank Hydro One's management and employees for their valuable contribution and dedication to their task. The Board looks forward to continuing the work of the Company in providing a safe, reliable, affordable electricity delivery system for the people of Ontario. After a 35-year career in public service, I leave this post confident that Hydro One and Ontario's electricity delivery system are in capable hands. It has been a great honour to serve.

R. Burak

Rita Burak
Chair

Letter from the President and CEO

Laura Formusa
President and
Chief Executive Officer

The people of Ontario depend upon Hydro One to deliver a precious resource to them. And, as stewards of Ontario's electricity delivery system, our role is clear: we must maintain operational excellence while working with our partners to ensure that electricity can be delivered safely, reliably and affordably for generations to come.

Hydro One is more than just wires, towers and poles traversing this great province. We are good neighbours, safe operators and partners in powerful communities.

Hydro One employees are among the best in North America, and our performance this year reflected that fact. One of the most important measures of our performance is the satisfaction of our customers. And in 2007, our largest customers told us that they were more satisfied with our performance than ever before. Like safety, customer satisfaction is part of every conversation, every project and every day at our Company.

With major refurbishment, growth and construction underway and planned for the years ahead, it's a dynamic and challenging period for our Company. I am confident that Hydro One will continue to successfully deliver the electricity that Ontario needs. I am also confident that our efforts in energy efficiency and demand management will foster a culture of conservation in this province.

In addition to the stations and many thousands of kilometres of lines that we maintain, we have been very busy with major construction projects across Ontario. Our work crews completed the construction of a major underground cable in Toronto to improve supply reliability and flexibility. Significant progress was also made in 2007 on the interconnection with Quebec to improve Ontario's access to clean sources of electricity.

Hydro One is more than just wires, towers and poles traversing this great province. We are good neighbours, safe operators and partners in powerful communities.

The construction of infrastructure projects is only a small part of our task. To be a successful utility requires partnering with the public in a way that was not always part of the model in the past.

I believe that *how* we work with customers, *how* we treat communities and *how* we run our business are just as important as *what* we do.

With a generation of energy workers on the verge of retirement, we have embarked on an ambitious program to renew and enhance our workforce. Our efforts to create value for our shareholder and the people of Ontario are driven by the men and women who work for Hydro One. Maximizing their potential, developing future leaders and recruiting the best and brightest employees will determine Hydro One's strength in the years ahead. In that regard, Hydro One has taken a leadership role by partnering with four Ontario colleges to fund curriculum development to ensure that graduates will leave school with the skills our industry requires.

In 2007, we were also recognized for our focus on diversity. We are proud of receiving an award and believe that creating a diverse workplace is essential to our future and will bring the very best people to Hydro One. Our efforts are ensuring that we're attracting employees who reflect Ontario's communities.

Hydro One's 4,600 employees live and work in almost every community in Ontario. Through employee and pensioner fundraising, they contribute generously to charities of their choice. In 2007, Hydro One launched the PowerPlay grants program to fund projects in our communities for healthy and safe children's sports and play facilities.

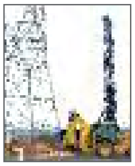
I'd like to thank the Hydro One Board of Directors for its guidance and oversight. Their contribution is critical to the success of our Company. I'm proud to work with the employees of Hydro One, employees who are dedicated, hard-working and aware of how much Ontario counts on them. We all know that the towers, stations, wires and poles we build, operate and maintain are more than just infrastructure, more than just our business. They deliver more than electricity. They deliver light, hope and opportunity.

Laura Formusa
President and Chief Executive Officer

To meet the growing needs of Ontario's communities, Hydro One is engaged in its largest infrastructure renewal initiative in more than two decades.

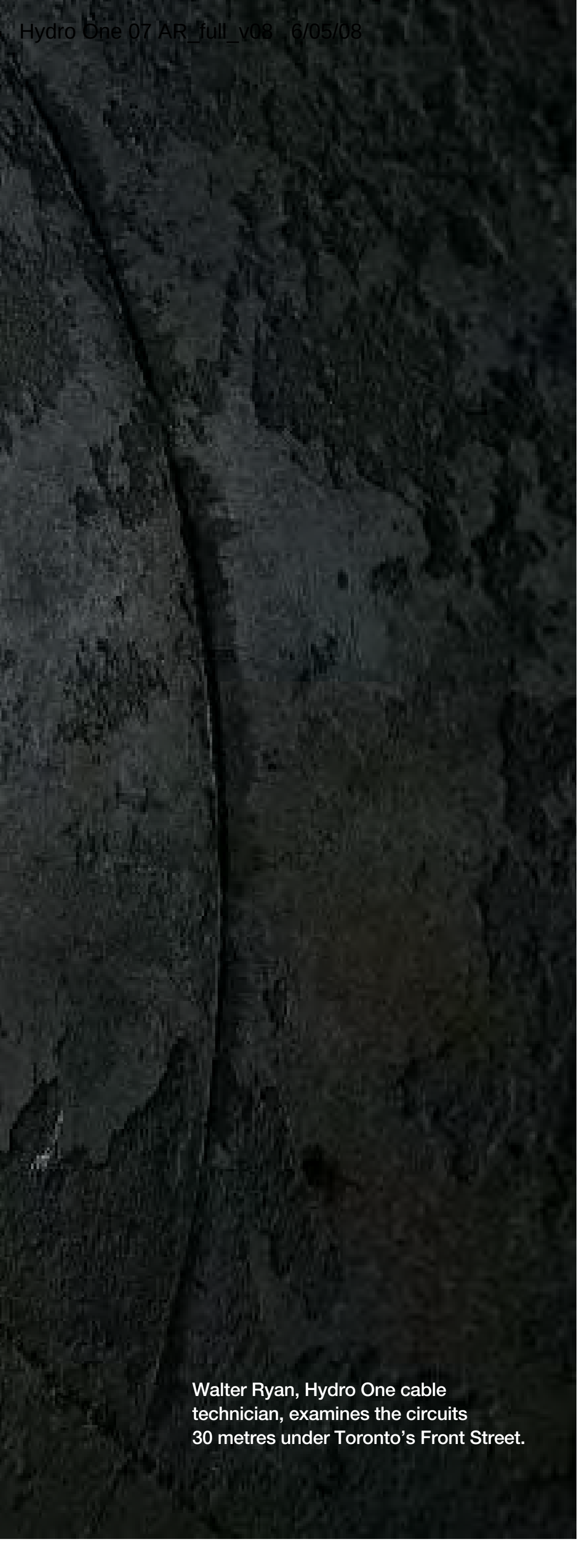
Connecting Clean and New Renewable Energy

To meet southern Ontario's growing energy needs, Hydro One intends to build a 180-km, double-circuit transmission line from the Bruce Power facility near Kincardine to the Milton Switching Station. With a projected in-service date of 2012, the completed line will deliver 3,000 MW of clean electricity. In 2007, Hydro One held a series of public meetings and made a concerted effort to inform and work with communities directly affected by the project.



Connecting Energy in Ontario and Quebec

Hydro One is working with Hydro-Québec TransÉnergie to expand transmission capacity between Ontario and Quebec and provide Ontarians with greater access to a reliable supply of renewable energy. A new line is being built between transformer stations in Ottawa and Masson, Quebec. With an expected in-service date of spring 2009, the new interconnection will increase Ontario's capacity to transfer power from or to Quebec by 1,250 MW.



Walter Ryan, Hydro One cable technician, examines the circuits 30 metres under Toronto's Front Street.

Building infrastructure. Creating opportunity.

To ensure that Ontario's businesses and communities continue to enjoy the benefits of reliable, safe and secure electricity, Hydro One has embarked on a province-wide effort to enhance and expand our transmission infrastructure.

As stewards of the province's transmission system for more than a century, we've learned through experience that the key to a successful construction project is first building a strong relationship with the communities we serve. The recently completed underground transmission line, connecting two transformer stations in downtown Toronto, exemplifies Hydro One's approach of identifying vital needs, seeking stakeholder input and then developing innovative technical solutions.

Downtown Toronto is the heart of Canada's business and financial sectors and its access to a secure, reliable supply of energy has national implications. An analysis of the area's energy requirements made it clear that the existing transmission grid needed improvement. To improve both flexibility and functionality, Hydro One built two underground cables, spanning 2.2 km, between the St. Lawrence Market and the Rogers Centre to connect two transformer stations.

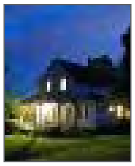
In the past, building a tunnel 30 metres below street level would require tearing up streets and disrupting traffic for months – a particularly unattractive prospect for the country's largest and busiest city. However, an innovative earth-boring machine enabled Hydro One to dig the tunnel without significant disruption to local business activities and with minimal impact on traffic.

Throughout the process, Hydro One kept stakeholders informed through public meetings and regular project updates published on our website. The project was completed on time and the circuit became operational in December 2007.

335 municipalities

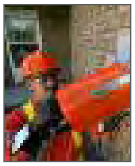
Hydro One's distribution network serves 335 of the 445 municipalities in Ontario.

Hydro One is committed to delivering the clean, reliable, renewable energy Ontario needs to meet the challenges of the 21st century.



Creating a Conservation Culture

Our conservation and demand management programs have reached 1.1 million participants to date. These programs combine to save 272 million kWh annually, enough energy to power 23,000 homes for one year. For more conservation and demand management program results, take a look at the inside back cover.



Doing the Smart Thing Is Rewarding

In September 2007, an international panel of judges named Hydro One the winner of the Utility Planning Network's 2007 Metering Award – Automated Meter Reading Initiative category. The award was given in recognition of Hydro One's efforts to support the province's Smart Meter Program. As of December 31, 2007, Hydro One teams had installed 288,000 smart meters, which allow for the sophisticated metering and management of power use and will ultimately facilitate time-of-use rates when they come into effect.

Linda Heinzle tends to a month-old calf while George keeps on top of feeding time at Terryland Farms in St. Eugene, Ontario.

Sustainable. Renewable. It's our energy future.

Ontario's energy needs are growing and changing. The impact of climate change on the environment has made it clear that the province and its people must take a new approach to energy use and supply management.

Hydro One is partnering with other leaders in the energy sector on a number of innovative measures aimed at reducing energy use and incorporating new sources of renewable energy into Ontario's electricity system.

Over the past year, Hydro One made great strides to deliver on the Province of Ontario's Renewable Energy Standard Offer Program (RESOP). Targeted at small, local suppliers, RESOP supports the development of renewable energy sources, such as solar, wind, biogas, biomass and water power, by offering participants price stability and a 20-year contract. Hydro One reviews the feasibility of all proposals and connects approved suppliers to our distribution system where possible.

In 2007, George and Linda Heinzle became the first suppliers of biomass energy connected to Hydro One's transmission system as part of RESOP.

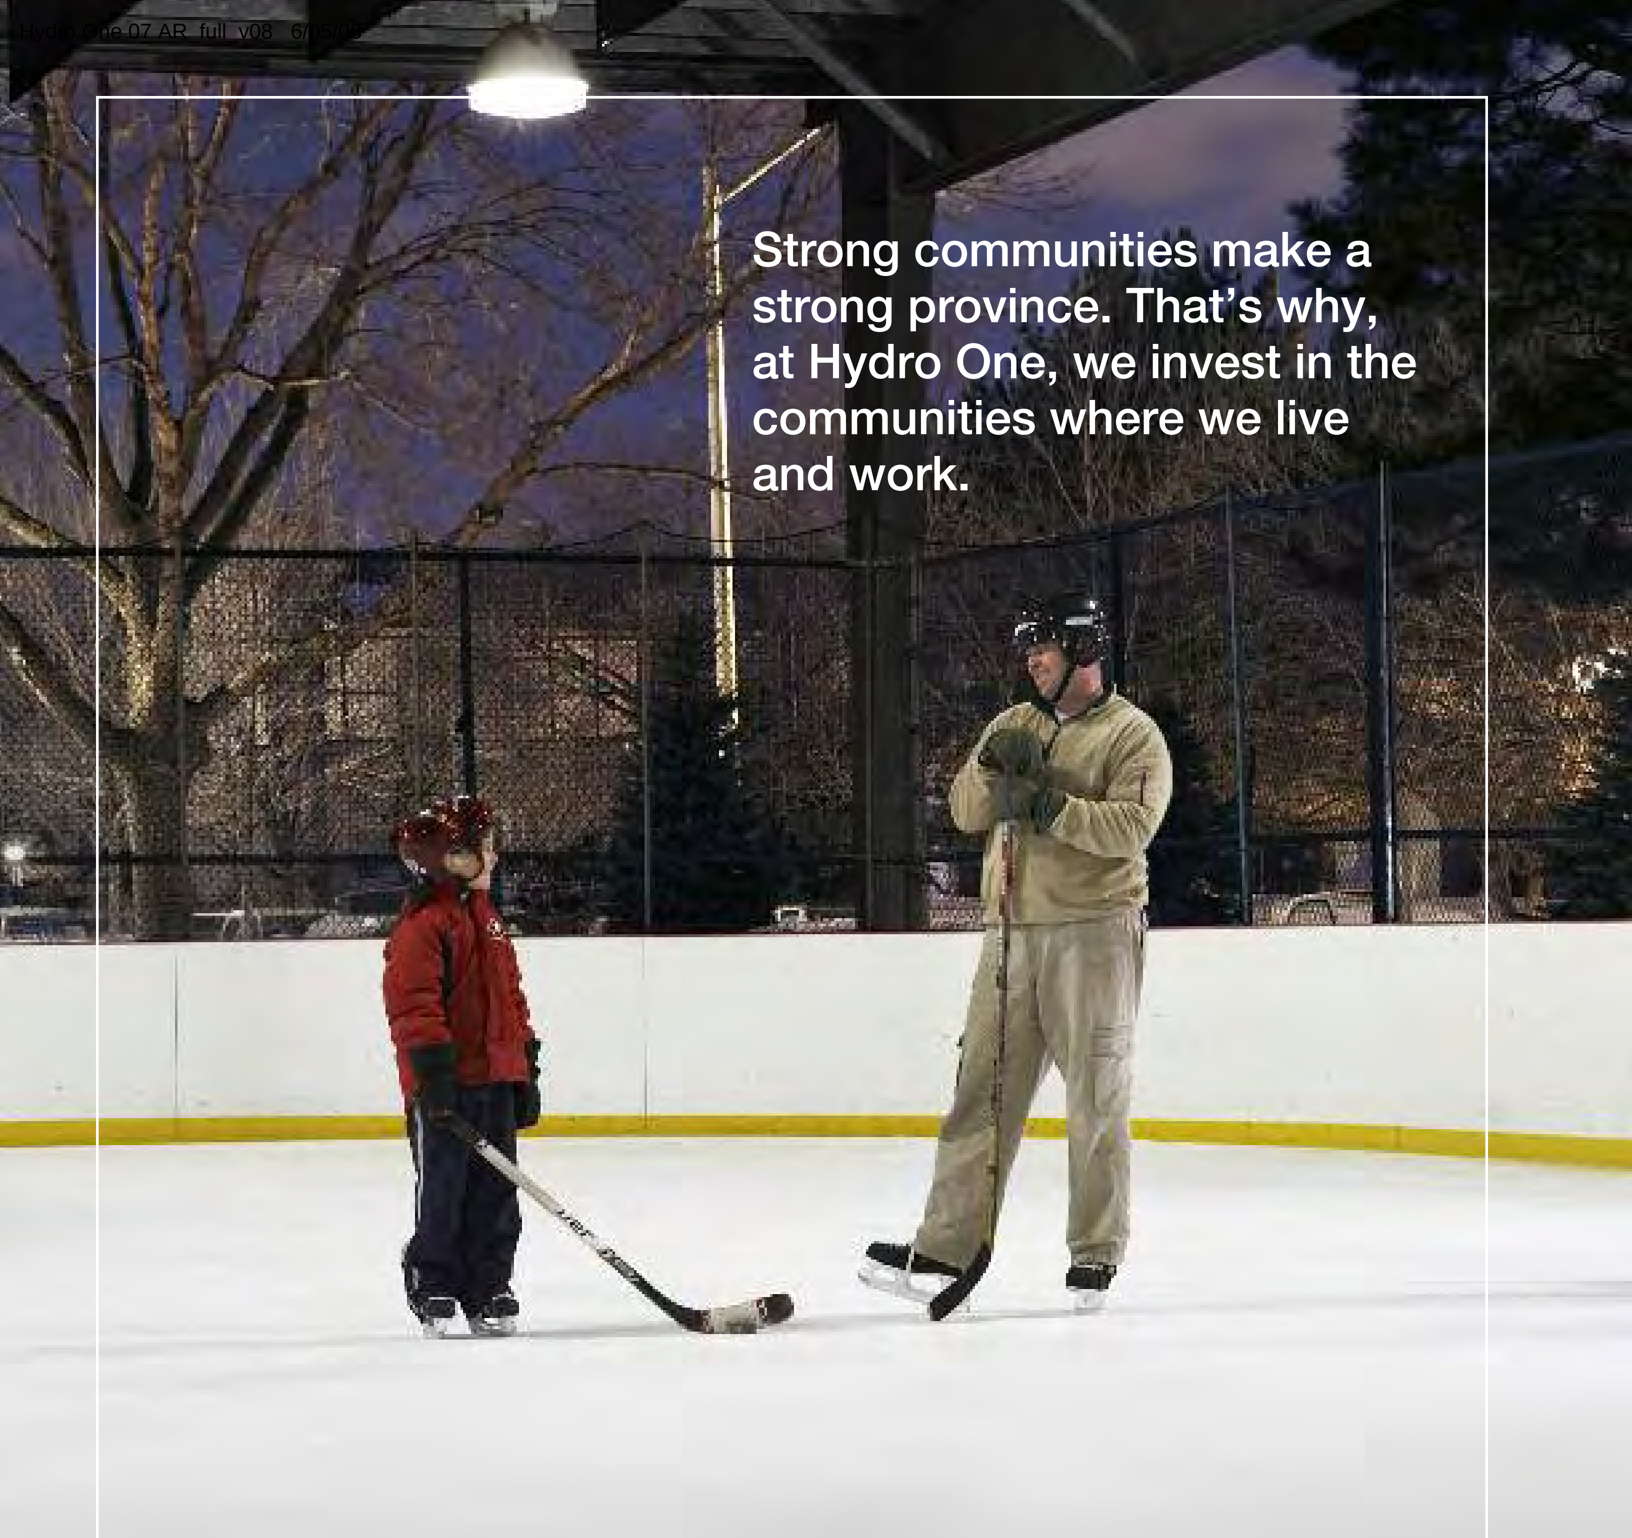
The Heinzles own Terryland Farm, a 130-head dairy operation located east of Ottawa. Like all dairy farms, it produces a significant amount of renewable biomass. But where others saw waste, George and Linda recognized a wasted resource. The Heinzles can generate 700 kWh per day, enough to power an average household for almost one month.

Connecting the Heinzles to the grid was an important first step. As more small providers of renewable energy connect to the electricity system, they will make a big contribution to the system's long-term reliability and diversity of Ontario's power supply.

8,000 MW

In 20 years, Ontario's renewable energy supply is expected to increase by 8,000 MW, enough to meet almost one third of the province's current electricity demand.

– according to the Ontario Power Authority's *Supply Mix Advice Report*.



Strong communities make a strong province. That's why, at Hydro One, we invest in the communities where we live and work.

Supporting First Nations Literacy

In Ontario's north, Hydro One is working with local communities to preserve First Nations' languages and traditions. As a major sponsor of the Kwayaciiwin Literacy Program, we are helping to ensure the ongoing vitality and relevance of aboriginal languages. Offered in seven different northern communities, the program starts in the earliest grades, providing kindergartners and their teachers with special books and teaching materials. The goal of the Kwayaciiwin program is to graduate students who are literate and fluent in both Anihshiniimowin and English.

Powering the International Plowing Match

Since 2001, Hydro One has provided electricity to the International Plowing Match (IPM), Canada's largest agricultural exhibition. The IPM offers an excellent opportunity for Hydro One staff to meet Ontario's agricultural community and discuss smart meters, conservation and other Hydro One programs. By meeting our customers face-to-face, we can better understand their needs and what works for them. This means we can deliver programs and services that help them use electricity as efficiently as possible.

Hydro One is improving children's recreation and play facilities across Ontario through its new PowerPlay grants program.

Partners in powerful communities.

From busy urban centres to the towns and villages of the north, Hydro One and its employees are committed to building strong, healthy communities across Ontario. Through our employees' volunteer efforts and charitable grants and sponsorships, Hydro One supports a wide range of community-building initiatives.

In August 2007, Hydro One announced the launch of PowerPlay, a new grants program to support and enhance children's sports and recreation facilities. PowerPlay offers grants of up to $25,000 for projects for community centres, indoor or outdoor ice rinks, playgrounds, splash pads and sports fields – places where kids can participate in community sports, stay healthy and active and have fun. The program is open to municipalities and registered charities where Hydro One is the local electricity supplier.

Last year, *Corporate Knights*, the world's largest circulation magazine with an explicit focus on corporate responsibility, named Hydro One as one of Canada's Top 50 Corporate Citizens. Rankings are based on a review of environmental, social and governance indicators as well as key performance indicators for specific industry sectors. Hydro One was ranked 26 out of the top 50 and third among utilities in Canada.

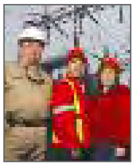
$500,000

Hydro One has committed $500,000 to advance research and treatment of patients with electrical burns, through the Ross Tilley Burn Centre at Sunnybrook Health Sciences Centre.

Hydro One's team of 4,600 employees works together to ensure Ontario has a safe, reliable supply of electricity.

Making Solid Progress in Customer Satisfaction

Customer satisfaction levels increased substantially this year. Overall satisfaction for Large Transmission Customers increased by 10% to 95% this year and overall satisfaction for Large Distribution Customers increased by 6% to reach 90%. These increases are due to a concerted effort by each and every employee in our Company to address customer issues quicker. Our goal is to achieve 90% satisfaction or better for all customers in the next five years.



Building Tomorrow's Workforce

In a few years, more than 30% of Hydro One's workforce can retire. That's why Hydro One is taking action to attract future employees by partnering with four Ontario colleges: Algonquin, Georgian, Mohawk and Northern. In addition to donating equipment and establishing scholarships and bursaries, Hydro One's professionals will help develop curriculum for the program. The partnership will make talented young people aware of the many opportunities available in the electrical transmission and distribution sector. Hydro One is also sponsoring similar programs at the University of Western Ontario, McMaster University and Ryerson University.

Kristy Dennis, controller-trainee, Farooq Qureshy, transmission system planner, and Dean Edwards, line maintainer, don't all work at the Ontario Grid Control Centre, but they do work together to meet Ontario's electricity needs.

Our greatest power is our people.

Every day the women and men of Hydro One go to work with one goal in mind: the safe, reliable operation of Ontario's electricity system. Stewardship of Ontario's electricity delivery system demands a diverse workforce with a wide variety of skills, talents and training. We need people who are not only experts in their respective fields but who are also able to contribute as members of an integrated team. System planners, station maintenance technicians, foresters, line maintainers, system operators and engineers all have to cooperate to keep Ontario strong.

Like many large employers, Hydro One is facing a massive demographic shift. Within five years, 30% of our workforce can retire. In 2007, we focused on strategies to facilitate knowledge transfer to the next generation of employees. Our New Grad initiative recruits top university graduates into an intensive two-year program that rotates them through a range of our operations.

Hydro One's apprenticeship program has steadily expanded in the last four years, with 774 apprentices joining trades such as line maintenance, electrical forestry, station maintenance and others. Hydro One's rigorous training sets the industry standard for the province and produces safe and productive workers that Ontarians can rely on.

Initiatives like our new pilot partnership with the Sioux Lookout Aboriginal Management Board and the Power Workers' Union, launched to attract new Aboriginal employees, demonstrate Hydro One's commitment to reflect the communities where we live and work.

774

Hydro One has taken on 774 apprentices in the last four years.

Management's Discussion and Analysis

We prepare our financial statements in Canadian dollars and in accordance with accounting principles generally accepted in Canada. The following discussion is based upon our Consolidated Financial Statements for the years ended December 31, 2007 and 2006.

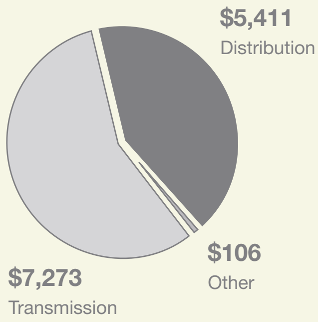
Overview

We are wholly owned by the Province of Ontario (the Province), and our transmission and distribution businesses are regulated by the Ontario Energy Board (OEB). We are the leading electricity transmitter and distributor in Ontario, delivering power safely and reliably to homes and businesses. As stewards of this province's massive and complex transmission and delivery system, our mission is to be an efficient and dynamic transmission and distribution company that is best in North America in the areas of safety, customer service and reliability, while focusing on the development and retention of our employees and creating shareholder value. In 2007, we continued our focus on our core businesses, substantially maintained and improved our performance in various key areas of the business, and made important contributions to the rebuilding of Ontario's core infrastructure.

Transmission

Substantially all of Ontario's electricity transmission system is owned and operated by our company. Our transmission system forms an integrated transmission grid that is monitored, controlled and managed centrally from one location, our Ontario Grid Control Centre in Barrie, Ontario. It operates over relatively long distances and links major sources of generation to transmission stations and larger area load centres. In 2007, we earned total transmission revenues of $1,242 million primarily by transmitting approximately 152 TWh of electricity, directly or indirectly, to substantially all consumers of electricity in Ontario. Our transmission system is one of the largest in North America, and is linked to five adjoining jurisdictions through 26 interconnections. Through these interconnections, we can accommodate imports of about 4,000 MW and exports of approximately 5,800 MW of electricity. In terms of assets, our transmission business is our largest business segment, representing approximately 57% of our total assets.

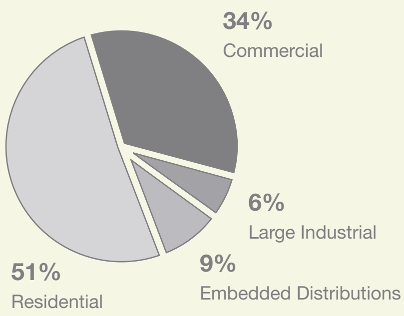
Total Assets
December 31, 2007
(Cdn $ millions)



Distribution

Our distribution system is the largest in Ontario and spans roughly 75% of the province, serving approximately 1.3 million rural and urban customers, and 50 large industrial customers. We also operate small, regulated generation and distribution systems in a number of remote communities across northern Ontario that are not connected to Ontario's electricity grid. As illustrated in the accompanying chart, about half of our distribution revenues are earned from our residential customers.

2007 Distribution Revenues



Other

Our other business segment contributed revenues of $31 million in 2007 and has assets of about $106 million, which constitute less than 1% of our total assets. This segment primarily represents the operations of our wholly owned subsidiary, Hydro One Telecom Inc., which markets fibre-optic capacity to telecommunications carriers and commercial customers with broadband network requirements.

Our Strategy

In 2007, aligned with retaining and building public confidence and trust, we maintained our strategic focus on our core operations and built upon our accomplishments. Consequently, we have moved closer to achieving our goals to be recognized by our customers as their best service provider, by our peers as their benchmark for excellence, and by our shareholder for delivering superior value, while striving to attract, develop and retain productive employees.

We seek to achieve these goals by continuing to implement the following strategies:

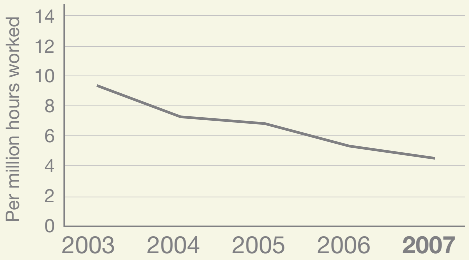
- *Stewardship:* Retain and build the public trust placed in us to ensure the safe, reliable and efficient delivery of electricity.
- *Safety:* Create and maintain an injury-free workplace with a concentrated focus on eliminating serious injury and "near misses" in high potential harm categories of work.
- *Customers:* Become a leading customer-focused company. We intend to maintain our focus and commitment to improving our customers' level of satisfaction. We strive to strengthen relationships with our large and mid-sized customers, acknowledging their commercial requirements. For residential customers, our key focus is on improving the quality of customer services such as billing, call handling, outage management, and meter reading. We also aim to make positive contributions in communities across Ontario through our corporate citizenship programs.
- *Reliability:* Enhance the reliability of our transmission and distribution systems through our productive and cost effective work programs. In transmission, we are proactively developing the system to meet Ontario's power needs. Within distribution, we are focused on reliability while recognizing the challenges in operating a system with low customer density and vast geography.
- *Financial:* Ensure our actions contribute towards maximizing the value of our company, while maintaining effective access to funds on a long-term basis at reasonable rates and delivering appropriate financial returns to our shareholder.
- *Employees:* Manage the challenges of labour demographics by attracting, developing and retaining productive employees.

Performance Measures and Targets

We measure and target our performance in all of the above strategic areas, ensuring that we are recognizing the needs of all of our key stakeholders. We met or exceeded our challenging 2007 objectives, improving in a number of areas over 2006, and are moving towards achieving our strategic goals.

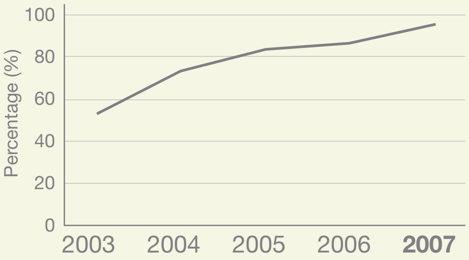
The potentially hazardous nature of our business requires a strong focus on safety. Consequently, one of our goals is to eliminate serious injuries. Accordingly, we measure our Serious Incident Rate to identify possible situations that may increase the risk of injury. These incidents include electrical contacts, preventable motor vehicle accidents and work equipment operations, among others. As shown in the accompanying chart, we had 4.4 serious incidents per million hours worked in 2007, which is 15% lower than 2006, 34% lower than 2005, and 39% lower than 2004. Going forward, we will continue to stress the importance of safety through a sustained cultural change and a continued focus on people and the work environment. This involves an emphasis on strong leadership, understanding and leveraging human factors and the role of human traits in determining safe work performance. Planned initiatives include increased facility and site assessments and further use of decision analysis tools to reduce human error and its consequences.

Serious Incident Rate



Customer satisfaction is also vital to our success. In 2007, we exceeded our overall target for customer satisfaction levels. As shown in the accompanying chart, our Large Transmission Customer Satisfaction Survey results improved from 86% to 95% satisfied, as compared to 2006. Moreover, we have seen continuous improvement over the last five years. We also continue to be conscious of the needs of our residential and small business customers and survey results show an overall satisfaction level of 82%, which remains consistent with 2006 results. We achieved our overall target for generator customer satisfaction. Within this category, we met our satisfaction target for transmission connected generators, but did not achieve our target for distribution connected generators. Addressing the concerns identified will be an area of focus in 2008. We will continue to focus on improving the level of customer satisfaction across all customer segments by targeting our responses to the unique requirements of each segment.

Large Transmission Customer Satisfaction



We aim to retain and build public confidence and trust in our operations, as stewards of the province's electricity grid. In 2007, we continued our focus on this strategic priority by investing in the key assets of the electricity delivery system and by operating the existing system for our customers in a safe, reliable and efficient fashion. We are conscious that businesses of all sizes require reliable service and consequently, we focus on achieving top-quartile reliability in relation to other comparable systems. In 2007, we met our annual reliability targets and achieved improvements over 2006. Our continued commitment to the people of Ontario has been recognized by *Corporate Knights*, an independent media magazine, focused on promoting and reinforcing sustainable development in Canada, as one of Canada's Top 50 Corporate Citizens, ranking third among utilities. The ranking was based on environment, social and governance indicators, and our conservation and demand management (CDM) and Smart Meter Programs were cited as key factors in the recognition. In addition, *Corporate Knights* recognized us as Canada's most diverse utility and ranked us fifth overall in corporate Canada.

Given the retirement profile of our employees, we are entering into a period of significant demographic change. This change is taking place across the electricity sector and we have taken a leadership role to address the transition. As part of a comprehensive strategy to meet our staffing needs well into the future, we entered into a partnership with four community colleges of applied art and technology to attract and educate the future employees of the electricity transmission and distribution sectors. Through this partnership, we will contribute towards scholarships, program development and equipment for programs that will train people for technical, technological and trades positions in the electricity sector.

Our financial performance and the business environment in which we operate are taken into consideration in both our short-term and long-term credit ratings. In March 2007, Standard & Poor's Rating Services Inc. (S&P) assigned a positive outlook to our long-term "A" credit rating from stable, attributing the improvement to lower business risk for the sector as a whole. In November, S&P issued a commentary report which reaffirmed our assigned positive outlook while noting a steady improvement in our business risk profile. Our current credit ratings facilitate ongoing access to debt markets at a reasonable cost to fund the infrastructure requirements of our system.

Regulation

Our electricity transmission and distribution businesses are licensed and regulated by the OEB. The OEB sets rates following oral or written public hearings. Our transmission revenues primarily include our transmission tariff, which is based on the uniform province-wide transmission rates approved by the OEB for all transmitters across Ontario. Our distribution revenues primarily include our distribution tariff, which is also based on OEB-approved rates, and the recovery of the cost of purchased power used by our customers. Consequently, our distribution business does not have commodity price risk. Transmission and distribution tariff rates are set based on an approved revenue requirement that provides for cost recovery and includes a return on deemed common equity. In addition, the OEB approves rate riders to allow for the recovery or disposition of specific regulatory assets and liabilities over a specified timeframe.

Under the current market structure, low-volume and designated consumers pay electricity rates established through the Regulated Price Plan (RPP) and wholesale electricity consumers pay a blend of regulated, contract and wholesale spot market prices. The OEB sets prices for RPP customers based on a two-tiered electricity pricing structure with seasonal consumption thresholds. Unexpected shortfalls or overpayments associated with the RPP are financed by the Ontario Power Authority (OPA). Prices are reviewed every six months and may change based on an updated OEB forecast and any accumulated differences between the amount that customers paid for electricity and the amount paid to generators in the previous period. Customers who are not eligible for the RPP, or wholesale customers, pay the market price for electricity adjusted for the difference between market prices and prices paid to generators under the *Electricity Restructuring Act, 2004*. The Independent Electricity System Operator (IESO) is responsible for overseeing and operating the wholesale market, as well as ensuring the reliability of the integrated power system.

In addition to the oversight role of the OEB, and the market monitoring and coordination role of the IESO, the OPA was created through the *Electricity Restructuring Act, 2004,* to ensure the long-term supply of electricity, facilitate load management and conservation, and assist with the stability of rates for RPP customers, among others. As part of its mandate, and consistent with the Province's direction regarding supply mix, the OPA developed the Integrated Power System Plan (IPSP), which was submitted for OEB review and approval on August 29, 2007. The plan's estimated 20-year capital program will be directed toward initiatives required to deliver electricity to Ontario consumers. OEB approval is expected in the Fall of 2008.

The OPA is also responsible for coordinating the delivery and funding of conservation and demand management programs. This coordination furthers initiatives undertaken by individual local distribution companies (LDCs), including our distribution businesses, as a result of distribution tariff rate increases approved in 2005. Our CDM programs funded through the OPA in 2007 amounted to approximately $6 million and our programs funded through distribution rates since 2005 amounted to approximately $41 million. The overall goal of the CDM programs, under the IPSP, is to reduce provincial demand by 6,300 MW by 2025.

The *Energy Conservation Responsibility Act, 2006* furthers the broad objectives of CDM by providing the framework for the installation of 800,000 smart meters in Ontario homes and businesses by the end of 2007, with installation in all homes and businesses to be completed by the end of 2010. These meters will be capable of measuring and reporting usage over predetermined periods, being read remotely, and when combined with communications systems will be capable of providing customers with access to information about their consumption. In 2007, the Province appointed the IESO as the smart meter entity that will oversee the collection and management of data. LDCs, including our distribution businesses, are accountable for the development of smart meter infrastructure and related technology for communications to meet minimum requirements as defined in regulations, as well as the implementation of time of use rates that are presently voluntary. In 2007, we deployed over 260,000 smart meters, exceeding our 2007 target of approximately 240,000 meters, and bringing the cumulative number of installations under our Smart Meter Program to approximately 288,000. We are continuing the deployment of smart meters (see the Future Capital Expenditures chart on page 30).

Transmission Rates

The IESO facilitates payments to us based on the Ontario Uniform Transmission Rates (UTRs) approved by the OEB for all transmitters across Ontario.

In October 2005, the OEB initiated a proceeding to review our transmission rates and revenue requirements for 2006, 2007, and 2008 based on cost of service regulation. On February 21, 2006, the OEB announced its decision to apply an earnings sharing mechanism (ESM) to equally share, between our shareholder and customers, any transmission earnings in excess of the approved rate of return of 9.88% for the period ending January 1, 2006 until new transmission rates were set. Consequently, 50% of our excess earnings recovered from customers were deferred as a regulatory liability.

In September 2006, we filed a transmission rate application through our subsidiary, Hydro One Networks Inc. (Hydro One Networks). On March 30, 2007, prior to its decision on our transmission rate application, the OEB issued a decision ordering that the ESM cease effective December 31, 2006. The decision also approved the concept of establishing a new revenue difference deferral account (RDDA) to record the revenue differential between existing transmission rates and the new rates that were anticipated to be approved later in the year, for the period commencing January 1, 2007.

On August 16, 2007, the OEB issued its decision in respect of our 2007 and 2008 transmission rate application. The decision, which was effective January 1, 2007, showed confidence in our work programs by approving all of our operating and capital expenditures for 2007 and 2008. However, the decision resulted in an estimated 8% annual reduction in transmission rates primarily due to a reduction in the approved return on equity from 9.88% to 8.35%, based on a formula used by the OEB in the regulation of LDCs. Further, the OEB approved final amounts and disposition treatments for certain regulatory accounts including the RDDA, ESM and export and wheeling fees liabilities, as well as the transmission market ready regulatory asset. The RDDA and ESM will be refunded to customers over the 14-month period from November 1, 2007 to December 31, 2008, while the export and wheeling fees liability and transmission market ready regulatory asset will be factored into rates over the four-year period ending December 31, 2010.

As part of a joint proceeding involving all transmitters in Ontario, on October 17, 2007 the OEB approved new UTRs for implementation on November 1, 2007 through to December 31, 2008. The new rates fully reflect the approved changes to our revenue requirement and charge determinants and are, on average, 12% lower than previously approved rates. The new rates should result in approximately a 1% decrease in the average customer's total electricity bill. We anticipate the OEB will reset UTRs on January 1, 2009, at which time we anticipate our revenue requirement allocation from UTRs will increase to reflect the full repayment to customers of the ESM and RDDA. To achieve the necessary funding in support of the infrastructure required, we plan to submit a transmission rate application for 2009 to 2010 transmission rates in the Summer of 2008.

Distribution Rates

As a distributor, we are responsible for delivering electricity and billing our customers for approved distribution rates, purchased power costs, and other approved regulatory charges.

Distribution Tariffs

In August 2005, we filed a distribution rate application seeking approval for an increase in the 2006 revenue requirements for our distribution businesses operated through Hydro One Networks and Hydro One Brampton Networks Inc. (Hydro One Brampton). On April 12, 2006, the OEB announced its decisions regarding these applications and, on the basis of the written and oral evidence submitted, it approved the requested increases in the revenue requirements based on an approved rate of return of 9.00%, effective May 1, 2006.

In 2006, the OEB commenced the process of establishing an Incentive Regulation Mechanism (IRM) for the years 2007 to 2010. The process includes a formulaic approach to establishing 2007 rates with a rate rebasing approach to be staggered across all Ontario distributors between 2008 and 2010. Our subsidiaries, Hydro One Networks and Hydro One Brampton, applied for marginal distribution rate adjustments in February 2007, based on an OEB-approved formula that considers inflation, efficiency targets and significant events outside the control of management. In April 2007, the OEB approved our submissions on the basis of its cost of capital and second generation IRM policies, and the revised rates were implemented effective May 1, 2007.

As our subsidiary Hydro One Networks was among 25 LDCs selected for rebasing in 2008, we submitted the revenue requirement portion of our 2008 cost of service application in accordance with the OEB's multi-year distribution rate-setting plan on August 15, 2007. This application seeks the approval of a revenue requirement of $1,067 million based on a rate of return of 8.64% for 2008. The requested distribution rate increase amounts to a net average increase of less than 1% on the average customer's total bill. On December 18, 2007, we filed the details of our cost allocation and rate design proposals, which include a plan to reduce the number of customer rate classes and consolidate or harmonize the rates for its existing rate classes to the new proposed rate classes. Based on the OEB's processing guidelines, a decision is anticipated in the latter part of 2008.

On August 2, 2007, the OEB initiated a consultation on the development of the principles and methodology for the third generation IRM. This consultative process will culminate with the issuance of an OEB report expected in mid-2008 that will be used to adjust rates starting in 2009, for those LDCs, including our subsidiary Hydro One Networks, whose 2008 rates will be rebased. On November 1, 2007, Hydro One Brampton filed its application for 2008 rates on the basis of the OEB's cost of capital and second generation IRM policies. The distribution rates of our subsidiary, Hydro One Brampton, will be rebased in 2010.

Smart Meter Program

In March 2006, the OEB approved a monthly rate of 27 cents and 28 cents per metered customer, effective May 1, 2006, as initial funding for the required investment in smart meters for our subsidiaries Hydro One Networks and Hydro One Brampton, respectively. As a result, expenditures in excess of recoveries were recorded as a regulatory asset, with disposition to be established at a later date. In April 2007, as part of the OEB decision regarding the 2007 distribution rate applications made by Hydro One Networks and Hydro One Brampton, the OEB approved an amount of 93 cents and 67 cents, respectively, per month per metered customer for smart meters, for implementation effective May 1, 2007.

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine recoverability of expenditures incurred by distributors. Expenditures associated with the approved minimum functionality for advanced metering infrastructure incurred by our subsidiaries Hydro One Networks and Hydro One Brampton were approved for recovery. As a result of this decision, smart meter expenditures are no longer deferred as regulatory assets, and instead, are now classified as capital or are charged to results of operations. Expenditures determined to be above the minimum functionality for our subsidiary Hydro One Networks have been brought forward for review in our 2008 cost of service rate application. Hydro One Brampton will bring these expenditures forward in its 2010 cost of service application.

Results of Operations

Revenues

Distribution – units distributed to customers ***(TWh)***[1]	**30.2**	29.0	1.2	4

1 System-related statistics include preliminary figures for December.

Transmission

Transmission revenues predominantly consist of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate the maximum expected demand, which is primarily influenced by weather and economic conditions. Transmission revenues also include minor amounts of ancillary revenues which are primarily attributable to maintenance services provided to generators and secondary use of our land rights-of-way.

Revenues for the year were affected by the OEB's August 16, 2007 decision on our transmission rate application. While the OEB approved all of our work program expenditure requirements, our return on equity was reduced from 9.88% to 8.35% and our deemed capital structure was adjusted from one that included common and preferred shares and debt to a deemed capital structure of 60% debt and 40% common shares. This capital structure is consistent with that approved by the OEB in 2006 which established the capital structure for Ontario's LDCs. The OEB's decision was effective January 1, 2007 and new customer rates reflecting the decision were implemented on November 1, 2007. As a result of the OEB decision, we reduced our 2007 transmission revenues to reflect the approved revenue requirement. Excess amounts collected from customers have been recorded in the RDDA and are being returned to customers through lower rates commencing November 1, 2007. On March 30, 2007, the OEB approved cessation of the ESM effective December 31, 2006 and replaced it with the RDDA. The RDDA and ESM liabilities will be drawn down over the period the new rates are in place and will be reflected in revenue over the 14-month period from November 1, 2007 to December 31, 2008.

Our transmission revenues were lower by $3 million, compared to 2006. The OEB's August 16, 2007 transmission rate decision reduced our revenues by about $53 million. This includes the revenue adjustment associated with recording the RDDA liability and the impact of the new OEB-approved rates effective November 1, 2007. Partially offsetting this decrease was the effect of the OEB's earlier decision to end the ESM effective December 31, 2006, which increased our transmission revenues by about $33 million.

Revenues for the year also reflect higher average peak demands compared to last year, resulting in increased transmission revenues of $23 million and lower other revenues of $6 million.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are primarily influenced by our distribution rates, the amount of electricity we distribute, and the cost of purchased power. Distribution revenues also include a minor amount of ancillary distribution services revenues, such as fees related to the use of our poles by the telecommunications and cable television industries, and miscellaneous charges such as those for late payments.

Distribution revenues increased by $109 million, or 3%, in 2007 compared to last year. This change includes the recovery of increased purchased power costs of $19 million as described below under Purchased Power. In addition, the OEB approved increases in distribution tariff rates for our subsidiaries, Hydro One Networks and Hydro One Brampton, effective May 1, 2006 and May 1, 2007, respectively. These tariff rate increases, which support the maintenance and investment requirements of our distribution system and enable the safe and reliable delivery of electricity to our customers through Ontario, resulted in higher distribution revenues of $45 million during the year. In 2006, rates were approved based on a full cost of service hearing. In 2007, rates were approved based on OEB guidelines that included an incentive mechanism to adjust rates. Higher energy consumption, resulting primarily from the colder winter weather this year, increased our distribution revenues by a further $26 million. In addition, as a result of the OEB's decision on August 8, 2007 regarding the combined smart meter proceeding, we recorded smart meter revenues of $17 million reflecting recovery of our investments in this program. We also experienced higher other revenues of $2 million during the year.

Purchased Power

Purchased power costs incurred by our distribution business represent the cost of electricity delivered to customers within our distribution service territory and consist of the wholesale commodity cost of energy, the IESO's wholesale market service charges, and transmission charges levied by the IESO. The commodity cost of energy for certain low-volume and designated customers is based on the OEB's RPP, which consists of a two-tiered pricing structure with seasonal threshold amounts. Customers that are not eligible for the RPP pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the RPP affecting the two-year period 2006 and 2007 is provided below.

Summary of RPP

	Tier Threshold (kWh/month)		Tier Rates (cents/kWh)	
Effective Date	Residential	Non-Residential	First Tier	Second Tier
November 1, 2005	1,000	750	5.0	5.8
May 1, 2006	600	750	5.8	6.7
November 1, 2006	1,000	750	5.5	6.4
May 1, 2007	600	750	5.3	6.2
November 1, 2007	1,000	750	5.0	5.9

Purchased power costs increased in 2007 by $19 million, or 1%, to $2,240 million compared to last year. Our increased purchased power costs were primarily due to higher demand for electricity of $57 million, higher wholesale commodity prices of $25 million for customers who are not eligible for the RPP and higher wholesale market service charges levied by the IESO of $7 million. These increases were partially offset by lower costs of $62 million associated with the OEB's RPP for residential and other eligible customers, combined with the impacts of the OEB's August 16, 2007 transmission rate decision of $8 million.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

Year ended December 31 (Canadian dollars in millions)	**2007**	2006	$ Change	% Change
Transmission	**415**	390	25	6
Distribution	**549**	460	89	19
Other	**31**	30	1	3
	995	880	115	13

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way increased by $25 million, or 6%, in 2007 compared to last year. Within our work programs, we continued our investments necessary for the safe and reliable operation of the transmission system. We experienced higher work program expenditures of $24 million primarily related to our planned station maintenance programs for power equipment and transformers and our line clearing and brush control programs, partially offset by lower requirements for unplanned corrective maintenance. We also experienced marginally higher expenditures in support of the transmission system. This increase reflects the commencement of a major business systems and processes project which will enable the adoption of more efficient, standardized business processes, the impact on our transmission regulatory accounts as a result of the OEB's August 16, 2007 transmission rate decision and the impact of a negotiated property tax settlement in 2006. The effect of these increases was partially offset by the impacts of a statutory reduction in our capital taxes and the reassignment of resources to support this year's larger transmission capital program.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage distribution system increased by $89 million, or 19%, compared to last year. Increased requirements within our work program of $65 million primarily resulted from the planned expansion of our forestry and line maintenance programs incurred to increase reliability. In addition, we experienced increased customer participation in our conservation and demand management programs. These increases were partially offset by reductions in expenditures incurred to respond to storm damage. In addition, our costs increased due to impacts of last year's OEB rate decision, including the recognition of distribution-related pension costs which had been previously deferred as a regulatory asset. Our operating, maintenance and administration expenditures also increased as a result of the OEB's August 8, 2007 decision on its combined smart meter proceeding due to the recognition of smart meter-related operating expenditures that were incurred in the 2005 to 2007 period but which were previously deferred as regulatory assets. In addition to these increases, our other support expenditures were higher by $24 million as a result of resource requirements in support of the maintenance program and the commencement of a major business systems and processes project, partially offset by the impact of a statutory reduction in our capital taxes.

Depreciation and Amortization

Depreciation and amortization expense increased by $6 million, or 1%, to $521 million this year. This increase was mainly attributable to the placement of new assets in service, consistent with our ongoing capital work program. We also experienced higher amortization of our regulatory assets resulting from an April 12, 2006 OEB distribution rate decision that was effective on May 1, 2006. These increases were partially offset by lower fixed asset removal costs resulting from lower storm damage in the year, compared to 2006.

Financing Charges

Financing charges remain unchanged at $295 million compared to last year. We experienced a lower average effective interest rate on our outstanding debt which was offset by lower capitalized interest on our regulatory assets due to lower prescribed OEB rates and increased regulatory liabilities.

Provision for Payments in Lieu of Corporate Income Taxes

We make payments in lieu of corporate income taxes to the Ontario Electricity Financial Corporation (OEFC) in accordance with the *Electricity Act, 1998* and on the same basis as if we were subject to federal and provincial corporate taxes. In providing for payments in lieu of corporate income taxes relating to our regulated businesses, the taxes payable method is used, whereas the liability method is used in computing the tax provision for our unregulated businesses.

The provision for payments in lieu of corporate income taxes increased by $26 million, or 15%, to $205 million in 2007 compared to 2006. The increase is primarily due to last year's recognition of a $30 million tax benefit related to the recovery of payments in lieu of corporate taxes from prior years, taxes payable on transmission amounts received this year but not recognized as revenue for accounting purposes, and temporary differences associated with certain regulatory accounts. These increases were partially offset this year by lower taxable income and other minor temporary differences.

Net Income

Net income of $399 million was lower by $56 million, or 12%, compared to 2006 results. Net income for the year was impacted by the OEB's August 16, 2007 transmission rate decision. While the OEB approved all of our work program requirements for 2007 and 2008, our return on equity was reduced from 9.88% to 8.35% effective January 1, 2007. Our net income also reflects higher requirements to operate and safely maintain our transmission and distribution systems, including enhanced transmission station maintenance and forestry programs. Our net income was further impacted by OEB decisions, including a 2006 decision affecting our distribution-related pension expenditures, last year's property tax settlement and a higher effective tax rate. These impacts were partially offset by an increase in our distribution revenues resulting from OEB-approved increases to our distribution tariff rates, as well as increased tariff revenue in our transmission and distribution businesses due to increased peak demands and energy consumption, as well as the elimination of last year's ESM.

Quarterly Results of Operations

The following table sets forth unaudited quarterly information for each of the eight quarters from March 31, 2006 through December 31, 2007. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)				**2007**				2006
Quarter ended	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**	Dec. 31	Sep. 30	Jun. 30	Mar. 31
Total revenues[1,2]	**1,129**	**1,128**	**1,120**	**1,278**	1,142	1,165	1,078	1,160
Net income[1,2]	**90**	**67**	**93**	**149**	101	103	99	152
Net income to common shareholder[1,2]	**85**	**63**	**88**	**145**	96	99	94	148

1 The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and profit, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

2 As a result of the OEB's August 16, 2007 decision on Hydro One Networks' transmission rate application that was effective January 1, 2007, revenues reflect a reduced revenue requirement based on the approved rate of return of 8.35%. Previously, the rate of return was 9.88%.

Liquidity and Capital Resources

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These sources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash

Year ended December 31 *(Canadian dollars in millions)*	**2007**	2006
Operating activities	**1,141**	909
Financing activities		
Long-term debt issued	**700**	775
Long-term debt retired	**(355)**	(589)
Short-term notes payable	**(60)**	60
Dividends paid	**(325)**	(350)
Investing activities		
Capital expenditures	**(1,091)**	(823)
Other financing and investing activities	**7**	(2)
Net change in cash and cash equivalents	**17**	(20)

Operating Activities

Net cash from operating activities increased by $232 million to $1,141 million, compared to 2006 results. Our working capital requirements were substantially lower than the comparative period primarily as a result of the impact of the *Ontario Price Credit* that was provided to RPP customers in early 2006, pursuant to regulation. Funding for the credit was received from the IESO in early December 2005. Our working capital requirements were also impacted by lower electricity prices charged to RPP customers in 2007, the impacts of last year's OEB distribution rate decision and increased accounts payable primarily associated with our capital expenditure program.

Financing Activities

Short-term liquidity is provided through funds from operations and our commercial paper program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. At December 31, 2007, we had no short-term notes payable outstanding. The commercial paper program is supported by a committed revolving credit facility with a syndicate of banks. On January 28, 2008, we increased the facility from $750 million to $1,000 million. The maturity date remains unchanged at August 10, 2010. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. At December 31, 2007, we had $5,615 million in long-term debt outstanding, including the current portion. Long-term financing is provided by our access to the debt markets, primarily through our Medium-Term Note Program. On June 21, 2007, we filed a $2.5 billion base shelf prospectus to renew our Medium-Term Note Program for another 25 months. Our notes and debentures mature between 2008 and 2046. We currently plan to refinance maturing debt principally through our Medium-Term Note Program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million, of which $2,200 million is remaining and is currently available until July 2009.

Rating Agency	Rating Short-term Debt	Rating Long-term Debt
DBRS Limited	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3
Standard & Poor's Rating Services Inc.	A-1	A

We have the customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement related to our $750 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations.

During 2007, we issued $700 million in long-term debt under our Medium-Term Note Program and we repaid $355 million in maturing long-term debt. In comparison, during 2006 we issued $775 million in debt under our Medium-Term Note Program and we repaid $589 million in maturing long-term debt. In 2007, we decreased our short-term notes by $60 million compared to an increase of $60 million in 2006.

In 2007, we paid dividends to the Province in the amount of $325 million, consisting of $307 million in common dividends and $18 million in preferred dividends. In the comparative period, we paid common dividends of $332 million and preferred dividends of $18 million. In 2007, cash dividends per common share were $3,070 compared to $3,320 per common share in 2006. Cash dividends per preferred share were $1.375 in each of 2007 and 2006.

Common dividends are declared at the sole discretion of our Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice, shareholder expectations. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

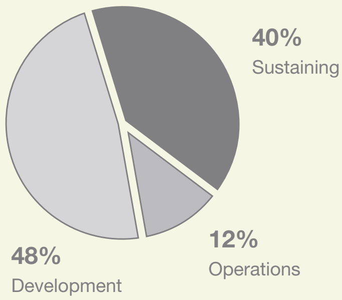
Cash used for investing activities, primarily representing capital expenditures to enhance and reinforce our transmission and distribution infrastructure in the public interest, was as follows:

Year ended December 31 (Canadian dollars in millions)	**2007**	2006	$ Change	% Change
Transmission	**560**	402	158	39
Distribution	**511**	417	94	23
Other	**20**	4	16	400
	1,091	823	268	33

Transmission

Transmission capital expenditures increased by $158 million in 2007 to $560 million, compared to 2006. Expenditures to expand and reinforce the transmission system were $271 million, representing an increase of $92 million over last year. This increase primarily reflects expenditures on our major lines and stations development projects. These projects include our new interconnection with Quebec, which will increase access to emission-free hydroelectric power, our Essa to Stayner connection, which will improve the adequacy and reliability of supply to the Southern Georgian Bay region in recognition of the growing needs of our customers, and the completion of our Downtown Toronto Cable Project. Expenditures on our load and generation connections work have also increased primarily as a result of reconfiguration work at our Lambton Transformer Station and work at our London Talbot, Pleasant, and Holland transformer stations. The impact of these project expenditures was partially offset by last year's expenditure on our Niagara Reinforcement Project. This connection was substantially completed last year but final completion continues to be delayed by the aboriginal land dispute in the Caledonia area. Discussions continue between the involved aboriginal peoples and the various government entities involved. We will complete this project when site access becomes available.

2007 Transmission Capital Expenditures

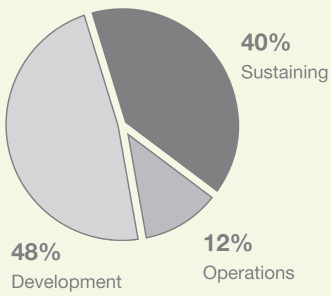


Expenditures to sustain our existing transmission system were $221 million, representing an increase of $31 million compared to 2006. This increase was primarily related to the refurbishment and replacement of end-of-life lines and stations, including work at our Claireville Transformer Station to improve current reliability and to meet growing demands, and protection and control work at our switchyard facility adjoining the Pickering Nuclear Generating Station. Our other transmission capital expenditures were $68 million in 2007, representing an increase of $35 million from last year. This increase included higher information technology expenditures primarily related to a major business systems and processes project.

Distribution

Distribution capital expenditures increased by $94 million to $511 million in 2007, compared to the prior year. Capital expenditures to expand and reinforce our distribution network were $245 million, an increase of $78 million compared to last year. This increase primarily reflects our ongoing investment in smart meters. During the year we installed approximately 260,000 meters, exceeding our 2007 target of approximately 240,000 meters, and bringing our cumulative program total to about 288,000 meters. We also experienced increased expenditures for new customer connections and for planned lines work, partially offset by slightly lower expenditures related to station meters.

2007 Distribution Capital Expenditures



Expenditures to sustain our low-voltage distribution system were $204 million, a reduction of $21 million from 2006. This reduction was primarily a result of lower storm-related expenditures. In 2007, we experienced lower capital expenditures of about $39 million to replace assets and components damaged or destroyed by major storms. Last year an unusual number of violent storms swept through the province and, in particular, a series of severe storms was experienced last summer. This impact was partially offset by higher planned end-of-life replacements of lines assets. Our other distribution capital expenditures were $62 million in 2007, representing an increase of $37 million from last year. This increase included higher information technology expenditures primarily related to a major business systems and processes project.

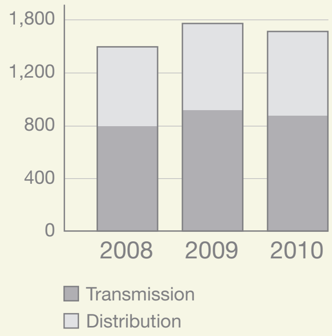
Other

Other capital expenditures made to enhance our telecom infrastructure increased by $16 million to $20 million in 2007. This increase was largely due to construction of a dedicated optical network which will provide secure, high capacity connectivity across numerous health care locations in Ontario.

Future Capital Expenditures

Our capital expenditures in 2008 are budgeted at approximately $1.4 billion. The 2008 capital budgets for our transmission and distribution businesses are about $800 million and $600 million, respectively. Capital expenditures, as shown in the accompanying chart, are expected to exceed $1.5 billion in both 2009 and 2010, primarily reflecting increasing investments to expand, refurbish or replace transmission infrastructure. The overall investment levels reflect transmission infrastructure requirements consistent with government policy, OPA planning information, local area supply requirements and the needs of preventive and corrective maintenance to manage aging assets. These investments will facilitate an adequate and reliable supply of electricity in the public interest. These investment levels also reflect the continued mass deployment of smart meters within our distribution businesses that began in 2007. The replacement of critical information technology systems is also underway. Capital expenditures of our other business segment are budgeted at about $11 million in 2008, about half of the 2007 level, as the implementation of a dedicated fibre-optic network, initiated in 2007, will be completed in 2008.

Future Capital Expenditures
(Cdn $ millions)



Transmission

Transmission system capital expenditures are anticipated to be significant over the period 2008 to 2010, amounting to about $2.5 billion. Our investment plan will address the needs of new generation development and load growth in local areas in the province. The transmission program also continues the focus on sustaining the performance of aging assets through maintenance and refurbishment programs and the replacement of assets that have reached their end of life.

With the primary focus of the recently filed IPSP being on mid- to long-term timeframes, the need justification for most major urgent, short-term transmission investments will continue through Leave-to-Construct (Section 92) proceedings. Referenced in the IPSP as short to mid-term investments is the project to connect redeveloped nuclear generation and wind from the Bruce Peninsula to our Milton Switching Station, other projects of local area supply, and the installation of equipment at our existing transmission stations. OEB and environmental approvals are being sought to build the 500kV line from the Bruce Peninsula, funding for which is included in the investment plan through to 2011. Given the timeframes required for stakeholdering, approvals, and construction, interim measures are being implemented to minimize the impact of generation scheduled to be available in 2009. These are comprised of the enhancement of the protection systems, the installation of Static Var Compensators and shunt capacitor banks in southwestern Ontario, and the upgrade of certain 230kV circuits.

Other projects included in the transmission investment plan include system expansions in northeastern Ontario to accommodate generation on the Mattagami River; transmission reinforcements in the Greater Toronto Area (GTA), Southern Georgian Bay, Woodstock and Windsor; and the interconnection between Ontario and Quebec. Construction of the Toronto third supply is contingent on the OEB approval of the IPSP and the OPA's determination of the need date. This project, for which funding is included in the plan, extends beyond the current planning horizon. This project is required to mitigate the risks associated with having only two major supply corridors to the City of Toronto and as such, to maintain a reliable supply of electricity.

At the local level, we continue to proactively address supply needs with our customers in order to meet load growth. For projects required to provide reliable delivery of electricity to communities, the participation and support of the affected LDCs, as partners in joint planning studies and throughout the consultation and approval processes, continue to be essential. Examples of projects under construction to meet the growing needs of our customers include new transformer stations to serve Essex County and Simcoe County, and expansions of transformer stations serving Brampton, Kingston, York Region and Red Lake. To address local future needs, we are in discussions with customers for major transmission expansions or new transformer stations and, where necessary, line connections in locations such as Woodstock, Mississauga, Oshawa and Brampton. Targeted investments in customer delivery point performance, power quality and our 115kV and 230kV systems are expected to lead to improved reliability.

The investment plan also includes increased program expenditures to manage the replacement and refurbishment of our aging transmission infrastructure to ensure a continued reliable supply of energy to customers throughout the province. Through targeted replacement programs for components, such as gas insulated switchgear, air blast circuit breakers, and 750 MVA autotransformers, improved performance is anticipated, which should reduce system integrity risks.

The timing of many development projects is uncertain as they are dependent upon the final approval of the IPSP and, in some instances, require approvals from various regulatory bodies, as well as negotiations and consultations with customers, neighbouring utilities and other stakeholders. We will not undertake large capital expenditures without a reasonable expectation of recovering them in our rates.

Distribution

Capital expenditures for the period 2008 to 2010 are estimated to be approximately $2 billion, including the Smart Meter Program, and core development and sustainment programs. With approximately 1.3 million customers in our service territory, we anticipate installing about a further one million meters under the program. Consistent with the government policy, all homes and small businesses are to receive a smart meter by 2010. At the Province's request, we will review our implementation plan and associated costs for the period from 2008 to 2010. Smart Network is an initiative that would leverage the smart meter infrastructure to enable functionality across our rural territory. This is currently being piloted and validated, and will be brought forward for consideration if benefits are confirmed.

Our core work will focus on demand programs such as new load connections, trouble calls and storm damage, and system capability reinforcement. The distribution investment plan also includes program expenditures relating to preserving the performance of our aging distribution asset base in order to improve system reliability. These include increased wood pole replacements, feeder sectionalization, and defect management, together with improved maintenance and line clearing practices. Given initiatives to encourage renewable energy technologies, we are experiencing increased distribution generation connection activity. Connection impact assessments are undertaken to determine project feasibility. Under OEB rules, the generator will pay connection costs other than distribution upgrades that also benefit other customers. No provision has been included in the plan for major distribution system modifications to accommodate this growth of new generation.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations, as well as other major commercial commitments:

December 31, 2007 *(Canadian dollars in millions)*	Total	2008	2009/2010	2011/2012	After 2012
Contractual obligations *(due by year)*:					
Long-term debt – principal repayments	5,615	540	800	850	3,425
Long-term debt – interest payments	5,211	307	554	488	3,862
Inergi LP (Inergi) outsourcing agreement[1]	396	100	190	106	–
Operating lease commitments	16	6	7	2	1
Total contractual obligations[5]	11,238	953	1,551	1,446	7,288
Other commercial commitments *(by year of expiry)*:					
Bank line[2]	750	–	750	–	–
Letters of credit[3]	99	99	–	–	–
Guarantees[3]	325	325	–	–	–
Pension[4]	196	94	102	–	–
Total other commercial commitments	1,370	518	852	–	–

1 On March 1, 2002, Inergi LP began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

2 As a backstop to our commercial paper program, we have a $750 million revolving standby credit facility with a syndicate of banks which matures in August 2010. On January 28, 2008 this facility was increased to $1,000 million.

3 We currently have bank letters of credit of $95 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO on behalf of our subsidiaries as required by the IESO's Market Rules, using parental guarantees of up to a maximum of $325 million. The maximum parental guarantee was increased in November 2007 to $325 million as a result of forecast power purchases and the November 1, 2007 change to our transmission rates. Although no letters of credit are currently required for prudential support, we would have to resume providing bank letters of credit if our highest long-term credit rating deteriorated to below the "Aa" category. The remaining amounts included in letters of credit pertain to operating letters of credit and to surety bonds.

4 Contributions to the pension fund are made one month in arrears. Contributions for 2008 are based on an actuarial valuation filed in September 2007 and effective December 31, 2006. Our annual pension contributions for 2008 and 2009 will be about $94 million. Contributions beyond 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension contributions beyond 2009 are not estimable at this time.

5 In addition, the Company has entered into various agreements to purchase goods or services in support of our work programs that are enforceable and legally binding. None of these are considered individually material, and the majority will result in payments by our company by December 31, 2008.

The amounts in the above table under long-term debt – principal repayments, are not charged to our results of operations, but are reflected on our Balance Sheet and Statement of Cash Flows. Interest associated with this debt is recorded under financing charges on our Statement of Operations or in our capital programs. Payments in respect of operating leases and our outsourcing agreement with Inergi LP are recorded under operation, maintenance and administration costs on our Statement of Operations or within our capital expenditures.

Related Party Transactions

Related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder. The year-over-year changes related to these amounts are described more fully in our discussion of our transmission revenues and purchased power costs. Other significant related party transactions include our dividends which are paid to the Province and our payments in lieu of corporate income taxes which are paid or payable to the OEFC.

Risk Management and Risk Factors

We have an enterprise risk management program that aims at balancing business risks and returns. An enterprise-wide approach enables regulatory, strategic, operational and financial risks to be managed and aligned with our strategic business objectives.

While our philosophy is that risk management is the responsibility of all employees, the Audit and Finance Committee of our Board of Directors annually reviews our company's risk tolerances, our risk profile and the status of our internal control framework. Our President and Chief Executive Officer has ultimate accountability for risk management. Our Leadership Team, comprising direct reports to the President and Chief Executive Officer, provides senior management oversight of risk in our company. Our Chief Risk Officer is responsible for the ongoing monitoring and review of our risk profile and practices, and our Chief Financial Officer is responsible for ensuring that the risk management program is an integral part of our business strategy, planning and objective setting. Each of our subsidiaries, as well as key specialist functions and field services, is required to complete a formal risk assessment and to develop a risk mitigation strategy.

The Audit and Finance Committee, the President and Chief Executive Officer, and the Chief Financial Officer are supported by our Chief Risk Officer. This support includes coordinating risk policies and programs, establishing risk tolerances, preparing risk assessments and profiles and assisting line and functional managers in fulfilling their responsibilities. Our internal audit staff is responsible for performing independent reviews of the effectiveness of risk management policies, processes and systems.

Ownership by the Province

The Province owns all of our outstanding shares. Accordingly, the Province has the power to determine the composition of our Board of Directors and appoint the Chair, and thus influence our major business and corporate decisions. We have entered into a shareholder agreement with the Province relating to certain aspects of the governance of our company.

Conflicts of interest may arise as a result of the Province's obligation to act in the best interests of the residents of Ontario in a broad range of matters, including the regulation of Ontario's electricity industry and environmental matters, any future sale or other transaction by the Province with respect to its ownership interest in our company, the Province's ownership of Ontario Power Generation Inc. (OPG), and the determination of the amount of dividend or payments in lieu of corporate income taxes. We may not be able to resolve any potential conflict with the Province on terms satisfactory to us.

Risk Associated with Transmission Projects

Significant investments have been initiated to increase transmission capacity and enable the reliable delivery of power to Ontario consumers from existing and future generation sources. In many cases, initiating these investments is contingent upon one or more approvals. These can include Section 92, expropriation and environmental approvals, as well as consultation, and possibly accommodation with First Nations where traditional lands or lands subject to land claims are involved. The ability to make such investments may also be impacted by public opposition. If we are unable to make such investments, the reliability of our transmission system and our service quality could be adversely affected.

Workforce Demographic Risk

More than 20% of our employees will be eligible for retirement by the end of 2008. We expect the skilled labour market for our industry to be highly competitive in the future. Consequently, we must continue to advance our training and apprenticeship programs and succession plans to ensure that our future operational staffing needs will be met. If we are unable to attract and retain qualified personnel, our operations could be adversely affected.

Regulatory Risk

We are subject to regulatory risks, including the approval by the OEB of rates for our transmission and distribution businesses that permit a reasonable opportunity to recover the estimated costs of providing service on a timely basis and to earn the approved rate of return.

The OEB approves our transmission and distribution rates based on projected electricity load and consumption levels. If actual load or consumption falls below projected levels, our rate of return for either or both of these businesses could be adversely affected. Also, our current revenue requirements for these businesses are based on cost assumptions that may not materialize. There is no assurance that the OEB would allow rate increases sufficient to offset unfavourable financial impacts from unanticipated changes in electricity demand or in our costs.

Our load could also be negatively impacted by successful CDM programs. Current requirements for CDM call for a 5% reduction in Ontario's projected peak electricity demand by 2010. These expectations are factored into our revenue requirements for OEB approval. There is a risk that our revenues would be reduced if these targets are exceeded. The OEB has recognized the need to compensate utilities for such lost revenue, but the approach, level and timing of such compensation is yet to be determined. We are also subject to risk of revenue loss from other factors. For example, revisions to the OEB's *Transmission System Code* have resulted in customers gaining the right to bypass some of our transformation facilities by constructing their own assets under certain conditions.

As a transmitter, we expect to make significant investment in the coming years in large-scale transmission infrastructure projects and to connect new third-party load and generation assets. Additionally, there is always the possibility that we could incur unexpected capital expenditures to maintain or improve our assets. The risk exists that the OEB may not allow full recovery of such investments. To the extent possible, we try to mitigate this risk by seeking from the regulator clear policy direction on cost responsibility and pre-approval of the need for capital expenditures.

The Province has passed regulations authorizing our subsidiaries, as distributors, to procure smart meters. Of the associated costs in rates, our subsidiaries Hydro One Networks and Hydro One Brampton are only currently authorized to recover 93 cents and 67 cents per metered customer per month, respectively. While we expect all of our expenditures to be fully recoverable after OEB review, any future regulatory decision to disallow or limit the recovery of such costs would lead to potential impairment and charges to results of operations.

Asset Condition

We continually monitor the condition of our assets and maintain, refurbish or replace them to maintain the performance that is needed to support transmission reliability and service quality to our customers. Capital and maintenance programs have been increasing to maintain the performance of our aging asset base. However, execution of these plans is dependent on external factors including limited opportunities to remove equipment from service to accommodate construction due to outage constraints as determined by the IESO and substantially increased lead times for material and equipment due to increased global demand and limited vendor capability. Consequently, the necessary maintenance or replacements may be delayed, which could affect transmission reliability.

Risk of Natural and Other Unexpected Occurrences

Our facilities are exposed to the effects of severe weather conditions, natural disasters and catastrophic events. Although constructed, operated and maintained to industry standards, our facilities may not withstand occurrences of this type in all circumstances. We do not have insurance for damage to our assets located outside our transmission and distribution stations. Lost revenues, repair costs, damage and claims from third parties could be substantial. In the event of a large uninsured loss, we would apply to the OEB for the recovery. However, there is no assurance that the OEB would approve such an application.

Risk from Transfer of Assets Located on Indian Lands

The transfer orders by which we acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on lands held for bands or bodies of Indians under the *Indian Act* (Canada). Currently, the OEFC holds these assets. Under the terms of the transfer orders, we are required to manage these assets until we have obtained all consents necessary to complete the transfer of title of these assets to us. We cannot predict the aggregate amount that we may have to pay, either on an annual or one-time basis, to obtain the required consents. However, we anticipate having to pay more than the approximately $900,000 per year that we currently are paying to these Indian bands and bodies. If we cannot obtain consents from the Indian bands and bodies, the OEFC will continue to hold these assets for an indefinite period of time. If we cannot reach a satisfactory settlement, we may have to relocate these assets from the Indian lands to other locations or replace them at a cost that could be substantial. These potential costs could have a material adverse effect on our results of operations if we are unable to recover them in future rate orders.

Labour Relations Risk

The substantial majority of our employees are represented by either the Power Workers Union (PWU) or the Society of Energy Professionals. The existing collective agreements with the PWU will expire on March 31, 2008; collective bargaining commenced in January 2008. The Society of Energy Professionals' collective agreement was recently renewed and now expires on March 31, 2013. We face financial risks related to our ability to negotiate collective agreements consistent with our rate orders. In the event of a labour dispute, we could face operational risk related to continued compliance with our license requirements of providing service to customers.

Environmental Risk

We are subject to extensive environmental regulation and failure to comply could subject us to fines and other penalties. In addition, the presence or release of hazardous or other substances could lead to claims by third parties and/or governmental orders requiring us to take specific actions such as investigating, controlling and remediating the effects of these substances. We are currently undertaking a voluntary land assessment and remediation program covering most of our stations and service centres. There is also risk associated with obtaining governmental approvals, permits, or renewals of existing approvals and permits related to constructing our operating facilities. This may require environmental assessment or result in the imposition of conditions, or both, which could mean delays and cost increases.

Future changes in environmental regulations may result in material changes to our estimates of future expenditures to complete this work. On November 4, 2006, Environment Canada published new draft regulations governing the management of polychlorinated biphenyls (PCBs). These draft regulations may be finalized in 2008. We have estimated the non-capital expenditures for complying with these draft regulations to be between $250 million and $375 million in excess of amounts we have already recorded as environmental liabilities on our Balance Sheet. If required, most of these additional expenditures would be incurred in the period from 2013 to 2025. No obligation has been recorded in the financial statements for these increased expenditures due to continued uncertainty regarding the timing and content of the final regulations. In any case, actual future environmental expenditures may vary materially from the estimates used in the calculation of the environmental liabilities on our Balance Sheet. We do not have insurance coverage for these environmental expenditures.

Scientists and public health experts have been studying the possibility that exposure to electric and magnetic fields emanating from power lines and other electric sources may cause health problems. If it were to be concluded that electric and magnetic fields present a health risk, we could face litigation, be required to take costly mitigation measures such as relocating some of our facilities or experience difficulties in locating and building new facilities.

Risk Associated with Information Technology Infrastructure

Our ability to operate effectively in the Ontario electricity market is in part dependent upon us developing, maintaining and managing complex information technology systems that are employed to operate our transmission and distribution facilities, financial and billing systems, and business systems to capture data and to produce timely and accurate information. We are working to transition most of our financial and business processes to an integrated business and financial reporting system which will enable productivity through the adoption of more efficient, standardized business processes. The conversion of these systems and processes may expose us to risk, including risks associated with maintaining internal controls, as new systems are brought online and the data and business processes are transitioned. System failures could have a material adverse effect on our company.

Risk Associated with Outsourcing Arrangement

Consistent with our strategy of reducing operating costs, we entered into an outsourcing services agreement in 2002 with Inergi. If this agreement is terminated for any reason, we could be required to incur significant expenses to re-establish all or some of the outsourced functions, which could have a material adverse effect on our results of operations.

Risk from Provincial Ownership of Transmission Corridors

Although we have the statutory right to use provincially-owned transmission corridors, we may be limited in our ability to expand our systems. Also, other uses of the transmission corridors by third parties in conjunction with the operation of our systems may increase safety or environmental risks.

Pension Plan Risk

We have a defined benefit registered pension plan for the majority of our employees. Contributions to the pension plan are established by actuarial valuations which are filed with the Financial Services Commission of Ontario on a tri-annual basis. The most recently filed valuation was prepared as at December 31, 2006 and was filed in September 2007. Our annual pension contributions for the three-year period 2007 to 2009 are approximately $94 million per year. The next valuation is required to be prepared as at December 31, 2009. The required level of contributions effective January 1, 2010 will depend on future investment returns, changes in benefits and changes in actuarial assumptions. Pension contributions beyond 2009 are not estimable at this time. The recovery of pension costs is subject to approval by the OEB. Failure to attain OEB approval could have an adverse effect on our results of operations.

Risk Associated with Arranging Debt Financing

We expect to borrow to repay our existing indebtedness and to fund capital expenditures. A substantial portion of our existing debt matures between 2008 and 2011. We are also planning a combined total of capital expenditures of approximately $3 billion in 2008 and 2009. Cash generated from operations will not be sufficient to fund the repayment of our existing indebtedness and capital expenditures. Our ability to arrange sufficient and cost effective debt financing could be adversely affected by numerous factors, including the regulatory environment in Ontario, our results of operations and financial position, market conditions, the ratings assigned to our debt securities by credit rating agencies and general economic conditions. Any failure or inability on our part to borrow substantial amounts of debt on satisfactory terms could impair our ability to repay maturing debt, fund capital expenditures and meet other obligations and requirements and, as a result, could have a material adverse effect on our business.

Market and Credit Risk

Market risk refers primarily to risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. We do not have commodity risk and our foreign exchange risk is currently insignificant, although we could in the future decide to issue foreign currency denominated debt. We are exposed to fluctuations in interest rates as our regulated rate of return is derived using a formula approach which is in part based on the forecast for long-term Government of Canada bond yields. We estimate that a 1% decrease in the forecast long-term Government of Canada bond yield used in determining our rate of return would reduce our transmission business' results of operations by approximately $20 million and our distribution business' results of operations by approximately $13 million. Our results of operations are adversely impacted by rising interest rates as our maturing long-term debt is refinanced at market rates. We periodically utilize interest rate swap agreements to mitigate elements of interest rate risk. We estimate that a 1% increase in interest rates on the refinancing of long-term debt maturing in 2008 and 2009 would reduce our results of operations by approximately $1 million and $4 million, respectively.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. Derivative financial instruments result in exposure to credit risk, since there is a risk of counter-party default. We monitor and minimize credit risk through various techniques, including dealing with highly rated counter-parties, limiting total exposure levels with individual counter-parties, and by entering into master agreements which enable net settlement. We do not trade in any energy derivatives. We do, however, have interest rate swap contracts outstanding from time to time. Currently, there are no significant concentrations of credit risk with respect to any class of financial assets. We are required to procure electricity on behalf of competitive retailers and embedded LDCs for resale to their customers. The resulting concentrations of credit risk are mitigated through the use of various security arrangements, including letters of credit, which are incorporated into our service agreements with these retailers in accordance with the OEB's Retail Settlements Code.

Critical Accounting Estimates

The preparation of our financial statements requires us to make estimates and judgements that affect the reported amounts of assets, liabilities, revenues and costs, and related disclosures of contingencies. We base our estimates and judgements on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgements about the carrying values of assets and liabilities as well as identifying and assessing our accounting treatment with respect to commitments and contingencies. Actual results may differ from these estimates and judgements under different assumptions or conditions.

We believe the following critical accounting estimates involve the more significant estimates and judgements used in the preparation of our financial statements:

Regulatory Assets and Liabilities

Regulatory assets as at December 31, 2007 amounted to $213 million and principally relate to regulatory asset recovery accounts (RARAs), employee future benefits other than pension, and environmental costs. We have also recorded regulatory liabilities amounting to $583 million as at December 31, 2007. These amounts pertain primarily to pension, the RDDA, export and wheeling fees, the ESM, and retail settlement variance accounts. These assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment or if future OEB direction is judged to be probable. Most of our regulatory accounts have already been reviewed by the OEB and confirmed as recoverable or refundable.

If management judges that it is no longer probable that the OEB will include a regulatory asset or liability in the setting of future rates, the relevant regulatory asset or liability would be charged or credited to results of operations in the period in which that judgement is made.

Environmental Liabilities

We record liabilities and related regulatory assets based on the present value of the estimated future expenditures to be made to settle obligations related to legacy environmental contamination inherited upon our de-merger from Ontario Hydro in 1999. These liabilities fall into two main categories: the management of PCB-contaminated assets and mineral oils and the assessment and remediation of contaminated lands. In determining the amounts to be recorded as environmental liabilities, we estimate the current cost of completing mitigation work and make assumptions for when the future expenditures will actually be incurred to generate future cash flow information. A long-term inflation assumption of approximately 2% has been used to express current cost estimates as estimated future expenditures. These future expenditures are discounted using factors ranging from 2.9% to 6.25%. Recording a liability for such long-term expenditures requires that many other assumptions be made, such as the number of contaminated properties and the extent of contamination, and the number and contamination levels of assets with PCBs. All factors used in deriving our environmental liabilities represent management's best estimates. However, it is reasonably possible that numbers or volumes of contaminated assets, current cost estimates, inflation assumptions and assumed pattern of annual cash flows may differ significantly from our assumptions. Estimated environmental liabilities are reviewed annually or more frequently if significant changes in regulation or other relevant facts occur. Estimate changes are accounted for prospectively.

Employee Future Benefits

We provide future benefits to our current and retired employees, including pension, group life insurance, health care and long-term disability.

In accordance with our rate orders, we record pension costs when employer contributions are paid to the pension fund (Fund) in accordance with the *Pension Benefits Act* (Ontario). Our annual pension contributions are approximately $94 million per year over the period 2007 through to 2009. Contributions after 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension costs are also disclosed in the notes to the financial statements on an accrual basis. We record employee future benefit costs other than pension on an accrual basis. The accrual costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. The assumptions were determined by management recognizing the recommendations of our actuaries.

The assumed return on pension plan assets of 6.75% per annum is based on expectations of long-term rates of return at the beginning of the fiscal year and reflects a pension asset mix consistent with the Fund's investment policy. During the year the Fund's target asset mix was changed to 62% exposure to equities, 33% to fixed income and 5% in alternative assets consisting of hedge funds and private equity. Returns on the respective portfolios are determined with reference to published Canadian and U.S. stock indices and long-term bond and treasury bill indices. The assumed rate of return on pension plan assets reflects our long-term expectations. We believe that this assumption is reasonable because, with the Fund's balanced investment approach, the higher volatility of equity investment returns is offset by the greater stability of fixed income and short-term investment returns. The net result, on a long-term basis, is a somewhat lower return than might be expected by investing in equities alone. The return on pension plan assets was lower than this long-term assumption in 2007.

The weighted-average discount rate used to calculate the accrued benefit obligations is determined each year end by referring to the most recently available market interest rates based on AA corporate bond yields reflecting the duration of the applicable employee future benefit plan. The discount rates at December 31, 2007 increased by 0.25% from those at December 31, 2006 in conjunction with an increase in bond yields over this period. The increase in discount rates has resulted in a corresponding reduction in liabilities.

The costs of employee future benefits other than pension are determined at the beginning of the year. The costs are based on assumptions for expected claims experience and future health care cost inflation. A 1% increase in the health care cost trends would result in an increase in service cost and interest cost of about $12 million per year and an increase in the year end obligation of about $167 million.

Employee future benefits are included in labour costs that are either charged to results of operations or capitalized as part of the cost of fixed assets. Changes in assumptions will affect the accrued benefit obligation of the employee future benefits and the future years' amounts that will be charged to our results of operations or capitalized as a cost of fixed assets.

Goodwill

In assessing the recoverability of goodwill, we must make assumptions regarding estimated future cash flows and other factors to determine the fair value of the distribution reporting unit. If these estimates or their related assumptions change in the future, we may be required to record impairment charges related to goodwill. An impairment review of goodwill was carried out during 2007 and we determined that the carrying value of our goodwill has not been impaired.

Emerging Accounting Pronouncements

Transition to International Financial Reporting Standards (IFRS)

The Canadian Accounting Standards Board (AcSB) ratified a new strategic plan for the period of 2006–2011 that entails converging Canadian generally accepted accounting principles (GAAP) with IFRS over the five-year transitional period. The final AcSB decision to proceed on the intended schedule will be made in March 2008. It is generally expected that the decision to adopt IFRS will be confirmed unless some unexpected event occurs. The AcSB has adopted an implementation plan and suggests that companies be in a position to disclose their implementation plans for the IFRS changeover in their 2008 Management's Discussion and Analysis (MD&A). The Canadian Securities Administrators will be defining the MD&A disclosure requirements regarding an enterprise's plans for IFRS conversion. We started planning our transition to IFRS during 2006 and plan to commence convergence work beginning in 2008.

Accounting for Rate Regulated Operations

During 2007, the AcSB issued an exposure draft proposing to remove all specific references to rate regulated accounting from the Handbook of the Canadian Institute of Chartered Accountants (CICA). In August 2007, the AcSB decided to remove a temporary exemption in CICA Handbook Section 1100, retain existing references to rate regulated accounting in the CICA Handbook, require the recognition of future income tax liabilities and assets as well as a separate regulatory asset or liability for the amount of future income taxes, and retain existing requirements to disclose the effects of rate regulation.

The new rules will apply prospectively to interim and annual financial statements relating to fiscal years beginning on or after January 1, 2009 and will result in accrual accounting being followed for payments in lieu of corporate taxes. Such amounts are currently accounted for on a cash basis, consistent with specific OEB rate-setting direction. Commencing the first quarter of 2009, the regulatory impact of the OEB's direction will be reflected through the recognition of regulatory assets and/or liabilities. There will be no impact on results of operations.

Inventories

The AcSB issued new CICA Handbook Section 3031, *Inventories*, which is effective for our company in the first quarter of 2008. The recommendations apply to our materials and supplies inventories and require major spare parts to be classified as future use fixed assets rather than inventory. We anticipate a significant transfer of book value from the materials and supplies category on the Balance Sheet to fixed assets. Additionally, the new handbook section will allow the reversal of prior period write-downs when the net realizable value of impaired inventory subsequently recovers.

Disclosure Controls and Internal Controls over Financial Reporting

As a reporting issuer we are required to comply with the Ontario Securities Commission's Multilateral Instrument 52-109 (Multilateral Instrument) concerning internal control and related certifications, often referred to as Bill 198. During 2005 and 2006, we documented all of our processes, risks and controls, and completed all testing necessary to make the required annual certifications. Commencing with our Consolidated Financial Statements for the year ended December 31, 2005, we certified that our disclosure controls and procedures provide reasonable assurance that all information considered necessary for appropriate disclosure has been accumulated and communicated to management on a timely basis. Commencing with our Consolidated Financial Statements for the year ended December 31, 2006, we also made certifications regarding the design of our internal controls over financial reporting.

Our focus for 2007 has been the ongoing sustainment of our control environment, including communication, evaluation and enhancements, as required to support the certifications of our President and Chief Executive Officer, and Chief Financial Officer (Certifying Officers). We have also carried out a comprehensive plan to test the operational effectiveness of our internal controls over financial reporting.

In compliance with the requirements of the Multilateral Instrument, our Certifying Officers have reviewed and certified the Consolidated Financial Statements for the year ended December 31, 2007, together with other financial information included in our annual securities filings. Our Certifying Officers have also certified that disclosure controls and procedures have been designed to provide reasonable assurance that material information relating to our company is made known within our company and that they operated effectively during the period. Further, our Certifying Officers have also certified that internal controls over financial reporting are designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with GAAP.

Selected Annual Information

The following table sets forth audited annual information for each of the three years ended December 31, 2005, 2006 and 2007. This information has been derived from our audited annual Consolidated Financial Statements.

Consolidated Statement of Operations

Year ended December 31 *(Canadian dollars in millions, except earnings per common share)*	**2007**	2006	2005
Revenues[1]	**4,655**	4,545	4,416
Net income[1]	**399**	455	483
Basic and fully diluted earnings per common share *(Canadian dollars)*	**3,809**	4,366	4,652

Consolidated Balance Sheet

Year ended December 31 *(Canadian dollars in millions, except cash dividends per share)*	**2007**	2006	2005
Total assets[2]	**12,790**	12,210	11,798
Total long-term debt[3]	**5,603**	5,243	5,032
Cash dividends per common share *(Canadian dollars)*	**3,070**	3,320	2,730
Cash dividends per preferred share *(Canadian dollars)*	**1.375**	1.375	1.375

1 As a result of the OEB's August 16, 2007 decision on Hydro One Networks' Transmission rate application that was effective January 1, 2007, revenues reflect a reduced revenue requirement based on the approved rate of return of 8.35%. Previously, the rate of return was 9.88%.

2 Total assets for 2006 and 2005 reflect the reclassification of deferred debt costs in 2007, applied retroactively.

3 Unamortized net losses relating to settled swap agreements were reclassified to AOCI on January 1, 2007 without prior year reclassification.

Outlook

To meet our challenge of being the best transmission and distribution company in North America, we will continue to concentrate on our strategic priorities relating to respect of the public trust, safety, our customers, system reliability, financial stewardship and our employees. Significant improvements have been made toward achieving our customer satisfaction and safety targets, while we maintain our financial profile and reliability performance. Our continued commitment to the people of Ontario has been recognized by the Edison Electric Institute (EEI) and by *Corporate Knights* magazine. Early in the year, EEI honoured us with the "Emergency Recovery Award" for outstanding storm restoration efforts in 2006. This was the first time a non-U.S. utility has won this prestigious award. *Corporate Knights* magazine recognized us as one of Canada's top 50 corporate citizens based on environmental, social and governance indicators. Our CDM program and leadership in the smart metering initiative were cited as key factors contributing to our ranking of third among utilities. This magazine also recognized us as Canada's most diverse utility and ranked us fifth overall in corporate Canada, based on the composition of our Board, senior executives and the company's practices and policies on diversity. In addition, Hydro One was selected as the recipient of the Utility Planning Network's 2007 Metering Award in the category of Automated Meter Reading Initiative – North American Municipal or Cooperative among numerous entries from around the globe.

Consistent with our continued commitment to the public interest and the Province's energy policies, we are planning significant investments in transmission infrastructure and the continued proactive maintenance of our assets to ensure the electricity system's reliability. Our transmission investment plan supports the achievement of the Province's renewable and nuclear objectives, facilitates the development and use of renewable energy resources, promotes system efficiency, sustains equipment performance, meets customers' service quality needs, and facilitates the integration of new supply.

In its transmission rate decision issued on August 16, 2007, the OEB approved our entire operation, maintenance and administration and capital work programs applied for in 2007 and 2008, expressing confidence in our ability and expertise to make an appropriate assessment of what is needed "to maintain a robust, safe, and reliable transmission system." However, the decision was not favourable in other areas such as the approved return on equity. We plan to file a transmission rate application for 2009 and 2010 rates. These rates, if approved, should provide the funding required to maintain and meet the infrastructure requirements of the transmission system in the public interest.

Our investment plan does not include spending for large-scale investments, such as the east-west transmission grid or potential long-term transmission projects identified in the IPSP. For certain long-term projects addressing generation-enabling connection lines and reliability of local area supply, the IPSP recommends that project development work (preliminary engineering, cost estimating, options assessment, and Environmental Assessment and Section 92 approvals, as required) begin upon approval of the IPSP by the OEB. As such, we would be prepared to initiate project development work for these projects to enable expedited construction once a need date is confirmed by the OPA and once we have a reasonable expectation of cost recovery through rates. For some projects such as the transmission connection for generation in the Nipigon area, the IPSP recommends that development work commence in 2008. It is anticipated that the final decision to proceed with the longer term major projects, such as new high voltage transmission lines from north to south, will be made when the next IPSP is prepared in about three years.

The 2006 distribution rate decision has provided a base funding level to build upon. The 2008 Cost of Service application supports the implementation of our Smart Meter Program, and enhances sustainment programs to improve reliability and customer service. In 2007, an OEB decision clarified the recoverability of costs associated with the minimum level of smart meter functionality, thereby reducing the uncertainty of recovery of this program. Smart meter costs in excess of minimum functionality will be reviewed as part of the 2008 Cost of Service hearing. Given the magnitude and unique nature of the Smart Meter Program, recovery of costs will be a key focus. In addition, the distribution investment plan does not provide for the implementation of a Smart Network, which would leverage the smart meter technology to enable further internal productivity initiatives through wireless broadband.

We remain committed to a prudent and measured approach to distribution rationalization. In October 2006, the government announced a two-year exemption of the electricity transfer tax. We will consider and respond to opportunities for acquisitions or divestitures, on a voluntary and commercial basis, where they are consistent with our strategy and direction from our shareholder. The investment plan does not include any funding for any LDC acquisitions or divestitures.

Key enablers of the successful implementation of the work program are our human and material resourcing strategies. Our human resource strategy is focused on hiring through partnering with universities, colleges and our unions, as well as skills development and retention. Significant retirement projections and increasing work volumes will result in an unprecedented number of new hires in the near-term. With regard to materials, we are seeing increasing lead times and costs as market shortages emerge globally. Consequently, sourcing strategies are being developed and implemented to ensure availability of materials to support the work programs.

Through the outlook period, we anticipate no changes to our role within the industry and that our financial returns will be sufficient to maintain our credit quality. In November 2007 the Agency Review Panel issued the second phase of its report on Ontario’s provincially-owned electricity agencies. The report confirmed that, overall, Ontario’s electricity sector and the provincial agencies within it are functioning reasonably well. We do not anticipate any structural changes to our company.

Forward Looking Statements and Information

Our oral and written public communications, including this MD&A, often contain forward-looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to, statements about our strategy; statements related to the IPSP and projects flowing therefrom; statements about smart meters including costs, cost recovery and deployment and/or implementation plans; expectations regarding the timing, content and impact of future applications and decisions related to our transmission and distribution businesses; the anticipated results on our business processes and productivity as a result of our business systems and processes project; the anticipated impact of CDM programs; statements regarding the reliability of our distribution and transmission systems; expectations regarding load growth and new generation; expectations regarding developments in the statutory and operating framework for electricity distribution and transmission in Ontario including changes to codes, licenses, rates, rate orders, cost recovery, rates of return, rate structures and revenue requirements in both our transmission and distribution businesses and the timing of decisions from the OEB; statements regarding future capital expenditures and our investment plans; expectations regarding the results of our ongoing and planned projects; expectations regarding our strategy for acquisitions or divestitures of distribution assets; expectations regarding future pension contributions; expectations regarding workforce demographics; expectations regarding environmental expenditures and other environmental matters including the need for environmental approvals and assessments; expectations regarding borrowing requirements; expectations regarding anticipated expenditures associated with transferring assets located on Indian lands; statements regarding provincial ownership of our transmission corridors; the estimated impact of changes in the forecast long-term Government of Canada bond yield (used in determining our regulated rate of return) on our results of operations; the estimated impact of changes in interest rates on our results of operations; statements about employee future benefit costs; statements about emerging accounting pronouncements; statements about the outlook period including our expectations regarding our role within the industry, our financial returns, and structural changes to our company. Words such as “expect,” “anticipate,” “intend,” “attempt,” “may,” “plan,” “will”, “believe,” “seek,” “estimate,” and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward-looking statements, except as required by law.

These forward-looking statements are based on a variety of factors and assumptions including, but not limited to, the following: no unforeseen changes in the legislative and operating framework for Ontario’s electricity market; no unfavourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; no unforeseen changes in rate orders or rate structures for our distribution and transmission businesses; a stable regulatory environment; and no significant event occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third-party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the content of the final IPSP, as approved by the OEB;
- delays or denials of the requisite approvals and accommodations for our planned projects;
- the risks associated with being controlled by the Province including potential conflicts of interest that may arise between us, the Province and related parties;
- the risks related to our workforce demographic and our potential inability to attract and retain qualified personnel;
- the risks associated with being subject to extensive regulation including risks associated with OEB action or inaction;
- regulatory decisions regarding our revenue requirements, cost recovery and rates;
- the potential impact of CDM programs on our load and our revenues;
- the potential impact of not being able to recover all of our project costs associated with the installation of smart meters;
- unanticipated changes in electricity demand or in our costs;
- the risks associated with the execution of our capital and operation, maintenance and administration programs necessary to maintain the performance of our aging asset base;
- the risk to our facilities posed by severe weather conditions, natural disasters or catastrophic events and our limited insurance coverage for losses resulting from these events;
- the risk that we may incur significant costs associated with transferring assets located on Indian lands;
- the inability to negotiate collective agreements consistent with our rate orders or in a timely fashion and the potential for labour disputes;
- the potential for substantial and currently undetermined environmental costs and liabilities;
- the risks associated with maintaining a complex information technology systems infrastructure and transitioning most of our financial and business processes to an integrated business and financial reporting system;
- the potential that we may incur significant expenses to replace some or all of the functions currently outsourced if our agreement with Inergi LP is terminated;
- the impact of the ownership by the Province of lands underlying our transmission system;
- the potential impact of not being able to recover our pension costs;
- the risk that we are not able to arrange sufficient cost effective financing to repay maturing debt and to fund capital expenditures and other obligations;
- the risks of counter-party default on our outstanding derivative contracts;
- the risks associated with changes in interest rates; and
- the risks associated with changes in the forecast long-term Government of Canada bond yield.

We caution the reader that the above list of factors is not exhaustive. Some of these and other factors are discussed in more detail under “Risk Management and Risk Factors” in this MD&A, which you should review in detail.

This MD&A is dated as at February 13, 2008. Additional information about our company, including our Annual Information Form, is available on SEDAR at www.sedar.com.

Management's Report

The Consolidated Financial Statements, Management's Discussion and Analysis ("MD&A") and related financial information presented in this Annual Report have been prepared by the management of Hydro One Inc. ("Hydro One" or the "Company"). Management is responsible for the integrity, consistency and reliability of all such information presented. The Consolidated Financial Statements have been prepared in accordance with accounting principles generally accepted in Canada and applicable securities legislation. The MD&A has been prepared in accordance with National Instrument 51-102, Part 5.

The preparation of the Consolidated Financial Statements and information in the MD&A involves the use of estimates and assumptions based on management's judgement, particularly when transactions affecting the current accounting period cannot be finalized with certainty until future periods. Estimates and assumptions are based on historical experience, current conditions and various other assumptions believed to be reasonable in the circumstances, with critical analysis of the significant accounting policies followed by the Company as described in Note 2 to the Consolidated Financial Statements. The preparation of the Consolidated Financial Statements and the MD&A includes information regarding the estimated impact of future events and transactions. The MD&A also includes information regarding sources of liquidity and capital resources, operating trends, risks and uncertainties. Actual results in the future may differ materially from the present assessment of this information because future events and circumstances may not occur as expected. The Consolidated Financial Statements and MD&A have been properly prepared within reasonable limits of materiality and in light of information up to February 13, 2008.

In meeting its responsibility for the reliability of financial information, management maintains and relies on a comprehensive system of internal control and internal audit. The system of internal control includes a written corporate conduct policy; implementation of a risk management framework; effective segregation of duties and delegation of authorities; and sound and conservative accounting policies that are regularly reviewed. This structure is designed to provide reasonable assurance that assets are safeguarded and that reliable information is available on a timely basis. In addition internal and disclosure controls have been documented, evaluated, tested and identified consistent with Multilateral Instrument 52-109 (Bill 198). An internal audit function independently evaluates the effectiveness of these internal controls on an ongoing basis and reports its findings to management and the Audit and Finance Committee of the Hydro One Board of Directors.

The Consolidated Financial Statements have been examined by Ernst & Young LLP, independent external auditors appointed by the Hydro One Board of Directors. The external auditors' responsibility is to express their opinion on whether the Consolidated Financial Statements are fairly presented in accordance with accounting principles generally accepted in Canada. The Auditors' Report, which appears on page 48, outlines the scope of their examination and their opinion.

The Hydro One Board of Directors, through its Audit and Finance Committee, is responsible for ensuring that management fulfills its responsibilities for financial reporting and internal controls. The Audit and Finance Committee of Hydro One met periodically with management, the internal auditors, and the external auditors to satisfy itself that each group had properly discharged its respective responsibility and to review the Consolidated Financial Statements before recommending approval by the Board of Directors. The external auditors had direct and full access to the Audit and Finance Committee, with and without the presence of management, to discuss their audit and their findings as to the integrity of the financial reporting and the effectiveness of the system of internal controls.

The Company's President and Chief Executive Officer, and Chief Financial Officer have certified Hydro One's annual Consolidated Financial Statements and annual MD&A filed under provincial securities legislation, related disclosure controls and procedures, and the design of related internal controls over financial reporting pursuant to Multilateral Instrument 52-109.

On behalf of Hydro One Inc.'s management:

Laura Formusa
President and Chief Executive Officer

Beth Summers
Executive Vice-President and
Chief Financial Officer

Auditors' Report

To the Shareholder of Hydro One Inc.

We have audited the Consolidated Balance Sheets of Hydro One Inc. (the Company) as at December 31, 2007 and December 31, 2006, and the Consolidated Statements of Operations, Retained Earnings and Cash Flows of the Company for each of the years in the two-year period ended December 31, 2007. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these Consolidated Financial Statements present fairly, in all material respects, the financial position of the Company as at December 31, 2007 and December 31, 2006 and the results of its operations and its cash flows for each of the years in the two-year period ended December 31, 2007 in accordance with Canadian generally accepted accounting principles.

Notes to Consolidated Financial Statements

Note 1.
Description of the Business

Hydro One Inc. (Hydro One or the Company) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

Note 2.
Significant Accounting Policies

Basis of Consolidation

The Consolidated Financial Statements include the accounts of the Company and its wholly owned subsidiaries: Hydro One Networks Inc. (Hydro One Networks), Hydro One Remote Communities Inc., Hydro One Brampton Inc., Hydro One Brampton Networks Inc. (Hydro One Brampton), Hydro One Telecom Inc., Hydro One Delivery Services Company Inc. and Hydro One Network Services Inc.

Hydro One Brampton Inc. was dissolved on January 30, 2007. Hydro One Network Services Inc. was dissolved on December 14, 2006. Hydro One Delivery Services Inc. will be dissolved pursuant to the *Business Corporations Act* (Ontario).

Basis of Accounting

The Consolidated Financial Statements are prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP).

Rate-Setting

The rates of the Company's electricity transmission and distribution businesses are subject to regulation by the OEB. In October 2005, the OEB initiated a proceeding to review Hydro One Network's transmission rates and to approve revenue requirements for 2006, 2007 and 2008 based on cost of service regulation. On February 21, 2006, the OEB announced a decision to apply an earnings sharing mechanism (ESM) to equally share, between Hydro One's shareholder and its customers, any transmission earnings in excess of the approved rate of return of 9.88% for the period ending January 1, 2006 until new transmission rates were set.

In September 2006, Hydro One Networks filed a transmission rate application. On March 30, 2007, prior to its decision on our transmission rate application, the OEB issued a decision ordering that the transmission ESM cease effective December 31, 2006. The decision also approved the concept of establishing a new revenue difference deferral account (RDDA) to record the revenue differential between existing transmission rates and the new rates that were anticipated to be approved later in the year, for the period commencing January 1, 2007.

On August 16, 2007, the OEB issued its decision in respect of Hydro One Networks' 2007 and 2008 transmission rate application. The decision, which was effective January 1, 2007, approved all operating and capital expenditures for 2007 and 2008. However, the decision resulted in a reduction in the approved return on equity from 9.88% to 8.35%. The OEB also approved final amounts and disposition treatments for certain regulatory liabilities including the RDDA, the ESM and export and wheeling fees, as well as the transmission market ready regulatory asset.

The Company's distribution rates are also based on a revenue requirement that includes a rate of return. On April 12, 2006, the OEB announced its decision regarding the Company's rate applications in respect of the distribution businesses of Hydro One Networks and Hydro One Brampton. On the basis of the written evidence submitted, the OEB approved the requested increase in the revenue requirement based on a reduction in the approved rate of return, from a targeted 9.88% to 9.00%, effective May 1, 2006.

In 2006, the OEB commenced a process of establishing an Incentive Regulation Mechanism (IRM) for the years 2007 to 2010. The process includes a formulaic approach to establishing 2007 rates with a rate rebasing approach to be staggered across all Ontario distributors between 2008 and 2010. Hydro One Networks and Hydro One Brampton applied for marginal distribution rate adjustments in February 2007, based on an OEB-approved formula that considers inflation, efficiency targets and significant events outside the control of management. In April 2007, the OEB approved the Company's submissions on the basis of its cost of capital and second generation IRM policies, and the revised rates were implemented effective May 1, 2007.

Hydro One Networks submitted the revenue requirement portion of its 2008 cost of service application in accordance with the OEB's multi-year distribution rate-setting plan on August 15, 2007. This application seeks the approval of a revenue requirement of $1,067 million based on a return of 8.64% for 2008. On December 18, 2007, Hydro One Networks filed the details of its cost allocation and rate design proposals, which include a plan to reduce the number of rate classes for its customers and consolidate or harmonize the rates for its existing rate classes to the new proposed rate classes. Based on the OEB's processing guidelines, a decision is anticipated in the Fall of 2008. On November 1, 2007, Hydro One Brampton filed an application for 2008 rates on the basis of the OEB's cost of capital and second generation IRM policies.

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing involves the application of rate regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities which represent amounts for expenses incurred in different periods than would be the case had the Company been unregulated. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made. Specific regulatory assets and liabilities are disclosed in Note 7.

Revenue Recognition and Allocation

Transmission revenues are collected through OEB-approved rates, which are based on an approved revenue requirement that includes a rate of return. Such revenue is recognized as power is transmitted and delivered to customers.

Distribution revenues attributable to the delivery of electricity are based on OEB-approved distribution rates and are recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2007 amounted to $413 million (2006 – $386 million).

Distribution revenue also includes an amount relating to rate protection for rural residential and remote customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential and remote consumers by reducing the electricity rates that would otherwise apply.

Segment revenues for transmission, distribution and other also include revenue related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, Hydro One is required to make payments in lieu of corporate taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act, 1998*, and related regulations.

The Company provides for payments in lieu of corporate income taxes relating to its regulated businesses using the taxes payable method as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from the customers of Hydro One at that time. The Company provides for payments in lieu of corporate income taxes relating to its unregulated businesses using the liability method.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the OEB-approved allowance for funds used during construction applicable to capital construction activities within regulated businesses, or interest applicable to capital construction activities within unregulated businesses.

Fixed assets in service consist of transmission, distribution, communication, administration and service assets and easements. Fixed assets also include future use assets such as land and capitalized development costs associated with deferred capital projects.

Some of the Company's transmission and distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations, conditional or otherwise. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of most asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of disposing of assets that the Company is legally required to remove, a related asset retirement obligation will be recognized at that time.

Transmission

Transmission assets include assets used for the transmission of high-voltage electricity, such as transmission lines, support structures, foundations, insulators, connecting hardware and grounding systems, and assets used to step up the voltage of electricity from generating stations for transmission and to step down voltages for distribution, such as transformers, circuit breakers and switches.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication

Communication assets include the fibre-optic and microwave radio system, optical ground wire, towers, telephone equipment and associated buildings.

Administration and Service

Administration and service assets include administrative buildings, major computer systems, personal computers, transport and work equipment, tools, vehicles and minor fixed assets.

Easements

Easements include statutory rights of use to transmission corridors and abutting lands granted under the *Reliable Energy and Consumer Protection Act, 2002*, as well as other amounts related to access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology. Financing costs are capitalized on fixed assets under construction based on the OEB's approved allowance for funds used during construction (2007 – 5.20%; 2006 – 6.39%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment, which are depreciated on a declining balance basis.

Effective January 1, 2007, the Company prospectively revised its fixed asset depreciation rates resulting from a periodic external review required by the OEB. The estimated impact of the change in rates is a reduction in depreciation expense of approximately $7 million per annum. A summary of the new rates for the various classes of assets is included below:

	Depreciation Rates (%)	
	Range	Average
Transmission	1%–4%	2%
Distribution	1%–13%	2%
Communication	1%–13%	5%
Administration and service	1%–20%	8%

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and are not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising from such a review are implemented on a remaining service life basis consistent with their inclusion in rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit's net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against the results of operations.

The Company has determined that goodwill is not impaired. All of the goodwill is attributable to the distribution business segment.

Discounts and Premiums on Debt

Discounts and premiums are amortized over the period of the related debt using the effective interest method.

Financial Instruments

Effective January 1, 2007, the Company adopted four new accounting standards comprising the following sections of the Handbook of the Canadian Institute of Chartered Accountants (CICA): 1530, *Comprehensive Income*; *3855, Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation*; and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that were recorded in opening accumulated other comprehensive income (AOCI) as described below, consistent with the CICA Handbook sections. The comparative annual Consolidated Financial Statements have not been restated. The principal changes in the accounting for financial instruments and hedges due to the adoption of these accounting standards are described below.

Comprehensive Income

Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of net unamortized hedging losses on discontinued cash flow hedges, and the change in fair value on existing cash flow hedges. The impact of the amortization of net hedging losses that were discontinued prior to the transition date was immaterial to the Statement of Operations.

Financial Assets and Liabilities

Under the new standards, all financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. All financial instruments, including derivatives, are carried at fair value on the Consolidated Balance Sheet except for loans and receivables, held-to-maturity investments and other financial liabilities, which are measured at amortized cost. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in financing charges in the period in which they arise. Available-for-sale financial instruments are measured at fair value with revaluation gains and losses included in OCI until the instrument is derecognized or impaired. The Company has classified its financial instruments as follows:

Short-term investments	Held-to-maturity
Long-term accounts receivable	Loans and receivables
Bank indebtedness	Other liabilities
Short-term notes payable	Other liabilities
Long-term debt (excluding MTN Series 8 Note)	Other liabilities
MTN Series 8 Note	Designated as held-for-trading

The MTN Series 8 Note is a step-up coupon note with extendable maturity dates up to 2011 (see Notes 8 and 9).

Where there is an economic hedge, as in the case of the MTN Series 8 Note and associated interest rate swap, the Company has applied the fair value option without hedge accounting. The impact was not material.

All financial instrument transactions are recorded at trade date.

Derivatives and Hedge Accounting

All derivative instruments, including embedded derivatives, are carried at fair value on the Consolidated Balance Sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. The impact of the change in the accounting policy related to embedded derivatives was not material.

The Company does not engage in derivative trading or speculative activities.

The Company periodically develops hedging strategies for execution taking into account risk management objectives. At the inception of a hedging relationship, the Company documents the relationship between the hedging instrument and the hedged item. This would include linking all derivatives to specific assets and liabilities on the Consolidated Balance Sheet or to specific firm commitments or forecasted transactions. The Company would also assess, both at the inception of the hedge and on an ongoing basis, whether the derivatives that are used are effective in offsetting changes in fair values or cash flows of hedged items.

Upon adoption of the new standards, the Company reclassified unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to AOCI. The hedging losses are amortized to financing charges using the effective interest method over the term of the hedged debt.

Transaction Costs

Transaction costs for financial assets and liabilities that are other than held-for-trading are added to the carrying value of the asset or liability and then amortized over the expected life of the instrument using the effective interest method. The impact of the change in amortization basis from an annuity method to the effective interest method was not material.

Employee Future Benefits

Employee future benefits provided by Hydro One include pension, group life insurance, health care and long-term disability.

In accordance with the OEB's rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management's best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

Hydro One recognizes a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. Hydro One reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province.

Note 3.
Depreciation and Amortization

Year ended December 31 *(Canadian dollars in millions)*	**2007**	2006
Depreciation of fixed assets in service	**384**	379
Fixed asset removal costs	**39**	41
Amortization of regulatory and other assets	**98**	95
	521	515

Note 4.
Financing Charges

Year ended December 31 *(Canadian dollars in millions)*	**2007**	2006
Interest on short-term notes payable	**4**	2
Interest on long-term debt payable	**308**	296
Amortization of debt discount	**5**	27
Other	**7**	9
Less:		
Interest capitalized on construction in progress	**(24)**	(28)
Interest accreted on regulatory accounts	**–**	(7)
Interest earned on investments	**(5)**	(4)
	295	295

Note 5.
Provision for Payments in Lieu of Corporate Income Taxes

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rates is provided as follows:

Year ended December 31 *(Canadian dollars in millions)*	**2007**	2006
Income before provision for PILs	**604**	634
Federal and Ontario statutory income tax rate	**36.12%**	36.12%
Provision for PILs at statutory rate	**218**	229
Increase (decrease) resulting from:		
Net temporary differences:		
Transmission amounts received but not recognized for accounting purposes	**25**	12
Retail settlement variance accounts	**17**	2
Pension contributions in excess of pension expense	**(13)**	(16)
Overheads capitalized for accounting but deducted for tax purposes	**(12)**	(11)
Interest capitalized for accounting purposes but deducted for tax purposes	**(9)**	(13)
Capital cost allowance in excess of depreciation and amortization	**(9)**	(3)
Employee future benefits other than pension expense in excess of cash payments	**7**	14
Environmental expenditures	**(4)**	(6)
Recovery of PILs related to prior years	**–**	(30)
Other	**(5)**	2
Net temporary differences	**(3)**	(49)
Net permanent differences	**(10)**	(1)
Provision for PILs	**205**	179
Effective income tax rate	**33.94%**	28.23%

In 2006, Hydro One recognized a tax benefit of approximately $30 million in respect of a recovery of PILs from prior years following a successful appeal allowing a deduction for certain overhead costs that had been previously capitalized.

Future income taxes relating to the regulated businesses have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2007, future income tax liabilities of $253 million (2006 – $281 million), based on substantively enacted income tax rates, have not been recorded. In the absence of rate regulated accounting, the Company's provision for PILs would have been recognized using the liability method rather than the taxes payable method. As a result, the provision for PILs would have been lower by approximately $28 million (2006 – higher by $16 million), including the impact of a change in substantively enacted tax rates.

Future income taxes relating to the non-regulated businesses have also not been recorded in the accounts as they have not met the criterion of "more likely than not" to be realized. As at December 31, 2007, future income tax assets of $4 million (2006 – $4 million), based on substantively enacted income tax rates, have not been recorded.

Note 6.
Fixed Assets

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2007				
Transmission	**8,708**	**3,152**	**370**	**5,926**
Distribution	**5,902**	**2,133**	**115**	**3,884**
Communication	**739**	**305**	**58**	**492**
Administration and service	**978**	**556**	**79**	**501**
Easements	**485**	**74**	**–**	**411**
	16,812	**6,220**	**622**	**11,214**
2006				
Transmission	8,293	3,024	359	5,628
Distribution	5,651	2,129	86	3,608
Communication	822	383	18	457
Administration and service	989	583	5	411
Easements	483	61	–	422
	16,238	6,180	468	10,526

Financing costs are capitalized on fixed assets under construction, including allowance for funds used during construction on regulated assets and interest on unregulated assets, and were $24 million in 2007 (2006 – $28 million).

Note 7.
Regulatory Assets and Liabilities

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One has recorded the following regulatory assets and liabilities:

December 31 *(Canadian dollars in millions)*	**2007**	2006
Regulatory assets:		
Regulatory asset recovery account II	**66**	87
Environmental	**65**	70
Employee future benefits other than pension	**42**	84
Regulatory asset recovery account I	**19**	58
Market ready	**13**	–
Smart meters	**4**	10
Other	**4**	2
Total regulatory assets	**213**	311
Less: current portion	**103**	121
	110	190
Regulatory liabilities:		
Deferred pension	**380**	382
Revenue difference deferral account	**73**	–
Retail settlement variance accounts	**50**	2
Export and wheeling fees	**38**	49
Transmission earnings sharing mechanism	**28**	34
Other	**14**	6
Total regulatory liabilities	**583**	473
Less: current portion	**114**	–
	469	473

Regulatory Assets

Regulatory Asset Recovery Account II (RARA II)

On April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the distribution business of Hydro One Networks. As part of this decision, the OEB also approved the distribution-related deferral account balances sought by Hydro One. The OEB ordered that the approved balances be recovered on a straight-line basis over a four-year period from May 1, 2006 to April 30, 2010. The RARA II includes retail settlement and cost variance amounts and distribution low-voltage service amounts, plus accrued interest. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $23 million (2006 – $16 million). In addition, related financing charges would have been higher by $3 million (2006 – $5 million).

Environmental

Hydro One records a liability for the estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized an equivalent amount as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. The OEB has the discretion to examine and assess the prudence and the timing of recovery of all of Hydro One's future regulatory expenditures. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $12 million (2006 – $17 million).

Employee Future Benefits Other Than Pension

Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 Hydro One recorded a regulatory asset, with an original balance of $419 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of one year (2006 – two years) and does not earn a return. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $42 million (2006 – $42 million).

Regulatory Asset Recovery Account I (RARA I)

On December 9, 2004, the OEB issued a decision on the prudence of the distribution related deferral account balances for which recovery was sought by Hydro One in its May 31, 2004 application. Amounts for which recovery was approved represented balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved amounts be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. Hydro One Networks has requested an extension of the period for the RARA I recovery until such time as new rates are implemented. The RARA I includes distribution business low-voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest. Any over- or under-recovery of the RARA I due to continuance of the rate rider will be tracked for disposition at a future date. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $20 million (2006 – $20 million). In addition, related financing charges would have been higher by $1 million (2006 – $3 million).

Market Ready

In September 2006, as part of its transmission rate application, Hydro One Networks applied for the recovery of various regulatory deferral accounts including the transmission market ready costs incurred in connection with market opening. The transmission related transition costs were incurred to meet IESO requirement associated with registration and authorization activities. On August 16, 2007, as a result of the oral and written evidence the OEB approved the recovery of substantially all of these costs. Consequently, the market ready regulatory asset was established and recovery is being factored into rates over the four-year period ending December 31, 2010. In the absence of rate regulated accounting, operation, maintenance and administration expense would have been higher by $16 million (2006 – $nil) and revenue would have been higher by $4 million (2006 – $nil).

Smart Meters

On March 21, 2006, the OEB approved the establishment of regulatory deferral accounts for smart meter-related expenditures and a monthly customer charge of 27 cents and 28 cents per metered customer for Hydro One Networks and Hydro One Brampton, respectively, was reflected in Hydro One's revenue requirement. Consistent with the OEB's direction and pending further guidance, the Company recognized a regulatory asset consisting of the net balance of capital and operating expenditures for smart meters less recoveries received from customers. In April 2007, as part of its decision regarding the Company's 2007 distribution rate applications, the OEB increased the monthly customer charge effective May 1, 2007 to 93 cents and 67 cents per metered customer for Hydro One Networks and Hydro One Brampton, respectively.

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine recoverability of expenditures incurred by distributors. Expenditures associated with the minimum functionality for advanced metering infrastructure incurred by Hydro One Networks and Hydro One Brampton were approved for recovery. As a result of this decision, smart meter expenditures are no longer deferred as regulatory assets. Such expenditures are now classified as capital or are charged to results of operations consistent with the Company's standard accounting practices. Expenditures determined to be above the minimum functionality have been brought forward for review in Hydro One Networks' cost of service rate application filed in 2007.

The OEB decision also required that related revenues be based upon a calculated revenue requirement specific to smart meters. As a result, the carrying value of the smart meter regulatory asset account represents the difference between revenue recorded on this basis and actual recoveries received under existing rate adders. In the absence of rate regulated accounting, year-to-date operation, maintenance and administration expense would have been lower by $3 million (2006 – higher by $4 million) and revenues would have been lower by $2 million (2006 – higher by $2 million).

Regulatory Liabilities

Deferred Pension

In accordance with the OEB's 1999 transitional rate order, pension costs are recorded in results of operations when employer contributions are paid into the pension plan. The Company's deferred pension asset represents the cumulative difference between employer contributions and pension costs and the deferred pension regulatory liability results from the Company's recognition, as the result of OEB direction, of revenues and expenses in different periods than would be the case for an unregulated enterprise. In the absence of rate regulated accounting, operating, maintenance and administration expense would have been higher by $1 million (2006 – $50 million).

Revenue Difference Deferral Account (RDDA)

On March 30, 2007, the OEB issued a decision approving the establishment of the RDDA to record the revenue differential between existing transmission rates and the new rates that were anticipated to be approved later in the year. The new deferral account was to represent the revenue differential between existing and future rates for the period commencing January 1, 2007. On August 16, 2007, in its decision on Hydro One Networks' 2007 and 2008 transmission rates, the OEB approved final amounts and disposition treatments for the RDDA liability, which will be returned to customers over the 14-month period ending December 31, 2008.

Retail Settlement Variance Accounts (RSVA)

Hydro One has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's *Accounting Procedures Handbook*. The OEB's December 9, 2004 decision allowed for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA I. The OEB's April 12, 2006 decision allowed for recovery of retail settlement variance amounts accumulated since January 1, 2004 and forecasted through to April 30, 2006, inclusive of interest, within the RARA II. The Company has accumulated a net liability in its RSVA since May 1, 2006 which was taken into consideration in the revenue requirement of Hydro One Networks as part of the 2008 distribution rate application filed with the OEB in December 2007.

Export and Wheeling Fees

Consistent with the IESO's Market Rules, an export and wheeling fee is collected by the IESO and remitted to Hydro One at the rate of $1 per MWh on electricity exported outside of Ontario. The amounts collected in respect of these export and wheeling fees, plus interest, were taken into consideration in the revenue requirement of Hydro One's transmission business as part of the Company's transmission rate application filed with the OEB in September 2006. In August 2007, the OEB issued its decision in respect of the Company's transmission rate application and approved final amounts and disposition treatments for the export wheeling fees. The export wheeling fees will be factored into rates over a four-year period ending December 31, 2010.

Transmission Earnings Sharing Mechanism (ESM)

On February 21, 2006, the OEB issued a decision that established an ESM to equally share, between the Company's shareholder and ratepayers, any transmission earnings in excess of the approved rate of return of 9.88%, for the period ending January 1, 2006 until new transmission rates were set. Consequently, 50% of the Company's excess earnings were deferred as a regulatory liability. On March 30, 2007, the OEB issued a decision ordering that the transmission ESM cease effective December 31, 2006. The ESM was taken into consideration in setting the revenue requirement of Hydro One Networks for 2007 and 2008. On August 16, 2007, in its decision on Hydro One Networks 2007 and 2008 transmission rates, the OEB approved final amounts and disposition treatments for the ESM which will be returned to customers over a 14-month period ending December 31, 2008.

Note 8.
Debt

December 31 *(Canadian dollars in millions)*	2007	2006
Short-term notes payable	–	60
Long-term debt:		
4.45% notes due 2007	–	282
4.55% notes due 2007	–	73
4.70% (2006 – 4.10%) notes due 2008[1]	40	40
4.00% notes due 2008	500	500
3.95% notes due 2009	400	400
7.15% debentures due 2010	400	400
6.40% notes due 2011	250	250
5.77% notes due 2012	600	600
4.64% notes due 2016	450	450
5.18% notes due 2017	300	–
7.35% debentures due 2030	400	400
6.93% notes due 2032	500	500
6.35% notes due 2034	385	385
5.36% notes due 2036	600	600
4.89% notes due 2037	400	–
6.59% notes due 2043	315	315
5.00% notes due 2046	75	75
	5,615	5,270
Less:		
Long-term debt payable within one year	(540)	(395)
Net unamortized premiums	13	9
Unamortized hedging losses[2]	–	(12)
Unamortized debt issuance costs	(25)	(24)
Long-term debt	5,063	4,848

1 Step-up coupon from 4.10% to 6.40%, extendable to 2011.

2 Unamortized net losses relating to settled swap agreements were reclassified to AOCI on January 1, 2007 without prior year reclassification.

Short-term debt represents promissory notes issued pursuant to the Company's Commercial Paper Program. The notes are denominated in Canadian dollars with varying maturities not exceeding 365 days. In 2007, the notes had a weighted-average interest rate of 5.7%.

Hydro One has a $750 million committed and unused revolving standby credit facility with a syndicate of banks maturing in August 2010. If used, interest on the facility would apply based on Canadian benchmark rates. This credit facility supports the Company's Commercial Paper Program.

The Company issues notes for long-term financing under the Medium-Term Note Program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million of which $2,200 million is remaining and is currently available until July 2009.

The long-term debt is subject to covenants that, among other things, limit permissible debt as a percentage of total capitalization, limit ability to sell assets and impose a negative pledge provision, subject to customary exceptions. At December 31, 2007, the Company was in compliance with these covenants.

The long-term debt is unsecured and denominated in Canadian dollars. Such debt is summarized by the number of years to maturity in the following table:

Years to Maturity	Principal Outstanding on Notes and Debentures *(Canadian dollars in millions)*	Weighted Average Interest Rate *(Percent)*
1 year	540	4.1
2 years	400	4.0
3 years	400	7.2
4 years	250	6.4
5 years	600	5.8
	2,190	5.3
6–10 years	750	4.9
Over 10 years	2,675	6.2
	5,615	5.7

Note 9.
Fair Value of Financial Instruments and Risk Management

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of derivative financial instruments reflects the estimated amount that the Company, if required to settle an outstanding contract, would have been required to pay or would be entitled to receive at year end. The fair value of long-term debt, based on year end quoted market prices for the same or similar debt of the same remaining maturities, is provided in the following table:

December 31 *(Canadian dollars in millions)*	**2007**		2006	
	Carrying Value	Fair Value	Carrying Value	Fair Value
Long-term debt[1]	**5,615**	**6,005**	5,270	5,831

[1] The carrying value of long-term debt represents the par value of the notes and debentures, other than the step-up note, which is marked to market.

Hydro One may enter into derivative agreements, such as forward starting pay fixed interest rate swap agreements, to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. These transactions are accounted for as cash flow hedges of anticipated transactions. In October 2007, upon issuance of debt under the Company's Medium-Term Note Program, Hydro One terminated two forward interest rate swap agreements having a total notional principal amount of $200 million, resulting in a net gain of $0.4 million. The net gain was recorded as other comprehensive income and is being amortized to financing charges over the term of the related debt. In late 2007, Hydro One entered into two new forward starting pay fixed interest rate swap agreements with a notional amount of $140 million.

As at December 31, 2007, the Company had a pay floating interest rate swap agreement related to a step-up coupon note issuance with an initial maturity date in 2007, and with extended maturity dates up to 2011. In 2006, the interest rate swap was accounted for as a fair value hedge. In 2007, the interest rate swap was accounted for using the fair value option without hedge accounting. This agreement has a notional principal amount of $40 million and a fair value of $nil (2006 – $nil).

The Company has no significant counter-party credit risk exposure as the fair value of the interest rate swap contracts was not significant in 2007 or in 2006.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2007, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One did not earn a significant amount of revenue from any single customer. As at December 31, 2007, there were no significant balances of accounts receivable due from any single customer.

The Company will continue to use derivative instruments to manage interest rate risk. Derivative financial instruments result in exposure to credit risk, since there is a risk of counter-party default. Hydro One monitors and minimizes credit risk through various techniques including dealing with highly rated counter-parties, limiting total exposure levels with individual counter-parties and entering into master agreements which enable net settlement.

Note 10.
Employee Future Benefits

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. Employees of Hydro One Brampton participate in the Ontario Municipal Employees Retirement System (OMERS), a multi-employer public sector pension fund. Current contributions by Hydro One Brampton are approximately $1 million annually.

Plan Asset Mix

Hydro One's pension plan asset mix at December 31, 2007 and 2006 was as follows:

	% of Plan Assets	
December 31	**2007**	2006
Equity securities	**62.5**	64.6
Debt securities	**34.1**	32.0
Other	**3.4**	3.4
	100.0	100.0

Supplementary Information

The Hydro One pension plan does not hold any direct securities of the Company, but did hold debt securities of the Province of $90 million and $92 million at December 31, 2007 and 2006, respectively.

The Company's pension plan provides benefits based on the highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals hired after November 17, 2005, benefits are based on the highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed with the Financial Services Commission of Ontario on September 20, 2007, effective for December 31, 2006, the Company contributed $95 million to its pension plan in respect of 2007 (2006 – $86 million), all of which is required to satisfy minimum funding requirements. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash. Contributions after 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, and changes in benefits or actuarial assumptions.

Total cash payments for employee future benefits made in 2007, consisting of cash contributed by the Company to its funded pension plan and cash paid directly to beneficiaries for its unfunded other benefit plans, was $137 million in 2007 (2006 – $122 million).

Year ended December 31 (Canadian dollars in millions)	Pension **2007**	Pension 2006	Employee Future Benefits Other Than Pension **2007**	Employee Future Benefits Other Than Pension 2006

2 The Company follows the cash basis of accounting. During 2007, pension costs of $95 million (2006 – $86 million) were attributed to labour, of which $58 million (2006 – $42 million) was charged to operations, $37 million (2006 – $34 million) was capitalized as part of the cost of fixed assets, and $nil (2006 – $10 million) was attributed to regulatory asset.

3 8.69% in 2007 grading down to 4.40% per annum in and after 2018 (2006 – 7.87% in 2006 grading down to 4.40% per annum in and after 2014).

4 8.33% in 2008 grading down to 4.40% per annum in and after 2018 (2006 – 8.69% in 2007 grading down to 4.40% per annum in and after 2014).

Note 11.
Environmental Liabilities

December 31 *(Canadian dollars in millions)*	**2007**	2006
Environmental liabilities, January 1	**70**	79
Interest accretion	**4**	5
Expenditures	**(12)**	(17)
Revaluation adjustment	**3**	3
Environmental liabilities, December 31	**65**	70
Less: current portion	**(13)**	(15)
	52	55

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2007 and in total thereafter are as follows: 2008 – $13 million; 2009 – $12 million; 2010 – $10 million; 2011 – $8 million; 2012 – $6 million and thereafter – $35 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. Hydro One continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

Note 12.
Share Capital

Common and Preferred Shares

On March 31, 2000, the Company issued to the Province 12,920,000 5.5% cumulative preferred shares with a redemption value of $25.00 per share, and 99,990 common shares, bringing the total number of outstanding common shares to 100,000. The Company is authorized to issue an unlimited number of preferred and common shares.

The preferred shares are entitled to an annual cumulative dividend of $18 million, which is payable on a quarterly basis. The preferred shares are redeemable at the option of the Province at a price of $25 per share, representing the stated value, plus any accrued and unpaid dividends if the Province sells a number of the common shares which it owns to the public such that the Province’s holdings are reduced to less than 50% of the common shares of the Company. Hydro One may elect, without condition, to pay all or part of this redemption price by issuing additional common shares to the Province. If the Province does not exercise its redemption right, the Company would have the ability to adjust the dividend on the preferred shares to produce a yield that is 0.50% less than the then-current dividend market yield for similarly rated preferred shares. The preferred shares do not carry voting rights, except in limited circumstances, and would rank in priority over the common shares upon liquidation.

Dividends

Common dividends are declared at the sole discretion of the Hydro One Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations.

In 2007, preferred dividends in the amount of $18 million (2006 – $18 million) and common dividends in the amount of $307 million (2006 – $332 million) were declared.

Earnings per Share

Earnings per share is calculated as net income during the year, after cumulative preferred dividends, divided by the weighted-average number of common shares outstanding during the year.

Note 13.
Related Party Transactions

The Province, OEFC, IESO, OPA and Ontario Power Generation Inc. (OPG) are related parties of Hydro One. In addition the OEB is related to the Company by virtue of its status as a Provincial Crown Corporation. Transactions between these parties and Hydro One were as follows:

Hydro One received revenue for transmission services from IESO, based on uniform transmission rates approved by the OEB. Transmission revenue for 2007 includes $1,203 million (2006 – $1,206 million) related to these services.

Hydro One receives amounts for rural rate protection from the IESO. Distribution revenue for 2007 includes $127 million (2006 – $127 million) related to this program. Hydro One also received revenue related to the supply of electricity to remote northern communities from the IESO. Distribution revenue for 2007 includes $21 million (2006 – $21 million) related to these services.

In 2007, Hydro One purchased power in the amount of $2,213 million (2006 – $2,183 million) from the IESO administered electricity market and $27 million (2006 – $38 million) from OPG.

Under the *Ontario Energy Board Act, 1998*, the OEB is required to recover all of its annual operating costs from gas and electricity distributors and electricity transmitters. In 2007, Hydro One incurred $10 million (2006 – $9 million) in OEB fees.

Hydro One has service level agreements with the other successor corporations. These services include field, engineering, logistics and telecommunications services. Revenues related to the provision of construction and equipment maintenance services to the other successor corporations were $12 million (2006 – $15 million), primarily for the transmission business. Operation, maintenance and administration costs related to the purchase of services from the other successor corporations were less than $1 million in each of 2007 and 2006.

Consistent with the OPA mandate, the OPA is responsible for some of our CDM programs. The funding includes program costs, incentives and management fees and bonuses. In 2007, Hydro One received $3 million (2006 – $nil) from the OPA in respect of the CDM programs and had a net accounts receivable of $3 million (2006 – $nil).

The provision for payments in lieu of corporate income taxes was paid or payable to the OEFC and dividends were paid or payable to the Province.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 *(Canadian dollars in millions)*	**2007**	2006
Accounts receivable	**97**	114
Accounts payable and accrued charges	**(234)**	(230)

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $202 million (2006 – $195 million).

Note 14.
Consolidated Statements of Cash Flows

For the purposes of the Consolidated Statements of Cash Flows, "cash and cash equivalents" refers to the Balance Sheet item "bank indebtedness."

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 *(Canadian dollars in millions)*	**2007**	2006
Accounts receivable decrease (increase)	**18**	(149)
Materials and supplies increase	**(11)**	–
Accounts payable and accrued charges increase (decrease)	**70**	(39)

Payments in lieu of corporate income taxes	**230**	252

Note 15.
Contingencies

Legal Proceedings

Hydro One is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters, except as noted below, will not have a materially adverse effect on the Company's consolidated financial position, results of operations or cash flows.

On March 29, 1999, the Whitesand First Nation Band commenced an action in the Ontario Court (General Division), now the Superior Court Justice, naming as defendants the Province, the Attorney General of Canada, Ontario Hydro, OEFC, OPG and the Company. On May 24, 2001, the Whitesand First Nation Band issued an almost identical claim against the same parties. The reason for the second claim is the procedural defence of the Province that proper notice of the first claim was not given under the *Proceedings Against the Crown Act* (Ontario). These actions seek declaratory relief, injunctive relief and damages in an unspecified amount. The Whitesand Band alleges that since at least the first half of the 20th century, Ontario Hydro has erected dams, generating stations and other facilities within or affecting the band's traditional lands and that those facilities have caused damage to band members and the lands, including substantial flooding and erosion. The Whitesand Band also claims treaty rights to a share of the profits arising from the activities of these Ontario Hydro facilities, an entitlement to increases in annuity payments established by treaty and for breach of an alleged contract to reimburse the band for negotiation costs with Ontario Hydro. The Whitesand Band asserts multiple causes of action, including trespass, breach of fiduciary duty, nuisance and negligence. The May 24, 2001 case was consolidated in 2004 with a similar claim by Red Rock First Nation Band which commenced on September 7, 2001 as all procedural issues in both matters were the same. There is now one action in which the claims of both Whitesand and Red Rock are set out. The claims relating to activities of Ontario Hydro (i.e., flooding) are the matters for which OPG would have responsibility pursuant to Transfer Orders under the *Electricity Act, 1998*. In the consolidated claim, Whitesand and Red Rock seek to tie Hydro One into the flooding allegations on the alleged basis of the integrated nature of the transmission system with the entire electricity system, which includes the method of generating power. To date, Hydro One has not filed a defence. Hydro One believes that it is unlikely that the outcome of this litigation will have a material adverse effect on its consolidated financial position, results of operations or cash flows.

Transfer of Assets

The transfer orders by which Hydro One acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on lands held for bands or bodies of Indians under the *Indian Act* (Canada). Currently, the OEFC holds these assets. Under the terms of the transfer orders, Hydro One is required to manage these assets until it has obtained all consents necessary to complete the transfer of title of these assets to itself. The Company cannot predict the aggregate amount that it may have to pay, either on an annual or one-time basis, to obtain the required consents. However, it anticipates having to pay more than the approximately $900,000 per year than it currently is paying to these Indian bands and bodies. If the Company cannot obtain consents from the Indian bands and bodies, OEFC will continue to hold these assets for an indefinite period of time. If the Company cannot reach a satisfactory settlement, it may have to relocate these assets from the Indian lands to other locations at a cost that could be substantial or, in a limited number of cases, to abandon a line and replace it with diesel generation facilities. The costs relating to these assets could have a material adverse effect on the Company's results of operations if it is not able to recover them in future rate orders.

Draft PCB Regulations

Future changes in environmental regulations may result in material changes to the Company's estimated liability related to the management of PCBs. On November 4, 2006, Environment Canada published new draft regulations governing the management of PCBs. These draft regulations may be finalized in 2008. The Company has estimated its operating expenditures for complying with these draft regulations to be between $250 million and $375 million in excess of amounts already recorded as environmental liabilities on its Balance Sheet. If required, most of these additional expenditures are expected to be incurred between 2013 and 2025. No obligation has been recorded in the financial statements for these increased expenditures due to continued uncertainty regarding the timing and content of the final regulations. In the event that an obligation related to new regulations is recorded, the Company expects to simultaneously record a regulatory asset of equivalent value.

Note 16.
Commitments

Agreement with Inergi

Effective March 1, 2002, Cap Gemini Canada Inc. began providing services to Hydro One through Inergi. As a result of this initiative, Hydro One receives from Inergi a range of services including information technology, customer care, supply chain and certain human resources and finance services for a 10-year period. The initial service level price ranged between $90 million and $130 million per year, subject to external benchmarking every three years to ensure Hydro One is receiving a defined competitive and continuously improved price. In connection with this agreement, on March 1, 2002 the Company transferred approximately 900 employees to Inergi, including about 130 non-regular employees.

The annual commitments under the agreement in each of the five years subsequent to December 31, 2007, and in total thereafter are as follows: 2008 – $100 million; 2009 – $97 million; 2010 – $93 million; 2011 – $90 million; 2012 – $16 million and thereafter – $nil.

Prudential Support

Purchasers of electricity in Ontario, through the IESO, are required to provide security to mitigate the risk of their default based on their expected activity in the market. The IESO could draw on these guarantees if Hydro One Networks or Hydro One Brampton fails to make a payment required by a default notice issued by the IESO. The maximum potential payment is the face value of any bank letters of credit plus the nominal amount of the parental guarantee. As at December 31, 2007, the Company provided prudential support using only parental guarantees, reflecting a change from 2006. If Hydro One's highest long-term credit rating deteriorated to below the "Aa" category, the Company would be required to resume providing letters of credit as prudential support. Prudential support at December 31, 2007 was provided using bank letters of credit of $nil million (2006 – $22 million) and parental guarantees of $325 million (2006 – $275 million).

Retirement Compensation Arrangements

Bank letters of credit have been issued to provide security for the Company's liability under the terms of a trust fund established pursuant to the supplementary pension plan for the employees of Hydro One and its subsidiaries. The trustee is required to draw upon the letters of credit if Hydro One is in default of its obligations under the terms of this plan. Such obligations include the requirement to provide the trustee with an annual actuarial report as well as letters of credit sufficient to secure the Company's liability under the plan, to pay benefits payable under the plan and to pay the letter of credit fee. The maximum potential payment is the face value of the bank letters of credit. As at December 31, 2007, Hydro One had bank letters of credit of $95 million (2006 – $93 million) outstanding relating to retirement compensation arrangements.

Operating Leases

The future minimum lease payments under operating leases for each of the five years subsequent to December 31, 2007 and in total thereafter are as follows: 2008 – $6 million; 2009 – $5 million; 2010 – $2 million; 2011 – $1 million; 2012 – $1 million and thereafter – $1 million.

Note 17.
Segment Reporting

Hydro One has three reportable segments:

- The transmission business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;
- The distribution business, which comprises the core business of delivering and selling electricity to customers; and
- The "other" segment, which primarily consists of the telecommunications business.

The designation of segments is based on a combination of regulatory status and the nature of the products and services provided. The accounting policies followed by the segments are the same as those described in the summary of significant accounting policies (see Note 2). Segment information on the above basis is as follows:

Year ended December 31 (Canadian dollars in millions)	Transmission	Distribution	Other	Consolidated
2007				
Segment profit				
Revenues	**1,242**	**3,382**	**31**	**4,655**

Other	**106**	99
	12,790	12,210

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

Note 18.
Subsequent Events

On January 21, 2008, the Company entered into a forward starting pay fixed interest rate swap agreement to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. This transaction had a notional amount of $60 million and is used to lock in the interest rate of a forecasted debt issuance planned for later in 2008. This transaction is being accounted for as a cash flow hedge of a forecasted transaction.

On January 28, 2008 the Company increased its committed revolving credit facility, which supports its commercial paper program, by $250 million to $1,000 million. The maturity date remains unchanged at August 10, 2010.

Note 19.
Comparative Figures

The comparative Consolidated Financial Statements have been reclassified from statements previously presented to conform to the presentation of the December 31, 2007 Consolidated Financial Statements.

Ontario 60-minute system peak demand *(MW)*[4]	**25,737**	27,005	26,160	24,979	24,753
Total transmission lines *(circuit-kilometres)*	**28,915**	28,600	28,547	28,643	28,621
Distribution					
Units distributed to Hydro One customers *(TWh)*[4]	**30.2**	29.0	29.7	28.5	27.9
Units distributed through Hydro One lines *(TWh)*[4, 5]	**45.7**	44.7	45.6	44.8	44.7
Total distribution lines *(circuit-kilometres)*	**122,933**	122,460	122,118	121,736	121,285
Customers	**1,311,714**	1,293,396	1,273,768	1,258,925	1,238,748
Total regular employees	**4,602**	4,295	4,189	4,118	3,967

1 As a result of the oral and written evidence submitted by Hydro One, on December 9, 2004, the OEB issued a ruling, citing prudence, and approving recovery of amounts previously delayed by the *Electricity Pricing, Conservation and Supply Act, 2002*, relating to regulatory deferral account balances sought by Hydro One in its May 31, 2004 submission. Consequently, a one-time regulatory recovery of $91 million was recorded.

2 The net asset coverage on long-term debt ratio is calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt (including current portion).

3 The earnings coverage ratio has been calculated as the sum of net income, financing charges and provision for payments in lieu of corporate income taxes divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

4 System-related statistics include preliminary figures for December.

5 Units distributed through Hydro One lines represent total distribution system requirements and include electricity distributed to consumers who purchased power directly from the IESO.

Board Committees

1 **Audit and Finance Committee**
The Audit and Finance Committee oversees the integrity of accounting policies and financial reporting, internal controls, internal audit, significant corporate risk exposures and financial compliance. The committee met six times in 2007.

2 **Corporate Governance Committee**
The Corporate Governance Committee is responsible for the Board's governance of the Company. It recommends issues to be discussed at meetings of the Board of Directors, reviews the mandate of the Board and each committee of the Board, conducts Board Assessments, monitors the quality of management's relationship with the Board and recommends suitable nominees for election to the Board of Directors. The committee met four times in 2007.

3 **Human Resources and Public Policy Committee**
The Human Resources and Public Policy Committee is responsible for reviewing the appropriateness of our current and future organizational structure, succession plans for corporate and divisional officers, the code of business conduct, the performance and remuneration of our senior executives, including recommending to the Board the remuneration of the President and CEO and for identifying, assessing and providing advice to the Board of Directors on public affairs issues that have a significant impact on us. The committee met 11 times in 2007.

4 **Business Transformation Committee (Formerly the Information Technology Committee)**
The Business Transformation Committee is an advisory committee of the Board established to assist the Board in its oversight responsibility on matters related to the Company's enterprise application systems replacement strategy. The committee met five times in 2007.

5 **Regulatory and Environment Committee**
The Regulatory and Environment Committee monitors the Company's compliance with applicable regulatory requirements and environmental legislation. The committee oversees compliance programs, policies, standards and procedures, reviews the Company's proposals for rate applications and reviews compliance actions and reports. The committee met six times in 2007.

6 **Health and Safety Committee**
The Health and Safety Committee is responsible for reviewing occupational health and safety policies, standards, and programs, compliance with occupational health and safety legislation, policies and standards, and public health and safety issues. The committee met four times in 2007.

* Effective March 31, 2008, James Arnett was elected as Chair of the Board of Directors of Hydro One Inc. by our shareholder following the resignation of Rita Burak, who did not seek reappointment.

Something To Smile About.

Hydro One customers have saved more than 272 million kWh of energy since our Conservation and Demand Management program was launched in 2005.

Our Conservation and Demand Management (CDM) initiatives have helped Hydro One customers substantially reduce their energy consumption. To date, they have saved an astonishing 272 million kWh of energy – that's enough electricity to power 23,000 homes for an entire year. This also reduces carbon emissions to the environment by 178,000 tonnes.

Our Conservation and Demand Management programs have had more than 1.1 million participants and that number continues to grow daily.

Over the five-year average life span of efficiency measures installed, the expected electrical savings are almost 1.5 billion kWh – that is equivalent to powering 120,000 homes for one year.

$3.40 in societal benefits

Every dollar we've spent on CDM is worth $3.40 of societal benefits, as measured through the Total Resource Cost test.

10,000 smart stats

We installed 10,000 web-enabled thermostats that allow central air conditioners to be remotely turned down during peak demand hours.

2,200 traffic signals

2,200 traffic signals in 16 municipalities were replaced with LED technologies, saving 1.7 million kWh annually.

31,000 monitors

We installed 31,000 real-time electricity use monitors in northern Ontario. Seeing real-time data on a daily basis can reduce electricity consumption by up to 15%.

11,000 recycled appliances

We picked up more than 11,000 old refrigerators, freezers and room air conditioners and disposed of them in an environmentally responsible manner.

HYDRO ONE INC. – BRIDGE YEAR (2007) AND TEST YEAR (2008) QUARTERLY REPORTS

Included in this exhibit are Hydro One Inc.'s first, second, third and fourth quarterly reports for the year 2007 and first quarterly report for 2008.

RESULTS OF OPERATIONS

As used in this section, references to increases and decreases, whether in terms of amounts or percentages, are made by comparison of the three months ended March 31, 2007 to the three months ended March 31, 2006.

Revenues

Three months ended March 31 (Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**
Transmission	327	298	29	10
Distribution	944	856	88	10
Other	7	6	1	17
	1,278	1,160	118	10
Average Ontario 60-minute peak demand *(MW)* [1]	23,480	22,382	1,098	5
Distribution - units distributed to customers *(TWh)* [1]	8.6	8.0	0.6	8

[1]System-related statistics are preliminary

The demand for electricity generally follows normal weather-related variations and therefore, our energy-related revenues tend to be higher in the first and third quarters than in the second and fourth quarters.

Transmission

Transmission revenues consist predominantly of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate maximum expected demand, which is primarily influenced by weather as well as economic conditions. Transmission revenues also include minor amounts of ancillary revenues which are primarily attributable to maintenance services provided to generators and secondary use of our land rights-of-way.

Our transmission tariff revenues increased by $29 million, or 10%, during the first quarter of 2007 compared to the same period last year. On March 30, 2007, the Ontario Energy Board (OEB) issued a decision ordering that the transmission earnings sharing mechanism cease effective January 1, 2007. This decision had the effect of increasing transmission revenues by $15 million in the quarter as compared to the same period last year. In addition, the monthly peak demands were higher during the first quarter of 2007, reflecting the colder weather experienced in the winter. Consequently, tariff revenues increased by $14 million compared to the same period last year.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are primarily influenced by our distribution rates, the amount of electricity we distribute, and the cost of purchased power. Distribution revenues also include a minor amount of ancillary distribution services revenues, such as fees related to the use of our poles by the telecommunications and cable television industries, and miscellaneous charges such as those for late payments.

Distribution revenues increased by $88 million, or 10%, during the first quarter of 2007 compared to the same period last year, primarily as a result of the recovery of increased purchased power costs of $43 million, as described below under "Purchased Power." In addition, on April 12, 2006, after reviewing our oral and written evidence, the OEB approved increases in tariff rates for the distribution businesses conducted by our subsidiaries, Hydro One Networks Inc. (Hydro One Networks) and Hydro One Brampton Networks Inc. (Hydro One Brampton Networks), effective May 1, 2006. We also received OEB approval for low-voltage rates for services provided to local distribution companies that are embedded within our service territory. These tariff rate increases support the maintenance and investment requirements of our distribution system, enabling the safe and reliable delivery of electricity to our customers throughout Ontario, and resulted in higher distribution revenues of $33 million. Higher energy consumption resulting from the colder winter weather this year increased distribution revenues by an additional $8 million. The remaining increase reflects marginally higher ancillary revenues.

Purchased Power

Purchased power costs incurred by our distribution business represent the cost of electricity delivered to customers within our distribution service territory and consist of the wholesale commodity cost of energy, the Independent Electricity System Operator's (IESO's) wholesale market service charges, and transmission charges levied by the IESO. The commodity cost of energy for certain low-volume and designated customers is based on the OEB's Regulated Price Plan (RPP) which consists of a two-tiered pricing structure with threshold amounts adjusted twice annually. Customers who are not eligible for the RPP pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the RPP is provided below.

Summary of RPP

	Tier Threshold (kWh)		Tier Rates (cents/kWh)	
Effective Date	**Residential**	**Non-Residential**	**First Tier**	**Second Tier**
November 1, 2005	1,000	750	5.0	5.8
May 1, 2006	600	750	5.8	6.7
November 1, 2006	1,000	750	5.5	6.4

Purchased power costs increased by $43 million, or 7%, to $641 million compared to the first quarter of 2006. This increase primarily reflects higher demand for electricity of $34 million due to the colder weather experienced during the winter, an increase in wholesale market service charges levied by the IESO of $8 million, and an increase associated with the OEB's RPP for residential and other eligible customers of $2 million, partially offset lower wholesale commodity prices of $1 million for customers who are not eligible for the RPP.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

Three months ended March 31 (Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**
Transmission	99	93	6	6
Distribution	128	86	42	49
Other	7	6	1	17
	234	185	49	26

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way increased by $6 million, or by 6%, in the quarter compared to the same period last year. Within our work programs, we continued our investments to ensure the operation of a safe and reliable transmission system. We experienced higher work program expenditures of approximately $4 million, primarily related to increased maintenance within our stations resulting from an earlier commencement of planned program work. This increase was partially offset by lower line clearing and brush control expenditures. In addition, we experienced marginally higher support expenditures this quarter, primarily related to the commencement of a major business systems and processes project.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage system increased by $42 million, or 49%, relative to the comparative period in 2006. Our work program increased by $40 million, primarily due to higher line clearing and brush control expenditures, consistent with our increased focus on these activities within our distribution business in the current period, as well as higher conservation and demand management (CDM) expenditures. In addition, pension costs within our distribution business were impacted by a 2006 OEB rate decision. Prior to May 1, 2006, all of our distribution-related pension costs were deferred as a regulatory asset. In addition to the increase in our work program, our other support expenditures increased marginally, primarily as a result of the commencement of a major business systems and processes project.

Depreciation and Amortization

Depreciation and amortization expense for the first quarter increased by $7 million, or 6%, to $125 million compared to the same period last year. This increase was primarily due to higher amortization of our regulatory assets resulting from the April 12, 2006 OEB rate decision, effective May 1, 2006. In addition, our depreciation expense was higher this year due to increased assets in-service, consistent with our capital expenditures programs.

Financing Charges

Financing charges for the first three months of the year were unchanged from the same period last year at $73 million. Our interest on long-term debt was lower by approximately $5 million, reflecting lower interest rates. This impact was offset by lower interest capitalization on our regulatory assets combined with the impact of interest on our refund of payments in lieu of property taxes in the first quarter of last year.

Provision for Payments in Lieu of Corporate Income Taxes

The provision for payments in lieu of corporate income taxes increased by $22 million, or 65%, to $56 million in the first three months of this year compared to last year. This increase was primarily due to last year's recognition of a $30 million tax benefit related to the recovery of payments in lieu of corporate taxes from prior years, combined with higher pre-tax income this year. These impacts were partially offset by increased temporary differences, primarily related to higher capital cost allowance.

Net Income

Net income of $149 million was lower by $3 million, or 2%, compared to 2006 first quarter results. We experienced higher tariff revenues this year, primarily as a result of OEB decisions removing the transmission earnings sharing mechanism effective January 1, 2007 and approving new distribution rates effective May 1, 2006. However, these increases were more than offset by the impact of an increase in our effective tax rate in the period due to the recognition of a tax benefit in the first quarter of last year, combined with higher operation, maintenance and administration expenditures on our work programs and the impact of a 2006 OEB decision on our distribution-related pension expenditures.

Quarterly Results of Operations

The following table sets forth unaudited quarterly information for each of the eight quarters from June 30, 2005 through March 31, 2007. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)	**2007**	**2006**				**2005**		
Quarter ended	**Mar. 31**	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**	**Dec. 31**	**Sep. 30**	**Jun. 30**
Total revenues[1,2,3]	1,278	1,142	1,165	1,078	1,160	1,025	1,179	1,018
Net income[1,2,3]	149	101	103	99	152	104	133	115
Net income to common shareholder[1,2,3]	145	96	99	94	148	99	129	110

[1] The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and net income, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

[2] Under a new regulation issued in October 2005, RPP customers received a one-time credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and cost of power were both reduced by approximately $140 million. The application of the one-time credit did not result in any adjustment to net income.

[3] During 2006, the OEB applied an earnings sharing mechanism to any transmission earnings in excess of the approved rate of return of 9.88% until new rates are set. This is expected to occur later in 2007.

LIQUIDITY AND CAPITAL RESOURCES

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These resources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash

Three months ended March 31 (Canadian dollars in millions)	**2007**	**2006**
Operating activities	299	146
Financing activities		
Long-term debt issued	400	300
Short-term notes payable	(60)	-
Dividends paid	(107)	(159)
Investing activities		
Capital expenditures	(187)	(177)
Other financing and investing activities	(1)	8
Net change in cash and cash equivalents	344	118

Operating Activities

Net cash generated from operating activities increased in the first quarter by $153 million to $299 million relative to the comparative period. This increase reflects lower working capital requirements this year, primarily attributable to the impact of issuing the *Ontario Price Credit* to RPP customers in early 2006, pursuant to regulation. Our working capital requirements in the quarter also decreased as a result of the timing of tax installment payments.

Financing Activities

Short-term liquidity is provided through funds from operations and our Commercial Paper Program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. As at March 31, 2007, we had no short-term notes outstanding. The commercial paper program is supported by a $750 million committed revolving credit facility with a syndicate of banks, which matures in August 2007 and has a two-year extension option. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. Long-term financing is provided by our access to the debt markets, including our Medium-Term Note Program. Our notes and debentures mature between 2007 and 2046. We currently plan to refinance maturing debt principally through our Medium-Term Note Program. The maximum authorised principal amount of medium-term notes issuable under this program is $2,500 million. As at March 31, 2007, $1,325 million remained available until July 2007.

	Rating	
Rating Agency	**Short-term Debt**	**Long-term Debt**
Standard & Poor's Rating Services Inc. [1]	A-1	A
Dominion Bond Rating Service Inc.	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3

[1] On March 26, 2007, Standard & Poor's Ratings Services Inc. affirmed our "A" long-term debt rating and revised its outlook on the company to positive from stable.

We have customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement related to our $750 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations.

During the first quarter of 2007, we issued $400 million in long-term debt under our Medium-Term Note Program and had no maturities and no short-term notes outstanding at the balance sheet date. During the same period in 2006, we issued $300 million in long-term debt and also had no maturities or short-term notes outstanding.

In the first quarter of 2007, we paid dividends to the Province of Ontario in the amount of $107 million, consisting of $103 million in common dividends and $4 million in preferred dividends. In the comparative period, we paid common dividends of $155 million and preferred dividends of $4 million.

Common dividends are declared at the sole discretion of our Board of Directors and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

Cash used for investing activities primarily represents capital expenditures for each of our three business segments as follows:

Three months ended March 31 (Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**
Transmission	95	100	(5)	(5)
Distribution	91	75	16	21
Other	1	2	(1)	(50)
	187	177	10	6

Transmission

Transmission capital expenditures decreased by $5 million, or 5%, to $95 million, compared to the first quarter of 2006. Expenditures made to expand and reinforce our transmission system were $48 million, a reduction of $6 million from the comparative period in 2006. This reduction primarily reflects last year's substantive completion of our Niagara Reinforcement Project. Final completion continues to be delayed by the aboriginal land dispute in the Caledonia area. Discussions continue between the affected aboriginal peoples and the various government entities involved. This impact was partially offset by increased development work related to the construction of our new inter-connection with Quebec, a major reconfiguration of our Lambton Transformer Station, and the continued construction of our downtown Toronto Cable Project. Expenditures to sustain our existing transmission system were relatively unchanged in the first three months compared to the same period last year at $41 million, an increase of $1 million. Our other transmission capital expenditures were unchanged compared to the first three months last year at $6 million.

Distribution

Distribution business capital expenditures made during the first three months of this year were $91 million, representing a $16 million, or 21%, increase over last year's levels for the same period. Expenditures to sustain our distribution system were moderately higher at $40 million, an increase of $5 million in the quarter. This increase was primarily due to higher end of life planned replacement expenditures in our lines work program. Capital investments to expand and reinforce our distribution network were $38 million, $5 million higher than the comparative period. This increase primarily reflects our investments in smart meters. During the quarter, we installed about 29,000 smart meters, for a cumulative total of approximately 57,000. We plan to install approximately 240,000 smart meters in 2007. Other capital expenditures increased by $6 million to $13 million in the quarter as a result of higher information technology expenditures, including expenditures related to a significant business systems and processes project, and increased purchases of minor support assets.

Future Capital Expenditures

Our capital expenditures are planned to be about $1.25 billion in 2007 and $1.35 billion in 2008. These planned investments will address new development and supply enhancement initiatives, including system expansions, generation requirements and load connections, and the needs of our aging transmission system under continued challenging conditions of generation supply. Our transmission rate application, which was filed in the third quarter of 2006, reflected these prudent transmission infrastructure project investments in a secure and reliable transmission system, consistent with the public interest. Within our distribution business, we plan to continue the mass deployment of smart meters begun in the first quarter of this year.

The Ontario Power Authority (OPA) is responsible for developing the Integrated Power System Plan (IPSP) and submitting it to the OEB for review and approval. The OPA is expected to submit the IPSP to the OEB in 2007. We intend to proceed with some transmission projects in the short-term because of pressing need, consistent with our transmission rate application. The IPSP is expected to influence the amount of our future capital expenditures. The timing of many of our development projects is dependent upon the final IPSP, the requirement for approvals from various regulatory bodies, and requirements for negotiations and consultations with customers, neighbouring utilities and other stakeholders and our ability to effectively resource these projects. We will not undertake large capital expenditures without a reasonable expectation of recovering them in our rates.

Our distribution investment plan includes the mass rollout of the smart metering program. Over the period 2007 to 2010, we anticipate installing over 1 million meters throughout our service territory. Consistent with the government policy, all homes and small businesses are to receive a smart meter by 2010. Total project costs are anticipated to be significant. In 2007, we plan to invest approximately $75 million under our smart meter program. At the Province's request, we will review our implementation plan and associated costs for the period 2008 to 2010.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations as well as other major commercial commitments.

March 31, 2007 (Canadian dollars in millions)	**Total**	**2007**[1]	**2008/2009**	**2010/2011**	**After 2011**
Contractual Obligations *(due by year)*					
Long-term debt – principal repayments	5,670	395	900	650	3,725
Long-term debt – interest payments	5,324	269	563	487	4,005
Inergi LP outsourcing agreement[2]	469	83	192	179	15
Operating lease commitments	15	4	9	1	1
Total Contractual Obligations	11,478	751	1,664	1,317	7,746
Other Commercial Commitments *(by year of expiry)*					
Bank line[3]	750	750	-	-	-
Letters of credit[4]	113	113	-	-	-
Guarantees[4]	275	275	-	-	-
Pension[5]	283	75	200	8	-
Total Other Commercial Commitments	1,421	1,213	200	8	-

[1] The amounts disclosed represent the balances due over the period April 1, 2007 to December 31, 2007.

[2] On March 1, 2002, Inergi began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

[3] As a backstop to our commercial paper program, we have a $750 million, 364-day revolving standby credit facility with a syndicate of banks that matures in August 2007, with a two-year extension option.

[4] We currently have bank letters of credit of $93 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO as required by the Market Rules, using a combination of bank letters of credit of $17 million and parental guarantees of $275 million. Currently, the amount of prudential support that we provide in the form of bank letters of credit to the IESO is based on our highest long-term credit rating which is in the “Aa” category. The amount of bank letters of credit provided would need to increase if our highest credit rating deteriorated. For example, if our credit rating declined to the “A” category, the amount of bank letters of credit required to meet our prudential support obligation would be 1.7 times our current amount, and if our credit ratings declined to “BBB” category, the amount of bank letters of credit required to meet our prudential support obligation would be 3.3 times the current amount. The remaining amounts included in letters of credit pertain to operating letters of credit and to surety bonds.

[5] Contributions to the pension fund are made one month in arrears. Contributions for 2007 will be based on an actuarial valuation effective December 31, 2006 and will depend on future investment returns, changes in benefits or actuarial assumptions. Based on current factors, we currently estimate our annual pension contributions for 2007 and beyond to be up to $100 million.

The amounts in the above table under long-term debt are not charged to our results of operations, but are reflected on our balance sheet and statement of cash flows. Interest associated with this debt is recorded under financing charges on our statement of operations or in our capital programs, but these financing charges are not reflected in the above table. Payments in respect of operating leases and our outsourcing agreement with Inergi LP are recorded under operation, maintenance and administration costs on our statement of operations or in our capital programs.

RELATED PARTY TRANSACTIONS

Related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder the Province of Ontario. The year-over-year changes in these amounts are described more fully in our discussion of our transmission revenues and purchased power costs. Other significant related party transactions include our dividends which are paid to the Province and our payments in lieu of corporate income taxes which are paid or payable to the Ontario Electricity Financial Corporation.

RECENT DEVELOPMENTS

Bruce to Milton Transmission Reinforcement

On March 26, 2007, the OPA recommended commencement of the planning and approval process required to build a new 500kV transmission line on an existing transmission corridor that is to be widened between the Bruce region and our Milton Switching Station. The new line will provide transmission capability to reliably deliver an additional 3,000 MW of generation capacity. This project is the largest expansion of Ontario's transmission system in almost 20 years, and is critical to securing Ontario's clean and renewable energy future. On March 29, 2007, we filed a leave-to-construct application with the OEB. This project represents an investment of approximately $635 million in Ontario's transmission system and is expected to be complete in late 2011.

Other Applications to Construct Facilities

On January 26, 2007 and January 31, 2007, the OEB issued decisions approving our leave-to-construct applications for our Southern Georgian Bay Transmission Line Reinforcement and Hurontario Station and Transmission Line Reinforcement projects, respectively. These facilities are required to maintain reliability and improve system performance.

On February 28, 2007, we filed an application with the OEB to build approximately three kilometers of 230kV underground transmission circuits to be located on an existing transmission line right of way between Jim Yarrow Transformer Station in Brampton and the proposed Hurontario Switching Station. The new circuits are required to improve the reliability and quality of service to consumers in the Western Brampton area.

On March 9, 2007, we filed an application with the OEB to build transmission line facilities in the Woodstock area. These facilities are required to increase transmission capacity to ensure the availability and quality of electricity supply to consumers in the area.

Transmission and Distribution Rate Applications

On March 26 and 27, 2007, a settlement conference was held in connection with Hydro One Networks' application seeking the approval of transmission rates and revenue requirement for implementation in 2007. On March 30, 2007, the OEB issued a decision ordering that the transmission earnings sharing mechanism cease effective January 1, 2007. After OEB review, the approved balance of this account, including interest, is expected to be incorporated into future rates to be set later in 2007. In its recent decision, the OEB also ordered Hydro One Networks to establish a new regulatory deferral account, effective January 1 2007, to record the revenue differential between existing transmission rates and the new rates that will be approved later in the year.

On April 20, 2007, the OEB released its decision regarding the 2007 rate application made by Hydro One Networks. The OEB approved the submission on the basis of its cost of capital and second generation incentive regulation mechanism policies. The revised rates, including an amount of 93 cents per month per metered customer for smart meters, were approved for implementation effective May 1, 2007. On April 12, 2007, the OEB issued a decision on the same basis in respect of the 2007 rate application made by our subsidiary Hydro One Brampton Networks. The new rates include an amount of 67 cents per month per metered customer for smart meters and were also approved for implementation effective May 1, 2007.

On April 4, 2007, the OEB announced that Hydro One Networks has been selected to have 2008 distribution rates rebased under the OEB's multi-year distribution rate-setting plan. Hydro One Brampton Networks filed a letter with the OEB requesting to be included in the 2010 distribution rate group for their cost of service review.

OEB RPP Price Change

On April 12, 2007, the OEB announced a decrease in electricity prices for RPP customers for the period May 1 to October 31, 2007. The electricity price has been reduced from 5.5 cents to 5.3 cents per kilowatt hour for customers consuming up to certain thresholds, depending on the type of customer, and from 6.4 cents to 6.2 cents for kilowatt hours exceeding the thresholds.

Conservation and Demand Management (CDM)

On April 2, 2007, we filed our 2006 CDM Annual Report with the OEB which highlights our results since the program's inception in 2005. To date, approximately 880,000 of our customers have participated in one or more of our 20 CDM initiatives and programs. The results of this participation include expected electricity savings over the lifetime of installed energy efficient equipment of 635 million kWh, or the annual consumption of over 53,000 homes. In addition to energy savings, the demand for electricity during peak periods has been reduced by almost 11 MW.

Purchases and Sales of Electricity Distributors

On October 17, 2006, the government of Ontario lifted the moratorium on the purchase and sale of our electricity distribution assets and customer service territories and required us to submit a rationalization strategy for approval. On March 19, 2007, the government approved our proposed rationalization strategy.

Debt Issue

On March 13, 2007, we issued $400 million of 30-year notes at a coupon rate of 4.89% and with a maturity date of March 13, 2037 at a yield of 4.89%. This is our first issue under the Medium-Term Note Program in 2007.

Credit Rating

On March 26, 2007, Standard & Poor's Ratings Services Inc. affirmed our "A" long-term debt rating and revised its outlook on the company to positive from stable.

Society Negotiations

We commenced early bargaining for the next collective agreement with the Society of Energy Professionals to proactively address a number of operational challenges at this point in time. Discussions will continue through May with a mutually agreed deadline of May 31, 2007 set for reaching an agreement.

SELECTED FINANCIAL HIGHLIGHTS AND RATIOS

Three months ended March 31 (Canadian dollars in millions) (except as otherwise noted)	**2007**	**2006**
Net income	149	152
Net cash from operations	299	146
Capital expenditures	187	177
Earnings per common share *(Canadian dollars)*	1,446	1,474
Earnings coverage ratio[1]	2.74	2.69
Net asset coverage on long-term debt ratio[2]	1.86	1.92
Total debt to capitalization ratio[3]	54%	52%

[1]The earnings coverage ratio has been presented for the twelve months ended March 31, 2007 and March 31, 2006, respectively and has been calculated as the sum of net income, provision for payments in lieu of corporate income taxes and financing charges divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

[2]The net asset coverage on long-term debt ratio has been presented as at March 31, 2007 and December 31, 2006 and has been calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt (including current portion).

[3]Total debt to capitalization ratio has been presented as at March 31, 2007 and December 31, 2006 and has been calculated as total debt divided by total debt plus total shareholder's equity.

FORWARD-LOOKING STATEMENTS AND INFORMATION

Our oral and written public communications, including this Management's Discussion and Analysis, often contain forward looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to statements regarding future capital expenditures; statements about the installation and cost of smart meters; expectations surrounding future pension contributions; statements regarding potential incremental environmental expenditures; and expectations concerning the impact of new accounting standards. Words such as "expect," "anticipate," "intend," "attempt," "may," "plan," "will", "believe," "seek," "estimate," and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward looking statements, whether written or oral, or whether as a result of new information, future events or otherwise, except as required by law.

These forward looking statements are based on a variety of factors and assumptions including, but not limited to the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; favourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; and no significant events occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third-party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the content of the final IPSP, as approved by the OEB;
- delays or denials of the requisite approvals for planned future capital expenditures;
- regulatory decisions regarding our revenue requirements and tariff rates; and
- future interest rates, inflation, changes in benefits and changes in actuarial assumptions.

We caution the reader that the above list of factors is not exhaustive.

This management's discussion and analysis is dated as at May10, 2007. Additional information about our company, including our annual information form, is available on SEDAR at www.sedar.com.

See accompanying notes to Consolidated Financial Statements.

1. BASIS OF PRESENTATION

The unaudited interim Consolidated Financial Statements do not conform in all respects to the disclosure requirements of Canadian generally accepted accounting principles for annual financial statements and should, therefore, be read in conjunction with the annual Consolidated Financial Statements of Hydro One Inc. (Hydro One or the Company) for the year ending December 31, 2006, which includes information necessary or useful to understanding the Company's business and financial statement presentation. In particular, the Company's significant accounting policies and practices are presented as Note 2 to the annual Consolidated Financial Statements, and have been consistently applied in the preparation of these interim Consolidated Financial Statements, except as described below in Note 2.

The demand for electricity generally follows normal weather-related variations, and therefore the Company's energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

2. ACCOUNTING CHANGES

Change in Accounting Policy – Financial Instruments, Hedges and Comprehensive Income

Effective January 1, 2007, the Company adopted four new accounting standards comprising the Canadian Institute of Chartered Accountants' (CICA) Handbook Sections 1530, *Comprehensive Income*; 3855, *Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation;* and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that are recorded in opening accumulated other comprehensive income (AOCI) as described below, consistent with the CICA Handbook sections. The comparative interim Consolidated Financial Statements have not been restated. The principal changes in the accounting for financial instruments and hedges due to the adoption of these accounting standards are described below.

(a) Comprehensive Income

Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date. The impact of this amortization is immaterial to the Statement of Operations.

(b) Financial Assets and Liabilities

Under the new standards, all financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. All financial instruments, including derivatives, are carried at fair value on the consolidated balance sheet except for loans and receivables, held-to-maturity investments and other financial liabilities, which are measured at amortized cost. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in financing charges in the period which they arise. Available-for-sale financial instruments are measured at fair value with revaluation gains and losses included in OCI until the instrument is derecognized or impaired. The Company has classified its financial instruments as follows:

Short-term investments	Held-to-maturity
Long-term accounts receivable	Loans and receivables
Bank indebtedness	Other liabilities
Short-term notes payable	Held-to-maturity
Long-term debt (excluding MTN Series 8 Note)	Held-to-maturity
MTN Series 8 Note	Designated as held-for-trading

The MTN Series 8 Note is a step-up coupon note issuance with an initial maturity date in 2007, and with extended maturity dates up to 2011.

Where there is an economic hedge, as in the case of the MTN Series 8 note and associated interest rate swap, we have applied the fair value option without hedge accounting and the impact is not material.

All financial instrument transactions are recorded at trade date.

(c) Derivatives and Hedge Accounting

Derivatives

All derivative instruments, including embedded derivatives, are carried at fair value on the balance sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. The impact of the change in the accounting policy related to embedded derivatives was not material.

Hedge Accounting

The Company periodically develops hedging strategies for execution taking into account risk management objectives. At the inception of a hedging relationship, the Company documents the relationship between the hedging instrument and the hedged item. This would include linking all derivatives to specific assets and liabilities on the consolidated balance sheet or to specific firm commitments or forecasted transactions. The Company would also assess, both at the inception of the hedge and on an ongoing basis, whether the derivatives that are used are effective in offsetting changes in fair values or cash flows of hedged items.

Upon adoption of the new standards, the Company reclassified unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to accumulated other comprehensive income. The hedging losses are amortized through OCI using the effective interest method over the term of the hedged debt.

(d) Transaction Costs

Transaction costs for financial assets and liabilities, classified as other than held-for-trading, are added to the carrying value of the asset or liability and then amortized over the expected life of the instrument using the effective interest method. The impact of the change in amortization method from an annuity basis to the effective interest method was not material.

Change in Accounting Estimate – Depreciation

Effective January 1, 2007, the Company prospectively revised its fixed asset depreciation rates resulting from a periodic external review required by the Ontario Energy Board (OEB). Capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment, which is depreciated on a declining balance basis. The estimated impact of the change in rates is a reduction in depreciation expense of approximately $7 million per annum. A summary of the new rates for the various classes of assets is included below:

	Depreciation rates (%)	
	Range	Average
Transmission	1% - 4%	2%
Distribution	1% - 13%	2%
Communication	1% - 13%	5%
Administration and service	1% - 20%	8%

3. TRANSMISSION EXCESS EARNINGS SHARING MECHANISM

On March 30, 2007, the OEB issued a decision ordering that the transmission earnings sharing mechanism cease effective January 1, 2007. The balance of the account was $35 million. After OEB review, the approved balance of this account, including interest, is expected to be incorporated into future rates to be set later in 2007. In its decision, the OEB also ordered that the Company establish a new regulatory deferral account to record the revenue differential between existing transmission rates and the new rates that are anticipated to be approved later in the year. The new deferral account will represent the revenue differential between existing and future rates for the period between January 1, 2007 and the date of the OEB's upcoming transmission rate decision. As the specifics of this decision cannot be foreseen, the value of this account cannot reasonably be determined at this time. Appropriate accounting recognition will be given to any revenue differential once the OEB renders its decision on our transmission rates.

4. DIVIDENDS

During the three months ended March 31, 2007, preferred dividends in the amount of $4 million (2006 - $4 million) and common dividends in the amount of $103 million (2006 - $155 million) were declared.

5. LONG-TERM DEBT

On March 13, 2007, Hydro One issued notes under the Company's medium term note program. The issue was comprised of medium term notes with a principal amount of $400 million having a 30-year term with a coupon rate of 4.89%. The notes are due March 13, 2037.

6. EMPLOYEE FUTURE BENEFITS

Total benefit costs are as follows:

Three months ended March 31 (Canadian dollars in millions)	**2007**	**2006**
Pension		
Net periodic benefit cost	25	38
Pension fund contribution	25	22
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	10	8
Portion attributable to regulatory assets	-	8
Charged to results of operations	15	6
Employee Future Benefits Other than Pension		
Net periodic benefit cost	27	30
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	10	10
Charged to results of operations	17	20

7. SEGMENTED REPORTING

Hydro One has three reportable segments:

- The transmission business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;
- The distribution business, which comprises the core business of delivering and selling electricity to customers; and
- An "other" segment primarily consisting of telecommunication.

The designation of segments has been based on a combination of regulatory status and the nature of the products and services provided. Segment information on the above basis is as follows:

Three months ended March 31 *(Canadian dollars in millions)*	Transmission	Distribution	Other	Consolidated
2007				
Segment profit				
Revenues	327	944	7	1,278
Purchased power	-	641	-	641
Operation, maintenance and administration	99	128	7	234
Depreciation and amortization	60	64	1	125
Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	168	111	(1)	278
Financing charges				73
Income before provision for payments in lieu of corporate income taxes				205
Capital expenditures	95	91	1	187

Three months ended March 31 *(Canadian dollars in millions)*	Transmission	Distribution	Other	Consolidated
2006				
Segment profit				
Revenues	298	856	6	1,160
Purchased power	-	598	-	598
Operation, maintenance and administration	93	86	6	185
Depreciation and amortization	59	58	1	118
Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	146	114	(1)	259
Financing charges				73
Income before provision for payments in lieu of corporate income taxes				186
Capital expenditures	100	75	2	177

(Canadian dollars in millions)	**March 31, 2007**	**December 31, 2006**
Total assets		
Transmission	6,978	6,950
Distribution	5,264	5,161
Other	419	99
	12,661	12,210

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

8. SUBSEQUENT EVENTS

On April 20, 2007 and April 12, 2007, the OEB released its decision regarding the 2007 rate applications made by the Company's subsidiaries Hydro One Networks Inc. and Hydro One Brampton Inc. respectively. The OEB approved the submissions on the basis of its cost of capital and second generation incentive regulation mechanism policies. The revised rates, including an amount of 93 cents and 67 cents per month per metered customer for smart meters, were approved for implementation effective May 1, 2007.

On April 12, 2007, the OEB announced a decrease in electricity prices for Regulated Price Plan customers. Beginning May 1, 2007, the electricity price has been reduced from 5.5 cents to 5.3 cents per kilowatt hour for customers consuming up to certain thresholds, depending on the type of customer, and from 6.4 cents to 6.2 cents for kilowatt hours exceeding the thresholds.

9. COMPARATIVE FIGURES

The comparative interim Consolidated Financial Statements have been reclassified from statements previously presented to conform to the presentation of the March 31, 2007 unaudited interim Consolidated Financial Statements.

RESULTS OF OPERATIONS

As used in this section, references to increases and decreases, whether in terms of amounts or percentages are made by comparison of the three and six months ended June 30, 2007 to the three and six months ended June 30, 2006.

Revenues

	Three months ended June 30				Six months ended June 30			
(Canadian dollars in millions)	2007	2006	$ Change	% Change	2007	2006	$ Change	% Change
Transmission	315	316	(1)	-	642	614	28	5
Distribution	798	757	41	5	1,742	1,613	129	8
Other	7	5	2	40	14	11	3	27
	1,120	1,078	42	4	2,398	2,238	160	7
Average Ontario 60-minute peak demand *(MW)*[1]	22,414	22,596	(182)	(1)	22,947	22,489	458	2
Distribution - units distributed to customers *(TWh)*[1]	6.9	6.6	0.3	5	15.5	14.6	0.9	6

[1]System-related statistics are preliminary

The demand for electricity generally follows normal weather-related variations, and, therefore, our energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

Transmission

Transmission revenues predominantly consist of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate the maximum expected demand, which is primarily influenced by weather and economic conditions. Transmission revenues also include minor amounts of ancillary revenues, which are primarily attributable to maintenance services provided to generators, and secondary use of our land rights-of-way.

Our transmission tariff revenues were marginally lower during the second quarter of 2007, but increased by $28 million, or 5%, in the first six months compared to the same period last year. Both the three and six month periods reflect a decision issued by the Ontario Energy Board (OEB) on March 30, 2007 ordering that the transmission earnings sharing mechanism cease effective December 31, 2006. This decision had the effect of increasing transmission revenues by $3 million in the quarter and $18 million in the first six months compared to last year. In addition, revenues for the second quarter increased marginally as peak demands were comparable to the same period last year. However, the average monthly peak demand was higher during the first six months of 2007, resulting in increased transmission revenues of $16 million in the year-to-date period. We also experienced lower other revenues of $4 million in the quarter and $6 million on a year-to-date basis.

We are currently awaiting a decision on our transmission rate application which was initially filed in September 2006. On March 30, 2007, the OEB issued an order that we establish a new regulatory deferral account to record any revenue differential between existing transmission rates and the new rates that are anticipated to be approved later this year, effective January 1, 2007. The specifics of this decision cannot be estimated at this time. Appropriate accounting recognition, including an increase or decrease to current revenue levels, will be given to any revenue differential once the OEB renders its decision on our rates.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are primarily influenced by our distribution rates, the amount of electricity we distribute, and the cost of purchased power. Distribution revenues also include a minor amount of ancillary distribution services revenue, such as fees related to the use of our poles by the telecommunications and cable television industries, and miscellaneous charges such as those for late payments.

Distribution revenues increased by $41 million, or 5%, to $798 million in the second quarter and by $129 million, or 8%, to $1,742 million during the first six months compared to the same periods last year. These increases were primarily a result of the recovery of increased purchased power costs of $17 million in the quarter and $60 million in the first six months, as described below under "Purchased Power." In addition, the OEB approved increases in distribution tariff rates for our subsidiaries, Hydro One Networks Inc. (Hydro One Networks) and Hydro One Brampton Networks Inc. (Hydro One Brampton Networks), effective May 1, 2006 and May 1, 2007 respectively. These tariff rate increases of $8 million in the quarter and $42 million in the first six months support the maintenance and investment requirements of our distribution system, enabling the safe and reliable delivery of electricity to our customers throughout Ontario, resulted in higher distribution revenues. In 2006, rates were based on a full cost of service hearing and in 2007, rates were adjusted based on the OEB's Second Generation Incentive Regulation mechanism. Higher energy consumption, resulting primarily from the colder winter weather this year, increased our distribution revenues by a further $6 million in the quarter and $15 million in the year-to-date period. In addition, as a result of the OEB's decision on August 8, 2007 regarding the combined smart meter proceeding, we recognized an additional $10 million in revenue. We also experienced marginally higher ancillary revenues of $2 million in the first six months of 2007 compared to the same period last year.

Purchased Power

Purchased power costs incurred by our distribution business represent the cost of electricity delivered to customers within our distribution service territory and consist of the wholesale commodity cost of energy, the Independent Electricity System Operator's (IESO's) wholesale market service charges, and transmission charges levied by the IESO. The commodity cost of energy for certain low-volume and designated customers is based on the OEB's Regulated Price Plan (RPP), which consists of a two-tiered pricing structure with threshold amounts adjusted twice annually. Customers who are not eligible for the RPP pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the RPP is provided below.

Summary of RPP

	Tier Threshold (kWh)		Tier Rates (cents/kWh)	
Effective Date	**Residential**	**Non-Residential**	**First Tier**	**Second Tier**
November 1, 2005	1,000	750	5.0	5.8
May 1, 2006	600	750	5.8	6.7
November 1, 2006	1,000	750	5.5	6.4
May 1, 2007	600	750	5.3	6.2

Purchased power costs increased by $17 million, or 3%, to $522 million in the second quarter and by $60 million, or 5%, to $1,163 million during the first six months compared to last year. These increases primarily reflect higher demand for electricity of $14 million in the quarter and $48 million in the first six months, and higher wholesale commodity prices for customers who are not eligible for the RPP of $10 million, both in the quarter and during the first six months. For the quarter, these increases were partially offset by the impact of the May 1, 2007 RPP rate change for residential and other eligible customers and a reduction in wholesale market service charges levied by the IESO.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

	Three months ended June 30				Six months ended June 30			
(Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**	**2007**	**2006**	**$ Change**	**% Change**

Distribution	145	120	25	21	273	206	67	33
Other	7	5	2	40	14	11	3	27
	259	234	25	11	493	419	74	18

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way decreased by $2 million, or by 2%, in the quarter and increased by $4 million, or 2%, on a year-to-date basis compared to the same periods last year. Within our work programs, we continued our investments that support the safe and reliable operation of the transmission system. We experienced higher work program expenditures in the quarter of approximately $7 million and year-to-date of about $9 million, primarily due to the early mobilization of resources for our planned station maintenance program. For the year-to-date period, these expenditures were partially offset by lower line clearing and brush control expenditures experienced in the first quarter. In addition, expenditures incurred in support of the transmission system increased marginally during the first six months as we commenced a major business systems and processes project. These increases were substantially offset in the quarter and in the year-to-date periods by the impact of reassigning resources in support of our larger capital work program.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage system increased by $25 million, or 21%, in the second quarter and by $67 million, or 33%, on a year-to-date basis, relative to the comparative periods. Higher expenditures within our work program of $16 million in the quarter and $49 million for the first six months resulted from higher line clearing and brush control expenditures, customer participation in our conservation and demand management programs and higher planned maintenance in our lines work program. In addition, pension costs within our distribution business for the quarterly and year-to-date periods were impacted by a 2006 OEB rate decision. Prior to May 1, 2006, all of our distribution-related pension costs were deferred as a regulatory asset. Also, as a result of the OEB's decision on August 8, 2007 regarding the combined smart meter proceeding, we recognized an additional $10 million in expenditures associated with this program. In addition to these increases, our other support expenditures for the first six months increased marginally, as a result of the commencement of a major business systems and processes project.

Depreciation and Amortization

Depreciation and amortization increased by $2 million, or 2%, to $129 million in the second quarter and by $9 million, or 4%, to $254 million in the first six months compared to the same periods last year. These increases were primarily the result of higher fixed asset removal costs related to storm recovery work in our lines work program and, for the year-to-date period, higher amortization of our regulatory assets resulting from the April 12, 2006 OEB rate decision that was effective on May 1, 2006.

Financing Charges

Financing charges in both the second quarter and year-to-date periods increased by $1 million to $74 million and to $147 million respectively, compared to the same periods last year. These increases were primarily due to reduced capitalization of financing costs on our regulatory accounts of $4 million in the quarter and $6 million for the first six months. Interest related to a first quarter 2006 recovery of payments in lieu of corporate income taxes also contributed to the increase in year-over-year financing costs for the six month period. The impact of these increases was almost offset by lower interest on long-term debt reflecting the impact of lower average borrowing costs, partially offset by a higher average level of debt outstanding.

Provision for Payments in Lieu of Corporate Income Taxes

The provision for payments in lieu of corporate income taxes increased by $3 million, or 8%, to $43 million in the second quarter and increased by $25 million, or 34%, to $99 million on a year-to-date basis, compared to the same periods last year. The increase in the quarter was primarily attributable to minor temporary differences. The year-to-date increase primarily reflects higher pre-tax income in the first six months of this year and the impact of last year's first quarter recognition of a $30 million tax benefit related to the recovery of payments in lieu of corporate taxes from prior years.

Net Income

Net income of $93 million was lower by $6 million, or 6% in the second quarter, and lower by $9 million, or 4% in the first six months compared to 2006 results. These reductions reflect increased expenditures within our distribution work program to maintain system reliability and the impact of a 2006 OEB decision on our distribution-related pension expenditures. In addition, our effective tax rate was higher in the year-to-date period due to a recovery of payments in lieu of corporate income taxes in the first quarter of last year. These increases were partially offset by increased tariff revenues within our transmission and distribution businesses.

QUARTERLY RESULTS OF OPERATIONS

The following table sets forth unaudited quarterly information for each of the eight quarters from September 30, 2005 through June 30, 2007. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)	**2007**		**2006**				**2005**	
Quarter ended	**Jun. 30**	**Mar. 31**	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**	**Dec. 31**	**Sep. 30**
Total revenue[1, 2, 3,4]	1,120	1,278	1,142	1,165	1,078	1,160	1,025	1,179
Net income [1, 2, 3]	93	149	101	103	99	152	104	133
Net income to common shareholder [1, 2, 3]	88	145	96	99	94	148	99	129

[1] The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and profit, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

[2] Under a new regulation issued in October 2005, RPP customers received a one-time credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and cost of power were both reduced by approximately $140 million. The application of the one-time credit did not result in any adjustment to net income.

[3] Effective January 1, 2006, the OEB applied an earnings sharing mechanism (ESM) to any transmission earnings in excess of the approved rate of return of 9.88%. On March 30, 2007 the OEB issued a decision ordering that the ESM cease effective December 31, 2006. The approved balance of the ESM account is expected to be incorporated into future rates to be set later in 2007.

[4] As a result of the OEB's decision on August 8, 2007 regarding the combined smart meter proceeding, we recognized an additional $10 million in revenue and cost as at June 30, 2007.

LIQUIDITY AND CAPITAL RESOURCES

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These resources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash	**Three months ended June 30**		**Six months ended June 30**	
(Canadian dollars in millions)	**2007**	**2006**	**2007**	**2006**
Operating activities	238	218	537	364
Financing activities				
Long-term debt issued	-	250	400	550
Long-term debt retired	(282)	(448)	(282)	(448)
Short-term notes payable	75	130	15	130
Dividends paid	(73)	(64)	(180)	(223)
Investing activities				
Capital expenditures	(303)	(198)	(490)	(375)
Other financing and investing activities	15	(3)	14	5
Net change in cash and cash equivalents	(330)	(115)	14	3

Operating Activities

Net cash generated from operating activities increased by $20 million to $238 million in the second quarter, and by $173 million to $537 million in the first six months compared to 2006 results, primarily due to lower working capital requirements during the quarter and year-to-date periods. In the quarter, our working capital requirements were impacted by a first quarter 2006 recovery of payments in lieu of corporate income taxes. For the year-to-date period, our working capital requirements also increased as a result of the *Ontario Price Credit* that was provided to RPP customers in early 2006, pursuant to regulation. Funding for the credit was received from the IESO in early December 2005.

Financing Activities

Short-term liquidity is provided through funds from operations and our Commercial Paper Program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. As at June 30, 2007, we had $75 million of short-term notes outstanding. The commercial paper program is supported by a $750 million committed revolving credit facility with a syndicate of banks. The term of this facility has been extended as of August 10th, 2007 to August 10th, 2010. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. Long-term financing is provided by our access to the debt markets, including our Medium-Term Note Program. On June 21, 2007, we filed a $2.5 billion base shelf prospectus to renew our Medium-Term Note Program for another 25 months. Our notes and debentures mature between 2007 and 2046. We currently plan to refinance maturing debt principally through our Medium-Term Note Program. The maximum authorised principal amount of medium-term notes issuable under this program is $2,500 million, all of which currently remains available until July 2009.

	Rating	
Rating Agency	**Short-term Debt**	**Long-term Debt**
DBRS Inc.	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3
Standard & Poor's Rating Services Inc.	A-1	A

We have customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement related to our $750 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations.

During the second quarter of 2007, we repaid $282 million in maturing long term debt and increased our short-term notes by $75 million. During the same period in 2006, we issued $250 million in long-term debt under our Medium-Term Note Program, repaid $448 million in maturing long-term debt, and increased our short-term notes by $130 million.

During the first six months of 2007, we issued $400 million in long-term debt under our Medium-Term Note Program, repaid $282 million in maturing long-term debt, and increased our short-term notes by $15 million. In comparison, during the same period in 2006, we issued $550 million in long-term debt under our medium term note program, repaid $448 million in maturing long-term debt and increased our short-term notes by $130 million.

In the second quarter of 2007, we paid dividends to the Province of Ontario in the amount of $73 million, consisting of $68 million in common dividends and $5 million in preferred dividends. In the comparative period, we paid common dividends of $59 million and preferred dividends of $5 million. Year-to-date, we have paid common and preferred dividends totaling $180 million, compared to $223 million in 2006.

Common dividends are declared at the sole discretion of our Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

Cash used for investing activities primarily represents capital expenditures for each of our three business segments as follows:

(Canadian dollars in millions)	Three months ended June 30 2007	2006	$ Change	% Change	Six months ended June 30 2007	2006	$ Change	% Change
Transmission	155	97	58	60	250	197	53	27
Distribution	138	100	38	38	229	175	54	31
Other	10	1	9	900	11	3	8	267
	303	198	105	53	490	375	115	31

Transmission

Transmission capital expenditures increased by $58 million, or 60%, to $155 million in the second quarter, and increased by $53 million, or 27%, to $250 million in the first six months, compared to the same periods in 2006. Expenditures made to expand and reinforce our transmission system were $89 million in the quarter and $136 million for the first six months of the year, representing increases over the comparative periods of $58 million and $52 million, respectively. These increases primarily reflect load and generation connections work at our Whitby and London Talbot transformer stations, and the reconfiguration of our Lambton Transformer Station. Our expenditures on major lines and stations development projects have also increased as a result of construction on our new inter-connection with Quebec, which will increase access to emission-free hydroelectric power, work at our Cambridge Preston Transformer Station, and the continued construction of our Downtown Toronto Cable Project. The impact of these increases was partially offset by expenditures on our Niagara Reinforcement Project, which was substantively completed last year. Final completion continues to be delayed by the aboriginal land dispute in the Caledonia area. Discussions continue between the affected aboriginal peoples and the various government entities involved. Expenditures to sustain our existing transmission system were $51 million in the quarter and $92 million on a year-to-date basis, representing reductions of $4 million and $2 million respectively, compared to the same periods last year. Our other transmission capital expenditures were $15 million in the quarter and $22 million for the first six months, representing respective increases of $4 million and $3 million, primarily due to expenditures on a major business systems and processes project.

Distribution

Distribution capital expenditures increased by $38 million, or 38%, to $138 million in the quarter and by $54 million, or 31%, to $229 million for the first six months, compared to the same periods in 2006. Capital investments to expand and reinforce our distribution network were $71 million in the quarter and $109 million for the first six months, representing increases of $32 million and $37 million over the comparable periods. These increases primarily reflect our ongoing investments in smart meters. During the quarter, we installed about 60,000 smart meters, for a year-to-date total of approximately 89,000 and a cumulative program total of approximately 117,000. We plan to install about 240,000 smart meters in 2007. Expenditures to sustain our distribution system of $56 million in the quarter and $96 million year-to-date, increased by $3 million and $7 million respectively compared to last year. These increases were primarily due to higher end-of-life planned replacement expenditures in our lines work program and the impact of replacing storm damaged components in the second quarter. Other capital expenditures increased to $11 million and $24 million for the three and six month periods compared to $8 million and $14 million in the same periods last year as a result of higher information technology expenditures, including expenditures on a major business systems and processes project.

Other

Other capital expenditures made to enhance our telecom infrastructure increased by $9 million in the second quarter and by $8 million in the first six months compared to the same periods in 2006. These increases were largely due to construction of a dedicated optical network which will provide secure, high capacity connectivity across numerous healthcare locations in Ontario.

Future Capital Expenditures

Our capital expenditures are planned to be about $1.25 billion in 2007 and $1.35 billion in 2008. These planned investments will address new development and supply enhancement initiatives, including system expansions, generation requirements and load connections, and the needs of our aging transmission system under continued challenging conditions of generation supply. Our transmission rate application, which was filed in the third quarter of 2006, reflected these prudent transmission infrastructure project investments in a secure and reliable transmission system, consistent with the public interest. Within our distribution business, the mass deployment of smart meters is underway and we are currently on track to meet the 2007 year-end target. Our future capital expenditures also include a major business systems and processes project, which incorporates the replacement of end of life information systems.

The Ontario Power Authority (OPA) is responsible for developing the Integrated Power System Plan (IPSP) and submitting it to the OEB for review and approval. The OPA is expected to submit the IPSP to the OEB in 2007. We intend to proceed with some transmission projects in the short-term because of pressing need, consistent with our transmission rate application. The IPSP is expected to influence the amount of our future capital expenditures. The timing of many of our development projects is dependent upon the final IPSP, the requirement for approvals from various regulatory bodies, and requirements for negotiations and consultations with customers, neighbouring utilities and other stakeholders and our ability to effectively resource these projects. We will not undertake large capital expenditures without a reasonable expectation of recovering them in our rates.

Our distribution investment plan includes the mass rollout of the smart metering program. Over the period 2007 to 2010, we anticipate installing 1.3 million meters throughout our service territory. Consistent with the government policy, all homes and small businesses are to receive a smart meter by the end of 2010. Total project costs are anticipated to be significant. In 2007, we plan to invest approximately $75 million under our smart meter program. At the Province’s request, we will review our implementation plan and associated costs for the period 2008 to 2010.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations as well as other major commercial commitments.

June 30, 2007 (Canadian dollars in millions)	**Total**	**2007**[1]	**2008/2009**	**20010/2011**	**After 2011**
Contractual Obligations *(due by year)*					
Short-term note payable	75	75	-	-	-
Long-term debt – principal repayments	5,388	113	900	650	3,725
Long-term debt – interest payments	5,208	153	563	487	4,005
Inergi LP outsourcing agreement[2]	448	56	195	181	16
Operating lease commitments	16	3	10	2	1
Total Contractual Obligations	11,135	400	1,668	1,320	7,747
Other Commercial Commitments *(by year of expiry)*					
Bank line[3]	750	750	-	-	-
Letters of credit[4]	107	97	10	-	-
Guarantees[4]	275	275	-	-	-
Pension[5]	257	49	200	8	-
Total Other Commercial Commitments	1,389	1,171	210	8	-

[1] The amounts disclosed represent the balance due over the period July 1, 2007 to December 31, 2007.

[2] On March 1, 2002, Inergi LP began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

[3] As a backstop to our commercial paper program, we have a $750 million, 364-day revolving standby credit facility with a syndicate of banks. The term of this facility has been extended as of August 10th, 2007 to August 10th, 2010.

[4] We currently have bank letters of credit of $93 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO as required by the Market Rules, using a combination of bank letters of credit of $10 million and parental guarantees of $275 million. Pursuant to Market Rule changes which became effective August 1, 2007, we are now able to meet our entire prudential support obligation using only parental guarantees based on our highest long-term credit rating which is in the “Aa” category. Although no letters of credit are required for prudential support as of August 1, 2007, we would have to resume providing bank letters of credit if our credit rating deteriorated. The remaining amounts included in letters of credit pertain to operating letters of credit and to surety bonds.

[5] Contributions to the pension fund are made one-month in arrears. Contributions for 2007 will be based on an actuarial valuation effective December 31, 2006 and will depend on future investment returns, changes in benefits or actuarial assumptions. Based on current factors, we currently estimate our annual pension contributions for 2007 and beyond to be up to $100 million.

The amounts in the above table under long-term debt are not charged to our results of operations, but are reflected on our balance sheet and statement of cash flows. Interest associated with this debt is recorded under financing charges on our statement of operations or in our capital programs, but these financing charges are not reflected in the above table. Payments in respect of operating leases and our outsourcing agreement with Inergi LP are recorded under operation, maintenance and administration costs on our statement of operations or in our capital programs.

RELATED PARTY TRANSACTIONS

Related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder the Province of Ontario. The year-over-year changes in these amounts are described more fully in our discussion of our transmission revenues and purchased power costs. Other significant related party transactions include our dividends which are paid to the Province and our payments in lieu of corporate income taxes which are paid or payable to the Ontario Electricity Financial Corporation.

RECENT DEVELOPMENTS

Transmission and Distribution Rate Applications

During the second quarter, the evidentiary phase of the transmission rate hearing was completed and we filed our final argument with the OEB on June 13, 2007. Based on the OEB's processing guidelines, a decision is anticipated shortly.

We are currently in the process of preparing our 2008 distribution rate application for our subsidiary Hydro One Networks. On July 18, 2007, we held a stakeholder session which was attended by interested parties and we highlighted some of the key aspects of our application. We are required to file our application with the OEB by August 15, 2007.

Combined Smart Meter Proceeding

On May 2, 2007, the OEB issued a notice for a combined proceeding to determine certain general principles related to the prudence and recovery of costs associated with smart metering activities. Our subsidiaries, Hydro One Networks and Hydro One Brampton Networks participated in this proceeding. During June 2007, evidence was filed by our subsidiaries and an oral hearing was held. On August 8, 2007, the OEB issued a decision approving the recovery of expenditures associated with the minimum functionality for advanced metering infrastructure.

Society Negotiations

In April 2007, we commenced early bargaining for the next collective agreement with the Society of Energy Professionals (Society) and on May 31, 2007 we successfully reached a tentative agreement with a five-year term effective April 1, 2008. In June 2007, the collective agreement was ratified by our Board of Directors and the Society.

Application to Construct Facilities

On June 6, 2007, the Minister of the Environment issued a letter confirming an individual environmental assessment (EA) is not required for the Holland Transformer Station Project which proposes construction of a new transformer to address ongoing load growth in northern York Region. The letter grants approval of the EA subject to certain conditions. We anticipate the project to be in-service in Spring 2009.

In the first quarter, we filed leave-to-construct applications for our Western Brampton Line Reinforcement and our Supply to Woodstock projects. These applications are awaiting OEB review pursuant to the Transmission System Code in relation to the treatment of capital contributions for local area supply connection facilities. Decisions are anticipated in August 2007.

Purchase of Assets

On July 9, 2007, we entered into an agreement with the Township of Terrace Bay to purchase the assets of Terrace Bay Superior Wires Inc. (TBSW) for approximately $1 million. TBSW is located on the north shore of Lake Superior and has approximately 950 customers. The transaction is subject to OEB approval and on July 11, 2007 we submitted a joint application, with the Township of Terrace Bay, to the OEB. The transaction is anticipated to close in Fall 2007.

SELECTED FINANCAL HIGHLIGHTS AND RATIOS

	Three months ended June 30		Six months ended June 30	
(Canadian dollars in millions) (except as otherwise noted)	**2007**	**2006**	**2007**	**2006**
Net income	93	99	242	251
Net cash from operating activities	238	218	537	364
Capital expenditures	303	198	490	375
Earnings per common share *(Canadian dollars)*	888	943	2,334	2,417
Earnings coverage ratio[1]			2.77	2.71
Net asset coverage on long-term debt[2]			1.91	1.92
Total debt to capitalization[3]			52%	52%

[1]The earnings coverage ratio has been presented for the twelve months ended June 30, 2007 and June 30, 2006, respectively and has been calculated as the sum of net income, provision for payments in lieu of corporate income taxes and financing charges divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

[2]The net asset coverage on long-term debt ratio has been presented as at June 30, 2007 and December 31, 2006 and has been calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt including current portion.

[3]Total debt to capitalization ratio has been presented as at June 30, 2007 and December 31, 2006 and has been calculated as total debt divided by total debt plus total shareholder's equity.

FORWARD-LOOKING STATEMENTS AND INFORMATION

Our oral and written public communications, including this Management's Discussion and Analysis, often contain forward looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to statements regarding future capital expenditures; statements about the installation and cost of smart meters; expectations surrounding future pension contributions; statements regarding potential incremental environmental expenditures; and expectations concerning the impact of new accounting standards. Words such as "expect," "anticipate," "intend," "attempt," "may," "plan," "will", "believe," "seek," "estimate," and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward looking statements, whether written or oral, or whether as a result of new information, future events or otherwise, except as required by law.

These forward looking statements are based on a variety of factors and assumptions including, but not limited to the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; favourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; and no significant events occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third-party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the content of the final IPSP, as approved by the OEB;
- delays or denials of the requisite approvals for planned future capital expenditures;
- regulatory decisions regarding our revenue requirements and tariff rates;
- significant changes to Environment Canada's draft PCB regulations issued on November 4, 2006; and
- future interest rates, inflation, changes in benefits and changes in actuarial assumptions.

We caution the reader that the above list of factors is not exhaustive.

This management's discussion and analysis is dated as at August 10, 2007. Additional information about our company, including our annual information form, is available on SEDAR at www.sedar.com.

1. BASIS OF PRESENTATION

These interim Consolidated Financial Statements do not conform in all respects to the disclosure requirements of Canadian generally accepted accounting principles for annual financial statements and should, therefore, be read in conjunction with the annual Consolidated Financial Statements of Hydro One Inc. (Hydro One or the Company) for the year ending December 31, 2006 which includes information necessary or useful to understanding the Company's business and financial statement presentation. In particular, the Company's significant accounting policies and practices are presented as Note 2 to the annual Consolidated Financial Statements, and have been consistently applied in the preparation of these interim Consolidated Financial Statements, except as described below in note 2.

The demand for electricity generally follows normal weather-related variations, and therefore the Company's energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

2. ACCOUNTING CHANGES

Change in Accounting Policy – Financial Instruments, Hedges and Comprehensive Income

Effective January 1, 2007, the Company adopted four new accounting standards comprising the Canadian Institute of Chartered Accountants' (CICA) Handbook Sections 1530, *Comprehensive Income*; 3855, *Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation;* and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that are recorded in opening accumulated other comprehensive income (AOCI) as described below, consistent with the CICA Handbook sections. The comparative interim Consolidated Financial Statements have not been restated. The principal changes in the accounting for financial instruments and hedges due to the adoption of these accounting standards are described below.

(a) Comprehensive Income

Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date. The impact of this amortization is immaterial to the Statement of Operations.

(b) Financial Assets and Liabilities

Under the new standards, all financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. All financial instruments, including derivatives, are carried at fair value on the consolidated balance sheet except for loans and receivables, held-to-maturity investments and other financial liabilities, which are measured at amortized cost. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in financing charges in the period which they arise. Available-for-sale financial instruments are measured at fair value with revaluation gains and losses included in OCI until the instrument is derecognized or impaired. The Company has classified its financial instruments as follows:

Short-term investments	Held-to-maturity
Long-term accounts receivable	Loans and receivables
Bank indebtedness	Other liabilities
Short-term notes payable	Other liabilities
Long-term debt (excluding MTN Series 8 Note)	Other liabilities
MTN Series 8 Note	Designated as held-for-trading

The MTN Series 8 Note is a step-up coupon note with a maturity date in 2007, and with extended maturity dates up to 2011.

Where there is an economic hedge, as in the case of the MTN Series 8 note and associated interest rate swap, we have applied the fair value option without hedge accounting. The impact is not material.

All financial instrument transactions are recorded at trade date.

(c) Derivatives and Hedge Accounting

Derivatives

All derivative instruments, including embedded derivatives, are carried at fair value on the balance sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. The impact of the change in the accounting policy related to embedded derivatives was not material.

Hedge Accounting

The Company periodically develops hedging strategies for execution taking into account risk management objectives. At the inception of a hedging relationship, the Company documents the relationship between the hedging instrument and the hedged item. This would include linking all derivatives to specific assets and liabilities on the consolidated balance sheet or to specific firm commitments or forecasted transactions. The Company would also assess, both at the inception of the hedge and on an ongoing basis, whether the derivatives that are used are effective in offsetting changes in fair values or cash flows of hedged items.

Upon adoption of the new standards, the Company reclassified unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to accumulated other comprehensive income. The hedging losses are amortized through OCI using the effective interest method over the term of the hedged debt.

(d) Transaction Costs

Transaction costs for financial assets and liabilities that are other than held-for-trading, are added to the carrying value of the asset or liability and then amortized over the expected life of the instrument using the effective interest method. The impact of the change in amortization method from an annuity basis to the effective interest method was not material.

Change in Accounting Estimate – Depreciation

Effective January 1, 2007, the Company prospectively revised its fixed asset depreciation rates resulting from a periodic external review required by the Ontario Energy Board (OEB). Capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment, which is depreciated on a declining balance basis. The estimated impact of the change in rates is a reduction in depreciation expense of approximately $7 million per annum. A summary of the new rates for the various classes of assets is included below:

	Depreciation rates (%)	
	Range	Average
Transmission	1% - 4%	2%
Distribution	1% - 13%	2%
Communication	1% - 13%	5%
Administration and service	1% - 20%	8%

3. TRANSMISSION EXCESS EARNINGS SHARING MECHANISM

On March 30, 2007, the OEB issued a decision ordering that the transmission earnings sharing mechanism cease effective December 31, 2006. The balance of the account was $35 million. After OEB review, the approved balance of this account, including interest, is expected to be incorporated into future rates to be set later in 2007. In its decision, the OEB also ordered that the Company establish a new regulatory deferral account to record the revenue differential between existing transmission rates and the new rates that are anticipated to be approved later in the year. The new deferral account will represent the revenue differential between existing and future rates for the period between January 1, 2007 and the date of the OEB's upcoming transmission rate decision. As the specifics of this decision cannot be foreseen, the value of this account cannot reasonably be determined at this time. Appropriate accounting recognition will be given to any revenue differential once the OEB renders its decision on Hydro One's transmission rates.

4. SMART METER COST RECOVERY

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine the recovery of costs incurred by distributors. Expenditures associated with the minimum functionality for advanced metering infrastructure were approved for recovery. Consequently, as at June 30, 2007, the Company reduced its net smart meter regulatory asset and recorded fixed assets of $41 million. In addition, the Company recognized revenues of $10 million and an equivalent amount of costs incurred in support of the program which were deferred in previous periods. Costs determined to be above the minimum functionality will be brought forward for review in a subsequent cost of service rate application.

5. DIVIDENDS

During the three months ended June 30, 2007, preferred dividends in the amount of $5 million (2006 - $5 million) and common dividends in the amount of $68 million (2006 - $59 million) were declared. During the six months ended June 30, 2007, preferred dividends in the amount of $9 million (2006 - $9 million) and common dividends in the amount of $171 million (2006 - $214 million) were declared.

6. LONG-TERM DEBT

On March 13, 2007, Hydro One issued notes under the Company's medium term note program. The issue was comprised of medium term notes with a principal amount of $400 million having a 30-year term with a coupon rate of 4.89%. The notes are due March 13, 2037.

In the second quarter, Hydro One extended the maturity date of its $40 million extendible step-up note from May 15, 2007 to November 15, 2007.

The Company has a $750 million, 364-day revolving standby credit facility with a syndicate of banks. The term of this facility has been extended as of August 10th, 2007 to August 10th, 2010.

7. EMPLOYEE FUTURE BENEFITS

Total benefit costs are as follows:

	Three months ended June 30		Six months ended June 30	
(Canadian dollars in millions)	**2007**	**2006**	**2007**	**2006**
Pension				
Net periodic benefit cost	25	39	50	77
Pension fund contribution	26	22	51	44
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	10	9	20	17
Portion attributable to regulatory assets	-	3	-	11
Charged to results of operations	16	10	31	16
Employee Future Benefits Other than Pension				
Net periodic benefit cost	26	31	53	61
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	11	9	21	19
Charged to results of operations	15	22	32	42

8. SEGMENTED REPORTING

Hydro One has three reportable segments:

- The transmission business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;
- The distribution business, which comprises the core business of delivering and selling electricity to customers; and
- An "other" segment primarily consisting of telecommunications business.

The designation of segments has been based on a combination of regulatory status and the nature of the products and services provided. Segment information on the above basis is as follows:

Three months ended June 30 (Canadian dollars in millions)	Transmission	Distribution	Other	Consolidated
2007				
Segment profit				
Revenues	315	798	7	1,120
Purchased power	-	522	-	522

Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	292	182	(3)	471
Financing charges				146
Income before provision for payments in lieu of corporate income taxes				325
Capital expenditures	197	175	3	375

(Canadian dollars in millions)	**June 30, 2007**	**December 31, 2006**
Total assets		
Transmission	7,085	6,950
Distribution	5,256	5,161
Other	96	99
	12,437	12,210

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

9. COMMITMENTS

Purchasers of electricity in Ontario, through the Independent Electricity System Operator (IESO), are required to provide security to mitigate the risk of their default based on their expected activity in the market. The IESO could draw on these guarantees should the Company's subsidiaries, Hydro One Networks Inc. or Hydro One Brampton Networks Inc., fail to make a payment required by a default notice issued by the IESO.

On June 28, 2007, the IESO approved revisions to the prudential support obligations under the market rules. Previously, prudential support was provided to the IESO using a combination of bank letters of credit and parental guarantees. Under the new rules, effective August 1, 2007 the Company can meet its prudential support requirements using only parental guarantees, as long as it maintains a long-term credit rating in the "Aa" category. Consequently, the Company will reduce its bank letters of credit by $10 million.

10. SUBSEQUENT EVENT

On August 2, 2007, the Company entered into a forward starting pay fixed interest rate swap agreements to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. This transaction had a notional amount of $150 million and is used to lock in the interest rate of a forecasted debt issuance planned for later in 2007. This transaction is being accounted for as a cash flow hedge of a forecasted transaction.

11. COMPARATIVE FIGURES

The comparative unaudited interim Consolidated Financial Statements have been reclassified from statements previously presented to conform to the presentation of the June 30, 2007 unaudited interim Consolidated Financial Statements.

RESULTS OF OPERATIONS

As used in this section, references to increases and decreases, whether in terms of amounts or percentages are made by comparison of the three and nine months ended September 30, 2007 to the three and nine months ended September 30, 2006.

Revenues

	Three months ended September 30				Nine months ended September 30			
(Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**	**2007**	**2006**	**$ Change**	**% Change**

Distribution - units distributed to customers *(TWh)*[1]	7.1	7.0	0.1	1	22.5	21.6	0.9	4

[1]System-related statistics are preliminary

The demand for electricity generally follows normal weather-related variations, and, therefore, our energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

Transmission

Transmission revenues predominantly consist of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate the maximum expected demand, which is primarily influenced by weather and economic conditions. Transmission revenues also include minor amounts of ancillary revenues, which are primarily attributable to maintenance services provided to generators, and secondary use of our land rights-of-way.

Revenues for the quarter and for the year-to-date periods were affected by the Ontario Energy Board's (OEB's) August 16, 2007 decision on our transmission rate application. The OEB approved all of our work program expenditure requirements. Our return on equity was reduced from 9.88% to 8.35% and our deemed capital structure was adjusted from one that included common and preferred shares and debt to a deemed capital structure split of 60% debt and 40% common shares. This capital structure is consistent with that approved by the OEB in its December 2006 report which established the capital structure for Ontario's electricity distributors. The OEB's decision was effective January 1, 2007 and new customer rates reflecting the decision were implemented on November 1, 2007. As a result of the OEB decision, we reduced our 2007 transmission revenues in the third quarter to reflect the approved revenue requirement. These amounts are being returned to customers through lower rates commencing November 1, 2007. This liability has been recorded in the Revenue Difference Deferral Account (RDDA). On March 30, 2007, the OEB approved cessation of the 2006 transmission Earnings Sharing Mechanism (ESM) effective December 31, 2006 and replaced it with the RDDA. The RDDA liability will be drawn down over the period the new rates are in place and revenue will be recorded based on the approved revenue requirement throughout the remainder of 2007 and during 2008.

Our transmission tariff revenues decreased by $24 million, or 7%, during the third quarter of 2007, but increased by $4 million in the first nine months compared to the same period last year. Our transmission revenues reflect the impacts of the OEB's August 16, 2007 transmission rate decision, which had the effect of reducing our quarterly and year-to-date revenues by about $38 million. This reduction includes the revenue adjustment associated with recording the RDDA liability, as well as other decision-related revenue adjustments related to the disposition of regulatory asset and liability accounts and the recording of export and wheeling fees revenue. In addition, our transmission revenues were higher than the comparative periods by $6 million in the quarter and $23 million year-to-date as a result of the OEB's earlier decision to end the ESM effective December 31, 2006.

Revenues for the third quarter and year-to-date also reflect higher average peak demands compared to the same periods last year, resulting in increased transmission revenues of $5 million in the quarter and $21 million for the year-to-date period. We also experienced increased other revenues of $3 million in the quarter and decreased other revenues of $2 million on a year-to-date basis.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are primarily influenced by our distribution rates, the amount of electricity we distribute, and the cost of purchased power. Distribution revenues also include a minor amount of ancillary distribution services revenue, such as fees related to the use of our poles by the telecommunications and cable television industries, and miscellaneous charges such as those for late payments.

Distribution revenues decreased by $15 million, or 2%, to $813 million in the third quarter but increased by $114 million, or 5%, to $2,555 million during the first nine months compared to the same periods last year. These changes include the recovery of lower purchased power costs of $31 million in the quarter and higher purchased power costs of $29 million in the first nine months, as described below under "Purchased Power." In addition, the OEB approved increases in distribution tariff rates for our subsidiaries, Hydro One Networks Inc. (Hydro One Networks) and Hydro One Brampton Networks Inc. (Hydro One Brampton Networks), effective May 1, 2006 and May 1, 2007 respectively. These tariff rate increases, which support the maintenance and investment requirements of our distribution system, enabling the safe and reliable delivery of electricity to our customers throughout Ontario, resulted in higher distribution revenues of $1 million in the quarter and $44 million in the first nine months. In 2006, rates were based on a full cost of service hearing and in 2007, rates were adjusted based on OEB guidelines. Higher energy consumption, resulting primarily from the colder winter weather this year, increased our distribution revenues by a further $4 million in the quarter and $18 million in the year-to-date period. In addition, as a result of the OEB's decision on August 8, 2007 regarding the combined smart meter proceeding, we recorded smart meter revenues of $6 million in the quarter and $16 million in the first nine months. We also experienced higher other revenues of $5 million in the quarter and $7 million in the first nine months of 2007 compared to the same periods last year.

Purchased Power

Purchased power costs incurred by our distribution business represent the cost of electricity delivered to customers within our distribution service territory and consist of the wholesale commodity cost of energy, the Independent Electricity System Operator's (IESO's) wholesale market service charges, and transmission charges levied by the IESO. The commodity cost of energy for certain low-volume and designated customers is based on the OEB's Regulated Price Plan (RPP), which consists of a two-tiered pricing structure with threshold amounts adjusted twice annually. Customers who are not eligible for the RPP pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the RPP is provided below.

Summary of RPP				
	Tier Threshold (kWh)		Tier Rates (cents/kWh)	
Effective Date	**Residential**	**Non-Residential**	**First Tier**	**Second Tier**
November 1, 2005	1,000	750	5.0	5.8
May 1, 2006	600	750	5.8	6.7
November 1, 2006	1,000	750	5.5	6.4
May 1, 2007	600	750	5.3	6.2

Purchased power costs decreased by $31 million, or 5%, to $533 million in the third quarter but increased by $29 million, or 2%, to $1,696 million during the first nine months compared to the last year. The decrease for the quarter primarily reflects the impact of the May 1, 2007 reduction in RPP rates for residential and other eligible customers of $36 million, partially offset by higher wholesale commodity prices for customers who are not eligible for the RPP of $2 million, higher demand for electricity of $2 million, and higher wholesale market service charges levied by the IESO of $1 million. For the nine-month period, higher demand for electricity of $49 million, higher wholesale commodity prices for customers who are not eligible for the RPP of $12 million, and higher wholesale market service charges levied by the IESO of $3 million, more than offset the impact of the May 1, 2007 RPP rate change for residential and other eligible customers of $35 million.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

	Three months ended September 30				Nine months ended September 30			
(Canadian dollars in millions)	2007	2006	$ Change	% Change	2007	2006	$ Change	% Change
Transmission	117	105	12	11	323	307	16	5
Distribution	137	122	15	12	410	328	82	25
Other	9	6	3	50	23	17	6	35
	263	233	30	13	756	652	104	16

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way increased by $12 million, or by 11%, in the quarter and increased by $16 million, or 5%, on a year-to-date basis compared to the same periods last year. Within our work programs, we continued our investments that support the safe and reliable operation of the transmission system. We experienced higher work program expenditures of approximately $13 million in the quarter and about $24 million year-to-date, primarily due to the enhancement of our planned station maintenance program. Higher expenditures on line clearing and brush control were experienced in the quarter. In addition, we experienced a one-time $6 million cost related to revaluing some of our transmission regulatory accounts as a result of the OEB's August 16, 2007 transmission rate decision. Our expenditures incurred in support of the transmission system increased marginally during the first nine months as we commenced a major business systems and processes project. The impact of these increases was offset by the impact of reassigning resources to support our larger transmission capital program.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage system increased by $15 million, or 12%, in the third quarter and by $82 million, or 25%, on a year-to-date basis, relative to the comparative periods. Higher expenditures within our work program of $8 million in the quarter and $51 million for the first nine months resulted from higher line clearing expenditures and customer participation in our conservation and demand management programs. These impacts were partially offset in the quarter by a reduction in our lines maintenance work program, predominantly as a result of higher storm activity in 2006. In addition, pension costs within our distribution business for the quarterly and year-to-date periods were higher than in 2006 as a result of last year's OEB rate decision. Prior to May 1, 2006, all of our distribution-related pension costs were deferred as a regulatory asset. As a result of the OEB's August 8, 2007 decision on the combined smart meter proceeding, we have recorded increased operation, maintenance and administration expense related to smart meter expenditures incurred in the 2005 to 2007 period that were previously deferred as regulatory assets. In addition to these increases, our other support expenditures for the first nine months increased marginally as a result of the commencement of a major business systems and processes project.

Depreciation and Amortization

Depreciation and amortization decreased by $4 million, or 3%, to $128 million in the third quarter and increased by $5 million, or 1%, to $382 million in the first nine months compared to the same periods last year. The reduction in the quarter is primarily due to lower amortization of regulatory assets of $3 million. The remainder of the reduction in the quarter is due to lower fixed asset removal costs resulting from lower storm damage. The year-to-date increase is primarily due to higher year-over-year amortization of our regulatory assets of $2 million resulting from an April 12, 2006 OEB distribution rate decision that was effective on May 1, 2006, combined with higher fixed asset removal costs of $2 million as a result of increased storm work performed in the first and second quarters.

Financing Charges

Financing charges increased by $2 million, or 3%, to $76 million in the quarter and by $3 million, or 1%, to $223 million in the first nine months of the year, compared to the same periods last year. These increases were primarily due to reduced capitalization of financing costs of $4 million in the quarter and $10 million for the first nine months. Interest capitalization on our fixed and regulatory assets was lower as a result of lower OEB-prescribed rates and higher net regulatory liability balances resulting from recording the RDDA. Interest related to a first quarter 2006 recovery of payments in lieu of corporate income taxes also contributed to the increase in year-over-year financing costs for the nine month period. The impact of these increases was partially offset by lower interest on long-term debt of about $2 million in the quarter and $9 million for the first nine months, reflecting the impact of lower average borrowing costs partially offset by a higher average level of debt outstanding.

Provision for Payments in Lieu of Corporate Income Taxes

The provision for payments in lieu of corporate income taxes increased by $2 million, or 3%, to $61 million in the third quarter and by $27 million, or 20%, to $160 million on a year-to-date basis compared to last year. The year-to-date increase primarily reflects last year's first quarter recognition of a $30 million tax benefit related to the recovery of payments in lieu of corporate taxes from prior years. These impacts were partially offset by higher capital cost allowance in excess of depreciation this year and other temporary differences.

Net Income

Net income of $67 million was lower by $36 million, or 35%, in the third quarter and was lower by $45 million, or 13%, in the first nine months compared to 2006 results. Net income, both in the quarter and year-to-date, was impacted by the OEB's August 16, 2007 transmission rate decision. While the OEB approved all of our work program requirements for 2007 and 2008, our return on equity was reduced from 9.88% to 8.35%. Our net income levels in both the quarterly and year-to-date periods were also affected by higher distribution work program expenditures to maintain system reliability, the impact of a 2006 OEB decision on our distribution-related pension expenditures and by higher effective tax rates. The increased rates are related to temporary differences associated with amounts to be returned to customers as part of the OEB's transmission rate decision and a recovery of payments in lieu of corporate income taxes in the first quarter of last year. These impacts were partially offset by increased transmission revenues due to a higher average peak demand and distribution tariff revenues for the first nine months of 2007.

QUARTERLY RESULTS OF OPERATIONS

The following table sets forth unaudited quarterly information for each of the eight quarters from December 31, 2005 through September 30, 2007. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)		**2007**			**2006**			**2005**
Quarter ended	**Sep. 30**	**Jun. 30**	**Mar. 31**	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**	**Dec. 31**
Total revenue[1, 2, 3]	1,128	1,120	1,278	1,142	1,165	1,078	1,160	1,025
Net income [1, 2, 3]	67	93	149	101	103	99	152	104
Net income to common shareholder [1, 2, 3]	63	88	145	96	99	94	148	99

[1] The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and profit, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

[2] Under a new regulation issued in October 2005, RPP customers received a one-time credit reflecting a lower cost of power than the fixed commodity price between April 1, 2004 and March 31, 2005. In the fourth quarter of 2005, revenue and cost of power were both reduced by approximately $140 million. The application of the one-time credit did not result in any adjustment to net income.

[3] As a result of the OEB's August 16, 2007 decision on Hydro One Networks' Transmission rate application that was effective January 1, 2007, year-to-date revenues have been adjusted to reflect a reduced revenue requirement based on the approved rate of return of 8.35%.

LIQUIDITY AND CAPITAL RESOURCES

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These resources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash	**Three months ended September 30**		**Nine months ended September 30**	
(Canadian dollars in millions)	**2007**	**2006**	**2007**	**2006**
Operating activities	331	351	868	715
Financing activities				
Long-term debt issued	-	150	400	700
Long-term debt retired	(73)	-	(355)	(448)
Short-term notes payable	85	(130)	100	-
Dividends paid	(72)	(63)	(252)	(286)
Investing activities				
Capital expenditures	(275)	(218)	(765)	(593)
Other financing and investing activities	4	4	18	9
Net change in cash and cash equivalents	-	94	14	97

Operating Activities

Net cash generated from operating activities decreased by $20 million to $331 million in the third quarter, but increased by $153 million to $868 million in the first nine months. The decrease for the quarter was primarily due to marginally higher working capital requirements compared to the third quarter last year. Our working capital requirements in the year-to-date period were substantially lower than the comparative period primarily as a result of a first quarter 2006 recovery of payments in lieu of corporate income taxes and the impact of the *Ontario Price Credit* that was provided to RPP customers in early 2006, pursuant to regulation. Funding for the credit was received from the IESO in early December 2005.

Financing Activities

Short-term liquidity is provided through funds from operations and our Commercial Paper Program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. As at September 30, 2007, we had $161 million of short-term notes payable. The Commercial Paper Program is supported by a $750 million committed revolving credit facility with a syndicate of banks which matures on August 10, 2010. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. Long-term financing is provided by our access to the debt markets, primarily through our Medium-Term Note Program. On June 21, 2007, we filed a $2.5 billion base shelf prospectus to renew our Medium-Term Note Program for another 25 months. Our notes and debentures mature between 2007 and 2046. We currently plan to refinance maturing debt principally through our Medium-Term Note Program. The maximum authorised principal amount of medium-term notes issuable under this program is $2,500 million, all of which currently remains available until July 2009.

	Rating	
Rating Agency	**Short-term Debt**	**Long-term Debt**
DBRS Inc.	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3
Standard & Poor's Rating Services Inc.	A-1	A

We have the customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement related to our $750 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations.

During the third quarter of 2007, we repaid $73 million in maturing long term debt and increased our short-term notes by $86 million. During the same period in 2006, we issued $150 million in long-term debt under our Medium-Term Note Program and decreased our short-term notes by $130 million.

During the first nine months of 2007, we issued $400 million in long-term debt under our Medium-Term Note Program, repaid $355 million in maturing long-term debt, and increased our short-term notes by $101 million. In comparison, during the same period in 2006, we issued $700 million in long-term debt under our Medium Term Note Program and repaid $448 million in maturing long-term debt.

In the third quarter of 2007, we paid dividends to the Province of Ontario in the amount of $72 million, consisting of $68 million in common dividends and $4 million in preferred dividends. In the comparative period, we paid common dividends of $59 million and preferred dividends of $4 million. Year-to-date, we have paid common and preferred dividends totaling $252 million, compared to $286 million in 2006.

Common dividends are declared at the sole discretion of our Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

Cash used for investing activities primarily represents capital expenditures for each of our three business segments as follows:

	Three months ended September 30				**Nine months ended September 30**			
(Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**	**2007**	**2006**	**$ Change**	**% Change**
Transmission	144	93	51	55	394	290	104	36
Distribution	126	123	3	2	355	298	57	19
Other	5	2	3	150	16	5	11	220
	275	218	57	26	765	593	172	29

Transmission

Transmission capital expenditures increased by $51 million, or 55%, to $144 million in the third quarter, and increased by $104 million, or 36%, to $394 million in the first nine months, compared to the same periods in 2006. Expenditures made to expand and reinforce our transmission system were $72 million in the quarter and $208 million for the first nine months of the year, representing increases over the comparative periods of $26 million and $78 million, respectively. These increases primarily reflect expenditures on major lines and stations development projects. These expenditures have increased primarily as a result of our construction on a new inter-connection with Quebec, which will increase access to emission-free hydroelectric power, work on our Cambridge Preston Transformer Station and on our Essa to Stayner connection, and the continued construction of our Downtown Toronto Cable Project. The impact of these increases was partially offset by last year’s expenditures on our Niagara Reinforcement Project. This project was substantially completed last year but final completion continues to be delayed by the aboriginal land dispute in the Caledonia area. Discussions continue between the affected aboriginal peoples and the various government entities involved. Expenditures on our load and generation connections work have also increased as a result of work at our London Talbot, Holland and Whitby transformer stations, as well as the reconfiguration of our Lambton Transformer Station. Expenditures to sustain our existing transmission system were $55 million in the quarter and $147 million on a year-to-date basis, representing increases of $11 million and $8 million respectively, compared to the same periods last year. Our other transmission capital expenditures increased to $17 million and $39 million for the three and nine month periods, compared to $3 million and $21 million in the same periods last year, primarily due to higher information technology expenditures, including expenditures on a major business systems and processes project.

Distribution

Distribution capital expenditures increased by $3 million, or 2%, to $126 million in the quarter and by $57 million, or 19%, to $355 million for the first nine months, compared to the same periods in 2006. Capital investments to expand and reinforce our distribution network were $57 million in the quarter and $166 million for the first nine months, representing increases of $10 million and $46 million, respectively over the comparable periods. These increases primarily reflect our ongoing investments in smart meters. During the quarter, we installed about 83,000 smart meters, for a year-to-date total of approximately 172,000 and a cumulative program total of approximately 200,000. We plan to install about 240,000 smart meters in 2007. Expenditures to sustain our distribution system were $56 million in the quarter and $152 million year-to-date, representing decreases of $17 million and $9 million, respectively compared to last year. These decreases were primarily due to reduced storm activity this year compared to the summer of 2006. This impact was partially offset by higher planned end-of-life asset component replacement expenditures in our lines work program this year. Our other distribution capital expenditures increased to $13 million and $37 million for the three and nine month periods, compared to $3 million and $17 million in the same periods last year primarily due to higher information technology expenditures, including expenditures on a major business systems and processes project.

Other

Other capital expenditures made to enhance our telecom infrastructure increased by $3 million in the third quarter and by $11 million in the first nine months compared to the same periods in 2006. These increases were largely due to construction of a dedicated optical network which will provide secure, high capacity connectivity across numerous healthcare locations in Ontario.

Future Capital Expenditures

Our capital expenditures are planned to be about $1.2 billion in 2007 and $1.4 billion in 2008. These planned investments will address new development and supply enhancement initiatives, including system expansions, generation requirements and load connections, and the needs of our aging transmission system under continued challenging conditions of generation supply. The OEB approved the transmission-related investments for both 2007 and 2008 in its decision of August 16, 2007. Within our distribution business, the mass deployment of smart meters is underway and we are currently on track to meet our 2007 year-end target. Our future capital expenditures also include a major business systems and processes project, which incorporates the replacement of end of life information systems.

The Ontario Power Authority (OPA) has completed its Integrated Power System Plan (IPSP), focusing primarily on the mid- to long-term time frames, and submitted it to the OEB at the end of August 2007. Consequently, we will be required to justify the need for many of our key projects. We have initiated section 92 leave-to-construct filings with the OEB for our pre-IPSP projects. No significant changes have been noted between the IPSP and our business plan, although the IPSP recommends commencement of project development work on certain large and immediate projects. The IPSP is a key driver for the amount of our future capital expenditures. The timing of many of our development projects is also dependent on the requirement to seek and attain approvals from various regulatory bodies, requirements for negotiations and consultations with customers, neighbouring utilities and other stakeholders, and our ability to effectively resource these projects. We will not undertake large capital expenditures without a reasonable expectation of recovering them in our rates.

Our distribution investment plan includes the mass rollout of the smart metering program. Over the period 2007 to 2010, we anticipate installing 1.3 million meters throughout our service territory. Consistent with the government policy, all homes and small businesses are to receive a smart meter by the end of 2010. Total project costs are anticipated to be significant. In 2007, we plan to invest approximately $75 million under our smart meter program. At the Province’s request, we will review our implementation plan and associated costs for the period 2008 to 2010.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations as well as other major commercial commitments.

September 30, 2007 (Canadian dollars in millions)	**Total**	**2007[1]**	**2008/2009**	**20010/2011**	**After 2011**
Contractual Obligations *(due by year)*					
Short-term note payable	161	161	-	-	-
Long-term debt – principal repayments	5,315	40	900	650	3,725
Long-term debt – interest payments	5,166	111	563	487	4,005
Inergi LP outsourcing agreement[2]	419	28	195	181	15
Operating lease commitments	18	2	11	3	2
Total Contractual Obligations	11,079	342	1,669	1,321	7,747
Other Commercial Commitments *(by year of expiry)*					
Bank line[3]	750	-	-	750	-
Letters of credit[4]	97	96	1	-	-
Guarantees[4]	275	275	-	-	-
Pension[5]	214	18	188	8	-
Total Other Commercial Commitments	1,336	389	189	758	-

[1] The amounts disclosed represent the balance due over the period October 1, 2007 to December 31, 2007.

[2] On March 1, 2002, Inergi LP began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

[3] As a backstop to our commercial paper program, we have a $750 million revolving standby credit facility with a syndicate of banks which matures in August 2010.

[4] We currently have bank letters of credit of $93 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO on behalf of our subsidiaries as required by the Market Rules, using parental guarantees up to a maximum of $275 million. The maximum parental guarantee is expected to increase in November 2007 to $325 million as a result of forecast power purchases and the November 1, 2007 change to our transmission rates. Although no letters of credit are currently required for prudential support, we would have to resume providing bank letters of credit if our highest long-term credit rating deteriorated to below the "Aa" category. The remaining amounts included in letters of credit pertain to operating letters of credit and to surety bonds.

[5] Contributions to the pension fund are made one-month in arrears. Contributions for 2007 are based on an actuarial valuation filed in September 2007 and effective December 31, 2006. Our annual pension contributions for 2007 - 2009 will be about $94 million. Contributions beyond 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension contributions beyond 2009 are not estimable at this time.

The amounts in the above table under long-term debt are not charged to our results of operations, but are reflected on our balance sheet and statement of cash flows. Interest associated with this debt is recorded under financing charges on our statement of operations or in our capital programs, but these financing charges are not reflected in the above table. Payments in respect of operating leases and our outsourcing agreement with Inergi LP are recorded under operation, maintenance and administration costs on our statement of operations or in our capital programs.

RELATED PARTY TRANSACTIONS

Our related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder, the Province of Ontario. The year-over-year changes related to these amounts are described more fully in our discussion of transmission revenues and purchased power costs. Other significant related party transactions include our dividends which are paid to the Province of Ontario and our payments in lieu of corporate income taxes which are paid or payable to the Ontario Electricity Financial Corporation.

RECENT DEVELOPMENTS

Transmission Rate Decision

On August 16, 2007, the OEB issued its decision in respect of our 2007 and 2008 transmission rate application. The decision, which is effective January 1, 2007, showed confidence in our work programs by approving all of our operating and capital expenditures for 2007 and 2008. The decision resulted in an estimated 8% annual reduction in transmission rates primarily due to a reduction in the approved return on equity from 9.88% to 8.35%, based on a formula used by the OEB in the regulation of local distribution companies. With the rate adjustment taking effect November 1, 2007, there is an estimated one-time reduction in transmission rates of about 13%, resulting in a reduction of approximately 1% on an average customer's total bill.

As part of a joint proceeding involving all Transmitters in Ontario, on October 17, 2007, the OEB approved new Ontario Uniform Transmission Rates for implementation on November 1, 2007 noting that these Uniform Transmission Rates will be in effect until December 31, 2008.

IPSP

On August 29, 2007, the OPA submitted its application to the OEB for review and approval of the IPSP for Ontario. The plan's estimated 20-year, $60-billion capital cost will be directed toward initiatives required to deliver electricity to Ontario consumers. The IPSP focused on the medium to long term, recommending that project development work on certain major transmission projects, including generation enabling connection lines and projects addressing reliability of local area supply, commence once the IPSP is approved. OEB approval is expected in the Fall of 2008. Any development work commencing until at least the next IPSP is submitted, will continue to require us to prove project need as part of our section 92 leave-to-construct proceedings.

Decision on Combined Transmission Connection Procedures Proceeding

On September 6, 2007, the OEB issued its decision related to our August 20, 2006 application for transmission connection procedures. The OEB noted that the connection procedures that we filed drew no substantial criticism or comment from intervening parties or OEB staff as evidence of our commitment to a fair, transparent and effective connection process. The OEB's decision, however, was inconsistent with our position on the need for capital contributions for Local Area Supply facilities. The OEB determined that capital contributions should generally be required. On October 9, 2007, we filed a motion to request a review of parts the decision.

Applications to Construct Facilities

On August 20, 2007, the OEB issued its decision granting us early access to lands expected to be used in the proposed Bruce to Milton transmission line project so we could conduct certain survey, testing, appraisal and investigative activities. The interim order, which is effective through to April 1, 2009, is subject to conditions that establish the parameters by which we are to conduct our work in order to ensure minimal disruption to landowners. We commenced early access activities in September.

On October 9, 2007 and October 11, 2007, the OEB issued two decisions approving our leave-to-construct applications for electricity transmission facilities in the western Brampton and Woodstock areas, respectively. These facilities are required to maintain reliability and improve system performance.

2008 Distribution Rate Applications

On August 15, 2007, we filed the revenue requirement component of our cost of service application with the OEB for our distribution business operated through Hydro One Networks. The cost allocation and rate design components of our application is expected to be filed later in the year. Our proposed revenue requirement for 2008 results in a net distribution rate increase of about 4%. This translates into an average annual increase on total customer bills of less than 2%.

On September 28, 2007, the OEB issued its filing requirements for 2008 Incentive Regulation Mechanism applications to set distribution rates effective May 1, 2008 for all electricity distributors not filing a cost of service application. Our subsidiary Hydro One Brampton Networks filed its application with the OEB on November 1, 2007.

Distribution System Acquisition

On October 10, 2007, the OEB issued its decision approving our acquisition of the distribution system assets of Terrace Bay Superior Wires Inc. The acquisition closed on October 25, 2007.

OEB RPP Price Change

On October 12, 2007, the OEB announced a scheduled change in electricity prices for RPP customers. Beginning November 1, 2007, the electricity price has been reduced from 5.3 cents to 5.0 cents per kilowatt hour for customers consuming up to certain thresholds, depending on the type of customer, and from 6.2 cents to 5.9 cents for kilowatt hours exceeding the thresholds.

Debt Issue

On October 18, 2007, we issued $300 million of 10-year notes under our Medium-Term Note Program at a coupon rate of 5.18% and with a maturity date of October 18, 2017. The proceeds of the issue were temporarily invested in money market instruments, including asset backed commercial paper sponsored by the five major Canadian chartered banks. We do not hold any non-bank or third party sponsored commercial paper.

SELECTED FINANCAL HIGHLIGHTS AND RATIOS

	Three months ended September 30		Nine months ended September 30	
(Canadian dollars in millions) (except as otherwise noted)	**2007**	**2006**	**2007**	**2006**
Net income	67	103	309	354
Net cash from operating activities	331	351	868	715
Capital expenditures	275	218	765	593
Earnings per common share *(Canadian dollars)*	618	991	2,952	3,407
Earnings coverage ratio[1]			2.68	2.66
Net asset coverage on long-term debt[2]			1.92	1.92
Total debt to capitalization[3]			52%	52%

[1]The earnings coverage ratio has been presented for the twelve months ended September 30, 2007 and September 30, 2006, respectively and has been calculated as the sum of net income, provision for payments in lieu of corporate income taxes and financing charges divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

[2]The net asset coverage on long-term debt ratio has been presented as at September 30, 2007 and December 31, 2006 and has been calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt including current portion.

[3]Total debt to capitalization ratio has been presented as at September 30, 2007 and December 31, 2006 and has been calculated as total debt divided by total debt plus total shareholder's equity.

FORWARD-LOOKING STATEMENTS AND INFORMATION

Our oral and written public communications, including this Management's Discussion and Analysis, often contain forward looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to statements regarding future capital expenditures; statements about the installation and cost of smart meters; expectations surrounding future pension contributions; statements regarding potential incremental environmental expenditures; and expectations concerning the impact of new accounting standards. Words such as "expect," "anticipate," "intend," "attempt," "may," "plan," "will," "believe," "seek," "estimate," and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward looking statements, whether written or oral, or whether as a result of new information, future events or otherwise, except as required by law.

These forward looking statements are based on a variety of factors and assumptions including, but not limited to the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; favourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; and no significant events occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third-party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the content of the final IPSP, once it is approved by the OEB;
- delays or denials of the requisite approvals for planned future capital expenditures;
- regulatory decisions regarding our revenue requirements and tariff rates;
- significant changes to Environment Canada’s draft polychlorinated biphenyl (PCB) regulations issued on November 4, 2006; and
- future interest rates, inflation, changes in benefits and changes in actuarial assumptions.

We caution the reader that the above list of factors is not exhaustive.

This management’s discussion and analysis is dated as at November 8, 2007. Additional information about our company, including our annual information form, is available on SEDAR at www.sedar.com.

See accompanying notes to Consolidated Financial Statements.

1. BASIS OF PRESENTATION

These interim Consolidated Financial Statements do not conform in all respects to the disclosure requirements of Canadian generally accepted accounting principles for annual financial statements and should, therefore, be read in conjunction with the annual Consolidated Financial Statements of Hydro One Inc. (Hydro One or the Company) for the year ending December 31, 2006 which includes information necessary or useful to understanding the Company's business and financial statement presentation. In particular, the Company's significant accounting policies and practices are presented as Note 2 to the annual Consolidated Financial Statements, and have been consistently applied in the preparation of these interim Consolidated Financial Statements, except as described below in Note 2.

The demand for electricity generally follows normal weather-related variations, and therefore the Company's energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

2. ACCOUNTING CHANGES

Change in Accounting Policy – Financial Instruments, Hedges and Comprehensive Income

Effective January 1, 2007, the Company adopted four new accounting standards comprising the Canadian Institute of Chartered Accountants' (CICA) Handbook Sections 1530, *Comprehensive Income*; 3855, *Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation;* and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that are recorded in opening accumulated other comprehensive income (AOCI) as described below, consistent with the CICA Handbook sections. The comparative interim Consolidated Financial Statements have not been restated. The principal changes in the accounting for financial instruments and hedges due to the adoption of these accounting standards are described below.

(a) Comprehensive Income

Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date. The impact of this amortization is immaterial to the Statement of Operations.

(b) Financial Assets and Liabilities

Under the new standards, all financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. All financial instruments, including derivatives, are carried at fair value on the consolidated balance sheet except for loans and receivables, held-to-maturity investments and other financial liabilities, which are measured at amortized cost. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in financing charges in the period which they arise. Available-for-sale financial instruments are measured at fair value with revaluation gains and losses included in OCI until the instrument is derecognized or impaired. The Company has classified its financial instruments as follows:

Short-term investments	Held-to-maturity
Long-term accounts receivable	Loans and receivables
Bank indebtedness	Other liabilities
Short-term notes payable	Other liabilities
Long-term debt (excluding MTN Series 8 Note)	Other liabilities
MTN Series 8 Note	Designated as held-for-trading

The MTN Series 8 Note is a step-up coupon note with extendable maturity dates up to 2011.

Where there is an economic hedge, as in the case of the MTN Series 8 note and associated interest rate swap, we have applied the fair value option without hedge accounting. The impact is not material.

All financial instrument transactions are recorded at trade date.

(c) Derivatives and Hedge Accounting

Derivatives

All derivative instruments, including embedded derivatives, are carried at fair value on the balance sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. The impact of the change in the accounting policy related to embedded derivatives was not material.

Hedge Accounting

The Company periodically develops hedging strategies for execution taking into account risk management objectives. At the inception of a hedging relationship, the Company documents the relationship between the hedging instrument and the hedged item. This would include linking all derivatives to specific assets and liabilities on the consolidated balance sheet or to specific firm commitments or forecasted transactions. The Company would also assess, both at the inception of the hedge and on an ongoing basis, whether the derivatives that are used are effective in offsetting changes in fair values or cash flows of hedged items.

Upon adoption of the new standards, the Company reclassified unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to accumulated other comprehensive income. The hedging losses are amortized through OCI using the effective interest method over the term of the hedged debt.

(d) Transaction Costs

Transaction costs for financial assets and liabilities that are other than held-for-trading, are added to the carrying value of the asset or liability and then amortized over the expected life of the instrument using the effective interest method. The impact of the change in amortization method from an annuity basis to the effective interest method was not material.

Change in Accounting Estimate – Depreciation

Effective January 1, 2007, the Company prospectively revised its fixed asset depreciation rates resulting from a periodic external review required by the Ontario Energy Board (OEB). Capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment, which is depreciated on a declining balance basis. The estimated impact of the change in rates is a reduction in depreciation expense of approximately $7 million per annum. A summary of the new rates for the various classes of assets is included below:

	Depreciation rates (%)	
	Range	Average
Transmission	1% - 4%	2%
Distribution	1% - 13%	2%
Communication	1% - 13%	5%
Administration and service	1% - 20%	8%

3. TRANSMISSION RATE DECISION

On August 16, 2007, the OEB issued its decision on the Transmission rate application made by the Company's subsidiary, Hydro One Networks Inc. The OEB decision is effective January 1, 2007 with resultant rates being implemented on November 1, 2007. On the basis of written and oral evidence submitted, the OEB approved substantially all of the Company's proposed capital and non-capital work programs, as well as a targeted rate of return on deemed common equity of 8.35% for the Company's Transmission business for the rate years 2007 and 2008. Previously, the approved rate of return was 9.88% on deemed common equity and was set in 1999. With this reduction in the rate of return, the OEB decision will result in a reduction in revenue over the remainder of 2007 and in 2008. In addition, the Company's transmission revenues reflect the impacts of the OEB's August 16, 2007 transmission rate decision, which had the effect of reducing its quarterly and year-to-date revenues by about $38 million. This reduction includes the revenue adjustment associated with recording a new regulatory liability, termed the Revenue Difference Deferral Account (RDDA), as well as other decision-related revenue adjustments related to the disposition of regulatory asset and liability accounts and the recording of export and wheeling fees revenue.

The OEB decision also resulted in an increase in the aggregate carrying value of the Company's regulatory assets and liabilities of approximately $46 million, representing an increase in regulatory liabilities of $60 million and an increase in regulatory assets of $14 million. The RDDA liability was approved in concept in the OEB's March 30, 2007 decision that terminated the Transmission Earnings Sharing Mechanism (ESM) effective December 31, 2006. In its August decision, the OEB approved final amounts and disposition treatments for the RDDA liability, the ESM liability, the export and wheeling fees liability, and a new Transmission market ready regulatory asset. The RDDA and ESM will be returned to customers over the two-year period ending December 31, 2008, while the export and wheeling fees liability and Transmission market ready regulatory asset will be factored into rates over the four-year period ending December 31, 2010. In the absence of rate regulated accounting, year-to-date operation, maintenance and administration expense would have been higher by approximately $16 million and revenue would have been lower by approximately $3 million.

4. SMART METER COST RECOVERY

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine recoverability of expenditures incurred by distributors. Expenditures associated with the minimum functionality for advanced metering infrastructure incurred by the Company's subsidiaries Hydro One Networks Inc. and Hydro One Brampton Networks Inc. were approved for recovery. As a result of this decision, smart meter expenditures are no longer deferred as regulatory assets. Such expenditures are now classified as capital or are charged to results of operations consistent with the Company's standard accounting practices. Expenditures determined to be above the minimum functionality will be brought forward for review in a subsequent cost of service rate application.

The OEB decision also required that related revenues be based upon a calculated revenue requirement specific to smart meters. As a result, the carrying value of the smart meter regulatory asset account represents the difference between revenue recorded on this basis and actual recoveries received under existing rate adders. In the absence of rate regulated accounting, year-to-date operation, maintenance and administration expense would have been lower by approximately $4 million.

5. DIVIDENDS

During the three months ended September 30, 2007, preferred dividends in the amount of $4 million (2006 - $4 million) and common dividends in the amount of $68 million (2006 - $59 million) were declared. During the nine months ended September 30, 2007, preferred dividends in the amount of $13 million (2006 - $13 million) and common dividends in the amount of $239 million (2006 - $273 million) were declared.

6. LONG-TERM DEBT

On March 13, 2007, Hydro One issued notes under the Company's medium term note program. The issue was comprised of medium term notes with a principal amount of $400 million having a 30-year term with a coupon rate of 4.89%. The notes are due March 13, 2037.

In the second quarter, Hydro One extended the maturity date of its $40 million extendible step-up note from May 15, 2007 to November 15, 2007. On October 17, 2007, the maturity date of the note was extended again to May 15, 2008 with a new coupon rate of 4.70% per annum.

The Company has a $750 million, revolving standby credit facility with a syndicate of banks. The term of this facility has been extended as of August 10, 2007 to August 10, 2010.

In the third quarter, the Company entered into two forward starting pay fixed interest rate swap agreements to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. The transactions, with notional amounts of $150 million and $50 million respectively, are used to fix the interest rate of a forecasted debt issuance planned for later in 2007 and are being accounted for as cash flow hedges of a forecasted transaction.

7. EMPLOYEE FUTURE BENEFITS

Total benefit costs are as follows:

(Canadian dollars in millions)	Three months ended September 30 2007	2006	Nine months ended September 30 2007	2006
Pension				
Net periodic benefit cost	26	38	76	116
Pension fund contribution	25	22	76	66
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	10	8	30	25
Portion attributable to regulatory assets	-	-	-	11
Charged to results of operations	15	14	46	30
Employee Future Benefits Other than Pension				
Net periodic benefit cost	27	30	80	91
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	10	10	31	29
Charged to results of operations	17	20	49	62

8. SEGMENTED REPORTING

Hydro One has three reportable segments:

- The transmission business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;
- The distribution business, which comprises the core business of delivering and selling electricity to customers; and
- An "other" segment primarily consisting of telecommunications business.

The designation of segments has been based on a combination of regulatory status and the nature of the products and services provided. Segment information on the above basis is as follows:

Three months ended September 30 (Canadian dollars in millions)	Transmission	Distribution	Other	Consolidated
2007				
Segment profit				
Revenues	307	813	8	1,128

Income before provision for payments in lieu of corporate income taxes				469
Capital expenditures	394	355	16	765
2006				
Segment profit				
Revenues	945	2,441	17	3,403
Purchased power	-	1,667	-	1,667
Operation, maintenance and administration	307	328	17	652
Depreciation and amortization	184	189	4	377
Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	454	257	(4)	707
Financing charges				220
Income before provision for payments in lieu of corporate income taxes				487
Capital expenditures	290	298	5	593

(Canadian dollars in millions)	**September 30, 2007**	**December 31, 2006**
Total assets		
Transmission	7,180	6,950
Distribution	5,304	5,161
Other	101	99
	12,585	12,210

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

9. COMMITMENTS

Purchasers of electricity in Ontario, through the Independent Electricity System Operator (IESO), are required to provide security to mitigate the risk of their default based on their expected activity in the market. The IESO could draw on these guarantees should the Company's subsidiaries, Hydro One Networks Inc. or Hydro One Brampton Networks Inc., fail to make a payment required by a default notice issued by the IESO.

On June 28, 2007, the IESO approved revisions to the prudential support obligations under the market rules. Previously, prudential support was provided to the IESO using a combination of bank letters of credit and parental guarantees. Under the new rules, effective August 1, 2007 the Company can meet its prudential support requirements using only parental guarantees, as long as it maintains a long-term credit rating in the "Aa" category. Consequently, the Company has reduced its bank letters of credit by $10 million, having met the credit rating criteria.

10. SUBSEQUENT EVENTS

On October 12, 2007, the OEB announced a decrease in electricity prices for Regulated Price Plan customers. Beginning November 1, 2007, the electricity price has been reduced from 5.3 cents to 5.0 cents per kilowatt hour for customers consuming up to certain thresholds, depending on the type of customer, and from 6.2 cents to 5.9 cents for kilowatt hours exceeding the thresholds.

On October 18, 2007, Hydro One issued notes under the Company's medium term note program. The issue was comprised of medium term notes with a principal amount of $300 million having a 10-year term with a coupon rate of 5.18%. The notes are due on October 18, 2017. In relation to this debt issuance, the Company terminated on October 18, 2007 the two forward starting pay fixed interest rate swaps entered into on August 2, 2007 and September 10, 2007. The transactions had been accounted for as cash flow hedges of a forecasted debt issue for the purpose of fixing the interest rate for the debt issuance. The net gain realized on terminating the swaps was $0.4 million.

11. COMPARATIVE FIGURES

The comparative unaudited interim Consolidated Financial Statements have been reclassified from statements previously presented to conform to the presentation of the September 30, 2007 unaudited interim Consolidated Financial Statements.

HYDRO ONE INC.
ANNUAL CONSOLIDATED FINANCIAL STATEMENTS

We prepare our financial statements in Canadian dollars and in accordance with accounting principles generally accepted in Canada. The following discussion is based upon our Consolidated Financial Statements for the years ended December 31, 2007 and 2006.

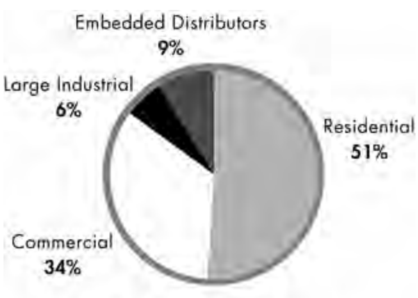
OVERVIEW

We are wholly owned by the Province of Ontario (the Province), and our transmission and distribution businesses are regulated by the Ontario Energy Board (OEB). We are the leading electricity transmitter and distributor in Ontario, delivering power safely and reliably to homes and businesses. As stewards of this province's massive and complex transmission and delivery system, our mission is to be an efficient and dynamic transmission and distribution company that is best in North America in the areas of safety, customer service and reliability, while focusing on the development and retention of our employees and creating shareholder value. In 2007, we continued our focus on our core businesses, substantially maintained and improved our performance in various key areas of the business, and made important contributions to the rebuilding of Ontario's core infrastructure.

Transmission

Substantially all of Ontario's electricity transmission system is owned and operated by our company. Our transmission system forms an integrated transmission grid that is monitored, controlled and managed centrally from one location, our Ontario Grid Control Centre in Barrie, Ontario. It operates over relatively long distances and links major sources of generation to transmission stations and larger area load centers. In 2007, we earned total transmission revenues of $1,242 million primarily by transmitting approximately 152 TWhs of electricity, directly or indirectly, to substantially all consumers of electricity in Ontario. Our transmission system is one of the largest in North America, and is linked to five adjoining jurisdictions through 26 interconnections. Through these interconnections, we can accommodate imports of about 4,000 MWs and exports of approximately 5,800 MWs of electricity. In terms of assets, our transmission business is our largest business segment, representing approximately 57% of our total assets.

Total Assets
December 31, 2007
(Cdn $ millions)



2007 Distribution Revenues

Distribution

Our distribution system is the largest in Ontario and spans roughly 75% of the province, serving approximately 1.3 million rural and urban customers, and 50 large industrial customers. We also operate small, regulated generation and distribution systems in a number of remote communities across Northern Ontario that are not connected to Ontario's electricity grid. As illustrated in the accompanying chart, about half of our distribution revenues are earned from our residential customers.

Other

Our other business segment contributed revenues of $31 million in 2007 and has assets of about $106 million, which constitute less than 1% of our total assets. This segment primarily represents the operations of our wholly owned subsidiary, Hydro One Telecom Inc., which markets fibre-optic capacity to telecommunications carriers and commercial customers with broadband network requirements.

Our Strategy

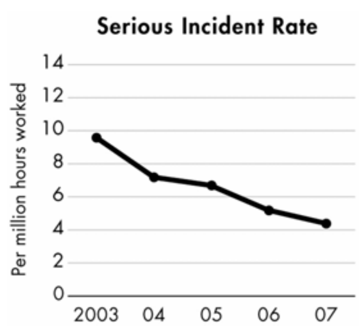
In 2007, aligned with retaining and building public confidence and trust, we maintained our strategic focus on our core operations and built upon our accomplishments. Consequently, we have moved closer to achieving our goals to be recognized by our customers as their best service provider, by our peers as their benchmark for excellence, and by our shareholder as delivering superior value, while striving to attract, develop and retain productive employees.

We seek to achieve these goals by continuing to implement the following strategies:

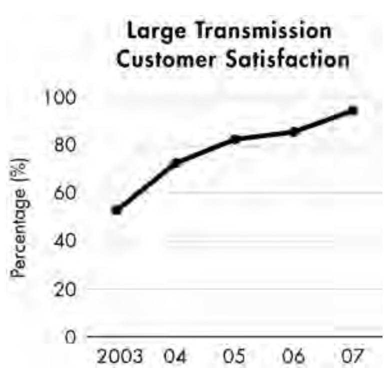
- *Stewardship:* Retain and build the public trust placed in us to ensure the safe, reliable and efficient delivery of electricity.
- *Safety:* Create and maintain an injury-free workplace with a concentrated focus on eliminating serious injury and "near misses" in high potential harm categories of work.
- *Customers:* Become a leading customer-focused company. We intend to maintain our focus and commitment to improving our customers' level of satisfaction. We strive to strengthen relationships with our large and mid-sized customers, acknowledging their commercial requirements. For residential customers, our key focus is on improving the quality of customer services such as billing, call handling, outage management, and meter reading. We also aim to make positive contributions in communities across Ontario through our corporate citizenship programs.
- *Reliability:* Enhance the reliability of our transmission and distribution systems through our productive and cost effective work programs. In transmission, we are proactively developing the system to meet Ontario's power needs. Within distribution, we are focused on reliability while recognizing the challenges in operating a system with low customer density and vast geography.
- *Financial:* Ensure our actions contribute towards maximizing the value of our company, while maintaining effective access to funds on a long-term basis at reasonable rates and delivering appropriate financial returns to our shareholder.
- *Employees*: Manage the challenges of labour demographics by attracting, developing and retaining productive employees.

Performance Measures and Targets

We measure and target our performance in all of the above strategic areas, ensuring that we are recognizing the needs of all of our key stakeholders. We met or exceeded our challenging 2007 objectives, improving in a number of areas over 2006, and are moving towards achieving our strategic goals.



The potentially hazardous nature of our business requires a strong focus on safety. Consequently, one of our goals is to eliminate serious injuries. Accordingly, we measure our Serious Incident Rate to identify possible situations that may increase the risk of injury. These incidents include electrical contacts, preventable motor vehicle accidents and work equipment operations, among others. As shown in the accompanying chart, we had 4.4 serious incidents per million hours worked in 2007, which is 15% lower than 2006, 34% lower than 2005, and 39% lower than 2004. Going forward, we will continue to stress the importance of safety through a sustained cultural change and a continued focus on people and the work environment. This involves an emphasis on strong leadership, understanding and leveraging human factors and the role of human traits in determining safe work performance. Planned initiatives include increased facility and site assessments and further use of decision analysis tools to reduce human error and its consequences.



Customer satisfaction is also vital to our success. In 2007, we exceeded our overall target for customer satisfaction levels. As shown in the accompanying chart, our Large Transmission Customer Satisfaction Survey results improved from 86% to 95% satisfied, as compared to 2006. Moreover, we have seen continuous improvement over the last five years. We also continue to be conscious of the needs of our residential and small business customers and survey results show an overall satisfaction level of 82%, which remains consistent with 2006 results. We achieved our overall target for generator customer satisfaction. Within this category, we met our satisfaction target for transmission connected generators, but did not achieve our target for distribution connected generators. Addressing the concerns identified will be an area of focus in 2008. We will continue to focus on improving the level of customer satisfaction across all customer segments by targeting our responses to the unique requirements of each segment.

We aim to retain and build public confidence and trust in our operations, as stewards of the province's electricity grid. In 2007, we continued our focus on this strategic priority by investing in the key assets of the electricity delivery system and by operating the existing system for our customers in a safe, reliable and efficient fashion. We are conscious that businesses of all sizes require reliable service and consequently, we focus on achieving top-quartile reliability in relation to other comparable systems. In 2007, we met our annual reliability targets and achieved improvements over 2006. Our continued commitment to the people of Ontario has been recognized by Corporate Knights, an independent media company focused on promoting and reinforcing sustainable development in Canada, as one of Canada's Top 50 Corporate Citizens, ranking third among utilities. The ranking was based on environment, social and governance indicators, and our conservation and demand management and smart meter programs were cited as key factors in the recognition. In addition, Corporate Knights recognized us as Canada's most diverse utility and ranked us fifth overall in corporate Canada.

Given the retirement profile of our employees, we are entering into a period of significant demographic change. This change is taking place across the electricity sector and we have taken a leadership role to address the transition. As part of a comprehensive strategy to meet our staffing needs well into the future, we entered into a partnership with four community colleges of applied art and technology to attract and educate the future employees of the electricity transmission and distribution sectors. Through this partnership, we will contribute towards scholarships, program development and equipment for programs that will train people for technical, technological and trades positions in the electricity sector.

Our financial performance and the business environment in which we operate are taken into consideration in both our short-term and long-term credit ratings. In March 2007, Standard & Poor's Rating Services Inc. (S&P) assigned a positive outlook to our long-term "A" credit rating from stable, attributing the improvement to lower business risk for the sector as a whole. In November, S&P issued a commentary report which reaffirmed our assigned positive outlook while noting a steady improvement in our business risk profile. Our current credit ratings facilitate ongoing access to debt markets at a reasonable cost to fund the infrastructure requirements of our system.

REGULATION

Our electricity transmission and distribution businesses are licensed and regulated by the OEB. The OEB sets rates following oral or written public hearings. Our transmission revenues primarily include our transmission tariff, which is based on the uniform province-wide transmission rates approved by the OEB for all transmitters across Ontario. Our distribution revenues primarily include our distribution tariff, which is also based on OEB-approved rates, and the recovery of the cost of purchased power used by our customers. Consequently, our distribution business does not have commodity price risk. Transmission and distribution tariff rates are set based on an approved revenue requirement that provides for cost recovery and includes a return on deemed common equity. In addition, the OEB approves rate riders to allow for the recovery or disposition of specific regulatory assets and liabilities over a specified timeframe.

Under the current market structure, low-volume and designated consumers pay electricity rates established through the Regulated Price Plan (RPP) and wholesale electricity consumers pay a blend of regulated, contract and wholesale spot market prices. The OEB sets prices for RPP customers based on a two-tiered electricity pricing structure with seasonal consumption thresholds. Unexpected shortfalls or overpayments associated with the RPP are financed by the Ontario Power Authority (OPA). Prices are reviewed every six months and may change based on an updated OEB forecast and any accumulated differences between the amount that customers paid for electricity and the amount paid to generators in the previous period. Customers who are not eligible for the RPP, or wholesale customers, pay the market price for electricity adjusted for the difference between market prices and prices paid to generators under the *Electricity Restructuring Act, 2004*. The Independent Electricity System Operator (IESO) is responsible for overseeing and operating the wholesale market, as well as ensuring the reliability of the integrated power system.

In addition to the oversight role of the OEB, and the market monitoring and coordination role of the IESO, the OPA was created through the *Electricity Restructuring Act, 2004* to ensure the long-term supply of electricity, facilitate load management and conservation, and assist with the stability of rates for RPP customers, among others. As part of its mandate, and consistent with the Province's direction regarding supply mix, the OPA developed the Integrated Power System Plan (IPSP), which was submitted for OEB review and approval on August 29, 2007. The plan's estimated 20-year capital program will be directed toward initiatives required to deliver electricity to Ontario consumers. OEB approval is expected in the Fall of 2008.

The OPA is also responsible for coordinating the delivery and funding of conservation and demand management (CDM) programs. This coordination furthers initiatives undertaken by individual local distribution companies (LDCs), including our distribution businesses, as a result of distribution tariff rate increases approved in 2005. Our CDM programs funded through the OPA in 2007 amounted to approximately $6 million and our programs funded through distribution rates since 2005 amounted to approximately $41 million. The overall goal of the CDM programs, under the IPSP, is to reduce provincial demand by 6,300 MW by 2025.

The *Energy Conservation Responsibility Act, 2006* furthers the broad objectives of CDM by providing the framework for the installation of 800,000 smart meters in Ontario homes and businesses by the end of 2007, with installation in all homes and businesses to be completed by the end of 2010. These meters will be capable of measuring and reporting usage over predetermined periods, being read remotely, and when combined with communications systems will be capable of providing customers with access to information about their consumption. In 2007, the Province appointed the IESO as the smart meter entity that will oversee the collection and management of data. LDCs, including our distribution businesses, are accountable for the development of smart meter infrastructure and related technology for communications to meet minimum requirements as defined in regulations, as well as the implementation of time of use rates that are presently voluntary. In 2007, we deployed over 260,000 smart meters, exceeding our 2007 target of approximately 240,000 meters, and bringing the cumulative number of installations under our Smart Meter Program to approximately 288,000. We are continuing the deployment of smart meters (see Future Capital Expenditures).

Transmission Rates

The IESO facilitates payments to us based on the Ontario Uniform Transmission Rates (UTRs) approved by the OEB for all transmitters across Ontario.

In October 2005, the OEB initiated a proceeding to review our transmission rates and revenue requirements for 2006, 2007, and 2008 based on cost of service regulation. On February 21, 2006, the OEB announced its decision to apply an earnings sharing mechanism (ESM) to equally share, between our shareholder and customers, any transmission earnings in excess of the approved rate of return of 9.88% for the period January 1, 2006 until new transmission rates were set. Consequently, 50% of our excess earnings recovered from customers were deferred as a regulatory liability.

In September 2006, we filed a transmission rate application through our subsidiary, Hydro One Networks Inc. (Hydro One Networks). On March 30, 2007, prior to their decision on our transmission rate application, the OEB issued a decision ordering that the ESM cease effective December 31, 2006. The decision also approved the concept of establishing a new revenue difference deferral account (RDDA) to record the revenue differential between existing transmission rates and the new rates that were anticipated to be approved later in the year, for the period commencing January 1, 2007.

On August 16, 2007, the OEB issued its decision in respect of our 2007 and 2008 transmission rate application. The decision, which was effective January 1, 2007, showed confidence in our work programs by approving all of our operating and capital expenditures for 2007 and 2008. However, the decision resulted in an estimated 8% annual reduction in transmission rates primarily due to a reduction in the approved return on equity from 9.88% to 8.35%, based on a formula used by the OEB in the regulation of LDCs. Further, the OEB approved final amounts and disposition treatments for certain regulatory accounts including the: RDDA, ESM and export and wheeling fees liabilities, as well as the transmission market ready regulatory asset. The RDDA and ESM will be refunded to customers over the fourteen-month period from November 1, 2007 to December 31, 2008, while the export and wheeling fees liability and transmission market ready regulatory asset will be factored into rates over the four-year period ending December 31, 2010.

As part of a joint proceeding involving all transmitters in Ontario, on October 17, 2007 the OEB approved new UTRs for implementation on November 1, 2007 through to December 31, 2008. The new rates fully reflect the approved changes to our revenue requirement and charge determinants and are, on average, 12% lower than previously approved rates. The new rates should result in approximately a 1% decrease in the average customer's total electricity bill. We anticipate the OEB will reset UTRs on January 1, 2009, at which time we anticipate our revenue requirement allocation from UTRs will increase to reflect the full repayment to customers of the ESM and RDDA. To achieve the necessary funding in support of the infrastructure required, we plan to submit a transmission rate application for 2009 to 2010 transmission rates in the Summer of 2008.

Distribution Rates

As a distributor, we are responsible for delivering electricity and billing our customers for approved distribution rates, purchased power costs, and other approved regulatory charges.

Distribution Tariffs

In August 2005, we filed a distribution rate application seeking approval for an increase in the 2006 revenue requirements for our distribution businesses operated through Hydro One Networks and Hydro One Brampton Networks Inc. (Hydro One Brampton). On April 12, 2006, the OEB announced its decisions regarding these applications and, on the basis of the written and oral evidence submitted, it approved the requested increases in the revenue requirements based on an approved rate of return of 9.00%, effective May 1, 2006.

In 2006, the OEB commenced the process of establishing an Incentive Regulation Mechanism (IRM) for the years 2007 to 2010. The process includes a formulaic approach to establishing 2007 rates with a rate rebasing approach to be staggered across all Ontario distributors between 2008 and 2010. Our subsidiaries, Hydro One Networks and Hydro One Brampton, applied for marginal distribution rate adjustments in February 2007, based on an OEB-approved formula that considers inflation, efficiency targets and significant events outside the control of management. In April 2007, the OEB approved our submissions on the basis of its cost of capital and second generation IRM policies, and the revised rates were implemented effective May 1, 2007.

As our subsidiary Hydro One Networks was among 25 LDCs selected for rebasing in 2008, we submitted the revenue requirement portion of our 2008 cost of service application in accordance with the OEB's multi-year distribution rate-setting plan on August 15, 2007. This application seeks the approval of a revenue requirement of $1,067 million based on a rate of return of 8.64% for 2008. The requested distribution rate increase amounts to a net average increase of less than 1% on the average customer's total bill. On December 18, 2007, we filed the details of our cost allocation and rate design proposals, which include a plan to reduce the number of customer rate classes and consolidate or harmonize the rates for its existing rate classes to the new proposed rate classes. Based on the OEB's processing guidelines, a decision is anticipated in the latter part of 2008.

On August 2, 2007, the OEB initiated a consultation on the development of the principles and methodology for the third generation IRM. This consultative process will culminate with the issuance of an OEB report expected in mid-2008 that will be used to adjust rates starting in 2009, for those LDCs, including our subsidiary Hydro One Networks, whose 2008 rates will be rebased. On November 1, 2007, Hydro One Brampton filed its application for 2008 rates on the basis of the OEB's cost of capital and second generation IRM policies. The distribution rates of our subsidiary, Hydro One Brampton, will be rebased in 2010.

Smart Meter Program

In March 2006, the OEB approved a monthly rate of 27 cents and 28 cents per metered customer, effective May 1, 2006, as initial funding for the required investment in smart meters for our subsidiaries Hydro One Networks and Hydro One Brampton, respectively. As a result, expenditures in excess of recoveries were recorded as a regulatory asset, with disposition to be established at a later date. In April 2007, as part of the OEB decision regarding the 2007 distribution rate applications made by Hydro One Networks and Hydro One Brampton, the OEB approved an amount of 93 cents and 67 cents, respectively, per month per metered customer for smart meters, for implementation effective May 1, 2007.

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine recoverability of expenditures incurred by distributors. Expenditures associated with the approved minimum functionality for advanced metering infrastructure incurred by our subsidiaries Hydro One Networks and Hydro One Brampton were approved for recovery. As a result of this decision, smart meter expenditures are no longer deferred as regulatory assets, and instead, are now classified as capital or are charged to results of operations. Expenditures determined to be above the minimum functionality for our subsidiary Hydro One Networks have been brought forward for review in our 2008 cost of service rate application. Hydro One Brampton will bring these expenditures forward in its 2010 cost of service application.

RESULTS OF OPERATIONS

Revenues

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**
Transmission	1,242	1,245	(3)	-
Distribution	3,382	3,273	109	3
Other	31	27	4	15
	4,655	4,545	110	2
Average annual Ontario 60-minute peak demand *(MW)* [1]	22,988	22,650	338	1
Distribution – units distributed to customers *(TWh)*[1]	30.2	29.0	1.2	4

[1] System related statistics include preliminary figures for December.

Transmission

Transmission revenues predominantly consist of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate the maximum expected demand, which is primarily influenced by weather and economic conditions. Transmission revenues also include minor amounts of ancillary revenues which are primarily attributable to maintenance services provided to generators and secondary use of our land rights-of-way.

Revenues for the year were affected by the OEB’s August 16, 2007 decision on our transmission rate application. While the OEB approved all of our work program expenditure requirements, our return on equity was reduced from 9.88% to 8.35% and our deemed capital structure was adjusted from one that included common and preferred shares and debt to a deemed capital structure of 60% debt and 40% common shares. This capital structure is consistent with that approved by the OEB in 2006 which established the capital structure for Ontario’s LDCs. The OEB’s decision was effective January 1, 2007 and new customer rates reflecting the decision were implemented on November 1, 2007. As a result of the OEB decision, we reduced our 2007 transmission revenues to reflect the approved revenue requirement. Excess amounts collected from customers have been recorded in the RDDA and are being returned to customers through lower rates commencing November 1, 2007. On March 30, 2007, the OEB approved cessation of the ESM effective December 31, 2006 and replaced it with the RDDA. The RDDA and ESM liabilities will be drawn down over the period the new rates are in place and will be reflected in revenue over the fourteen month period from November 1, 2007 to December 31, 2008.

Our transmission revenues were lower by $3 million, compared to 2006. The OEB’s August 16, 2007 transmission rate decision reduced our revenues by about $53 million. This includes the revenue adjustment associated with recording the RDDA liability and the impact of the new OEB-approved rates effective November 1, 2007. Partially offsetting this decrease was the effect of the OEB’s earlier decision to end the ESM effective December 31, 2006, which increased our transmission revenues by about $33 million.

Revenues for the year also reflect higher average peak demands compared to last year, resulting in increased transmission revenues of $23 million and lower other revenues of $6 million.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are primarily influenced by our distribution rates, the amount of electricity we distribute, and the cost of purchased power. Distribution revenues also include a minor amount of ancillary distribution services revenues, such as fees related to the use of our poles by the telecommunications and cable television industries, and miscellaneous charges such as those for late payments.

Distribution revenues increased by $109 million, or 3%, in 2007 compared to last year. This change includes the recovery of increased purchased power costs of $19 million as described below under "Purchased Power." In addition, the OEB approved increases in distribution tariff rates for our subsidiaries, Hydro One Networks and Hydro One Brampton, effective May 1, 2006 and May 1, 2007 respectively. These tariff rate increases, which support the maintenance and investment requirements of our distribution system, enabling the safe and reliable delivery of electricity to our customers through Ontario, resulted in higher distribution revenues of $45 million during the year. In 2006, rates were approved based on a full cost of service hearing. In 2007, rates were approved based on OEB guidelines that included an incentive mechanism to adjust rates. Higher energy consumption, resulting primarily from the colder winter weather this year, increased our distribution revenues by a further $26 million. In addition, as a result of the OEB's decision on August 8, 2007 regarding the combined smart meter proceeding, we recorded smart meter revenues of $17 million reflecting recovery of our investments in this program. We also experienced higher other revenues of $2 million during the year.

Purchased Power

Purchased power costs incurred by our distribution business represent the cost of electricity delivered to customers within our distribution service territory and consist of the wholesale commodity cost of energy, the IESO's wholesale market service charges, and transmission charges levied by the IESO. The commodity cost of energy for certain low-volume and designated customers is based on the OEB's RPP, which consists of a two-tiered pricing structure with seasonal threshold amounts. Customers that are not eligible for the RPP pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the RPP affecting the two-year period 2006 and 2007 is provided below.

Summary of RPP

	Tier Threshold (kWh/month)		Tier Rates (cents/kWh)	
Effective Date	**Residential**	**Non-Residential**	**First Tier**	**Second Tier**
November 1, 2005	1,000	750	5.0	5.8
May 1, 2006	600	750	5.8	6.7
November 1, 2006	1,000	750	5.5	6.4
May 1, 2007	600	750	5.3	6.2
November 1, 2007	1,000	750	5.0	5.9

Purchased power costs increased in 2007 by $19 million, or 1%, to $2,240 million compared to last year. Our increased purchased power costs were primarily due to higher demand for electricity of $57 million, higher wholesale commodity prices of $25 million for customers who are not eligible for the RPP and higher wholesale market service charges levied by the IESO of $7 million. These increases were partially offset by lower costs of $62 million associated with the OEB's RPP for residential and other eligible customers, combined with the impacts of the OEB's August 16, 2007 transmission rate decision of $8 million.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**
Transmission	415	390	25	6
Distribution	549	460	89	19
Other	31	30	1	3
	995	880	115	13

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way increased by $25 million, or 6%, in 2007 compared to last year. Within our work programs, we continued our investments necessary for the safe and reliable operation of the transmission system. We experienced higher work program expenditures of $24 million primarily related to our planned station maintenance programs for power equipment and transformers and our line clearing and brush control programs, partially offset by lower requirements for unplanned corrective maintenance. We also experienced marginally higher expenditures in support of the transmission system. This increase reflects the commencement of a major business systems and processes project which will enable the adoption of more efficient, standardized business processes, the impact on our transmission regulatory accounts as a result of the OEB's August 16, 2007 transmission rate decision and the impact of a negotiated property tax settlement in 2006. The effect of these increases was partially offset by the impacts of a statutory reduction in our capital taxes and the reassignment of resources to support this year's larger transmission capital program.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage distribution system increased by $89 million, or 19%, compared to last year. Increased requirements within our work program of $65 million primarily resulted from the planned expansion of our forestry and line maintenance programs incurred to increase reliability. In addition, we experienced increased customer participation in our conservation and demand management programs. These increases were partially offset by reductions in expenditures incurred to respond to storm damage. In addition, our costs increased due to impacts of last year's OEB rate decision, including the recognition of distribution-related pension costs which had been previously deferred as a regulatory asset. Our operating, maintenance and administration expenditures also increased as a result of the OEB's August 8, 2007 decision on its combined smart meter proceeding due to the recognition of smart meter-related operating expenditures that were incurred in the 2005 to 2007 period but which were previously deferred as regulatory assets. In addition to these increases, our other support expenditures were higher by $24 million as a result of resource requirements in support of the maintenance program and the commencement of a major business systems and processes project, partially offset by the impact of a statutory reduction in our capital taxes.

Depreciation and Amortization

Depreciation and amortization expense increased by $6 million, or 1%, to $521 million this year. This increase was mainly attributable to the placement of new assets in service, consistent with our ongoing capital work program. We also experienced higher amortization of our regulatory assets resulting from an April 12, 2006 OEB distribution rate decision that was effective on May 1, 2006. These increases were partially offset by lower fixed asset removal costs resulting from lower storm damage in the year, compared to 2006.

Financing Charges

Financing charges remain unchanged at $295 million compared to last year. We experienced a lower average effective interest rate on our outstanding debt which was offset by lower capitalized interest on our regulatory assets due to lower prescribed OEB rates and increased regulatory liabilities.

Provision for Payments in Lieu of Corporate Income Taxes

We make payments in lieu of corporate income taxes to the Ontario Electricity Financial Corporation (OEFC) in accordance with the *Electricity Act, 1998* and on the same basis as if we were subject to federal and provincial corporate taxes. In providing for payments in lieu of corporate income taxes relating to our regulated businesses, the taxes payable method is used, whereas the liability method is used in computing the tax provision for our unregulated businesses.

The provision for payments in lieu of corporate income taxes increased by $26 million, or 15%, to $205 million in 2007 compared to 2006. The increase is primarily due to last year's recognition of a $30 million tax benefit related to the recovery of payments in lieu of corporate taxes from prior years, taxes payable on transmission amounts received this year but not recognized as revenue for accounting purposes, and temporary differences associated with certain regulatory accounts. These increases were partially offset this year by lower taxable income and other minor temporary differences.

Net Income

Net income of $399 million was lower by $56 million, or 12%, compared to 2006 results. Net income for the year was impacted by the OEB's August 16, 2007 transmission rate decision. While the OEB approved all of our work program requirements for 2007 and 2008, our return on equity was reduced from 9.88% to 8.35% effective January 1, 2007. Our net income also reflects higher requirements to operate and safely maintain our transmission and distribution systems, including enhanced transmission station maintenance and forestry programs. Our net income was further impacted by OEB decisions, including a 2006 decision affecting our distribution-related pension expenditures, last year's property tax settlement and a higher effective tax rate. These impacts were partially offset by an increase in our distribution revenues resulting from OEB-approved increases to our distribution tariff rates, as well as increased tariff revenue in our transmission and distribution businesses due to increased peak demands and energy consumption, as well as the elimination of last year's ESM.

Quarterly Results of Operations

The following table sets forth unaudited quarterly information for each of the eight quarters from March 31, 2006 through December 31, 2007. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)	**2007**				**2006**			
Quarter ended	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**	**Dec. 31**	**Sep. 30**	**Jun. 30**	**Mar. 31**
Total revenues[1,2]	1,129	1,128	1,120	1,278	1,142	1,165	1,078	1,160
Net income[1,2]	90	67	93	149	101	103	99	152
Net income to common shareholder[1,2]	85	63	88	145	96	99	94	148

[1] The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and profit, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

[2] As a result of the OEB's August 16, 2007 decision on Hydro One Networks' Transmission rate application that was effective January 1, 2007, revenues reflect a reduced revenue requirement based on the approved rate of return of 8.35%. Previously, the rate of return was 9.88%.

LIQUIDITY AND CAPITAL RESOURCES

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These sources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Operating activities	1,141	909
Financing activities		
Long-term debt issued	700	775
Long-term debt retired	(355)	(589)
Short-term notes payable	(60)	60
Dividends paid	(325)	(350)
Investing activities		
Capital expenditures	(1,091)	(823)
Other financing and investing activities	7	(2)
Net change in cash and cash equivalents	17	(20)

Operating Activities

Net cash from operating activities increased by $232 million, to $1,141 million, compared to 2006 results. Our working capital requirements were substantially lower than the comparative period primarily as a result of the impact of the *Ontario Price Credit* that was provided to RPP customers in early 2006, pursuant to regulation. Funding for the credit was received from the IESO in early December 2005. Our working capital requirements were also impacted by lower electricity prices charged to RPP customers in 2007, the impacts of last year's OEB distribution rate decision and increased accounts payable primarily associated with our capital expenditure program.

Financing Activities

Short-term liquidity is provided through funds from operations and our commercial paper program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. At December 31, 2007, we had no short-term notes payable outstanding. The commercial paper program is supported by a committed revolving credit facility with a syndicate of banks. On January 28, 2008, we increased the facility from $750 million to $1,000 million. The maturity date remains unchanged at August 10, 2010. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. At December 31, 2007, we had $5,615 million in long-term debt outstanding, including the current portion. Long-term financing is provided by our access to the debt markets, primarily through our Medium-Term Note Program. On June 21, 2007, we filed a $2.5 billion base shelf prospectus to renew our Medium-Term Note Program for another 25 months. Our notes and debentures mature between 2008 and 2046. We currently plan to refinance maturing debt principally through our Medium-Term Note Program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million, of which $2,200 million is remaining and is currently available until July 2009.

	Rating	
Rating Agency	**Short-term Debt**	**Long-term Debt**
DBRS Limited	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3
Standard & Poor's Rating Services Inc.	A-1	A

We have the customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement related to our $750 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations.

During 2007, we issued $700 million in long-term debt under our Medium-Term Note Program and we repaid $355 million in maturing long-term debt. In comparison, during 2006 we issued $775 million in debt under our medium-term note program and we repaid $589 million in maturing long-term debt. In 2007, we decreased our short-term notes by $60 million compared to an increase of $60 million in 2006.

In 2007, we paid dividends to the Province in the amount of $325 million, consisting of $307 million in common dividends and $18 million in preferred dividends. In the comparative period, we paid common dividends of $332 million and preferred dividends of $18 million. In 2007, cash dividends per common share were $3,070 compared to $3,320 per common share in 2006. Cash dividends per preferred share were $1.375 in each of 2007 and 2006.

Common dividends are declared at the sole discretion of our Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice, shareholder expectations. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

Cash used for investing activities, primarily representing capital expenditures to enhance and reinforce our transmission and distribution infrastructure in the public interest, was as follows:

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**	**$ Change**	**% Change**
Transmission	560	402	158	39
Distribution	511	417	94	23
Other	20	4	16	400
	1,091	823	268	33

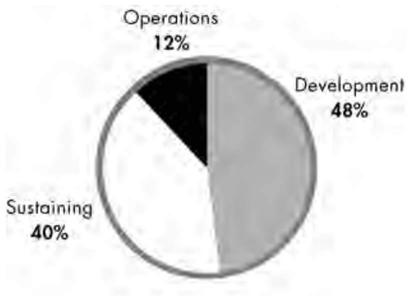
Transmission

2007 Transmission Capital Expenditures

Transmission capital expenditures increased by $158 million in 2007 to $560 million, compared to 2006. Expenditures to expand and reinforce the transmission system were $271 million, representing an increase of $92 million over last year. This increase primarily reflects expenditures on our major lines and stations development projects. These projects include our new interconnection with Québec, which will increase access to emission-free hydroelectric power, our Essa to Stayner connection, which will improve the adequacy and reliability of supply to the Southern Georgian Bay region in recognition of the growing needs of our customers, and the completion of our Downtown Toronto Cable Project. Expenditures on our load and generation connections work have also increased primarily as a result of reconfiguration work at our Lambton Transformer Station and work at our London Talbot, Pleasant, and Holland transformer stations. The impact of these project expenditures was partially offset by last year's expenditure on our Niagara Reinforcement Project. This connection was substantially completed last year but final completion continues to be delayed by the aboriginal land dispute in the Caledonia area. Discussions continue between the involved aboriginal peoples and the various government entities involved. We will complete this project when site access becomes available.

Expenditures to sustain our existing transmission system were $221 million, representing an increase of $31 million compared to 2006. This increase was primarily related to the refurbishment and replacement of end-of-life lines and stations, including work at our Claireville Transformer Station to improve current reliability and to meet growing demands, and protection and control work at our switchyard facility adjoining the Pickering Nuclear Generating Station. Our other transmission capital expenditures were $68 million in 2007, representing an increase of $35 million from last year. This increase included higher information technology expenditures primarily related to a major business systems and processes project.

Distribution



2007 Distribution
Capital Expenditures

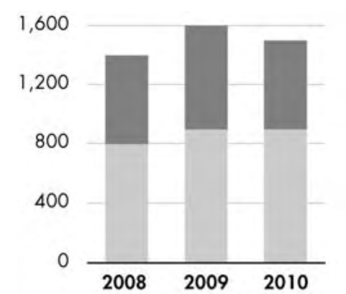
Distribution capital expenditures increased by $94 million to $511 million in 2007, compared to the prior year. Capital expenditures to expand and reinforce our distribution network were $245 million, an increase of $78 million compared to last year. This increase primarily reflects our ongoing investment in smart meters. During the year we installed approximately 260,000 meters, exceeding our 2007 target of approximately 240,000 meters, and bringing our cumulative program total to about 288,000 meters. We also experienced increased expenditures for new customer connections and for planned lines work, partially offset by slightly lower expenditures related to station meters.

Expenditures to sustain our low-voltage distribution system were $204 million, a reduction of $21 million from 2006. This reduction was primarily a result of lower storm-related expenditures. In 2007, we experienced lower capital expenditures of about $39 million to replace assets and components damaged or destroyed by major storms. Last year an unusual number of violent storms swept through the province and, in particular, a series of severe storms was experienced last summer. This impact was partially offset by higher planned end-of-life replacements of lines assets. Our other distribution capital expenditures were $62 million in 2007, representing an increase of $37 million from last year. This increase included higher information technology expenditures primarily related to a major business systems and processes project.

Other

Other capital expenditures made to enhance our telecom infrastructure increased by $16 million to $20 million in 2007. This increase was largely due to construction of a dedicated optical network which will provide secure, high capacity connectivity across numerous healthcare locations in Ontario.

Future Capital Expenditures



Future Capital Expenditures
(Cdn $ millions)

Our capital expenditures in 2008 are budgeted at approximately $1.4 billion. The 2008 capital budgets for our transmission and distribution businesses are about $800 million and $600 million, respectively. Capital expenditures, as shown in the accompanying chart, are expected to exceed $1.5 billion in both 2009 and 2010, primarily reflecting increasing investments to expand, refurbish or replace transmission infrastructure. The overall investment levels reflect transmission infrastructure requirements consistent with government policy, OPA planning information, local area supply requirements and the needs of preventive and corrective maintenance to manage aging assets. These investments will facilitate an adequate and reliable supply of electricity in the public interest. These investment levels also reflect the continued mass deployment of smart meters within our distribution businesses that began in 2007. The replacement of critical information technology systems is also underway. Capital expenditures of our other business segment are budgeted at about $11 million in 2008, about half of the 2007 level, as the implementation of a dedicated fibre optic network, initiated in 2007, will be completed in 2008.

Transmission

Transmission system capital expenditures are anticipated to be significant over the period 2008 to 2010, amounting to about $2.5 billion. Our investment plan will address the needs of new generation development and load growth in local areas in the province. The transmission program also continues the focus on sustaining the performance of aging assets through maintenance and refurbishment programs and the replacement of assets that have reached their end of life.

With the primary focus of the recently filed IPSP being on mid to long-term timeframes, the need justification for most major urgent, short-term transmission investments will continue through Leave-to-Construct (Section 92) proceedings. Referenced in the IPSP as short to mid-term investments is the project to connect redeveloped nuclear generation and wind from the Bruce Peninsula to our Milton Switching Station, other projects of local area supply, and the installation of equipment at our existing transmission stations. OEB and environmental approvals are being sought to build the 500kV line from the Bruce Peninsula, funding for which is included in the investment plan through to 2011. Given the timeframes required for stakeholdering, approvals, and construction, interim measures are being implemented to minimize the impact of generation scheduled to be available in 2009. These are comprised of the enhancement of the protection systems, the installation of Static Var Compensators and shunt capacitor banks in Southwestern Ontario, and the upgrade of certain 230kV circuits.

Other projects included in the transmission investment plan include system expansions in Northeastern Ontario to accommodate generation on the Mattagami River; transmission reinforcements in the Greater Toronto Area (GTA), Southern Georgian Bay, Woodstock and Windsor; and the interconnection between Ontario and Québec. Construction of the Toronto third supply is contingent on the OEB approval of the IPSP and the OPA’s determination of the need date. This project, for which funding is included in the plan, extends beyond the current planning horizon. This project is required to mitigate the risks associated with having only two major supply corridors to the City of Toronto and as such, to maintain a reliable supply of electricity.

At the local level, we continue to proactively address supply needs with our customers in order to meet load growth. For projects required to provide reliable delivery of electricity to communities, the participation and support of the affected LDCs as partners in joint planning studies and throughout the consultation and approval processes, continue to be essential. Examples of projects under construction to meet the growing needs of our customers include new transformer stations to serve Essex County and Simcoe County, and expansions of transformer stations serving Brampton, Kingston, York Region and Red Lake. To address local future needs, we are in discussions with customers for major transmission expansions or new transformer stations and, where necessary, line connections in locations such as Woodstock, Mississauga, Oshawa and Brampton. Targeted investments in customer delivery point performance, power quality and our 115kV and 230kV systems are expected to lead to improved reliability.

The investment plan also includes increased program expenditures to manage the replacement and refurbishment of our aging transmission infrastructure to ensure a continued reliable supply of energy to customers throughout the province. Through targeted replacement programs for components, such as gas insulated switchgear, air blast circuit breakers, and 750 MVA autotransformers, improved performance is anticipated, which should reduce system integrity risks.

The timing of many development projects is uncertain as they are dependent upon the final approval of the IPSP and, in some instances, require approvals from various regulatory bodies, as well as negotiations and consultations with customers, neighbouring utilities and other stakeholders. We will not undertake large capital expenditures without a reasonable expectation of recovering them in our rates.

Distribution

Capital expenditures for the period 2008 to 2010 are estimated to be approximately $2 billion, including the Smart Meter Program, and core development and sustainment programs. With approximately 1.3 million customers in our service territory, we anticipate installing about a further 1 million meters under the program. Consistent with the government policy, all homes and small businesses are to receive a smart meter by 2010. At the Province’s request, we will review our implementation plan and associated costs for the period from 2008 to 2010. Smart Network is an initiative that would leverage the smart meter infrastructure to enable functionality across our rural territory. This is currently being piloted and validated, and will be brought forward for consideration if benefits are confirmed.

Our core work will focus on demand programs such as new load connections, trouble calls and storm damage, and system capability reinforcement. The distribution investment plan also includes program expenditures relating to preserving the performance of our aging distribution asset base in order to improve system reliability. These include increased wood pole replacements, feeder sectionalization, and defect management, together with improved maintenance and line clearing practices. Given initiatives to encourage renewable energy technologies, we are experiencing increased distribution generation connection activity. Connection impact assessments are undertaken to determine project feasibility. Under OEB rules, the generator will pay connection costs other than distribution upgrades that also benefit other customers. No provision has been included in the plan for major distribution system modifications to accommodate this growth of new generation.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations, as well as other major commercial commitments:

December 31, 2007 (Canadian dollars in millions)	Total	2008	2009/2010	2011/2012	After 2012
Contractual Obligations *(due by year):*					
Long-term debt – principal repayments	5,615	540	800	850	3,425
Long-term debt – interest payments	5,211	307	554	488	3,862
Inergi LP (Inergi) outsourcing agreement[1]	396	100	190	106	-
Operating lease commitments	16	6	7	2	1
Total Contractual Obligations[5]	11,238	953	1,551	1,446	7,288
Other Commercial Commitments *(by year of expiry)*:					
Bank line[2]	750	-	750	-	-
Letters of credit[3]	99	99	-	-	-
Guarantees[3]	325	325	-	-	-
Pension[4]	196	94	102	-	-
Total Other Commercial Commitments	1,370	518	852	-	-

[1] On March 1, 2002, Inergi LP began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

[2] As a backstop to our commercial paper program, we have a $750 million revolving standby credit facility with a syndicate of banks which matures in August 2010. On January 28, 2008 this facility was increased to $1,000 million.

[3] We currently have bank letters of credit of $95 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO on behalf of our subsidiaries as required by the IESO's Market Rules, using parental guarantees of up to a maximum of $325 million. The maximum parental guarantee was increased in November 2007 to $325 million as a result of forecast power purchases and the November 1, 2007 change to our transmission rates. Although no letters of credit are currently required for prudential support, we would have to resume providing bank letters of credit if our highest long-term credit rating deteriorated to below the "Aa" category. The remaining amounts included in letters of credit pertain to operating letters of credit and to surety bonds.

[4] Contributions to the pension fund are made one-month in arrears. Contributions for 2008 are based on an actuarial valuation filed in September 2007 and effective December 31, 2006. Our annual pension contributions for 2008 and 2009 will be about $94 million. Contributions beyond 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension contributions beyond 2009 are not estimable at this time.

[5] In addition, the Company has entered into various agreements to purchase goods or services in support of our work programs that are enforceable and legally binding. None of these are considered individually material, and the majority will result in payments by our Company by December 31, 2008.

The amounts in the above table under long-term debt – principal repayments, are not charged to our results of operations, but are reflected on our Balance Sheet and Statement of Cash Flows. Interest associated with this debt is recorded under financing charges on our Statement of Operations or in our capital programs. Payments in respect of operating leases and our outsourcing agreement with Inergi LP are recorded under operation, maintenance and administration costs on our Statement of Operations or within our capital expenditures.

RELATED PARTY TRANSACTIONS

Related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder. The year-over-year changes related to these amounts are described more fully in our discussion of our transmission revenues and purchased power costs. Other significant related party transactions include our dividends which are paid to the Province and our payments in lieu of corporate income taxes which are paid or payable to the OEFC.

RISK MANAGEMENT AND RISK FACTORS

We have an enterprise risk management program that aims at balancing business risks and returns. An enterprise-wide approach enables regulatory, strategic, operational and financial risks to be managed and aligned with our strategic business objectives.

While our philosophy is that risk management is the responsibility of all employees, the Audit and Finance Committee of our Board of Directors annually reviews our company's risk tolerances, our risk profile and the status of our internal control framework. Our President and Chief Executive Officer has ultimate accountability for risk management. Our Leadership Team, comprising direct reports to the President and Chief Executive Officer, provides senior management oversight of risk in our company. Our Chief Risk Officer is responsible for the ongoing monitoring and review of our risk profile and practices, and our Chief Financial Officer is responsible for ensuring that the risk management program is an integral part of our business strategy, planning and objective setting. Each of our subsidiaries, as well as key specialist functions and field services, is required to complete a formal risk assessment and to develop a risk mitigation strategy.

The Audit and Finance Committee, the President and Chief Executive Officer, and the Chief Financial Officer are supported by our Chief Risk Officer. This support includes coordinating risk policies and programs, establishing risk tolerances, preparing risk assessments and profiles and assisting line and functional managers in fulfilling their responsibilities. Our internal audit staff is responsible for performing independent reviews of the effectiveness of risk management policies, processes and systems.

Ownership by the Province

The Province owns all of our outstanding shares. Accordingly, the Province has the power to determine the composition of our Board of Directors and appoint the Chair, and thus influence our major business and corporate decisions. We have entered into a shareholder agreement with the Province relating to certain aspects of the governance of our company.

Conflicts of interest may arise as a result of the Province’s obligation to act in the best interests of the residents of Ontario in a broad range of matters, including the regulation of Ontario’s electricity industry and environmental matters, any future sale or other transaction by the Province with respect to its ownership interest in our company, the Province’s ownership of Ontario Power Generation Inc. (OPG), and the determination of the amount of dividend or payments in lieu of corporate income taxes. We may not be able to resolve any potential conflict with the Province on terms satisfactory to us.

Risk Associated with Transmission Projects

Significant investments have been initiated to increase transmission capacity and enable the reliable delivery of power to Ontario consumers from existing and future generation sources. In many cases, initiating these investments is contingent upon one or more approvals. These can include Section 92, expropriation and environmental approvals, as well as consultation, and possibly accommodation with First Nations where traditional lands or lands subject to land claims are involved. The ability to make such investments may also be impacted by public opposition. If we are unable to make such investments, the reliability of our transmission system and our service quality could be adversely affected.

Work Force Demographic Risk

More than 20% of our employees will be eligible for retirement by the end of 2008. We expect the skilled labour market for our industry to be highly competitive in the future. Consequently, we must continue to advance our training and apprenticeship programs and succession plans to ensure that our future operational staffing needs will be met. If we are unable to attract and retain qualified personnel, our operations could be adversely affected.

Regulatory Risk

We are subject to regulatory risks, including the approval by the OEB of rates for our transmission and distribution businesses that permit a reasonable opportunity to recover the estimated costs of providing service on a timely basis and to earn the approved rate of return.

The OEB approves our transmission and distribution rates based on projected electricity load and consumption levels. If actual load or consumption falls below projected levels, our rate of return for either or both of these businesses could be adversely affected. Also, our current revenue requirements for these businesses are based on cost assumptions that may not materialize. There is no assurance that the OEB would allow rate increases sufficient to offset unfavourable financial impacts from unanticipated changes in electricity demand or in our costs.

Our load could also be negatively impacted by successful CDM programs. Current requirements for CDM call for a 5% reduction in Ontario's projected peak electricity demand by 2010. These expectations are factored into our revenue requirements for OEB approval. There is a risk that our revenues would be reduced if these targets are exceeded. The OEB has recognized the need to compensate utilities for such lost revenue, but the approach, level and timing of such compensation is yet to be determined. We are also subject to risk of revenue loss from other factors. For example, revisions to the OEB's *Transmission System Code* have resulted in customers gaining the right to bypass some of our transformation facilities by constructing their own assets under certain conditions.

As a transmitter, we expect to make significant investment in the coming years in large-scale transmission infrastructure projects, and to connect new third-party load and generation assets. Additionally, there is always the possibility that we could incur unexpected capital expenditures to maintain or improve our assets. The risk exists that the OEB may not allow full recovery of such investments. To the extent possible, we try to mitigate this risk by seeking from the regulator clear policy direction on cost responsibility, and pre-approval of the need for capital expenditures.

The Province has passed regulations authorizing our subsidiaries, as distributors, to procure smart meters. Of the associated costs in rates, our subsidiaries Hydro One Networks and Hydro One Brampton are only currently authorized to recover 93 cents and 67 cents per metered customer per month, respectively. While we expect all of our expenditures to be fully recoverable after OEB review, any future regulatory decision to disallow or limit the recovery of such costs would lead to potential impairment and charges to results of operations.

Asset Condition

We continually monitor the condition of our assets and maintain, refurbish or replace them to maintain the performance that is needed to support transmission reliability and service quality to our customers. Capital and maintenance programs have been increasing to maintain the performance of our aging asset base. However, execution of these plans is dependent on external factors including limited opportunities to remove equipment from service to accommodate construction due to outage constraints as determined by the IESO and substantially increased lead times for material and equipment due to increased global demand and limited vendor capability. Consequently, the necessary maintenance or replacements may be delayed, which could affect transmission reliability.

Risk of Natural and Other Unexpected Occurrences

Our facilities are exposed to the effects of severe weather conditions, natural disasters and catastrophic events. Although constructed, operated and maintained to industry standards, our facilities may not withstand occurrences of this type in all circumstances. We do not have insurance for damage to our assets located outside our transmission and distribution stations. Lost revenues, repair costs, damage and claims from third parties could be substantial. In the event of a large uninsured loss, we would apply to the OEB for the recovery. However, there is no assurance that the OEB would approve such an application.

Risk from Transfer of Assets Located on Indian Lands

The transfer orders by which we acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on lands held for bands or bodies of Indians under the *Indian Act* (Canada). Currently, the OEFC holds these assets. Under the terms of the transfer orders, we are required to manage these assets until we have obtained all consents necessary to complete the transfer of title of these assets to us. We cannot predict the aggregate amount that we may have to pay, either on an annual or one-time basis, to obtain the required consents. However, we anticipate having to pay more than the approximately $900,000 per year that we currently are paying to these Indian bands and bodies. If we cannot obtain consents from the Indian bands and bodies, the OEFC will continue to hold these assets for an indefinite period of time. If we cannot reach a satisfactory settlement, we may have to relocate these assets from the Indian lands to other locations or replace them at a cost that could be substantial. These potential costs could have a material adverse effect on our results of operations if we are unable to recover them in future rate orders.

Labour Relations Risk

The substantial majority of our employees are represented by either the Power Workers Union (PWU) or the Society of Energy Professionals. The existing collective agreements with the PWU will expire on March 31, 2008; collective bargaining commenced in January 2008. The Society of Energy Professionals collective agreement was recently renewed and now expires on March 31, 2013. We face financial risks related to our ability to negotiate collective agreements consistent with our rate orders. In the event of a labour dispute, we could face operational risk related to continued compliance with our license requirements of providing service to customers.

Environmental Risk

We are subject to extensive environmental regulation and failure to comply could subject us to fines and other penalties. In addition, the presence or release of hazardous or other substances could lead to claims by third parties and/or governmental orders requiring us to take specific actions such as investigating, controlling and remediating the effects of these substances. We are currently undertaking a voluntary land assessment and remediation program covering most of our stations and service centers. There is also risk associated with obtaining governmental approvals, permits, or renewals of existing approvals and permits related to constructing or operating facilities. This may require environmental assessment or result in the imposition of conditions, or both, which could mean delays and cost increases.

Future changes in environmental regulations may result in material changes to our estimates of future expenditures to complete this work. On November 4, 2006, Environment Canada published new draft regulations governing the management of polychlorinated biphenyls (PCBs). These draft regulations may be finalized in 2008. We have estimated the non-capital expenditures for complying with these draft regulations to be between $250 million and $375 million in excess of amounts we have already recorded as environmental liabilities on our Balance Sheet. If required, most of these additional expenditures would be incurred in the period from 2013 to 2025. No obligation has been recorded in the financial statements for these increased expenditures due to continued uncertainty regarding the timing and content of the final regulations. In any case, actual future environmental expenditures may vary materially from the estimates used in the calculation of the environmental liabilities on our Balance Sheet. We do not have insurance coverage for these environmental expenditures.

Scientists and public health experts have been studying the possibility that exposure to electric and magnetic fields emanating from power lines and other electric sources may cause health problems. If it were to be concluded that electric and magnetic fields present a health risk, we could face litigation, be required to take costly mitigation measures such as relocating some of our facilities or experience difficulties in locating and building new facilities.

Risk Associated with Information Technology Infrastructure

Our ability to operate effectively in the Ontario electricity market is in part dependent upon us developing, maintaining and managing complex information technology systems that are employed to operate our transmission and distribution facilities, financial and billing systems, and business systems to capture data and to produce timely and accurate information. We are working to transition most of our financial and business processes to an integrated business and financial reporting system which will enable productivity through the adoption of more efficient, standardized business processes. The conversion of these systems and processes may expose us to risk, including risks associated with maintaining internal controls, as new systems are brought online and the data and business processes are transitioned. System failures could have a material adverse effect on our company.

Risk Associated with Outsourcing Arrangement

Consistent with our strategy of reducing operating costs, we entered into an outsourcing services agreement in 2002 with Inergi. If this agreement is terminated for any reason, we could be required to incur significant expenses to re-establish all or some of the outsourced functions, which could have a material adverse effect on our results of operations.

Risk from Provincial Ownership of Transmission Corridors

Although we have the statutory right to use provincially-owned transmission corridors, we may be limited in our ability to expand our systems. Also, other uses of the transmission corridors by third parties in conjunction with the operation of our systems may increase safety or environmental risks.

Pension Plan Risk

We have a defined benefit registered pension plan for the majority of our employees. Contributions to the pension plan are established by actuarial valuations which are filed with the Financial Services Commission of Ontario on a tri-annual basis. The most recently filed valuation was prepared as at December 31, 2006 and was filed in September 2007. Our annual pension contributions for the three year period 2007 to 2009 are approximately $94 million per year. The next valuation is required to be prepared as at December 31, 2009. The required level of contributions effective January 1, 2010 will depend on future investment returns, changes in benefits and changes in actuarial assumptions. Pension contributions beyond 2009 are not estimable at this time. The recovery of pension costs is subject to approval by the OEB. Failure to attain OEB approval could have an adverse effect on our results of operations.

Risk Associated with Arranging Debt Financing

We expect to borrow to repay our existing indebtedness and to fund capital expenditures. A substantial portion of our existing debt matures between 2008 and 2011. We are also planning a combined total of capital expenditures of approximately $3 billion in 2008 and 2009. Cash generated from operations will not be sufficient to fund the repayment of our existing indebtedness and capital expenditures. Our ability to arrange sufficient and cost effective debt financing could be adversely affected by numerous factors, including the regulatory environment in Ontario, our results of operations and financial position, market conditions, the ratings assigned to our debt securities by credit rating agencies and general economic conditions. Any failure or inability on our part to borrow substantial amounts of debt on satisfactory terms could impair our ability to repay maturing debt, fund capital expenditures and meet other obligations and requirements and, as a result, could have a material adverse effect on our business.

Market and Credit Risk

Market risk refers primarily to risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. We do not have commodity risk and our foreign exchange risk is currently insignificant, although we could in future decide to issue foreign currency denominated debt. We are exposed to fluctuations in interest rates as our regulated rate of return is derived using a formula approach which is in part based on the forecast for long-term Government of Canada bond yields. We estimate that a 1% decrease in the forecast long-term Government of Canada bond yield used in determining our rate of return would reduce our transmission business' results of operations by approximately $20 million and our distribution business' results of operations by approximately $13 million. Our results of operations are adversely impacted by rising interest rates as our maturing long-term debt is refinanced at market rates. We periodically utilize interest rate swap agreements to mitigate elements of interest rate risk. We estimate that a 1% increase in interest rates on the refinancing of long-term debt maturing in 2008 and 2009 would reduce our results of operations by approximately $1 million and $4 million, respectively.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. Derivative financial instruments result in exposure to credit risk, since there is a risk of counter-party default. We monitor and minimize credit risk through various techniques, including dealing with highly rated counter-parties, limiting total exposure levels with individual counter-parties, and by entering into master agreements which enable net settlement. We do not trade in any energy derivatives. We do, however, have interest rate swap contracts outstanding from time to time. Currently, there are no significant concentrations of credit risk with respect to any class of financial assets. We are required to procure electricity on behalf of competitive retailers and embedded LDCs for resale to their customers. The resulting concentrations of credit risk are mitigated through the use of various security arrangements, including letters of credit, which are incorporated into our service agreements with these retailers in accordance with the OEB's *Retail Settlements Code*.

CRITICAL ACCOUNTING ESTIMATES

The preparation of our financial statements requires us to make estimates and judgements that affect the reported amounts of assets, liabilities, revenues and costs, and related disclosures of contingencies. We base our estimates and judgements on historical experience, current conditions and various other assumptions that are believed to be reasonable under the circumstances, the results of which form the basis for making judgements about the carrying values of assets and liabilities as well as identifying and assessing our accounting treatment with respect to commitments and contingencies. Actual results may differ from these estimates and judgements under different assumptions or conditions.

We believe the following critical accounting estimates involve the more significant estimates and judgements used in the preparation of our financial statements:

Regulatory Assets and Liabilities

Regulatory assets as at December 31, 2007 amounted to $213 million and principally relate to regulatory asset recovery accounts (RARAs), employee future benefits other than pension, and environmental costs. We have also recorded regulatory liabilities amounting to $583 million as at December 31, 2007. These amounts pertain primarily to pension, the RDDA, export and wheeling fees, the ESM, and retail settlement variance accounts. These assets and liabilities can be recognized for rate-setting and financial reporting purposes only if the OEB directs the relevant regulatory treatment or if future OEB direction is judged to be probable. Most of our regulatory accounts have already been reviewed by the OEB and confirmed as recoverable or refundable.

If management judges that it is no longer probable that the OEB will include a regulatory asset or liability in the setting of future rates, the relevant regulatory asset or liability would be charged or credited to results of operations in the period in which that judgement is made.

Environmental Liabilities

We record liabilities and related regulatory assets based on the present value of the estimated future expenditures to be made to settle obligations related to legacy environmental contamination inherited upon our de-merger from Ontario Hydro in 1999. These liabilities fall into two main categories: the management of PCB-contaminated assets and mineral oils and the assessment and remediation of contaminated lands. In determining the amounts to be recorded as environmental liabilities, we estimate the current cost of completing mitigation work and make assumptions for when the future expenditures will actually be incurred to generate future cash flow information. A long-term inflation assumption of approximately 2% has been used to express current cost estimates as estimated future expenditures. These future expenditures are discounted using factors ranging from 2.9% to 6.25%. Recording a liability for such long-term future expenditures requires that many other assumptions be made, such as the number of contaminated properties and the extent of contamination, and the number and contamination levels of assets with PCBs. All factors used in deriving our environmental liabilities represent management's best estimates. However, it is reasonably possible that numbers or volumes of contaminated assets, current cost estimates, inflation assumptions and assumed pattern of annual cash flows may differ significantly from our assumptions. Estimated environmental liabilities are reviewed annually or more frequently if significant changes in regulation or other relevant facts occur. Estimate changes are accounted for prospectively.

Employee Future Benefits

We provide future benefits to our current and retired employees, including pension, group life insurance, health care and long-term disability.

In accordance with our rate orders, we record pension costs when employer contributions are paid to the pension fund (Fund) in accordance with the *Pension Benefits Act* (Ontario). Our annual pension contributions are approximately $94 million per year over the period 2007 through to 2009. Contributions after 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension costs are also disclosed in the notes to the financial statements on an accrual basis. We record employee future benefit costs other than pension on an accrual basis. The accrual costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management's best estimates. The assumptions were determined by management recognizing the recommendations of our actuaries.

The assumed return on pension plan assets of 6.75% per annum is based on expectations of long-term rates of return at the beginning of the fiscal year and reflects a pension asset mix consistent with the Fund's investment policy. During the year the Fund's target asset mix was changed to 62% exposure to equities, 33% to fixed income and 5% in alternative assets consisting of hedge funds and private equity. Returns on the respective portfolios are determined with reference to published Canadian and U.S. stock indices and long-term bond and treasury bill indices. The assumed rate of return on pension plan assets reflects our long-term expectations. We believe that this assumption is reasonable because, with the fund's balanced investment approach, the higher volatility of equity investment returns is offset by the greater stability of fixed income and short-term investment returns. The net result, on a long-term basis, is a somewhat lower return than might be expected by investing in equities alone. The return on pension plan assets was lower than this long-term assumption in 2007.

The weighted-average discount rate used to calculate the accrued benefit obligations is determined each year end by referring to the most recently available market interest rates based on AA corporate bond yields reflecting the duration of the applicable employee future benefit plan. The discount rates at December 31, 2007 increased by 0.25% from those at December 31, 2006 in conjunction with increase in bond yields over this period. The increase in discount rates has resulted in a corresponding reduction in liabilities.

The costs of employee future benefits other than pension are determined at the beginning of the year. The costs are based on assumptions for expected claims experience and future health care cost inflation. A 1% increase in the health care cost trends would result in an increase in service cost and interest cost of about $12 million per year and an increase in the year end obligation of about $167 million.

Employee future benefits are included in labour costs that are either charged to results of operations or capitalized as part of the cost of fixed assets. Changes in assumptions will affect the accrued benefit obligation of the employee future benefits and the future years' amounts that will be charged to our results of operations or capitalized as a cost of fixed assets.

Goodwill

In assessing the recoverability of goodwill, we must make assumptions regarding estimated future cash flows and other factors to determine the fair value of the distribution reporting unit. If these estimates or their related assumptions change in the future, we may be required to record impairment charges related to goodwill. An impairment review of goodwill was carried out during 2007 and we determined that the carrying value of our goodwill has not been impaired.

EMERGING ACCOUNTING PRONOUNCEMENTS

Transition to International Financial Reporting Standards (IFRS)

The Canadian Accounting Standards Board (AcSB) ratified a new strategic plan for the period of 2006-2011 that entails converging Canadian generally accepted accounting principles (GAAP) with IFRS over the five-year transitional period. The final AcSB decision to proceed on the intended schedule will be made in March 2008. It is generally expected that the decision to adopt IFRS will be confirmed unless some unexpected event occurs. The AcSB has adopted an implementation plan and suggests that companies be in a position to disclose their implementation plans for the IFRS changeover in their 2008 Management, Discussion and Analysis (MD&A). The Canadian Securities Administrators will be defining the MD&A disclosure requirements regarding an enterprise's plans for IFRS conversion. We started planning our transition to IFRS during 2006 and plan to commence convergence work beginning in 2008.

Accounting for Rate Regulated Operations

During 2007, the AcSB issued an exposure draft proposing to remove all specific references to rate regulated accounting from the Handbook of the Canadian Institute of Chartered Accountants (CICA). In August 2007, the AcSB decided to remove a temporary exemption in CICA Handbook Section 1100, retain existing references to rate regulated accounting in the CICA Handbook, require the recognition of future income tax liabilities and assets as well as a separate regulatory asset or liability for the amount of future income taxes, and retain existing requirements to disclose the effects of rate regulation.

The new rules will apply prospectively to interim and annual financial statements relating to fiscal years beginning on or after January 1, 2009 and will result in accrual accounting being followed for payments in lieu of corporate taxes. Such amounts are currently accounted for on a cash basis, consistent with specific OEB rate-setting direction. Commencing the first quarter of 2009, the regulatory impact of the OEB's direction will be reflected through the recognition of regulatory assets and/or liabilities. There will be no impact on results of operations.

Inventories

The AcSB issued new CICA Handbook Section 3031, *Inventories*, which is effective for our company in the first quarter of 2008. The recommendations apply to our materials and supplies inventories and require major spare parts to be classified as future use fixed assets rather than inventory. We anticipate a significant transfer of book value from the materials and supplies category on the Balance Sheet to fixed assets. Additionally, the new handbook section will allow the reversal of prior period write-downs when the net realizable value of impaired inventory subsequently recovers.

DISCLOSURE CONTROLS AND INTERNAL CONTROLS OVER FINANCIAL REPORTING

As a reporting issuer we are required to comply with the Ontario Securities Commission's Multilateral Instrument 52-109 (Multilateral Instrument) concerning internal control and related certifications, often referred to as Bill 198. During 2005 and 2006, we documented all of our processes, risks and controls, and completed all testing necessary to make the required annual certifications. Commencing with our Consolidated Financial Statements for the year ended December 31, 2005, we certified that our disclosure controls and procedures provide reasonable assurance that all information considered necessary for appropriate disclosure has been accumulated and communicated to management on a timely basis. Commencing with our Consolidated Financial Statements for the year ended December 31, 2006, we also made certifications regarding the design of our internal controls over financial reporting.

Our focus for 2007 has been the ongoing sustainment of our control environment, including communication, evaluation and enhancements, as required to support the certifications of our President and Chief Executive Officer, and Chief Financial Officer (Certifying Officers). We have also carried out a comprehensive plan to test the operational effectiveness of our internal controls over financial reporting.

In compliance with the requirements of the Multilateral Instrument, our Certifying Officers have reviewed and certified the Consolidated Financial Statements for the year ended December 31, 2007, together with other financial information included in our annual securities filings. Our Certifying Officers have also certified that disclosure controls and procedures have been designed to provide reasonable assurance that material information relating to our company is made known within our company and that they operated effectively during the period. Further, our Certifying Officers have also certified that internal controls over financial reporting are designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with GAAP.

SELECTED ANNUAL INFORMATION

The following table sets forth audited annual information for each of the three years ended December 31, 2005, 2006 and 2007. This information has been derived from our audited annual Consolidated Financial Statements.

Consolidated Statement of Operations

Year ended December 31 (Canadian dollars in millions, except earnings per common share)	**2007**	**2006**	**2005**
Revenues[1]	4,655	4,545	4,416
Net income[1]	399	455	483
Basic and fully diluted earnings per common share *(Canadian dollars)*	3,809	4,366	4,652

Consolidated Balance Sheet

Year ended December 31 (Canadian dollars in millions, except cash dividends per share)	**2007**	**2006**	**2005**
Total assets[2]	12,790	12,210	11,798
Total long-term debt[3]	5,603	5,243	5,032
Cash dividends per common share *(Canadian dollars)*	3,070	3,320	2,730
Cash dividends per preferred share *(Canadian dollars)*	1.375	1.375	1.375

[1] As a result of the OEB's August 16, 2007 decision on Hydro One Networks' Transmission rate application that was effective January 1, 2007, revenues reflect a reduced revenue requirement based on the approved rate of return of 8.35%. Previously, the rate of return was 9.88%.
[2] Total assets for 2006 and 2005 reflect the reclassification of deferred debt costs in 2007, applied retroactively
[3] Unamortized net losses relating to settled swap agreements were reclassified to AOCI on January 1, 2007 without prior year reclassification.

OUTLOOK

To meet our challenge of being the best transmission and distribution company in North America, we will continue to concentrate on our strategic priorities relating to respect of the public trust, safety, our customers, system reliability, financial stewardship and our employees. Significant improvements have been made toward achieving our customer satisfaction and safety targets, while we maintain our financial profile and reliability performance. Our continued commitment to the people of Ontario has been recognized by the Edison Electric Institute (EEI) and by Corporate Knights magazine. Early in the year, EEI honoured us with the "Emergency Recovery Award" for outstanding storm restoration efforts in 2006. This was the first time a non-U.S. utility has won this prestigious award. Corporate Knights magazine recognized us as one of Canada's top 50 corporate citizens based on environmental, social and governance indicators. Our CDM program and leadership in the Smart Metering initiative were cited as key factors contributing to our ranking of third among utilities. This magazine also recognized us as Canada's most diverse utility and ranked us fifth overall in corporate Canada, based on the composition of our Board, senior executives and the company's practices and policies on diversity. In addition, Hydro One was selected as the recipient of the Utility Planning Network's 2007 Metering Award in the category of Automated Meter Reading Initiative – North American Municipal or Cooperative among numerous entries from around the globe.

Consistent with our continued commitment to the public interest and the Province's energy policies, we are planning significant investments in transmission infrastructure and the continued proactive maintenance of our assets to ensure the electricity system's reliability. Our transmission investment plan supports the achievement of the Province's renewable and nuclear objectives, facilitates the development and use of renewable energy resources, promotes system efficiency, sustains equipment performance, meets customers' service quality needs, and facilitates the integration of new supply.

In its transmission rate decision issued on August 16, 2007, the OEB approved our entire operation, maintenance and administration and capital work programs applied for in 2007 and 2008, expressing confidence in our ability and expertise to make an appropriate assessment of what is needed "to maintain a robust, safe, and reliable transmission system". However, the decision was not favourable in other areas such as the approved return on equity. We plan to file a transmission rate application for 2009 and 2010 rates. These rates, if approved, should provide the funding required to maintain and meet the infrastructure requirements of the transmission system in the public interest.

Our investment plan does not include spending for large scale investments, such as the east-west transmission grid or potential long-term transmission projects identified in the IPSP. For certain long-term projects addressing generation-enabling connection lines and reliability of local area supply, the IPSP recommends that project development work (preliminary engineering, cost estimating, options assessment, and Environmental Assessment and Section 92 approvals, as required) begin upon approval of the IPSP by the OEB. As such, we would be prepared to initiate project development work for these projects to enable expedited construction once a need date is confirmed by the OPA and once we have a reasonable expectation of cost recovery through rates. For some projects such as the transmission connection for generation in the Nipigon area, the IPSP recommends that development work commence in 2008. It is anticipated that the final decision to proceed with the longer term major projects, such as new high voltage transmission lines from north to south, will be made when the next IPSP is prepared in about three years.

The 2006 distribution rate decision has provided a base funding level to build upon. The 2008 Cost of Service application supports the implementation of our Smart Meter Program, and enhances sustainment programs to improve reliability and customer service. In 2007, an OEB decision clarified the recoverability of costs associated with the minimum level of smart meter functionality, thereby reducing the uncertainty of recovery of this program. Smart meter costs in excess of minimum functionality will be reviewed as part of the 2008 Cost of Service hearing. Given the magnitude and unique nature of the Smart Meter Program, recovery of costs will be a key focus. In addition, the distribution investment plan does not provide for the implementation of a Smart Network, which would leverage the smart meter technology to enable further internal productivity initiatives through wireless broadband.

We remain committed to a prudent and measured approach to distribution rationalization. In October 2006, the Government announced a two-year exemption of the electricity transfer tax. We will consider and respond to opportunities for acquisitions or divestitures, on a voluntary and commercial basis, where they are consistent with our strategy and direction from our shareholder. The investment plan does not include any funding for any LDC acquisitions or divestitures.

Key enablers of the successful implementation of the work program are our human and material resourcing strategies. Our human resource strategy is focused on hiring through partnering with universities, colleges and our unions, as well as skills development and retention. Significant retirement projections and increasing work volumes will result in an unprecedented number of new hires in the near-term. With regard to materials, we are seeing increasing lead times and costs as market shortages emerge globally. Consequently, sourcing strategies are being developed and implemented to ensure availability of materials to support the work programs.

Through the outlook period, we anticipate no changes to our role within the industry and that our financial returns will be sufficient to maintain our credit quality. In November 2007 the Agency Review Panel issued the second phase of its report on Ontario's provincially-owned electricity agencies. The report confirmed that, overall, Ontario's electricity sector and the provincial agencies within it are functioning reasonably well. We do not anticipate any structural changes to our company.

FORWARD LOOKING STATEMENTS AND INFORMATION

Our oral and written public communications, including this MD&A, often contain forward-looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to statements about our strategy; statements related to the IPSP and projects flowing therefrom; statements about smart meters including costs, cost recovery and deployment and/or implementation plans; expectations regarding the timing, content and impact of future applications and decisions related to our transmission and distribution businesses; the anticipated results on our business processes and productivity as a result of our business systems and processes project; the anticipated impact of CDM programs; statements regarding the reliability of our distribution and transmission systems; expectations regarding load growth and new generation; expectations regarding developments in the statutory and operating framework for electricity distribution and transmission in Ontario including changes to codes, licenses, rates, rate orders, cost recovery, rates of return, rate structures and revenue requirements in both our transmission and distribution businesses and the timing of decisions from the OEB; statements regarding future capital expenditures and our investment plans; expectations regarding the results of our on-going and planned projects; expectations regarding our strategy for acquisitions or divestitures of distribution assets; expectations regarding future pension contributions; expectations regarding workforce demographics; expectations regarding environmental expenditures and other environmental matters including the need for environmental approvals and assessments; expectations regarding borrowing requirements; expectations regarding anticipated expenditures associated with transferring assets located on Indian lands; statements regarding provincial ownership of our transmission corridors; the estimated impact of changes in the forecast long-term Government of Canada bond yield (used in determining our regulated rate of return) on our results of operations; the estimated impact of changes in interest rates on our results of operations; statements about employee future benefit costs; statements about emerging accounting pronouncements; statements about the outlook period including our expectations regarding our role within the industry, our financial returns, and structural changes to our company. Words such as "expect," "anticipate," "intend," "attempt," "may," "plan," "will", "believe," "seek," "estimate," and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward-looking statements, except as required by law.

These forward-looking statements are based on a variety of factors and assumptions including, but not limited to the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; no unfavourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; no unforeseen changes in rate orders or rate structures for our distribution and transmission businesses; a stable regulatory environment; and no significant event occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the content of the final IPSP, as approved by the OEB;
- delays or denials of the requisite approvals and accommodations for our planned projects;
- the risks associated with being controlled by the Province including potential conflicts of interest that may arise between us, the Province and related parties;
- the risks related to our work force demographic and our potential inability to attract and retain qualified personnel;
- the risks associated with being subject to extensive regulation including risks associated with OEB action or inaction;

- regulatory decisions regarding our revenue requirements, cost recovery and rates;
- the potential impact of CDM programs on our load and our revenues;
- the potential impact of not being able to recover all of our project costs associated with the installation of smart meters;
- unanticipated changes in electricity demand or in our costs;
- the risks associated with the execution of our capital and operation, maintenance and administration programs necessary to maintain the performance of our aging asset base;
- the risk to our facilities posed by severe weather conditions, natural disasters or catastrophic events and our limited insurance coverage for losses resulting from these events;
- the risk that we may incur significant costs associated with transferring assets located on Indian lands;
- the inability to negotiate collective agreements consistent with our rate orders or in a timely fashion and the potential for labour disputes;
- the potential for substantial and currently undetermined environmental costs and liabilities;
- the risks associated with maintaining a complex information technology systems infrastructure and transitioning most of our financial and business processes to an integrated business and financial reporting system;
- the potential that we may incur significant expenses to replace some or all of the functions currently outsourced if our agreement with Inergi LP is terminated;
- the impact of the ownership by the Province of lands underlying our transmission system;
- the potential impact of not being able to recover our pension costs;
- the risk that we are not able to arrange sufficient cost effective financing to repay maturing debt and to fund capital expenditures and other obligations;
- the risks of counter-party default on our outstanding derivative contracts;
- the risks associated with changes in interest rates; and
- the risks associated with changes in the forecast long-term Government of Canada bond yield.

We caution the reader that the above list of factors is not exhaustive. Some of these and other factors are discussed in more detail under “Risk Management and Risk Factors” in this MD&A. You should review the section entitled “Risk Management and Risk Factors” in detail.

This MD&A is dated as at February 13, 2008. Additional information about our company, including our Annual Information Form, is available on SEDAR at www.sedar.com.

HYDRO ONE INC.
MANAGEMENT'S REPORT

The Consolidated Financial Statements, Management's Discussion and Analysis ("MD&A") and related financial information presented in this Annual Report have been prepared by the management of Hydro One Inc. ("Hydro One" or the "Company"). Management is responsible for the integrity, consistency and reliability of all such information presented. The Consolidated Financial Statements have been prepared in accordance with accounting principles generally accepted in Canada and applicable securities legislation. The MD&A has been prepared in accordance with National Instrument 51-102, Part 5.

The preparation of the Consolidated Financial Statements and information in the MD&A involves the use of estimates and assumptions based on management's judgement, particularly when transactions affecting the current accounting period cannot be finalized with certainty until future periods. Estimates and assumptions are based on historical experience, current conditions and various other assumptions believed to be reasonable in the circumstances, with critical analysis of the significant accounting policies followed by the Company as described in Note 2 to the Consolidated Financial Statements. The preparation of the Consolidated Financial Statements and the MD&A includes information regarding the estimated impact of future events and transactions. The MD&A also includes information regarding sources of liquidity and capital resources, operating trends, risks and uncertainties. Actual results in the future may differ materially from the present assessment of this information because future events and circumstances may not occur as expected. The Consolidated Financial Statements and MD&A have been properly prepared within reasonable limits of materiality and in light of information up to February 13, 2008.

In meeting its responsibility for the reliability of financial information, management maintains and relies on a comprehensive system of internal control and internal audit. The system of internal control includes a written corporate conduct policy; implementation of a risk management framework; effective segregation of duties and delegation of authorities; and sound and conservative accounting policies that are regularly reviewed. This structure is designed to provide reasonable assurance that assets are safeguarded and that reliable information is available on a timely basis. In addition internal and disclosure controls have been documented, evaluated, tested and identified consistent with Multilateral Instrument 52-109 (Bill 198). An internal audit function independently evaluates the effectiveness of these internal controls on an ongoing basis and reports its findings to management and the Audit and Finance Committee of the Hydro One Board of Directors.

The Consolidated Financial Statements have been examined by Ernst & Young LLP, independent external auditors appointed by the Hydro One Board of Directors. The external auditors' responsibility is to express their opinion on whether the Consolidated Financial Statements are fairly presented in accordance with accounting principles generally accepted in Canada. The Auditors' Report, which appears on page 28, outlines the scope of their examination and their opinion.

The Hydro One Board of Directors, through its Audit and Finance Committee, is responsible for ensuring that management fulfills its responsibilities for financial reporting and internal controls. The Audit and Finance Committee of Hydro One met periodically with management, the internal auditors, and the external auditors to satisfy itself that each group had properly discharged its respective responsibility and to review the Consolidated Financial Statements before recommending approval by the Board of Directors. The external auditors had direct and full access to the Audit and Finance Committee, with and without the presence of management, to discuss their audit and their findings as to the integrity of the financial reporting and the effectiveness of the system of internal controls.

The Company's President and Chief Executive Officer, and Chief Financial Officer have certified Hydro One's annual Consolidated Financial Statements and annual MD&A filed under provincial securities legislation, related disclosure controls and procedures, and the design of related internal controls over financial reporting pursuant to Multilateral Instrument 52-109.

On behalf of Hydro One Inc.'s management:

Laura Formusa
President and Chief Executive Officer

Beth Summers
Chief Financial Officer

HYDRO ONE INC.
AUDITORS' REPORT

To the Shareholder of Hydro One Inc.

We have audited the Consolidated Balance Sheets of Hydro One Inc. (the Company) as at December 31, 2007 and December 31, 2006, and the Consolidated Statements of Operations, Retained Earnings and Cash Flows of the Company for each of the years in the two-year period ended December 31, 2007. These financial statements are the responsibility of the Company's management. Our responsibility is to express an opinion on these financial statements based on our audits.

We conducted our audits in accordance with Canadian generally accepted auditing standards. Those standards require that we plan and perform an audit to obtain reasonable assurance whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation.

In our opinion, these Consolidated Financial Statements present fairly, in all material respects, the financial position of the Company as at December 31, 2007 and December 31, 2006 and the results of its operations and its cash flows for each of the years in the two-year period ended December 31, 2007 in accordance with Canadian generally accepted accounting principles.

1. DESCRIPTION OF THE BUSINESS

Hydro One Inc. (Hydro One or the Company) was incorporated on December 1, 1998, under the *Business Corporations Act* (Ontario) and is wholly owned by the Province of Ontario (the Province). The principal businesses of Hydro One are the transmission and distribution of electricity to customers within Ontario. These businesses are regulated by the Ontario Energy Board (OEB).

2. SIGNIFICANT ACCOUNTING POLICIES

Basis of Consolidation

The Consolidated Financial Statements include the accounts of the Company and its wholly-owned subsidiaries: Hydro One Networks Inc. (Hydro One Networks), Hydro One Remote Communities Inc., Hydro One Brampton Inc., Hydro One Brampton Networks Inc. (Hydro One Brampton), Hydro One Telecom Inc., Hydro One Delivery Services Company Inc. and Hydro One Network Services Inc.

Hydro One Brampton Inc. was dissolved on January 30, 2007. Hydro One Network Services Inc. was dissolved on December 14, 2006. Hydro One Delivery Services Inc. will be dissolved pursuant to the *Business Corporations Act* (Ontario).

Basis of Accounting

The Consolidated Financial Statements are prepared in accordance with accounting principles generally accepted in Canada (Canadian GAAP).

Rate-setting

The rates of the Company's electricity transmission and distribution businesses are subject to regulation by the OEB. In October 2005, the OEB initiated a proceeding to review Hydro One Network's transmission rates and to approve revenue requirements for 2006, 2007 and 2008 based on cost of service regulation. On February 21, 2006, the OEB announced a decision to apply an earnings sharing mechanism (ESM) to equally share, between Hydro One's shareholder and its customers, any transmission earnings in excess of the approved rate of return of 9.88% for the period January 1, 2006 until new transmission rates were set.

In September 2006, Hydro One Networks filed a transmission rate application. On March 30, 2007, prior to their decision on our transmission rate application, the OEB issued a decision ordering that the transmission ESM cease effective December 31, 2006. The decision also approved the concept of establishing a new revenue difference deferral account (RDDA) to record the revenue differential between existing transmission rates and the new rates that were anticipated to be approved later in the year, for the period commencing January 1, 2007.

On August 16, 2007, the OEB issued its decision in respect of Hydro One Networks' 2007 and 2008 transmission rate application. The decision, which was effective January 1, 2007, approved all operating and capital expenditures for 2007 and 2008. However, the decision resulted in a reduction in the approved return on equity from 9.88% to 8.35%. The OEB also approved final amounts and disposition treatments for certain regulatory liabilities including: the RDDA, the ESM and export and wheeling fees, as well as the transmission market ready regulatory asset.

The Company's distribution rates are also based on a revenue requirement that includes a rate of return. On April 12, 2006, the OEB announced its decision regarding the Company's rate applications in respect of the distribution businesses of Hydro One Networks and Hydro One Brampton. On the basis of the written evidence submitted, the OEB approved the requested increase in the revenue requirement based on a reduction in the approved rate of return, from a targeted 9.88% to 9.00%, effective May 1, 2006.

In 2006, the OEB commenced a process of establishing an Incentive Regulation Mechanism (IRM) for the years 2007 to 2010. The process includes a formulaic approach to establishing 2007 rates with a rate rebasing approach to be staggered across all Ontario distributors between 2008 and 2010. Hydro One Networks and Hydro One Brampton applied for marginal distribution rate adjustments in February 2007, based on an OEB-approved formula that considers inflation, efficiency targets and significant events outside the control of management. In April 2007, the OEB approved the Company's submissions on the basis of its cost of capital and second generation IRM policies, and the revised rates were implemented effective May 1, 2007.

Hydro One Networks submitted the revenue requirement portion of its 2008 cost of service application in accordance with the OEB's multi-year distribution rate-setting plan on August 15, 2007. This application seeks the approval of a revenue requirement of $1,067 million based on a return of 8.64% for 2008. On December 18, 2007, Hydro One Networks filed the details of its cost allocation and rate design proposals, which include a plan to reduce the number of rate classes for its customers and consolidate or harmonize the rates for its existing rate classes to the new proposed rate classes. Based on the OEB's processing guidelines, a decision is anticipated in the Fall of 2008. On November 1, 2007, Hydro One Brampton filed an application for 2008 rates on the basis of the OEB's cost of capital and second generation IRM policies.

The OEB has the general power to include or exclude costs, revenues, losses or gains in the rates of a specific period, resulting in a change in the timing of accounting recognition from that which would have applied in an unregulated company. Such change in timing involves the application of rate regulated accounting, giving rise to the recognition of regulatory assets and liabilities. The Company's regulatory assets represent certain amounts receivable from future customers and costs that have been deferred for accounting purposes because it is probable that they will be recovered in future rates. In addition, the Company has recorded regulatory liabilities which represent amounts for expenses incurred in different periods than would be the case had the Company been unregulated. The Company continually assesses the likelihood of recovery of each of its regulatory assets and continues to believe that it is probable that the OEB will factor its regulatory assets and liabilities into the setting of future rates. If, at some future date, the Company judges that it is no longer probable that the OEB will include a regulatory asset or liability in future rates, the appropriate carrying amount will be reflected in results of operations in the period that the assessment is made. Specific regulatory assets and liabilities are disclosed in Note 7.

Revenue Recognition and Allocation

Transmission revenues are collected through OEB-approved rates, which are based on an approved revenue requirement that includes a rate of return. Such revenue is recognized as power is transmitted and delivered to customers.

Distribution revenues attributable to the delivery of electricity are based on OEB-approved distribution rates and are recognized as electricity is delivered to customers. The Company estimates the monthly revenue for the period based on wholesale power purchases because customer meters are not generally read at the end of each month. Unbilled revenue included within accounts receivable as at December 31, 2007 amounted to $413 million (2006 - $386 million).

Distribution revenue also includes an amount relating to rate protection for rural residential and remote customers, which is received from the Independent Electricity System Operator (IESO) based on a standardized customer rate that is approved by the OEB. The current legislation provides rate protection for prescribed classes of rural residential and remote consumers by reducing the electricity rates that would otherwise apply.

Segment revenues for transmission, distribution and other also include revenue related to sales of other services and equipment. Such revenue is recognized as services are rendered or as equipment is delivered.

Corporate Income and Capital Taxes

Under the *Electricity Act, 1998*, Hydro One is required to make payments in lieu of corporate taxes to the Ontario Electricity Financial Corporation (OEFC). These payments are calculated in accordance with the rules for computing income and taxable capital and other relevant amounts contained in the *Income Tax Act* (Canada) and the *Corporations Tax Act* (Ontario) as modified by the *Electricity Act*, *1998*, and related regulations.

The Company provides for payments in lieu of corporate income taxes relating to its regulated businesses using the taxes payable method as directed by the OEB. Under the taxes payable method, no provisions are made for future income taxes as a result of temporary differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from the customers of Hydro One at that time. The Company provides for payments in lieu of corporate income taxes relating to its unregulated businesses using the liability method.

Materials and Supplies

Materials and supplies represent spare parts and construction material held for internal construction and maintenance of fixed assets. These assets are carried at lower of average cost or net realizable value.

Fixed Assets

Fixed assets are capitalized at cost which comprises materials, labour, engineering costs, overheads, depreciation on service equipment and the OEB-approved allowance for funds used during construction applicable to capital construction activities within regulated businesses, or interest applicable to capital construction activities within unregulated businesses.

Fixed assets in service consist of transmission, distribution, communication, administration and service assets and easements. Fixed assets also include future use assets such as land and capitalized development costs associated with deferred capital projects.

Some of the Company's transmission and distribution assets, particularly those located on unowned easements and rights-of-way, may have asset retirement obligations, conditional or otherwise. The majority of the Company's easements and rights-of-way are either of perpetual duration or are automatically renewed annually. Land rights with finite terms are generally subject to extension or renewal. As the Company expects to use the majority of its installed assets for an indefinite period, no removal date can be determined and consequently a reasonable estimate of the fair value of most asset retirement obligations cannot be made at this time. If, at some future date, it becomes possible to estimate the fair value cost of disposing of assets that the Company is legally required to remove, a related asset retirement obligation will be recognized at that time.

Transmission

Transmission assets include assets used for the transmission of high-voltage electricity, such as transmission lines, support structures, foundations, insulators, connecting hardware and grounding systems, and assets used to step up the voltage of electricity from generating stations for transmission and to step down voltages for distribution, such as transformers, circuit breakers and switches.

Distribution

Distribution assets comprise assets related to the distribution of low-voltage electricity, including lines, poles, switches, transformers, protective devices and metering systems.

Communication

Communication assets include the fibre-optic and microwave radio system, optical ground wire, towers, telephone equipment and associated buildings.

Administration and Service

Administration and service assets include administrative buildings, major computer systems, personal computers, transport and work equipment, tools, vehicles and minor fixed assets.

Easements

Easements include statutory rights of use to transmission corridors and abutting lands granted under the *Reliable Energy and Consumer Protection Act, 2002*, as well as other amounts related to access rights.

Construction in Progress

Overhead costs, including corporate functions and services costs, are capitalized on a fully allocated basis, consistent with an OEB-approved methodology. Financing costs are capitalized on fixed assets under construction based on the OEB's approved allowance for funds used during construction (2007 – 5.20%; 2006 – 6.39%).

Depreciation

The capital costs of fixed assets are depreciated on a straight-line basis, except for transport and work equipment, which are depreciated on a declining balance basis.

Effective January 1, 2007, the Company prospectively revised its fixed asset depreciation rates resulting from a periodic external review required by the OEB. The estimated impact of the change in rates is a reduction in depreciation expense of approximately $7 million per annum. A summary of the new rates for the various classes of assets is included below:

	Depreciation rates (%)	
	Range	Average
Transmission	1% - 4%	2%
Distribution	1% - 13%	2%
Communication	1% - 13%	5%
Administration and service	1% - 20%	8%

Depreciation rates for easements are based on their contract life. The majority of easements are held in perpetuity and are not depreciated.

In accordance with group depreciation practices, the original cost of normal fixed asset retirements is charged to accumulated depreciation, with no gain or loss reflected in results of operations. Gains and losses on sales of fixed assets and losses on premature retirements are charged to results of operations as adjustments to depreciation expense. Depreciation expense also includes the costs incurred to remove fixed assets.

The estimated service lives of fixed assets are subject to periodic review. Any changes arising from such a review are implemented on a remaining service life basis consistent with their inclusion in rates.

Goodwill

Goodwill represents the cost of acquired local distribution companies in excess of fair value of the net identifiable assets purchased and is evaluated for impairment on an annual basis, or more frequently if circumstances require. Goodwill impairment is assessed based on a comparison of the fair value of the reporting unit to the underlying carrying value of the reporting unit's net assets, including goodwill, with any write-down of the carrying value of goodwill being charged against the results of operations.

The Company has determined that goodwill is not impaired. All of the goodwill is attributable to the distribution business segment.

Discounts and Premiums on Debt

Discounts and premiums are amortized over the period of the related debt using the effective interest method.

Financial Instruments

Effective January 1, 2007, the Company adopted four new accounting standards comprising the following sections of the Handbook of the Canadian Institute of Chartered Accountants (CICA): 1530, *Comprehensive Income*; 3855, *Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation;* and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that were recorded in opening accumulated other comprehensive income (AOCI) as described below, consistent with the CICA Handbook sections. The comparative annual Consolidated Financial Statements have not been restated. The principal changes in the accounting for financial instruments and hedges due to the adoption of these accounting standards are described below.

Comprehensive Income

Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of net unamortized hedging losses on discontinued cash flow hedges, and the change in fair value on existing cash flow hedges. The impact of the amortization of net hedging losses that were discontinued prior to the transition date was immaterial to the Statement of Operations.

Financial Assets and Liabilities

Under the new standards, all financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. All financial instruments, including derivatives, are carried at fair value on the Consolidated Balance Sheet except for loans and receivables, held-to-maturity investments and other financial liabilities, which are measured at amortized cost. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in financing charges in the period in which they arise. Available-for-sale financial instruments are measured at fair value with revaluation gains and losses included in OCI until the instrument is derecognized or impaired. The Company has classified its financial instruments as follows:

Short-term investments	Held-to-maturity
Long-term accounts receivable	Loans and receivables
Bank indebtedness	Other liabilities
Short-term notes payable	Other liabilities
Long-term debt (excluding MTN Series 8 Note)	Other liabilities
MTN Series 8 Note	Designated as held-for-trading

The MTN Series 8 Note is a step-up coupon note with extendable maturity dates up to 2011. (See Notes 8 and 9)

Where there is an economic hedge, as in the case of the MTN Series 8 note and associated interest rate swap, the Company has applied the fair value option without hedge accounting. The impact was not material.

All financial instrument transactions are recorded at trade date.

Derivatives and Hedge Accounting

All derivative instruments, including embedded derivatives, are carried at fair value on the Consolidated Balance Sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. The impact of the change in the accounting policy related to embedded derivatives was not material.

The Company does not engage in derivative trading or speculative activities.

The Company periodically develops hedging strategies for execution taking into account risk management objectives. At the inception of a hedging relationship, the Company documents the relationship between the hedging instrument and the hedged item. This would include linking all derivatives to specific assets and liabilities on the Consolidated Balance Sheet or to specific firm commitments or forecasted transactions. The Company would also assess, both at the inception of the hedge and on an ongoing basis, whether the derivatives that are used are effective in offsetting changes in fair values or cash flows of hedged items.

Upon adoption of the new standards, the Company reclassified unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to AOCI. The hedging losses are amortized to financing charges using the effective interest method over the term of the hedged debt.

Transaction Costs

Transaction costs for financial assets and liabilities that are other than held-for-trading, are added to the carrying value of the asset or liability and then amortized over the expected life of the instrument using the effective interest method. The impact of the change in amortization basis from an annuity method to the effective interest method was not material.

Employee Future Benefits

Employee future benefits provided by Hydro One include pension, group life insurance, health care and long-term disability.

In accordance with the OEB’s rate orders, pension costs are recorded when employer contributions are paid to the pension fund in accordance with the *Pension Benefits Act* (Ontario). Actuarial valuations are conducted at least every three years. Pension costs are also calculated on an accrual basis. Pension costs are actuarially determined using the projected benefit method prorated on service and based on assumptions that reflect management’s best estimate of the effect of future events, including future compensation increases, on the actuarial present value of accrued pension benefits. Pension plan assets, consisting primarily of listed equity securities as well as corporate and government debt securities, are valued using fair values. Past service costs from plan amendments and all actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefits other than pension are recorded on an accrual basis. Costs are determined by independent actuaries using the projected benefit method prorated on service and based on assumptions that reflect management’s best estimates. Past service costs from plan amendments and actuarial gains or losses are amortized on a straight-line basis over the expected average remaining service life of the employees covered.

Employee future benefit costs are attributed to labour and charged to operations or capitalized as part of the cost of fixed assets.

Environmental Costs

Hydro One recognizes a liability for estimated future expenditures associated with the assessment and remediation of contaminated lands and for the phase-out and destruction of polychlorinated biphenyl (PCB) contaminated mineral oil from electrical equipment, based on the net present value of these estimated future expenditures. As the Company anticipates that the related expenditures will continue to be recoverable in future rates, a regulatory asset has been recognized to reflect the future recovery of these costs from customers. Hydro One reviews its estimates of future environmental expenditures on an ongoing basis.

Use of Estimates

The preparation of financial statements in conformity with Canadian GAAP requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and the disclosure of contingent assets and liabilities at the date of the financial statements, and the reported amounts of revenues and expenses for the year. Actual results could differ from estimates, including changes as a result of future decisions made by the OEB or the Province.

3. DEPRECIATION AND AMORTIZATION

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Depreciation of fixed assets in service	384	379
Fixed asset removal costs	39	41
Amortization of regulatory and other assets	98	95
	521	515

4. FINANCING CHARGES

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Interest on short-term notes payable	4	2
Interest on long-term debt payable	308	296
Amortization of debt discount	5	27
Other	7	9
Less: Interest capitalized on construction in progress	(24)	(28)
Interest accreted on regulatory accounts	-	(7)
Interest earned on investments	(5)	(4)
	295	295

5. PROVISION FOR PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

The provision for payments in lieu of corporate income taxes (PILs) differs from the amount that would have been recorded using the combined Canadian Federal and Ontario statutory income tax rate. A reconciliation between the statutory and effective tax rates is provided as follows:

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Income before provision for PILs	604	634
Federal and Ontario statutory income tax rate	36.12%	36.12%
Provision for PILs at statutory rate	218	229
Increase (decrease) resulting from:		
Net temporary differences:		
Transmission amounts received but not recognized for accounting purposes	25	12
Retail settlement variance accounts	17	2
Pension contributions in excess of pension expense	(13)	(16)
Overheads capitalized for accounting but deducted for tax purposes	(12)	(11)
Interest capitalized for accounting purposes but deducted for tax purposes	(9)	(13)
Capital cost allowance in excess of depreciation and amortization	(9)	(3)
Employee future benefits other than pension expense in excess of cash payments	7	14
Environmental expenditures	(4)	(6)
Recovery of PILs related to prior years	-	(30)
Other	(5)	2
Net temporary differences	(3)	(49)
Net permanent differences	(10)	(1)
Provision for PILs	205	179
Effective income tax rate	33.94%	28.23%

In 2006, Hydro One recognized a tax benefit of approximately $30 million in respect of a recovery of PILs from prior years following a successful appeal allowing a deduction for certain overhead costs that had been previously capitalized.

Future income taxes relating to the regulated businesses have not been recorded in the accounts as they are expected to be recovered through future revenues. As at December 31, 2007, future income tax liabilities of $253 million (2006 - $281 million), based on substantively enacted income tax rates, have not been recorded. In the absence of rate regulated accounting, the Company's provision for PILs would have been recognized using the liability method rather than the taxes payable method. As a result, the provision for PILs would have been lower by approximately $28 million (2006 – higher by $16 million), including the impact of a change in substantively enacted tax rates.

Future income taxes relating to the non-regulated businesses have also not been recorded in the accounts as they have not met the criterion of "more likely than not" to be realized. As at December 31, 2007, future income tax assets of $4 million (2006 - $4 million), based on substantively enacted income tax rates, have not been recorded.

6. FIXED ASSETS

December 31 (Canadian dollars in millions)	Fixed Assets in Service	Accumulated Depreciation	Construction in Progress	Total
2007				
Transmission	8,708	3,152	370	5,926
Distribution	5,902	2,133	115	3,884
Communication	739	305	58	492
Administration and service	978	556	79	501
Easements	485	74	-	411
	16,812	6,220	622	11,214
2006				
Transmission	8,293	3,024	359	5,628
Distribution	5,651	2,129	86	3,608
Communication	822	383	18	457
Administration and service	989	583	5	411
Easements	483	61	-	422
	16,238	6,180	468	10,526

Financing costs are capitalized on fixed assets under construction, including allowance for funds used during construction on regulated assets and interest on unregulated assets, and were $24 million in 2007 (2006 - $28 million).

7. REGULATORY ASSETS AND LIABILITIES

Regulatory assets and liabilities arise as a result of the rate-making process. Hydro One has recorded the following regulatory assets and liabilities:

December 31 (Canadian dollars in millions)	**2007**	**2006**
Regulatory assets:		
Regulatory asset recovery account II	66	87
Environmental	65	70
Employee future benefits other than pension	42	84
Regulatory asset recovery account I	19	58
Market ready	13	-
Smart meters	4	10
Other	4	2
Total regulatory assets	213	311
Less: current portion	103	121
	110	190
Regulatory liabilities:		
Deferred pension	380	382
Revenue difference deferral account	73	-
Retail settlement variance accounts	50	2
Export and wheeling fees	38	49
Transmission earnings sharing mechanism	28	34
Other	14	6
Total regulatory liabilities	583	473
Less: current portion	114	-
	469	473

Regulatory assets

Regulatory asset recovery account II (RARA II)

On April 12, 2006, the OEB announced its decision regarding the Company's rate application in respect of the distribution business of Hydro One Networks. As part of this decision, the OEB also approved the distribution-related deferral account balances sought by Hydro One. The OEB ordered that the approved balances be recovered on a straight-line basis over a four year period from May 1, 2006 to April 30, 2010. The RARA II includes retail settlement and cost variance amounts and distribution low-voltage service amounts, plus accrued interest. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $23 million (2006 - $16 million). In addition, related financing charges would have been higher by $3 million (2006 - $5 million).

Environmental

Hydro One records a liability for the estimated future expenditures required to remediate past environmental contamination. Because such expenditures are expected to be recoverable in future rates, the Company has recognized an equivalent amount as a regulatory asset. This regulatory asset is expected to be amortized to results of operations on a basis consistent with the pattern of actual expenditures expected to be incurred up to the year 2030. The OEB has the discretion to examine and assess the prudence and the timing of recovery of all of Hydro One's future regulatory expenditures. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $12 million (2006 - $17 million).

Employee future benefits other than pension

Employee future benefits other than pension are recorded using the accrual method as required by Canadian GAAP. The OEB has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period. As a result, in 1999 Hydro One recorded a regulatory asset, with an original balance of $419 million, to reflect this regulatory treatment. This regulatory asset has a remaining recovery period of 1 year (2006 - 2 years) and does not earn a return. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $42 million (2006 - $42 million).

Regulatory asset recovery account I (RARA I)

On December 9, 2004, the OEB issued a decision on the prudence of the distribution related deferral account balances for which recovery was sought by Hydro One in its May 31, 2004 application. Amounts for which recovery was approved represented balances incurred prior to December 31, 2003, plus associated interest. The OEB ordered that the approved amounts be aggregated into a single regulatory account to be recovered on a straight-line basis over the period ending April 30, 2008. Hydro One Networks has requested an extension of the period for the RARA I recovery until such time as new rates are implemented. The RARA I includes distribution business low-voltage services amounts, deferred environmental expenditures incurred in 2001 and 2002, deferred market ready expenditures, retail settlement variance amounts, and other amounts primarily consisting of accrued interest. Any over or under recovery of the RARA I due to continuance of the rate rider will be tracked for disposition at a future date. In the absence of rate regulated accounting, amortization expense in 2007 would have been lower by $20 million (2006 - $20 million). In addition, related financing charges would have been higher by $1 million (2006 - $3 million).

Market ready

In September 2006, as part of its transmission rate application, Hydro One Networks applied for the recovery of various regulatory deferral accounts including the transmission market ready costs incurred in connection with market opening. The transmission related transition-costs were incurred to meet IESO requirement associated with registration and authorization activities. On August 16, 2007, as a result of the oral and written evidence the OEB approved the recovery of substantially all of these costs. Consequently, the market ready regulatory asset was established and recovery is being factored into rates over the four-year period ending December 31, 2010. In the absence of rate regulated accounting, operation, maintenance and administration expense would have been higher by $16 million (2006 - $nil) and revenue would have been higher by $4 million (2006 - $nil).

Smart meters

On March 21, 2006, the OEB approved the establishment of regulatory deferral accounts for smart meter-related expenditures and a monthly customer charge of 27 cents and 28 cents per metered customer for Hydro One Networks and Hydro One Brampton, respectively, was reflected in Hydro One's revenue requirement. Consistent with the OEB's direction and pending further guidance, the Company recognized a regulatory asset consisting of the net balance of capital and operating expenditures for smart meters less recoveries received from customers. In April 2007, as part of its decision regarding the Company's 2007 distribution rate applications, the OEB increased the monthly customer charge effective May 1, 2007 to 93 cents and 67 cents per metered customer for Hydro One Networks and Hydro One Brampton, respectively.

On August 8, 2007, the OEB issued a decision on its combined proceeding to determine recoverability of expenditures incurred by distributors. Expenditures associated with the minimum functionality for advanced metering infrastructure incurred by Hydro One Networks and Hydro One Brampton were approved for recovery. As a result of this decision, smart meter expenditures are no longer deferred as regulatory assets. Such expenditures are now classified as capital or are charged to results of operations consistent with the Company's standard accounting practices. Expenditures determined to be above the minimum functionality have been brought forward for review in Hydro One Networks cost of service rate application filed in 2007.

The OEB decision also required that related revenues be based upon a calculated revenue requirement specific to smart meters. As a result, the carrying value of the smart meter regulatory asset account represents the difference between revenue recorded on this basis and actual recoveries received under existing rate adders. In the absence of rate regulated accounting, year-to-date operation, maintenance and administration expense would have been lower by $3 million (2006 – higher by $4 million) and revenues would have been lower by $2 million (2006 – higher by $2 million).

Regulatory liabilities

Deferred pension

In accordance with the OEB's 1999 transitional rate order, pension costs are recorded in results of operations when employer contributions are paid into the pension plan. The Company's deferred pension asset represents the cumulative difference between employer contributions and pension costs and the deferred pension regulatory liability results from the Company's recognition, as the result of OEB direction, of revenues and expenses in different periods than would be the case for an unregulated enterprise. In the absence of rate regulated accounting, operating, maintenance and administration expense would have been higher by $1 million (2006 - $50 million).

Revenue difference deferral account (RDDA)

On March 30, 2007, the OEB issued a decision approving the establishment of the RDDA to record the revenue differential between existing transmission rates and the new rates that were anticipated to be approved later in the year. The new deferral account was to represent the revenue differential between existing and future rates for the period commencing January 1, 2007. On August 16, 2007, in its decision on Hydro One Networks' 2007 and 2008 transmission rates, the OEB approved final amounts and disposition treatments for the RDDA liability, which will be returned to customers over the fourteen-month period ending December 31, 2008.

Retail settlement variance accounts (RSVA)

Hydro One has deferred certain retail settlement variance amounts under the provisions of Article 490 of the OEB's *Accounting Procedures Handbook*. The OEB's December 9, 2004 decision allowed for recovery of retail settlement variance amounts accumulated prior to December 31, 2003, inclusive of interest, within the RARA I. The OEB's April 12, 2006 decision allowed for recovery of retail settlement variance amounts accumulated since January 1, 2004 and forecasted through to April 30, 2006, inclusive of interest, within the RARA II. The Company has accumulated a net liability in its RSVA since May 1, 2006 which was taken into consideration in the revenue requirement of Hydro One Networks as part of the 2008 distribution rate application filed with the OEB in December 2007.

Export and wheeling fees

Consistent with the IESO's Market Rules, an export and wheeling fee is collected by the IESO and remitted to Hydro One at the rate of $1 per MWh on electricity exported outside of Ontario. The amounts collected in respect of these export and wheeling fees, plus interest, were taken into consideration in the revenue requirement of Hydro One's transmission business as part of the Company's transmission rate application filed with the OEB in September 2006. On August 16, 2007, the OEB issued its decision in respect of the Company's transmission rate application and approved final amounts and disposition treatments for the export wheeling fees. The export wheeling fees will be factored into rates over a four-year period ending December 31, 2010.

Transmission earnings sharing mechanism (ESM)

On February 21, 2006, the OEB issued a decision that established an ESM to equally share, between the Company's shareholder and ratepayers, any transmission earnings in excess of the approved rate of return of 9.88%, for the period January 1, 2006 until new transmission rates were set. Consequently, 50% of the Company's excess earnings were deferred as a regulatory liability. On March 30, 2007, the OEB issued a decision ordering that the transmission ESM cease effective December 31, 2006. The ESM was taken into consideration in setting the revenue requirement of Hydro One Networks for 2007 and 2008. On August 16, 2007, in its decision on Hydro One Networks 2007 and 2008 transmission rates, the OEB approved final amounts and disposition treatments for the ESM which will be returned to customers over a fourteen-month period ending December 31, 2008.

8. DEBT

December 31 (Canadian dollars in millions)	**2007**	**2006**
Short-term notes payable	-	60
Long-term debt:

5.00% notes due 2046	75	75
	5,615	5,270
Less: Long-term debt payable within one year	(540)	(395)
Net unamortized premiums	13	9
Unamortized hedging losses[2]	-	(12)
Unamortized debt issuance costs	(25)	(24)
Long-term debt	5,063	4,848

[1] Step-up coupon from 4.10% to 6.40%, extendable to 2011.

[2] Unamortized net losses relating to settled swap agreements were reclassified to AOCI on January 1, 2007 without prior year reclassification.

Short-term debt represents promissory notes issued pursuant to the Company's Commercial Paper Program. The notes are denominated in Canadian dollars with varying maturities not exceeding 365 days. In 2007, the notes had a weighted-average interest rate of 5.7%.

Hydro One has a $750 million committed and unused revolving standby credit facility with a syndicate of banks maturing in August 2010. If used, interest on the facility would apply based on Canadian benchmark rates. This credit facility supports the Company's Commercial Paper Program.

The Company issues notes for long-term financing under the Medium-Term Note Program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million of which $2,200 million is remaining and is currently available until July 2009.

The long-term debt is subject to covenants that, among other things, limit permissible debt as a percentage of total capitalization, limit ability to sell assets and impose a negative pledge provision, subject to customary exceptions. At December 31, 2007, the Company was in compliance with these covenants.

The long-term debt is unsecured and denominated in Canadian dollars. Such debt is summarized by the number of years to maturity in the following table:

Years to Maturity	Principal Outstanding on Notes and Debentures *(Canadian dollars in millions)*	Weighted Average Interest Rate *(Percent)*
1 year	540	4.1
2 years	400	4.0
3 years	400	7.2
4 years	250	6.4
5 years	600	5.8
	2,190	5.3
6 – 10 years	750	4.9
Over 10 years	2,675	6.2
	5,615	5.7

9. FAIR VALUE OF FINANCIAL INSTRUMENTS AND RISK MANAGEMENT

The carrying amounts of all financial instruments, except long-term debt, approximate fair value. The fair value of derivative financial instruments reflects the estimated amount that the Company, if required to settle an outstanding contract, would have been required to pay or would be entitled to receive at year end. The fair value of long-term debt, based on year end quoted market prices for the same or similar debt of the same remaining maturities, is provided in the following table:

December 31 (Canadian dollars in millions)	**2007**		**2006**	
	Carrying Value	Fair Value	Carrying Value	Fair Value
Long-term debt[1]	5,615	6,005	5,270	5,831

[1] The carrying value of long-term debt represents the par value of the notes and debentures, other than the step-up note, which is marked to market.

Hydro One may enter into derivative agreements, such as forward starting pay fixed interest rate swap agreements, to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. These transactions are accounted for as cash flow hedges of anticipated transactions. In October 2007, upon issuance of debt under the Company's medium term note program, Hydro One terminated two forward interest rate swap agreements having a total notional principal amount of $200 million, resulting in a net gain of $0.4 million. The net gain was recorded as other comprehensive income and is being amortized to financing charges over the term of the related debt. In late 2007, Hydro One entered into two new forward starting pay fixed interest rate swap agreements with a notional amount of $140 million.

As at December 31, 2007, the Company had a pay floating interest rate swap agreement related to a step-up coupon note issuance with an initial maturity date in 2007, and with extended maturity dates up to 2011. In 2006, the interest rate swap was accounted for as a fair value hedge. In 2007, the interest rate swap was accounted for using the fair value option without hedge accounting. This agreement has a notional principal amount of $40 million and a fair value of $nil (2006 - $nil).

The Company has no significant counter-party credit risk exposure as the fair value of the interest rate swap contracts was not significant in 2007 or in 2006.

Financial assets create a risk that a counter-party will fail to discharge an obligation, causing a financial loss. As at December 31, 2007, there were no significant concentrations of credit risk with respect to any class of financial assets. The Company's revenue is earned from a broad base of customers. As a result, Hydro One did not earn a significant amount of revenue from any single customer. As at December 31, 2007, there were no significant balances of accounts receivable due from any single customer.

The Company will continue to use derivative instruments to manage interest rate risk. Derivative financial instruments result in exposure to credit risk, since there is a risk of counter-party default. Hydro One monitors and minimizes credit risk through various techniques including dealing with highly rated counter-parties, limiting total exposure levels with individual counter-parties and entering into master agreements which enable net settlement.

10. EMPLOYEE FUTURE BENEFITS

Hydro One has a contributory defined benefit pension plan covering all regular employees of Hydro One and its subsidiaries, except Hydro One Brampton. Employees of Hydro One Brampton participate in the Ontario Municipal Employees Retirement System (OMERS), a multi-employer public sector pension fund. Current contributions by Hydro One Brampton are approximately $1 million annually.

Plan Asset Mix

Hydro One's pension plan asset mix at December 31, 2007 and 2006 was as follows:

	% of Plan Assets	
December 31	**2007**	**2006**
Equity securities	62.5	64.6
Debt securities	34.1	32.0
Other	3.4	3.4
	100.0	100.0

Supplementary Information

The Hydro One pension plan does not hold any direct securities of the Company, but did hold debt securities of the Province of $90 million and $92 million at December 31, 2007 and 2006 respectively.

The Company's pension plan provides benefits based on highest three-year average pensionable earnings. For new management employees who commenced employment on or after January 1, 2004, and for new Society of Energy Professionals hired after November 17, 2005, benefits are based on highest five-year average pensionable earnings. After retirement, pensions are indexed to inflation. The measurement date used to determine plan assets and the accrued benefit obligation is December 31. Based on the actuarial valuation filed with the Financial Services Commission of Ontario on September 20, 2007, effective for December 31, 2006, the Company contributed $95 million to its pension plan in respect of 2007 (2006 - $86 million), all of which is required to satisfy minimum funding requirements. Contributions are payable one month in arrears. All of the contributions are expected to be in the form of cash. Contributions after 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, and changes in benefits or actuarial assumptions.

Total cash payments for employee future benefits made in 2007, consisting of cash contributed by the Company to its funded pension plan and cash payments directly to beneficiaries for its unfunded other benefit plans was $137 million in 2007 (2006 - $122 million).

For accrued benefit obligation, December 31:				
Weighted-average discount rate	5.50%	5.25%	5.50%	5.24%
Rate of compensation scale escalation (without merit)	3.00%	3.25%	3.00%	3.25%
Rate of cost of living increase	2.25%	2.50%	2.25%	2.50%
Rate of increase in health care cost trend[4]	-	-	4.40%	4.40%

[2] The Company follows the cash basis of accounting. During 2007, pension costs of $95 million (2006 - $86 million) were attributed to labour, of which $58 million (2006 - $42 million) was charged to operations, $37 million (2006 - $34 million) was capitalized as part of the cost of fixed assets, and $nil (2006- $10 million) was attributed to a regulatory asset.

[3] 8.69% in 2007 grading down to 4.40% per annum in and after 2018 (2006 – 7.87% in 2006 grading down to 4.40% per annum in and after 2014).

[4] 8.33% in 2008 grading down to 4.40% per annum in and after 2018 (2006 – 8.69% in 2007 grading down to 4.40% per annum in and after 2014).

11. ENVIRONMENTAL LIABILITIES

December 31 (Canadian dollars in millions)	**2007**	**2006**
Environmental liabilities, January 1	70	79
Interest accretion	4	5
Expenditures	(12)	(17)
Revaluation adjustment	3	3
Environmental liabilities, December 31	65	70
Less: current portion	(13)	(15)
	52	55

Estimated future environmental expenditures for each of the five years subsequent to December 31, 2007 and in total thereafter are as follows: 2008 - $13 million; 2009 - $12 million; 2010 - $10 million; 2011 - $8 million; 2012 - $6 million and thereafter - $35 million.

There are uncertainties in estimating future environmental costs due to potential external events such as changing regulations and advances in remediation technologies. Hydro One continuously reviews factors affecting its cost estimates as well as the environmental condition of the various properties. The actual cost of investigation or remediation may differ from current estimates.

12. SHARE CAPITAL

Common and Preferred Shares

On March 31, 2000, the Company issued to the Province 12,920,000 5.5% cumulative preferred shares with a redemption value of $25.00 per share, and 99,990 common shares, bringing the total number of outstanding common shares to 100,000. The Company is authorized to issue an unlimited number of preferred and common shares.

The preferred shares are entitled to an annual cumulative dividend of $18 million, which is payable on a quarterly basis. The preferred shares are redeemable at the option of the Province at a price of $25 per share, representing the stated value, plus any accrued and unpaid dividends if the Province sells a number of the common shares which it owns to the public such that the Province’s holdings are reduced to less than 50% of the common shares of the Company. Hydro One may elect, without condition, to pay all or part of this redemption price by issuing additional common shares to the Province. If the Province does not exercise its redemption right, the Company would have the ability to adjust the dividend on the preferred shares to produce a yield that is 0.50% less than the then-current dividend market yield for similarly rated preferred shares. The preferred shares do not carry voting rights, except in limited circumstances, and would rank in priority over the common shares upon liquidation.

Dividends

Common dividends are declared at the sole discretion of the Hydro One Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations.

In 2007, preferred dividends in the amount of $18 million (2006 - $18 million) and common dividends in the amount of $307 million (2006 - $332 million) were declared.

Earnings per Share

Earnings per share is calculated as net income during the year, after cumulative preferred dividends, divided by the weighted-average number of common shares outstanding during the year.

13. RELATED PARTY TRANSACTIONS

The Province, OEFC, IESO, OPA and Ontario Power Generation Inc. (OPG) are related parties of Hydro One. In addition the OEB is related to the Company by virtue of its status as a Provincial Crown Corporation. Transactions between these parties and Hydro One were as follows:

Hydro One received revenue for transmission services from IESO, based on uniform transmission rates approved by the OEB. Transmission revenue for 2007 includes $1,203 million (2006 - $1,206 million) related to these services.

Hydro One receives amounts for rural rate protection from the IESO. Distribution revenue for 2007 includes $127 million (2006 - $127 million) related to this program. Hydro One also received revenue related to the supply of electricity to remote northern communities from the IESO. Distribution revenue for 2007 includes $21 million (2006 - $21 million) related to these services.

In 2007, Hydro One purchased power in the amount of $2,213 million (2006 - $2,183 million) from the IESO administered electricity market and $27 million (2006 - $38 million) from OPG.

Under the *Ontario Energy Board Act, 1998,* the OEB is required to recover all of its annual operating costs from gas and electricity distributors and electricity transmitters. In 2007, Hydro One incurred $10 million (2006 - $9 million) in OEB fees.

Hydro One has service level agreements with the other successor corporations. These services include field, engineering, logistics and telecommunications services. Revenues related to the provision of construction and equipment maintenance services to the other successor corporations were $12 million (2006 - $15 million), primarily for the transmission business. Operation, maintenance and administration costs related to the purchase of services from the other successor corporations were less than $1 million in each of 2007 and 2006.

Consistent with the OPA mandate, the OPA is responsible for some of our CDM programs. The funding includes program costs, incentives and management fees and bonuses. In 2007, Hydro One received $3 million (2006 – $nil) from the OPA in respect of the CDM programs and had a net accounts receivable of $3 million (2006 – $nil).

The provision for payments in lieu of corporate income taxes was paid or payable to the OEFC and dividends were paid or payable to the Province.

The amounts due to and from related parties as a result of the transactions referred to above are as follows:

December 31 (Canadian dollars in millions)	**2007**	**2006**
Accounts receivable	97	114
Accounts payable and accrued charges	(234)	(230)

Included in accounts payable and accrued charges are amounts owing to the IESO in respect of power purchases of $202 million (2006 - $195 million).

14. CONSOLIDATED STATEMENTS OF CASH FLOWS

For the purposes of the Consolidated Statements of Cash Flows, “cash and cash equivalents” refers to the Balance Sheet item “bank indebtedness.”

The changes in non-cash balances related to operations consist of the following:

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**
Accounts receivable decrease (increase)	18	(149)
Materials and supplies increase	(11)	-
Accounts payable and accrued charges increase (decrease)	70	(39)
Accrued interest increase	6	6
Long-term accounts payable and accrued charges decrease	(3)	(7)
Employee future benefits other than pension increase	52	87
Other	3	(4)
	135	(106)

Supplementary information:		
Interest paid	306	302
Payments in lieu of corporate income taxes	230	252

15. CONTINGENCIES

Legal Proceedings

Hydro One is involved in various lawsuits, claims and regulatory proceedings in the normal course of business. In the opinion of management, the outcome of such matters, except as noted below, will not have a materially adverse effect on the Company's consolidated financial position, results of operations or cash flows.

On March 29, 1999, the Whitesand First Nation Band commenced an action in the Ontario Court (General Division), now the Superior Court Justice, naming as defendants the Province, the Attorney General of Canada, Ontario Hydro, OEFC, OPG and the Company. On May 24, 2001, the Whitesand First Nation Band issued an almost identical claim against the same parties. The reason for the second claim is the procedural defence of the Province that proper notice of the first claim was not given under the *Proceedings Against the Crown Act* (Ontario). These actions seek declaratory relief, injunctive relief and damages in an unspecified amount. The Whitesand Band alleges that since at least the first half of the twentieth century, Ontario Hydro has erected dams, generating stations and other facilities within or affecting the band's traditional lands and that those facilities have caused damage to band members and the lands, including substantial flooding and erosion. The Whitesand Band also claims treaty rights to a share of the profits arising from the activities of these Ontario Hydro facilities, an entitlement to increases in annuity payments established by treaty and for breach of an alleged contract to reimburse the band for negotiation costs with Ontario Hydro. The Whitesand Band asserts multiple causes of action, including trespass, breach of fiduciary duty, nuisance and negligence. The May 24, 2001 case was consolidated in 2004 with a similar claim by Red Rock First Nation Band which commenced on September 7, 2001 as all procedural issues in both matters were the same. There is now one action in which the claims of both Whitesand and Red Rock are set out. The claims relating to activities of Ontario Hydro (i.e., flooding) are the matters for which OPG would have responsibility pursuant to Transfer Orders under the *Electricity Act, 1998*. In the consolidated claim, Whitesand and Red Rock seek to tie Hydro One into the flooding allegations on the alleged basis of the integrated nature of the transmission system with the entire electricity system, which includes the method of generating power. To date, Hydro One has not filed a defence. Hydro One believes that it is unlikely that the outcome of this litigation will have a material adverse effect on its consolidated financial position, results of operations or cash flows.

Transfer of Assets

The transfer orders by which Hydro One acquired certain of Ontario Hydro's businesses as of April 1, 1999 did not transfer title to some assets located on lands held for bands or bodies of Indians under the *Indian Act* (Canada). Currently, the OEFC holds these assets. Under the terms of the transfer orders, Hydro One is required to manage these assets until it has obtained all consents necessary to complete the transfer of title of these assets to itself. The Company cannot predict the aggregate amount that it may have to pay, either on an annual or one-time basis, to obtain the required consents. However, it anticipates having to pay more than the approximately $900,000 per year than it currently is paying to these Indian bands and bodies. If the Company cannot obtain consents from the Indian bands and bodies, OEFC will continue to hold these assets for an indefinite period of time. If the Company cannot reach a satisfactory settlement, it may have to relocate these assets from the Indian lands to other locations at a cost that could be substantial or, in a limited number of cases, to abandon a line and replace it with diesel generation facilities. The costs relating to these assets could have a material adverse effect on the Company's results of operations if it is not able to recover them in future rate orders.

Draft PCB regulations

Future changes in environmental regulations may result in material changes to the Company's estimated liability related to the management of PCBs. On November 4, 2006, Environment Canada published new draft regulations governing the management of PCBs. These draft regulations may be finalized in 2008. The Company has estimated its operating expenditures for complying with these draft regulations to be between $250 million and $375 million in excess of amounts already recorded as environmental liabilities on its Balance Sheet. If required, most of these additional expenditures are expected to be incurred between 2013 and 2025. No obligation has been recorded in the financial statements for these increased expenditures due to continued uncertainty regarding the timing and content of the final regulations. In the event that an obligation related to new regulations is recorded, the Company expects to simultaneously record a regulatory asset of equivalent value.

16. COMMITMENTS

Agreement with Inergi

Effective March 1, 2002, Cap Gemini Canada Inc. began providing services to Hydro One through Inergi. As a result of this initiative, Hydro One receives from Inergi a range of services including information technology, customer care, supply chain and certain human resources and finance services for a ten-year period. The initial service level price ranged between $90 million and $130 million per year, subject to external benchmarking every three years to ensure Hydro One is receiving a defined competitive and continuously improved price. In connection with this agreement, on March 1, 2002 the Company transferred approximately 900 employees to Inergi, including about 130 non-regular employees.

The annual commitments under the agreement in each of the five years subsequent to December 31, 2007, and in total thereafter are as follows: 2008 - $100 million, 2009 - $97 million; 2010 - $93 million; 2011 - $90 million; 2012 - $16 million and thereafter - $nil.

Prudential Support

Purchasers of electricity in Ontario, through the IESO, are required to provide security to mitigate the risk of their default based on their expected activity in the market. The IESO could draw on these guarantees if Hydro One Networks or Hydro One Brampton fails to make a payment required by a default notice issued by the IESO. The maximum potential payment is the face value of any bank letters of credit plus the nominal amount of the parental guarantee. As at December 31, 2007, the Company provided prudential support using only parental guarantees, reflecting a change from 2006. If Hydro One's highest long term credit rating deteriorated to below the "Aa" category, the Company would be required to resume providing letters of credit as prudential support. Prudential support at December 31, 2007 was provided using bank letters of credit of $nil million (2006 - $22 million) and parental guarantees of $325 million (2006 - $275 million).

Retirement Compensation Arrangements

Bank letters of credit have been issued to provide security for the Company's liability under the terms of a trust fund established pursuant to the supplementary pension plan for the employees of Hydro One and its subsidiaries. The trustee is required to draw upon the letters of credit if Hydro One is in default of its obligations under the terms of this plan. Such obligations include the requirement to provide the trustee with an annual actuarial report as well as letters of credit sufficient to secure the Company's liability under the plan, to pay benefits payable under the plan and to pay the letter of credit fee. The maximum potential payment is the face value of the bank letters of credit. As at December 31, 2007, Hydro One had bank letters of credit of $95 million (2006 - $93 million) outstanding relating to retirement compensation arrangements.

Operating Leases

The future minimum lease payments under operating leases for each of the five years subsequent to December 31, 2007 and in total thereafter are as follows: 2008 - $6 million; 2009 - $5 million; 2010 - $2 million; 2011 - $1 million; 2012 - $1 million and thereafter - $1 million.

17. SEGMENT REPORTING

Hydro One has three reportable segments:

- The transmission business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;
- The distribution business, which comprises the core business of delivering and selling electricity to customers; and
- The "other" segment, which primarily consists of the telecommunications business.

The designation of segments is based on a combination of regulatory status and the nature of the products and services provided. The accounting policies followed by the segments are the same as those described in the summary of significant accounting policies (see Note 2). Segment information on the above basis is as follows:

Year ended December 31 (Canadian dollars in millions)	**Transmission**	**Distribution**	**Other**	**Consolidated**
2007				
Segment profit				
Revenues	1,242	3,382	31	4,655
Purchased power	-	2,240	-	2,240
Operation, maintenance and administration	415	549	31	995

Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	585	320	(6)	899
Financing charges				295
Income before provision for payments in lieu of corporate income taxes				604
Capital expenditures	560	511	20	1,091
2006				
Segment profit				
Revenues	1,245	3,273	27	4,545
Purchased power	-	2,221	-	2,221
Operation, maintenance and administration	390	460	30	880
Depreciation and amortization	241	269	5	515
Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	614	323	(8)	929
Financing charges				295
Income before provision for payments in lieu of corporate income taxes				634
Capital expenditures	402	417	4	823

December 31 (Canadian dollars in millions)	**2007**	**2006**
Total assets		
Transmission	7,273	6,950
Distribution	5,411	5,161
Other	106	99
	12,790	12,210

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

18. SUBSEQUENT EVENTS

On January 21, 2008, the Company entered into a forward starting pay fixed interest rate swap agreement to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. This transaction had a notional amount of $60 million and is used to lock in the interest rate of a forecasted debt issuance planned for later in 2008. This transaction is being accounted for as a cash flow hedge of a forecasted transaction.

On January 28, 2008 the Company increased its committed revolving credit facility, which supports its commercial paper program, by $250 million to $1,000 million. The maturity date remains unchanged at August 10, 2010.

19. COMPARATIVE FIGURES

The comparative Consolidated Financial Statements have been reclassified from statements previously presented to conform to the presentation of the December 31, 2007 Consolidated Financial Statements.

HYDRO ONE INC.
FIVE-YEAR SUMMARY OF FINANCIAL AND OPERATING STATISTICS

Year ended December 31 (Canadian dollars in millions)	**2007**	**2006**	**2005**	**2004**	**2003**
Statement of operations data

Total regular employees	4,602	4,295	4,189	4,118	3,967

[1]As a result of the oral and written evidence submitted by Hydro One, on December 9, 2004 the OEB issued a ruling, citing prudence, and approving recovery of amounts previously delayed by the *Electricity Pricing, Conservation and Supply Act, 2002,* relating to regulatory deferral account balances sought by Hydro One in its May 31, 2004 submission. Consequently, a one-time regulatory recovery of $91 million was recorded.

[2] The net asset coverage on long-term debt ratio is calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt (including current portion).

[3] The earnings coverage ratio has been calculated as the sum of net income, financing charges and provision for payments in lieu of corporate income taxes divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

[4] System related statistics include preliminary figures for December.

[5] Units distributed through Hydro One lines represent total distribution system requirements and include electricity distributed to consumers who purchased power directly from the IESO.

HYDRO ONE INC.
MANAGEMENT'S DISCUSSION AND ANALYSIS

RESULTS OF OPERATIONS

As used in this section, references to increases and decreases, whether in terms of amounts or percentages, are made by comparison of the three months ended March 31, 2008 to the three months ended March 31, 2007.

Revenues

Three months ended March 31 (Canadian dollars in millions)	**2008**	**2007**	**$ Change**	**% Change**
Transmission	304	327	(23)	(7)
Distribution	908	944	(36)	(4)
Other	10	7	3	43
	1,222	1,278	(56)	(4)
Average Ontario 60-minute peak demand *(MW)* [1]	22,275	23,480	(1,205)	(5)
Distribution - units distributed to customers *(TWh)* [1]	8.5	8.6	(0.1)	(1)

[1]System-related statistics are preliminary

The demand for electricity generally follows normal weather-related variations, and, therefore, our energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

Transmission

Transmission revenues predominantly consist of our transmission tariff, which is based on the monthly peak demand for electricity across our high-voltage network. The tariff is designed to recover revenues necessary to support a transmission system with sufficient capacity to accommodate the maximum expected demand, which is primarily influenced by weather and economic conditions. Transmission revenues also include minor amounts of ancillary revenues which are primarily attributable to maintenance services provided to generators and secondary use of our land rights-of-way.

Our transmission revenues were lower by $23 million, or 7%, in the first quarter of 2008, compared to the same period last year. Lower average peak demands compared to the same period last year resulted in lower tariff revenues of about $16 million and we also experienced lower other transmission revenues of approximately $1 million.

In addition, as a result of the Ontario Energy Board’s (OEB’s) August 16, 2007 decision on our transmission rate application, our tariff revenues were lower than the comparable period by approximately $6 million. In its decision, the OEB approved all of our work program expenditure requirements, but reduced our rate of return on equity from 9.88% to 8.35%. The impact of the OEB’s decision, which was effective January 1, 2007, was recognized at the decision date. A new regulatory liability, the Revenue Difference Deferral Account (RDDA), was recorded to reflect excess amounts recovered from customers. This account, together with the OEB’s transmission Earnings Sharing Mechanism (ESM) that was put in place to equally share 2006 excess transmission earnings between the customers and our shareholder, will be repaid to customers over the period November 1, 2007 to December 31. 2008. In the first quarter of 2008, compared to the first three months of 2007, we experienced a $39 million reduction to our transmission revenues as a result of the OEB’s decision to reduce our rate of return. This impact was partially offset by adjustments to our earned revenue of $33 million reflecting the fact that rates include a refund of amounts that were previously recorded as revenue reductions in the ESM in 2006 and RDDA in 2007.

Distribution

Distribution revenues include our distribution tariff, which is based on OEB-approved rates, as well as amounts to recover the cost of purchased power used by our customers. Accordingly, distribution revenues are primarily influenced by our distribution rates, the amount of electricity we distribute, and the cost of purchased power. Distribution revenues also include a minor amount of ancillary distribution services revenues, such as fees related to the use of our poles by the telecommunications and cable television industries, and miscellaneous charges such as those for late payments.

Distribution revenues were lower by $36 million, or 4%, in the first quarter relative to the comparative period. This reduction primarily reflects lower purchased power cost recoveries of $45 million as described below under “Purchased

Power." This reduction in revenues was partially offset by revenue increases following two OEB decisions. The OEB's August 8, 2007 decision on its combined smart meter proceeding allowed us to begin recording revenue related to our installed smart meters. The decision resulted in an increase of $6 million reflecting recovery of our investments under this program. Effective May 1, 2007, the OEB approved increases in distribution tariff rates for our subsidiaries, Hydro One Networks Inc. and Hydro One Brampton Inc., under an OEB incentive rate-setting mechanism. These increases, which support the maintenance and investment requirements of our distribution systems and which enable continued safe and reliable delivery of electricity to our customers throughout Ontario, resulted in higher distribution revenues of $1 million during the quarter. We also experienced higher ancillary revenues of $2 million.

We estimate that a 1% decrease in the forecast long-term Government of Canada bond yield used in the current OEB formula for determining our rate of return would reduce our Transmission Business' results of operations by approximately $20 million and our Distribution Business' results of operations by approximately $13 million.

Purchased Power

Purchased power costs incurred by our Distribution Business represent the cost of electricity delivered to customers within our distribution service territory and consist of the wholesale commodity cost of energy, the Independent Electricity System Operator's (IESO's) wholesale market service charges, and transmission charges levied by the IESO. The commodity cost of energy for certain low-volume and designated customers is based on the OEB's Regulated Price Plan (RPP), which consists of a two-tiered pricing structure with threshold amounts adjusted twice annually. Customers who are not eligible for the RPP pay the market price for electricity, adjusted for the difference between market prices and the prices paid to generators under the *Electricity Restructuring Act, 2004*. A summary of the RPP impacting the reporting period is provided below.

	Tier Threshold (kWh/month)		Tier Rates (cents/kWh)	
Effective Date	**Residential**	**Non-Residential**	**First Tier**	**Second Tier**
November 1, 2006	1,000	750	5.5	6.4
May 1, 2007	600	750	5.3	6.2
November 1, 2007	1,000	750	5.0	5.9

Purchased power costs decreased by $45 million, or 7%, to $596 million in the first quarter compared to the same period last year. Our decreased purchased power costs were primarily due to lower costs of $28 million associated with the OEB's RPP for residential and other eligible customers, the impact of lower charges levied by the IESO of $15 million, including transmission charges due to the OEB's August 16, 2007 transmission rate decision and wholesale market service charges, and lower demand for electricity of $9 million. These decreases were partially offset by higher wholesale commodity prices of $7 million for customers who are not eligible for the RPP.

Operation, Maintenance and Administration

Our operation, maintenance and administration costs are comprised primarily of labour, material, equipment and purchased services in support of the operation and maintenance of the transmission and distribution systems. These costs also include property taxes and payments in lieu thereof on our transmission and distribution lines, stations and buildings.

Operation, maintenance and administration costs for each of our three business segments were as follows:

Three months ended March 31 (Canadian dollars in millions)	**2008**	**2007**	**$ Change**	**% Change**
Transmission	97	99	(2)	(2)
Distribution	115	128	(13)	(10)
Other	9	7	2	29
	221	234	(13)	(6)

Transmission

Operation, maintenance and administration expenditures incurred to sustain our high-voltage transmission stations, lines and rights-of-way decreased by $2 million, or 2%, in the first quarter compared to the same period last year. This change was attributable to a $12 million reduction in our support costs, primarily as the result of a one-time settlement credit associated with our transfer of pension assets to the Inergi LP (Inergi) pension plan following approval from the Financial Services

Commission of Ontario. This settlement related to the transfer of approximately 770 regular employees to Inergi effective March 1, 2002. The impact of this reduction was partially offset by an increase in our work program expenditures of $10 million required to maintain our safe and reliable operation of the transmission system. We carried out increased planned line maintenance, station-related corrective maintenance and forestry work consistent with making an earlier start to this year's program given favourable weather conditions.

Distribution

Operation, maintenance and administration expenditures necessary to maintain our low-voltage distribution system decreased by $13 million, or 10%, in the first three months of 2008 compared to the relative period last year. We experienced lower support expenditures of $11 million, primarily as a result of the Inergi pension asset transfer settlement. Our work program expenditures were also lower by $2 million, primarily as a result of lower conservation and demand management program expenditures following the completion of the OEB program requirements associated with the third phase Market Adjusted Rate of Return and reduced line clearing work. The impact of these work program reductions was partially offset by increased expenditures incurred to respond to winter storm damage.

Depreciation and Amortization

Depreciation and amortization expense for the first three months of the year increased by $5 million, or 4%, to $130 million relative to the comparative period. This increase was mainly attributable to increased depreciation expense related to the placement of new assets in service, consistent with our ongoing capital work program.

Financing Charges

Financing charges decreased by $4 million, or 5%, to $69 million in the quarter compared to the same period last year. This reduction in our net interest expense was primarily due to a $6 million interest credit related to the Inergi pension asset transfer settlement. The impact of this reduction was partially offset by a $2 million increase in interest expense reflecting a higher average level of debt, partially offset by a lower average effective interest rate.

Provision for Payments in Lieu of Corporate Income Taxes

The provision for payments in lieu of corporate income taxes decreased by $7 million, or 12%, to $49 million in the first quarter compared to the same period last year. This decrease was primarily due to a reduction in the statutory tax rate from 36.12% to 33.5%, combined with the impact of other minor temporary differences. Our income before the provision for payments in lieu of corporate income taxes included the effects of the Inergi pension asset transfer settlement.

Net Income

Net income of $157 million was higher by $8 million, or 5%, compared to 2007 first quarter results. This increase was mainly due to the impact of the Inergi pension asset transfer settlement following approval by the Financial Services Commission of Ontario. We also experienced an increase in our distribution tariff revenues reflecting increased smart meter revenues as a result of the August 8, 2007 OEB decision. The impact of these factors was partially offset by lower transmission revenues resulting from the August 16, 2007 transmission rate decision, lower average monthly peak demands and increased work program requirements.

QUARTERLY RESULTS OF OPERATIONS

The following table sets forth unaudited quarterly information for each of the eight quarters from June 30, 2006 through March 31, 2008. This information has been derived from our unaudited interim Consolidated Financial Statements which, in the opinion of our management, have been prepared on a basis consistent with the audited annual Consolidated Financial Statements and which include all adjustments, consisting only of normal recurring adjustments, necessary for fair presentation of our financial position and results of operations for those periods. These operating results are not necessarily indicative of results for any future period and should not be relied upon to predict our future performance.

(Canadian dollars in millions)	2008		2007				2006	
Three months ended	**Mar. 31**	**Dec. 31**	**Sep. 30**[2]	**Jun. 30**	**Mar. 31**	**Dec. 31**	**Sep. 30**	**Jun. 30**
Total revenues[1]	1,222	1,129	1,128	1,120	1,278	1,142	1,165	1,078
Net income[1]	157	90	67	93	149	101	103	99
Net income to common shareholder[1]	153	85	63	88	145	96	99	94

[1] The demand for electricity generally follows normal weather-related variations, and therefore our electricity-related revenues and profit, all other things being equal, would tend to be higher in the first and third quarters than in the second and fourth quarters.

[2] As a result of the OEB's August 16, 2007 decision on our transmission rate application that was effective January 1, 2007, revenues reflect a reduced revenue requirement based on the approved rate of return of 8.35%. Previously, the rate of return was 9.88%. Revenues in the third quarter of 2007 reflect a $38 million adjustment to revenues in respect of the period January 1, 2007 to August 16, 2007 and reflect the OEB's decision to reduce the rate of return and revise the capital structure of our Transmission Business.

LIQUIDITY AND CAPITAL RESOURCES

Our primary sources of liquidity and capital resources are funds generated from operations, debt capital market borrowings and bank financing. These resources will be used to satisfy our capital resource requirements, which continue to include capital expenditures, servicing and repayment of our debt, payments related to our outsourcing arrangements, investing activities, and dividends.

Summary of Sources and Uses of Cash

Three months ended March 31 (Canadian dollars in millions)	2008	2007
Operating activities	232	294
Financing activities		
Long-term debt issued	550	400
Short-term notes	-	(60)
Dividends paid	(41)	(107)
Investing activities		
Capital expenditures	(211)	(187)
Other financing and investing activities	8	4
Net change in cash and cash equivalents	538	344

Operating Activities

Net cash from operating activities decreased by $62 million, to $232 million, compared to the same period in 2007. This change was primarily due to changes in funding requirements relative to the comparative period, primarily in relation to accounts payable and accrued liabilities associated with our work programs and power purchases.

Financing Activities

Short-term liquidity is provided through funds from operations and our commercial paper program, under which we are authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. At March 31, 2008, we had no short-term notes payable outstanding. Our commercial paper program is supported by a committed revolving credit facility with a syndicate of banks. On January 28, 2008, we increased the facility from $750 million to $1,000 million. The maturity date remains unchanged at August 10, 2010. The short-term liquidity under this program and anticipated levels of funds from operations should be sufficient to fund our normal operating requirements. At March 31, 2008, we had $6,165 million in long-term debt outstanding, including the current portion. Our notes and debentures mature between 2008 and 2046. Long-term financing is provided by our access to the debt markets, primarily through our Medium-Term Note Program. We currently plan to refinance maturing debt principally through this program. The maximum authorized principal amount of medium-term notes issuable under this program is $2,500 million, of which $1,650 million is remaining and is currently available until July 2009.

	Rating	
Rating Agency	**Short-term Debt**	**Long-term Debt**
DBRS Limited	R-1 (middle)	A (high)
Moody's Investors Service Inc.	Prime-1	Aa3
Standard & Poor's Rating Services Inc.	A-1	A

We have the customary covenants normally associated with long-term debt. Among other things, our long-term debt covenants limit our permissible debt as a percentage of our total capitalization, limit our ability to sell assets and impose a negative pledge provision, subject to customary exceptions. The credit agreement related to our $1,000 million credit facility has no material adverse change clauses that could trigger default. However, the credit agreement requires that we provide notice to the lenders of any material adverse change within three business days of the occurrence. The agreement also provides limitations that debt cannot exceed 75% of total capitalization and that debt issued by our subsidiaries cannot exceed 10% of the total book value of our assets. We are in compliance with all of these covenants and limitations as at March 31, 2008.

During the first quarter of 2008, we issued $550 million in long-term debt under our Medium-Term Note Program. There were no debt maturities in the first quarter. During the first quarter of 2007, we issued $400 million in debt under our Medium-Term Note Program and had no maturities. For the first quarter of 2008, we had no change in our short-term notes outstanding, compared to a reduction of $60 million in the same period in 2007.

In the first three months of 2008, we paid dividends to the Province of Ontario (the Province) in the amount of $41 million, consisting of $37 million in common dividends and $4 million in preferred dividends. In the comparative period last year, we paid common dividends of $103 million and preferred dividends of $4 million.

Common dividends are declared at the sole discretion of our Board of Directors, and are recommended by management based on results of operations, financial condition, cash requirements and other relevant factors such as industry practice and shareholder expectations. Common dividends pertaining to the quarterly financial results are generally declared and paid in the immediately following quarter.

Investing Activities

Cash used for investing activities primarily represents capital expenditures for each of our three business segments as follows:

Three months ended March 31 (Canadian dollars in millions)	**2008**	**2007**	**$ Change**	**% Change**
Transmission	107	95	12	13
Distribution	102	91	11	12
Other	2	1	1	100
	211	187	24	13

Transmission

Transmission capital expenditures increased by $12 million, to $107 million in the first quarter compared to the same period in 2007. Our expenditures to expand and reinforce the transmission system were relatively unchanged in the first three months of the year at $47 million, a decrease of $1 million compared to the first quarter of last year. This reduction was primarily attributable to last year’s substantial completion of work on our Whitby and London Talbot transformer stations and reduced expenditures on our Lambton Transformer Station, partially offset by load connection work at our Pleasant Transformer Station and increased work on our lines and stations development projects. These projects include our Essa

Transformer Station to Stayner Transformer Station connection, which will improve the adequacy and reliability of supply to the Southern Georgian Bay region in recognition of the growing needs of our customers. In addition, in the first quarter of 2008, we commenced work on our Bruce to Milton Transmission Reinforcement Project to connect redeveloped nuclear and wind generation sources in the Huron-Grey-Bruce area. We also continued work on our new interconnection with Québec, which will increase access to emission-free hydroelectric power. The impact of these increased expenditures was partially offset by last year's completion of our Downtown Toronto Cable Project and last year's expenditures on our Cambridge Preston Transformer Station and our Niagara Reinforcement Project, final completion of which continues to be delayed by the aboriginal land dispute in the Caledonia area. Discussions continue between the involved aboriginal peoples and the various government entities involved. We will complete this project when site access becomes available.

Expenditures to sustain our existing transmission system were $39 million in the quarter, representing a decrease of $2 million compared to the same period in 2007, as a result of lower expenditures on a number of small lines and stations improvement projects. The impact of this reduction was partially offset by increased expenditures related to the refurbishment and replacement of end-of-life equipment at our Claireville Transformer Station to improve current reliability and to meet growing demands. Our other transmission capital expenditures were $21 million in the quarter, $15 million higher than the comparable period last year. This increase resulted from higher information technology expenditures primarily related to an entity-wide system improvement project to replace soon to be retired assets and increase productivity, combined with information security enhancements to the Ontario Grid Control Centre.

Distribution

Distribution capital expenditures increased by $11 million, to $102 million in the first quarter of 2008, compared to the same period in the prior year. Our capital expenditures to expand and reinforce our distribution network were $41 million, $3 million higher than the same period last year. This increase primarily reflects ongoing investments in our Smart Meter Program. During the quarter, we installed approximately 98,000 meters, bringing our cumulative program total to about 386,000 deployed smart meters. The impact of this increase was partially offset by lower expenditures for new customer connections.

Expenditures to sustain our low-voltage distribution system were $45 million in the quarter, an increase of $4 million from the same period in 2007. This increase was primarily a result of higher winter storm-recovery expenditures and planned end-of-life wood pole replacements within our lines work program. These increases were partially offset by lower planned asset replacement work. Our other distribution capital expenditures were $16 million in the quarter, representing an increase of $4 million from last year. This increase is primarily attributable to higher information technology expenditures related to our entity-wide system improvement project.

Future Capital Expenditures

Our capital expenditures in 2008 are budgeted at approximately $1.4 billion. The 2008 capital budgets for our transmission and distribution businesses are about $800 million and $600 million respectively. Our capital expenditures are expected to exceed $1.5 billion in both 2009 and 2010, primarily reflecting increasing investments to expand, refurbish or replace transmission infrastructure. Our overall investment levels reflect transmission infrastructure requirements consistent with government policy, Ontario Power Authority planning information as set up in its Integrated Power System Plan, local area supply requirements and preventive and corrective maintenance requirements to manage aging assets. These investments will facilitate an adequate and reliable supply of electricity in the public interest. These investment levels also reflect the continued mass deployment of smart meters within our distribution businesses that began in 2007. An entity-wide system improvement project to replace soon to be retired assets and increase productivity is also underway. Capital expenditures of our other business segment are budgeted at about $11 million in 2008, about half of the 2007 level, as the implementation of a dedicated fibre optic network that was initiated in 2007 will be completed this year.

Summary of Contractual Obligations and Other Commercial Commitments

The following table presents a summary of our debt and other major contractual obligations as well as other major commercial commitments.

March 31, 2008 (Canadian dollars in millions)	**Total**	**2008**[1]	**2009/2010**	**2011/2012**	**After 2012**
Contractual Obligations *(due by year)*					
Long-term debt – principal repayments	6,165	540	800	1,100	3,725
Long-term debt – interest payments	5,357	287	606	524	3,940
Inergi LP outsourcing agreement[2]	369	75	189	105	-
Operating lease commitments	15	4	8	2	1
Total Contractual Obligations	11,906	906	1,603	1,731	7,666
Other Commercial Commitments *(by year of expiry)*					
Bank line[3]	1,000	-	1,000	-	-
Letters of credit[4]	99	99	-	-	-
Guarantees[4]	325	325	-	-	-
Pension[5]	173	71	102	-	-
Total Other Commercial Commitments	1,597	495	1,102	-	-

[1] The amounts disclosed represent the balances due over the period April 1, 2008 to December 31, 2008.

[2] On March 1, 2002, Inergi began providing a range of services to us for a 10-year period, including information technology, customer care, supply chain and certain human resources and finance services.

[3] As a backstop to our commercial paper program, we have a $1,000 million revolving standby credit facility with a syndicate of banks which matures in August 2010.

[4] We currently have bank letters of credit of $95 million outstanding relating to retirement compensation arrangements. We have also provided prudential support to the IESO on behalf of our subsidiaries, as required by the Market Rules, using parental guarantees of up to a maximum of $325 million. Although no letters of credit are required for prudential support, we would have to resume providing bank letters of credit if our credit rating deteriorated to below the "Aa" category.

[5] Contributions to the pension fund are made one month in arrears. Contributions for 2008 are based on an actuarial valuation filed in September 2007 and effective December 31, 2006. Our annual pension contributions for 2008 and 2009 will be about $94 million. Contributions beyond 2009 will be based on an actuarial valuation effective December 31, 2009 and will depend on future investment returns, changes in benefits or actuarial assumptions. Pension contributions beyond 2009 are not estimable at this time.

The amounts in the above table under long-term debt are not charged to our results of operations, but are reflected on our Balance Sheet and Statement of Cash Flows. Interest associated with this debt is recorded under financing charges on our Statement of Operations or in our capital programs, but these financing charges are not reflected in the above table. Payments in respect of operating leases and our outsourcing agreement with Inergi are recorded under operation, maintenance and administration costs on our Statement of Operations or in our capital programs.

RELATED PARTY TRANSACTIONS

Related party transactions primarily consist of our transmission revenues received from, and our power purchases payments made to, the IESO, which is a related party by virtue of its status as an agency of our shareholder, the Province. The year-over-year changes related to these amounts are described more fully in our discussion of our transmission revenues and purchased power costs. Other significant related party transactions include our dividends which are paid to the Province and our payments in lieu of corporate income taxes which are paid or payable to the Ontario Electricity Financial Corporation.

STATUS OF OUR TRANSITION TO INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

On February 13, 2008, the Canadian Accounting Standards Board confirmed that publicly accountable enterprises will be required to adopt IFRS in place of Canadian Generally Accepted Accounting Principles (GAAP) for interim and annual reporting purposes for fiscal years beginning on or after January 1, 2011. At this time, the impact on our future financial position and results of operations is not reasonably determinable or estimable.

We commenced our IFRS conversion project in 2007 and we have established a formal project governance structure. This structure includes a steering committee consisting of senior levels of management from finance, information technology, treasury and our operations organizations, among others. Regular reporting will occur to senior executive management and to the Audit and Finance Committee of our Board of Directors. We have also engaged an external expert advisor.

Our project consists of four phases: diagnostic; design and planning; solution development; and implementation. We have completed the diagnostic phase which involved a high level review of the major differences between current Canadian GAAP and IFRS. Currently, we have determined that the areas of accounting difference with the highest potential to impact our company are rate regulated accounting, accounting for fixed assets, payments in lieu of corporate income taxes, employee future benefits, as well as initial adoption of IFRS under the provisions of IFRS 1, *First-Time Adoption of IFRS*.

We are now proceeding to the design and planning phase which will involve establishing issue-specific work teams to focus on generating options and making recommendations in the identified risk areas. Subsequent to carrying out this work at the consolidated level, we will also focus on the specific impacts on our various subsidiaries and regulated businesses that may affect their unconsolidated financial statements. During the design and planning phase, we will establish a staff communications plan, begin to develop our staff training programs, and evaluate the impacts of the IFRS transition on other business activities.

As part of our entity-wide system improvement project, many of our major financial systems will be replaced. To ensure that the future requirements of IFRS can be met, we have included links with this initiative within the governance structure of our IFRS project. We will also ensure there are strong communications between our IFRS project and staff accountable for disclosure controls and internal control over financial reporting. Control requirements will be reevaluated as our IFRS project progresses.

The OEB has also begun its own IFRS project to determine the nature of any changes that should be made in regulatory accounting requirements in response to IFRS. On May 8, 2008, the OEB announced the creation of an IFRS Consultation which will provide an opportunity for Board staff to work with industry participants to identify transition issues and suggest how those issues might be addressed. We plan on participating in this process. We intend to closely monitor any International Financial Reporting Interpretations Committee (IFRIC) initiatives with the potential to impact rate regulated accounting under IFRS and will participate in any related processes, as appropriate.

RECENT DEVELOPMENTS

Bruce to Milton Transmission Reinforcement Project

We announced our recommendations regarding the potential route refinements on our Bruce to Milton Transmission Reinforcement Project in mid-March 2008. The assessments we conducted included input we received from public consultation in the potentially affected areas. Based on our assessments, we have recommended moving the proposed line section in the Halton Hills area from the east to the west side of the existing transmission corridor. The route recommendations will be further examined in the environmental assessment study, which is subject to approval by the Ministry of the Environment as part of the environmental assessment process. The terms of reference for the environmental assessment were approved by the Minister of the Environment on April 4, 2008. The OEB's Section 92 Leave-to-Construct hearing commenced May 1, 2008.

2008 Distribution Rate Applications

In 2007, we filed a cost of service application with the OEB for our Distribution Business operated through our subsidiary Hydro One Networks Inc. The interrogatory process was completed on April 4, 2008, with an oral hearing scheduled to begin on June 23, 2008. Based on the OEB's guidelines, a decision is anticipated in the Fall of 2008. As a result, we requested that existing 2007 rates be declared interim effective May 1, 2008. We proposed the establishment of a variance account to track the difference between existing rates and the OEB-approved 2008 rates, once new rates are approved and until such time that new rates are actually implemented. On April 11, 2008, the OEB issued a decision approving the establishment of the variance account and declaring our existing 2007 rates interim effective May 1, 2008, with the exception of the component of our rates regarding transmission-related charges applied to our embedded distributors. No amounts will be recorded in the variance account until the OEB makes a decision on the rate application, including the effective date for final rates.

On March 19, 2008, the OEB released its decision regarding the 2008 rate application made by our subsidiary Hydro One Brampton Networks Inc. The OEB approved our submission on the basis of the OEB's cost of capital and second generation incentive regulation mechanism policies. The revised rates, including an amount of 67 cents per month per metered customer for smart meters, were approved with an implementation date of May 1, 2008.

Collective Agreements

We successfully reached new collective agreements with the Power Workers' Union, Canadian Auto Workers and International Brotherhood of Electrical Workers, with three-year terms effective April 1, 2008. The collective agreements have been ratified.

SELECTED FINANCAL HIGHLIGHTS AND RATIOS

Three months ended March 31 (Canadian dollars in millions) (except as otherwise noted)	**2008**	**2007**
Net income	157	149
Net cash from operating activities	232	294
Capital expenditures	211	187
Earnings per common share *(Canadian dollars)*	1,524	1,446
Earnings coverage ratio[1]	2.68	2.74
Net asset coverage on long-term debt[2]	1.81	1.86
Total debt to capitalization[3]	55%	54%

[1]The earnings coverage ratio has been presented for the twelve months ended March 31, 2008 and March 31, 2007, respectively and has been calculated as the sum of net income, provision for payments in lieu of corporate income taxes and financing charges divided by the sum of financing charges, capitalized interest and cumulative preferred dividends.

[2]The net asset coverage on long-term debt ratio has been presented as at March 31, 2008 and December 31, 2007 and has been calculated as total assets minus total liabilities excluding long-term debt (including current portion) divided by long-term debt (including current portion).

[3]Total debt to capitalization ratio has been presented as at March 31, 2008 and December 31, 2007 and has been calculated as total debt divided by total debt plus total shareholder's equity.

FORWARD-LOOKING STATEMENTS AND INFORMATION

Our oral and written public communications, including this document, often contain forward-looking statements that are based on current expectations, estimates, forecasts and projections about our business and the industry in which we operate and include beliefs and assumptions made by the management of our company. Such statements include, but are not limited to: expectations regarding developments in the statutory and operating framework for electricity distribution and transmission in Ontario including changes to codes, licenses, rates, rate orders, cost recovery, rates of return, rate structures and revenue requirements in both our transmission and distribution businesses and the timing of decisions from the OEB; expectations regarding our financing activities; statements regarding the pension asset transfer; statements regarding future capital expenditures and our investment plans; expectations regarding the results of our projects; statements regarding future pension contributions; the estimated impact of changes in the forecast long-term Government of Canada bond yield (used in determining our regulated rate of return) on our results of operations; and statements about IFRS. Words such as "expect," "anticipate," "intend," "attempt," "may," "plan," "will", "believe," "seek," "estimate," and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. We do not intend, and we disclaim any obligation to update any forward-looking statements, except as required by law.

These forward-looking statements are based on a variety of factors and assumptions including, but not limited to the following: no unforeseen changes in the legislative and operating framework for Ontario's electricity market; no unfavourable decisions from the OEB and other regulatory bodies concerning outstanding rate and other applications; no unforeseen changes in rate orders or rate structures for our distribution and transmission businesses; a stable regulatory environment; and no significant event occurring outside the ordinary course of business. These assumptions are based on information currently available to us, including information obtained from third party industry analysts. Actual results may differ materially from those predicted by such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and our credit stability may be materially adversely affected. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the content of the final Integrated Power System Plan, as approved by the OEB;
- delays or denials of the requisite approvals and accommodations for our planned projects;
- regulatory decisions regarding our revenue requirements, cost recovery and rates;
- the risk that we are not able to arrange sufficient financing to repay maturing debt and to fund capital expenditures and other obligations;
- the risks associated with changes in the forecast long-term Government of Canada bond yield; and
- future interest rates, inflation , changes in benefits and changes in actuarial assumptions.

We caution the reader that the above list of factors is not exhaustive. Some of these and other factors are discussed in more detail under "Risk Management and Risk Factors" in the 2007 annual Management's Discussion and Analysis (MD&A). You should review the section entitled "Risk Management and Risk Factors" in detail.

This MD&A is dated as at May 14, 2008. Additional information about our company, including our Annual Information Form, is available on SEDAR at www.sedar.com.

See accompanying notes to Consolidated Financial Statements.

1. BASIS OF PRESENTATION

These interim Consolidated Financial Statements do not conform in all respects to the disclosure requirements of Canadian generally accepted accounting principles for annual financial statements and should, therefore, be read in conjunction with the annual Consolidated Financial Statements of Hydro One Inc. (Hydro One or the Company) for the year ending December 31, 2007 which include information necessary or useful to understanding the Company's business and financial statement presentation. In particular, the Company's significant accounting policies and practices are presented as Note 2 to the annual Consolidated Financial Statements, and have been consistently applied in the preparation of these interim Consolidated Financial Statements, except as described below in Note 2 to the interim Consolidated Financial Statements.

The demand for electricity generally follows normal weather-related variations, and therefore the Company's energy-related revenues, all other things being equal, will tend to be higher in the first and third quarters than in the second and fourth quarters.

2. ACCOUNTING CHANGES

Change in Accounting Policy – Inventory

Effective January 1, 2008, the Company retrospectively adopted Canadian Institute of Chartered Accountants' (CICA) Handbook Section 3031, *Inventories,* with reclassification of comparative prior period amounts. This new section requires that certain major spare parts and standby equipment be reclassified from inventory to fixed assets. The new Handbook section also allows that previously recorded impairment losses taken on inventory to be reversed if there is evidence that the net realizable value has subsequently recovered.

The Company already includes certain major standby equipment as in-service fixed assets and depreciates these assets over their useful lives. To meet the requirements of the new section, the Company has reclassified approximately $42 million (2007 - $40 million) in asset components and equipment previously classified as materials and supplies inventory.

Concurrent with the above reclassification, the Company also reclassified future use land with a carrying value of approximately $69 million (2007 - $69 million) from "fixed assets in service" to "future use land, components and spares."

Future use land, components and spares are not depreciated until they are transferred to active capital projects and those projects are placed in-service.

Change in Capital Disclosures and Financial Instrument Disclosures and Presentation

Effective January 1, 2008, the Company adopted three new accounting standards comprising the CICA Handbook Sections 1535, *Capital Disclosures*; 3862, *Financial Instruments Disclosures*; and 3863, *Financial Instruments Presentation*. The adoption of these new standards required the disclosure of qualitative and quantitative information about the Company's capital and how it is managed, and an increased emphasis on disclosure about the risks associated with recognized and unrecognized financial instruments. The adoption of the new standard on presentation carried forward unchanged the presentation requirements from Section 3861, *Financial Instruments Disclosure and Presentation,* and therefore adoption of this new standard did not have any impact on the interim Consolidated Financial Statements.

Capital Disclosures

The Company's objectives with respect to its capital structure are to maintain effective access to capital on a long-term basis at reasonable rates, and to deliver appropriate financial returns. In order to ensure ongoing effective access to capital, the Company targets to maintain an "A" category long-term credit rating.

The Company considers the capital structure to consist of shareholder's equity, short-term and long-term debt, and cash and cash equivalents. The Company's capital structure as at March 31, 2008 and December 31, 2007 was as follows:

(Canadian dollars in millions)	**March 31, 2008**	**December 31, 2007**
Long-term debt payable within one year	940	540
Less (plus): Cash and cash equivalents	526	(12)
	414	552
Long-term debt	5,219	5,063
Preferred Shares	323	323
Common Shares	3,314	3,314
Retained Earnings	1,374	1,258
	5,011	4,895
Total Capital	10,644	10,510

For the purposes of this table and the Consolidated Statements of Cash Flows, "cash and cash equivalents" refers to the Consolidated Balance Sheet items "short-term investments" and "bank indebtedness."

The Company has customary covenants typically associated with long-term debt. Among other things, Hydro One's long-term debt and credit facility covenants limit the permissible debt to 75% of the Company's total capitalization, limit the ability to sell assets and impose a negative pledge provision, subject to customary exceptions. Hydro One is in compliance with all of these covenants and limitations.

Financial Instrument Disclosures

Exposure to market risk, credit risk and liquidity risk arises in the normal course of the Company's business.

Market Risk

Market risk refers primarily to risk of loss that results from changes in commodity prices, foreign exchange rates and interest rates. The Company does not have commodity risk and its foreign exchange risk is currently insignificant, although the Company could in future decide to issue foreign currency denominated debt. Hydro One is exposed to fluctuations in interest rates as the regulated rate of return for the Company's distribution and transmission businesses is derived using a formulaic approach which is in part based on the forecast for long-term Government of Canada bond yields. The Company estimates that a 1% decrease in the forecast long-term Government of Canada bond yield used in the current OEB formula for determining the Company's rate of return would reduce its Transmission Business' results of operations by approximately $20 million and its Distribution Business' results of operations by approximately $13 million.

Credit Risk

Financial assets create credit risk that a counter-party will fail to discharge an obligation, causing a financial loss. The Company's revenue is earned on a broad base of customers. As a result, Hydro One did not earn a significant amount of revenue from any individual customer. As at March 31, 2008, there were no significant balances of accounts receivable due from any single customer.

In the quarter, the Company's provision for bad debts increased by $1 million to $22 million as a result of write-offs and adjustments determined on the basis of a review of overdue accounts, taking into consideration historical experience. As at March 31, 2008, approximately 5% of the Company's accounts receivable were aged more than 60 days, while approximately 86% was classified as current.

Hydro One manages its counter-party credit risk through various techniques including, entering into transactions with highly rated counter-parties, limiting total exposure levels with individual counterparties consistent with the Company's Board-approved Credit Risk Policy, entering into master agreements which enable net settlement and the contractual right of offset, and monitoring the financial condition of counterparties. Short-term investments held as at March 31, 2008, were consistent with the credit exposure limits specified under the Company's Credit Risk Policy. The Company's credit risk for short-term investments and accounts receivable is limited to the carrying amount on the Consolidated Balance Sheet.

The Company uses derivative financial instruments to manage interest rate risk. Derivative financial instruments result in exposure to credit risk since there is a risk of counter-party default. As at March 31, 2008, the only derivative instrument held by Hydro One was a floating interest rate swap agreement related to a $40 million step-up coupon note. The exposure to credit risk from this derivative instrument as at March 31, 2008 was insignificant.

Liquidity Risk

Liquidity risk refers to the Company's ability to meet its financial obligations as they come due. Short-term liquidity is provided through cash and cash equivalents on hand, funds from operations, and the Company's Commercial Paper Program, under which Hydro One is authorized to issue up to $1 billion in short-term notes with a term to maturity of less than 365 days. The Commercial Paper Program is supported by a $1 billion committed revolving credit facility with a syndicate of banks maturing in August 2010. The short-term liquidity under this program should be sufficient to fund normal operating requirements.

Emerging Accounting Changes – Rate Regulated Operations

In August 2007, the Canadian Accounting Standards Board (AcSB) issued a decision, effective January 1, 2009, to withdraw the temporary exemption in CICA Handbook Section 1100, *Generally Accepted Accounting Principles*, which permits the recognition and measurement of assets and liabilities arising from rate regulation. Further, CICA Handbook Section 3465, *Income Taxes* was amended to require the recognition of future income tax liabilities and assets for regulated enterprises that were previously not subject these provisions. Consequently, the Company will be required to reflect on its Consolidated Balance Sheet, the effect of applying the liability method when accounting for payments in lieu of corporate income taxes and a corresponding regulatory asset. The Company is currently assessing the impact of the AcSB's decision on its Balance Sheet.

3. PENSION ASSET TRANSFER

Effective March 1, 2002, Hydro One began receiving a range of services from Inergi LP, including information technology, customer care, supply chain and certain human resources and financial services. In connection with this agreement, the Company transferred approximately 770 regular employees to Inergi LP. On March 10, 2008, the Company was granted consent from the Financial Services Commission of Ontario to transfer pension assets and related pension liabilities for affected employees from the Hydro One Pension Plan to the Inergi LP Pension Plan. The pension asset transfer will occur in the second quarter. Under the agreement, the Company recognized a settlement of $21 million in its results of operations, inclusive of a related interest credit of $6 million.

4. DIVIDENDS

During the three months ended March 31, 2008, preferred dividends in the amount of $4 million (2007 - $4 million) and common dividends in the amount of $37 million (2007 - $103 million) were declared.

5. LONG-TERM DEBT

In January 2008, the Company entered into a forward starting interest rate swap agreement to hedge against the effect of future interest rate movements on long-term fixed rate borrowing requirements. This transaction had a notional amount of $60 million and was used to lock in the interest rate of a forecasted debt issuance which took place on March 3, 2008. The transaction was accounted for as a cash flow hedge of a forecasted transaction.

On March 3, 2008, Hydro One issued additional notes under the Company's medium term note program. The new issue was comprised of medium term notes with a principal amount of $250 million having a 3 year term with a coupon rate of 4.08%. The notes are due March 3, 2011. At the same time the Company made an additional offering of 5.18% medium-term notes that originally settled October 18, 2007. The issue is comprised of medium term notes with a principal amount of $300 million having a 9.6 year term with a coupon rate of 5.18%. The notes are due October 18, 2017. In relation to this debt issuance, on March 3, 2008, the Company terminated the three forward starting interest rate swaps having a total notional principal amount of $200 million entered into in the last quarter of 2007 and the first quarter of 2008. The transactions had been accounted for as cash flow hedges of a forecasted debt issue for the purpose of fixing the interest rate for the debt issuance. The net loss realized on terminating the swaps was $1.2 million which has been recorded in Other Comprehensive Income and will be amortized to financing charges over the term of the related debt.

6. EMPLOYEE FUTURE BENEFITS

Total benefit costs are as follows:

Three months ended March 31 (Canadian dollars in millions)	**2008**	**2007**
Pension		
Net periodic benefit cost	10	25
Pension fund contribution	25	25
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	10	10
Charged to results of operations	15	15
Employee Future Benefits Other than Pension		
Net periodic benefit cost	23	27
Less: Portion attributable to labour and capitalized as part of the cost of fixed assets	9	10
Charged to results of operations	14	17

7. SEGMENTED REPORTING

Hydro One has three reportable segments:

- The Transmission Business, which comprises the core business of providing transportation and connection services, is responsible for transmitting electricity throughout the Ontario electricity grid;
- The Distribution Business, which comprises the core business of delivering and selling electricity to customers; and
- An "other" segment primarily consisting of a telecommunications business.

The designation of segments has been based on a combination of regulatory status and the nature of the products and services provided. Segment information on the above basis is as follows:

Three months ended March 31 (Canadian dollars in millions)	**Transmission**	**Distribution**	**Other**	**Consolidated**
2008				
Segment profit				
Revenues	304	908	10	1,222
Purchased power	-	596	-	596
Operation, maintenance and administration	97	115	9	221
Depreciation and amortization	59	70	1	130
Income before financing charges and provision for payments in lieu of corporate income taxes	148	127	-	275
Financing charges				69
Income before provision for payments in lieu of corporate income taxes				206
Capital expenditures	107	102	2	211

Three months ended March 31 (Canadian dollars in millions)	**Transmission**	**Distribution**	**Other**	**Consolidated**
2007				
Segment profit				
Revenues	327	944	7	1,278
Purchased power	-	641	-	641
Operation, maintenance and administration	99	128	7	234
Depreciation and amortization	60	64	1	125
Income (loss) before financing charges and provision for payments in lieu of corporate income taxes	168	111	(1)	278
Financing charges				73
Income before provision for payments in lieu of corporate income taxes				205
Capital expenditures	95	91	1	187

(Canadian dollars in millions)	**March 31, 2008**	**December 31, 2007**
Total assets		
Transmission	7,310	7,273
Distribution	5,529	5,411
Other	644	106
	13,483	12,790

All revenues, costs and assets, as the case may be, are earned, incurred or held in Canada.

8. SUBSEQUENT EVENTS

On April 11, 2008, the OEB ordered that existing 2007 distribution rates be declared interim as of May 1, 2008. The OEB also noted that it will allow Hydro One to track in a variance account the difference between revenue based on current rates and the distribution 2008 revenue requirement to be approved later this year for the period from May 1, 2008 until such time as final rates are implemented. No amounts will be recorded in the variance account until the OEB makes a decision on the Company’s current distribution rate application, including the effective date for final rates.

On April 11, 2008, Hydro One gave notice that it will not extend the maturity date of its $40 million extendible step-up note beyond its current maturity date of May 15, 2008. The notes will be redeemed at that time at a redemption price equal to the principal amount plus any accrued and unpaid interest.

9. COMPARATIVE FIGURES

The comparative unaudited interim Consolidated Financial Statements have been reclassified from statements previously presented to conform to the presentation of the March 31, 2008 unaudited interim Consolidated Financial Statements.

Hydro One Networks Inc.
Distribution
Reconciliation of Regulatory Financial Results with Audited Financial Statements

A (high)	Stable	Upgraded	Senior Unsecured Debentures

(All figures in Canadian dollars, unless otherwise noted.)

Rating History

	Current	2005	2004	2003	2002	2001	2000
Commercial Paper	R-1 (middle)	R-1 (low)	R-1 (low)	R-1 (low)	R-1 (low)	R-1 (low)	R-1 (low)
Senior Unsecured Debentures	A (high)	A	A	A	A	A	A

Rating Update

On June 23, 2006, Dominion Bond Rating Service ("DBRS") upgraded the rating on the Senior Unsecured Debentures of Hydro One Inc. ("Hydro One" or the "Company") to A (high) with a Stable trend from "A" with a Positive trend, and upgraded the rating on Hydro One's Commercial Paper to R-1 (middle) from R-1 (low), also with a Stable trend. Key factors supporting the upgrade include: (1) improvements to the regulatory framework in Ontario in recent years; (2) the supportive political environment for the electricity industry; and (3) the expectation that Hydro One's financial profile, which has seen material improvement since 2002, will remain strong over the medium to longer term.

The regulatory framework in Ontario has stabilized over the past two years, and recent decisions by the Ontario Energy Board ("OEB") have been supportive of Hydro One's regulated operations. For example, in its latest decision on Hydro One's transmission operations (February 21, 2006), the OEB stated that it is mindful of the fact that heavy handed regulation is not good for investor confidence. This is an important consideration at a time when Hydro One will experience increased capital investment requirements to address transmission system constraints that have been identified by the Independent Electricity System Operator ("IESO"). In addition, for the first time since 1999, Hydro One's distribution rate base has been adjusted to reflect investments made over the past five years. While there is a level of uncertainty regarding the rate setting process beyond 2006, DBRS is of the view that the OEB will continue to be supportive and allow for full cost of service recovery and the ability to earn a fair market-based rate of return. DBRS is of the view that the current government is unlikely to interfere with the ratemaking process for regulated transmission and distribution operators as it has made a strong commitment to ensuring that ratepayers pay the full cost of electricity production and supply.

The key challenge for Hydro One will be managing potentially over $2.0 billion in transmission upgrades and conservation and demand management initiatives (i.e., smart meters) over the next five years. Cash flow from operations is expected to remain near $900 million annually over the next few years, but will be insufficient to fully fund capital expenditures and dividends. The annual shortfall will be funded with debt. Despite the cash flow shortfall, total adjusted debt-to-capital is expected to remain around 55% over the medium term as Hydro One's equity will experience modest growth through retained earnings. (Continued on page 2.)

Rating Considerations

Strengths:
- Involved primarily in regulated activities
- Attractive Ontario-based business franchise
- Strong and supportive shareholder – Province of Ontario

Challenges:
- Regulatory risk/risk of political intervention
- Low regulatory returns
- Lack of access to equity markets

The Company

Hydro One Inc., one of the successor companies of the former Ontario Hydro, holds and operates electricity transmission and distribution assets, as well as a fibre-optic network across most of Ontario. Hydro One is the largest transmission operator in Ontario (servicing 95% of the province's transmission throughput), is the second largest electricity distributor in Ontario based on distribution throughput, and is the largest based on the number of customers. The Company is wholly owned by the Province of Ontario (the "Province"), although the Province does not guarantee debt issued by Hydro One.

Authorized Commercial Paper Amount

Program limit is Cdn$750 million (authorized limit remains Cdn$1 billion).

RATING UPDATE CONTINUED

Fixed charges coverage is expected to remain in the 2.75 times to 3.00 times range and cash flow-to-adjusted total debt is expected to be in the 16% to 18% range. As such, Hydro One's financial profile is expected to remain adequate to support an A (high) rating over the medium to longer term, given the Company's stable regulated transmission and distribution (T&D) operations in Ontario and barring any unforeseen negative changes to the regulatory framework, or political agendas. DBRS notes that a recent draft proposal by OEB staff to reduce the allowed ROE on distribution operations to below 9.0% would erode Hydro One's expected financial profile should this recommendation be ultimately adopted in future OEB decisions. However, impact on Hydro One's credit metrics cannot be assessed until the OEB's consultation process is complete and a final decision is made.

REGULATION

Hydro One's electricity distribution and transmission subsidiary (Hydro One Networks) is regulated by the OEB under the *Electricity Act*, 1998 (the "Electricity Act"), with the following noteworthy amendments:

- The *Electricity Pricing, Conservation and Supply Act*, 2002 ("Bill 210") – December 9, 2002.
- The *Ontario Energy Board Amendment Act* (Electricity Pricing), 2003 ("Bill 4") – December 18, 2003.
- The *Electricity Restructuring Act*, 2004 ("Bill 100") – December 9, 2004.

Hydro One's deemed capital structure is 36% common equity, 4% preferred equity, and 60% debt. Revenues from distribution operations are based on a fixed service charge and a volumetric charge, whereas revenues from transmission operations are based on peak monthly demand. The following is a summary of the regulatory framework for Hydro One's transmission and distribution operations.

Transmission:

On February 21, 2006, the OEB released its latest decision on Hydro One's transmission operations. This rate decision did not address any change in transmission rates, in fact transmission rates are still based on Hydro One's 2000 revenue requirements for transmission. The purpose of this rate decision was to deal with what the OEB had viewed as over-earnings by Hydro One's transmission operations. This has been achieved through the establishment of an earnings sharing mechanism, which will remain in place until transmission rates are addressed with a full rate hearing, likely some time in 2007. Key highlights of this latest decision are:

- The allowed ROE of 9.88% for transmission operations will remain in place until a new rate is established, likely in 2007.
- Any excess earnings, above an ROE of 9.88%, will be shared 50/50 with customers.

Distribution:

On November 11, 2005, the OEB set the allowable ROE for all Ontario local distribution companies (LDCs) at 9.00% (down from 9.88% in 2005).

On April 12, 2006, the OEB issued its rate decision on Hydro One's 2006 distribution rate application, with new distribution rates becoming effective on May 1, 2006. Hydro One elected to use the 2006 test year in its 2006 distribution rate application. The following are highlights of this rate decision:

- An approved rate base for distribution operations of $3,711 million. This represents the first rate base increase since the Electricity Act was implemented, which was set based on Hydro One's 1999 distribution rate base of $2,637 million.
- An approved debt rate of 6.24% on long-term debt and 3.33% on short-term debt, equivalent to a blended debt rate of 5.93% (53.7% of Hydro One's deemed capital structure for distribution is comprised of long-term debt and 6.3% is comprised of unfunded short-term debt).
- A $0.30 per residential customer per month as a result of the OEB's generic decision on Smart Metering.
- The total approved revenue requirement for Hydro One's distribution operations is $965 million, an overall increase of $130 million from the previously approved revenue requirement.
- The OEB disallowed Hydro One's proposal to harmonize distribution rates amongst all its customers, including LDCs the Company acquired in 2001.

Generic Cost of Capital (Distribution):

- On April 27, 2006, the OEB indicated its intent to establish a multi-year electricity distribution rate-setting plan for all LDCs in Ontario, which will include:
  - A generic cost of capital to be used in adjusting annual revenue requirements for 2007 and beyond, and
  - A mechanistic incentive rate adjustment for the period.
- The initial term of the multi-year plan will be three years, beginning with the 2007 rate adjustment.
- On June 19, 2006, the OEB posted on its website a draft report of Board staff containing staff's initial proposals for both the cost of capital and the second generation incentive regulation mechanism. The OEB intends to issue a second draft on July 20, 2006.
- DBRS notes that Hydro One's recent ratings upgrade is premised on the Company's reduced business risk profile associated with improvements to the regulatory framework and the supportive political environment that has materialized in recent years, together with improved credit metrics. In its draft report, Board staff has recommended an allowed ROE range of well below 9.0% for distribution operations (in the range of 7.52% to 8.36%), which would have a material negative impact on cash flow-to-debt and interest coverage ratios for Hydro One, especially if the same ROE range subsequently gets adopted for transmission operations.

However, it is too early to determine the impact on credit metrics until the consultation and review process is completed and a final decision is made. Furthermore, DBRS notes that due to past government intervention in the regulatory process, Hydro One's distribution operations earned well below the previous 9.88% ROE.

RATING CONSIDERATIONS

Strengths: (1) Almost all of Hydro One's assets and earnings are in regulated electricity T&D operations. Despite political interference in the Ontario electricity sector in the past, the current regulatory framework is supportive of Hydro One's T&D operations and is expected to remain supportive over the near to medium term. As such, T&D operations are expected to continue to provide a high degree of stability to Hydro One's earnings and financial profile. DBRS highlights a statement in Hydro One's most recent transmission decision, whereby the OEB indicated that in formulating its rate decision it was mindful not to diminish investor confidence in the utility by heavy handed regulatory actions. This is an important consideration, given the investment that Hydro One will have to make in upgrading the Ontario transmission grid over the coming years.

(2) Hydro One's transmission franchise area is one of the strongest in Canada, given that it covers virtually all of Ontario. While the Company's distribution franchise is less attractive, as it includes a large geographic area (most of rural Ontario outside major urban centres) with a low population density/high cost of service, the acquisition of 88 municipal electric utilities in 2001 has reduced unit costs and the regulatory framework provides full cost of service recovery with a market-based rate of return.

(3) While Hydro One faced a high degree of political interference during the previous government's mandate, the Province of Ontario (currently rated AA with a Stable trend by DBRS) continues to be a strong and supportive shareholder to the Company. The Province's support has been demonstrated in the past by various actions, including the provision of a line of a credit in 2002 when Hydro One was unable to access the capital markets. DBRS notes, however, that the rating on Hydro One is a stand-alone rating and is not guaranteed by the Province.

Challenges: (1) The key challenge facing Hydro One is regulatory risk and the risk of political intervention. Regulatory risk is an inherent challenge for any regulated utility given that the regulatory framework essentially dictates the maximum profitability that can be achieved and the degree of protection to bondholders. While some uncertainty exists regarding the regulatory framework beyond 2006, DBRS expects the OEB to remain supportive by continuing to allow full cost of service recovery with a market-based rate of return on regulated T&D operations. The key risk with respect to political intervention would be the imposition of a rate freeze, as was seen in 2002, which was at a time of high electricity prices and near a provincial election. However, DBRS believes the risk of political intervention in the rate-setting process is relatively low under the current provincial government's tenure, as this government has made a strong commitment to passing along the full cost of power to electricity ratepayers.

(2) The ROE of 9.0% for Ontario electricity distribution and 9.88% for electricity transmission is low in comparison with similar regulated utilities in the U.S., which are typically in the 10% to 12% range. As such, cash flow and coverage ratios for regulated utilities in Ontario will typically be lower than for similarly regulated utilities in the United Staes. However, the regulated rates of return for Ontario utilities are currently in line with the lower rates of return typically granted to regulated utilities in Canada. DBRS notes, however, that the Board staff recommendation of an ROE in the range of 7.52% to 8.36% will be lower than any other jurisdiction in Canada, placing additional pressure on credit metrics. Furthermore, there is a risk that lower ROEs for regulated utilities in Canada may make access to capital more challenging in the future, given that foreign content limits for investors have been eliminated by the Canadian government.

(3) Hydro One does not have access to the equity capital markets, as it is 100%-owned by the Province of Ontario. This limits the Company's financial flexibility, especially given its significant capital development commitments with respect to improving the reliability of the transmission grid. However, given the support of the provincial government, DBRS would expect Hydro One to reduce its dividends to the Province in order to support its equity base.

EARNINGS AND OUTLOOK

Segmented Information		12 mos. ended	For the year ended December 3				
($ millions)	%	March 30, 2006	2005	2004	2003	2002	2001
Net revenues:							
Transmission	56%	1,280	1,310	1,262	1,298	1,317	1,259
Distribution	43%	969	954	910	862	824	893
Other	1%	22	21	17	26	32	47
Total net revenues		2,271	2,285	2,189	2,186	2,173	2,199
Earnings before interest and taxes:							
Transmission		680	711	665	688	741	686
Distribution		319	305	284	252	263	339
Other		(9)	(10)	(11)	(3)	(49)	(34)
Total EBIT		990	1,006	938	937	955	991
Transmission throughputs (TWh)		n/a	157.0	153.4	151.7	153.2	146.9
Distribution throughputs (TWh)		29.3	29.7	28.5	27.9	27.1	21.3

n/a = not applicable.

Summary:

- The increase in EBIT in 2005 was largely a result of: Higher transmission revenues due to higher monthly peak demand in 2005 resulting from an abnormally hot summer, and
  - Earnings from distribution operations that were also positively impacted by weather as well as the collection of various regulatory deferrals.
- In general, EBIT has remained relatively stable over the past five years, in the $935 million to $1 billion range, which is reflective of the company's regulated operations.
- Interest expense has remained largely unchanged over the past three years, reflective of the Company's relatively stable debt levels.

Outlook:

- EBIT is expected to drop to near the $900 million range for 2006, under a more normal weather scenario (versus the more extreme weather experienced in 2005), and grow at a modest pace along with growth in rate base.
  - Also contributing to the lower EBIT is higher OM&A, resulting from an increase in pension contributions and increased spending on reliability-related maintenance.
- Furthermore, the earnings sharing mechanism for transmission operations will have a modestly negative impact on earnings in comparison to previous years.
- Earnings from one year to the next will continue to be sensitive to changes in monthly peak demand for electricity given the current regulatory framework for transmission.
- While there is a level of uncertainty regarding the rate setting process beyond 2006, DBRS is of the view that the OEB will continue to be supportive and allow for full cost of service recovery and the ability to earn a fair market-based rate of return.

Cash flow/capital expenditures (times)	1.34	1.37	1.27	1.43	1.27	1.25

*Adjusted for equity treatment of preferred shares.

Summary:

- •• Cash flow from operations improved modestly in 2005 and for the 12-months ended March 31, 2006, but remained insufficient to fully fund capital expenditure requirements and dividends.
- •• However, a significant positive change in working capital funded the shortfall in 2006, as well as $188 million in net debt repayment.
- •• Cash flow-to-debt and interest coverage ratios have continued to improve over the past few years, and are well within the range of an A (high) T&D utility with a supportive regulatory framework.

Outlook:

- •• Cash flow from operations is expected to remain near $900 million annually over the next few years, but will remain insufficient to fully fund capital expenditures and dividends. The shortfall is expected to be funded with debt.
  - •• Annual capital expenditures (maintenance and upgrades) are expected to be in the $750 million to $800 million range as Hydro One continues to focus on transmission upgrades to mitigate critical system constraints, and
  - •• Dividends will likely be in the $250 million to $275 million range.
- •• Despite the cash flow shortfall, total adjusted debt-to-capital is expected to remain around 55% over the medium term as Hydro One's equity will experience modest growth through retained earnings.
- •• Fixed charges coverage is expected to remain in the 2.75 times to 3.00 times range and cash flow-to-adjusted total debt is expected to remain in the 16% to 18% range.
- •• As such, Hydro One's financial profile is expected to remain adequate to continue to support the A (high) rating over the medium term, given the Company's stable regulated T&D operations in Ontario.

LONG-TERM DEBT MATURITIES AND BANK LINES

As of June 30, 2006

	2006	2007	2008	2009	2010	2011-2015	2016 & thereafter	Total
$ (millions)	141	395	500	400	400	850	2,500	5,185
Avg. coupon	4.2%	4.4%	4.0%	4.0%	7.2%	6.0%	6.6%	5.6%

Long-Term Debt:

- •• Hydro One currently has available $1.95 billion on its $2.5 billion MTN Shelf, which was established in June 2005. The majority of funds received from the issuance of MTNs under its Shelf have been used to refinance maturing debt.
- •• Hydro One faces a manageable level of term debt maturities over the next five years. Maturities will likely be refinanced with debt issued under the above-noted Shelf.

Bank Lines and Commercial Paper:

- In August 2004, Hydro One reduced its syndicated committed bank lines to $750 million from $1 billion and, consequently, reduced the limit on its commercial paper program to $750 million.
  - However, the authorized Board limit on its commercial paper program remains $1 billion.
  - Hydro One has a $750 million committed 364-day revolving credit facility, maturing in August 2006. DBRS expects this to be extended.
- As at March 31, 2006, Hydro One had $40 million of commercial paper outstanding.

Opinion

Company Profile

Hydro One Inc. (HOI) is wholly owned by the Province of Ontario. Its revenues and cash flows are almost completely derived from its transmission and distribution businesses, both of which are regulated by the Ontario Energy Board (OEB). HOI owns and operates virtually all of Ontario's electricity transmission system, and is responsible for a substantial portion of regulated electricity distribution in the province.

Recent Developments

HOI's Aa3 senior unsecured rating reflects the application of Moody's July 2006 rating methodology update for government-related issuers (GRIs), which describes the publication of baseline credit assessments (BCAs) on a 1-21 scale. Please refer to Moody's Rating Methodology entitled "The Application of Joint Default Analysis to Government-Related Issuers", published in April 2005, and its accompanying press release, for further background, as well as Moody's July 2005 Special Comment entitled "Rating Government-Related Issuers in Americas Corporate Finance" for a detailed discussion of the application of joint default analysis to GRI's in the Americas.

Rating Rationale

In accordance with Moody's GRI rating methodology, the Aa3 ratings of HOI reflect the combination of the following inputs:

- BCA in the range of 5 to 7 (on a scale of 1 to 21, where 1 represents the equivalent risk of a Aaa, 2 a Aa1, 3 a Aa2 and so forth)

- Aa2 local currency rating of the province of Ontario

- High dependence

- High support

The BCA range of 5 to 7 reflects HOI's stable and predictable cash flows and the low business risk of its regulated wires businesses. The BCA also reflects HOI's limited ability to raise equity and the potential that HOI can be utilized as an instrument of public policy. As demonstrated by the rate cap provisions of Bill 210 introduced in 2002, public policy goals are not always completely aligned with the interests of debtholders. HOI's financial metrics are consistent with those of other regulated utilities with a BCA of 5 to 7 in the low business risk category.

Going forward, HOI faces potentially significant credit challenges in terms of the evolution of the regulatory environment, capital spending pressures and an aging labour force. While a measure of relative regulatory and political stability has emerged over the last few years, the company is currently in the midst of two regulatory processes, the outcomes of which could have significant impact on the company's financial condition. Firstly, as part of the OEB's multi-year electricity distribution rate setting plan, OEB staff have tabled a discussion paper setting forth staff's proposal for establishing the cost of capital for rate-making purposes and establishing a 2nd generation incentive regulation mechanism (2nd Generation IRM) applicable to Ontario's electricity distributors (LDCs). Moody's notes that staff's cost of capital proposal is subject to change following stakeholder consultation and ultimately review by the OEB panel. However, if staff's cost of capital proposal, and in particular its allowed ROE formula, is adopted without change, Moody's believes it would likely result in a weakening of HOI's cash flow credit metrics which could place downward pressure on the company's BCA. Staff's proposal contemplates a capital structure common to all LDCs which would be comprised of 40% common equity and 60% debt. However, any actual preferred equity outstanding up to 4% of rate base would be captured within the 40% common equity component. Assuming that over time HOI's preferred equity will represent a diminishing portion of the capital structure, staff's proposal would allow HOI to increase its common equity thickness relative to the 36% common equity component currently used in determining HOI's distribution rates. However, Moody's believes that any benefit of thicker equity would be more than offset by an ROE that could be 50 to 100 bps below those of other regulated utilities in Canada. The staff proposal also outlines an annual adjustment to the cost of capital calculation which would be one component of the price cap mechanism for annually adjusting distribution rates under the 2nd generation IRM. In Moody's view, the benefits of transparent mechanisms for the adjustment of ROE, cost of capital and distribution rates would be more than offset by the reduced cash flows that staff's cost of capital proposal implies.

The second major regulatory process is HOI's 2007-2008 transmission rate application which is expected to be filed in the third quarter of 2006. While the outcome of that hearing cannot be determined at this time, it would seem likely that OEB staff would propose an allowed ROE/cost of capital mechanism for HOI's transmission business that is similar to that which it proposes for Ontario's electricity distributors. Given that HOI's transmission business represents approximately 65% of the company's assets and operating profit, Moody's would be concerned about the potential for material weakening of HOI's cash flows.

HOI expects to have large capital expenditure needs for a number of years. In addition to ongoing maintenance capital expenditures, the company expects to incur significant capex in support of the Ontario Power Authority's (OPA) pending Integrated Power System Plan (IPSP) and the provincial government's smart meter initiative. The OPA's IPSP, which is scheduled to be published in March 2007, is expected to call for significant expansion/reinforcement of Ontario's transmission grid in support of the government's objectives concerning generation supply mix, increased renewables generation and increased grid efficiency/congestion reduction. In addition, HOI anticipates that it will be required to spend between $600 million and $1.2 billion between 2007 and 2010 to fulfill its role in achieving the government's objective of installing smart meters in all Ontario homes and businesses by 2010. During 2007 and 2008 the company forecasts capital expenditures in excess of approximately $1.2 billion per year. Moody's estimates that approximately $1.4 billion will be required for transmission capital expenditures in 2007 and 2008. The balance of roughly $1 billion will be spent on the distribution side with approximately 40% being spent on smart metering. HOI's smart meter expenditures are currently being recorded in a regulatory deferral account. While Moody's expects that HOI will be afforded the opportunity to fully recover its smart meter costs, the timing of cost recovery is uncertain, as the period over which these cost are recovered has yet to be determined. Moody's notes that to some degree both the quantum and the timing of IPSP and smart meter expenditures are outside of HOI's control. HOI anticipates that it will fund a portion of the forecast capital expenditures with internally generated cash flows and the balance with debt. Given the province's ownership of HOI, the company has limited access to additional equity. Moody's estimates that, in the absence of a significant reduction in its dividend payout, HOI's FFO interest coverage and FFO/Debt ratios could come under pressure as a result of the company's capital expenditure needs.

The extent of HOI's capital expenditures over the next few years highlights another challenge that HOI and many other utilities face: that of an aging workforce. According to the company, approximately 25% of its workforce is eligible for retirement by 2008. The availability and cost of skilled labour necessary to successfully complete the work required under the forthcoming IPSP and the province's smart meter plan as well as HOI's ongoing system operation and maintenance could prove to be a challenge.

High dependence reflects the importance of the issuer to the provincial economy and its operating and financial proximity to the government.

High support reflects the strategic importance of the issuer to the province, the government's history of providing support through dividend deferrals in its capacity as a shareholder of the company and the government's history of intervening in the electricity sector.

Rating Outlook

The stable outlook is based on the predictable cash flow generated by HOI's regulated transmission and distribution businesses.

What Could Change the Rating - Up

- While considered unlikely at this time, a sustainable improvement in cash flow metrics (FFO interest coverage exceeding 4.5x and FFO/Debt exceeding 20%) related to increases in the deemed equity component and allowed ROE could result in a positive rating action

What Could Change the Rating - Down

- Reduced support level

- Downward revisions in ROE, undue reliance on debt to finance capital expenditures or other factors which lead to a sustained weakening of cash flow metrics (FFO interest coverage below 3.0x and FFO/Debt below the mid-teens)

- Actions on the part of the shareholder that impede the company's ability to act in a commercial manner

- Material changes in the ownership, governance or management structures

- Further restructuring of the electricity sector that increases HOI's business or financial risk profiles

Major Rating Factors

Strengths:

- Low-risk electricity transmission and distribution network businesses
- Monopoly position
- Regulated cash flows
- Supportive shareholder

Weaknesses:

- Moderate financial profile
- Large capital expenditure program

- Transmission and distribution revenues subject to some volumetric risk

Rationale

The ratings on Hydro One Inc. reflect the company's monopoly electricity transmission and distribution networks, relatively stable and secure cash flows, improved financial profile, and the support of its owner, the Province of Ontario (AA/Stable/A-1+). These strengths are offset by regulatory uncertainty, and the financial and operational risks associated with the company's large capital expenditure program.

Toronto-based Hydro One is the incumbent electricity transmission business and largest distributor of electricity in Ontario. The company owns and operates more than 97% of the province's transmission network as measured by revenue, and its distribution network service territory covers about 75% of the province. Hydro One's monopoly position and regulatory restrictions limit the risk of network bypass.

Hydro One's debt-servicing capacity is supported by the regulated returns it receives from its network businesses. The company's relatively secure and predictable earnings, which provide 99% of cash flows, reflect its low-risk assets. The regulated cash flows are determined on a cost-of-service and rate-of-return methodology such that the company recovers all prudent costs and a return on its capital investment.

Hydro One's funds from operations (FFO) interest and debt coverages are not expected to show improvement and could weaken in the next few years. In the four-year period from 2005-2008, the company will recover C$144 million in regulatory costs. FFO cash interest coverage is expected to remain substantially the same, at about 4.3x. FFO interest coverage could decline in the next few years from its three-year average and 2005 levels of 3.7x to 3.4x, respectively, assuming financially unfavorable outcomes of upcoming regulatory decisions and the eventual approval and execution of increased capital spending. The tempering effect of the refinancing of higher cost debt maturing in 2006 and 2007, and at today's lower interest rates, is factored into these projections. In the next two to three years, FFO-to-average total debt is also expected to decrease to about 15% from its 2005 level of 19%; incremental debt will be required to partially fund upcoming capital expenditures, some of which will not immediately contribute to cash flow. The company is expected to debt finance 20% or more of forecast capital expenditure in the next several years. Hydro One's leverage, as measured by total debt-to-total capital, is likely to creep back up to its historical level of 55%, as compared with 52% in 2005. The fall to 52% in 2005 was due in part to the redemption in late 2005 of C$109 million of notes due in January 2006.

The province's ownership of Hydro One enhances the utility's credit quality. Although the province does not formally guarantee Hydro One's debt obligations, the strategic nature of the company within the provincial economy and the government's demonstrated willingness to financially assist the business under extraordinary circumstances in the past bode well for future support.

Hydro One's operational and financial performance is subject to regulatory risk. The transparency, predictability, and stability of the regulatory regime governing the company's electricity transmission and distribution operations continue to improve. Nevertheless, political interference in the regulatory process in recent years and the transitioning nature of the regulatory environment pose ongoing risks for the company's cash flows. The outcome of the Ontario Energy Board's (OEB) ongoing generic cost-of-capital review will be used to determine rates for 2007 and beyond, and could affect the cash flow strength of Hydro One's distribution segment. Both the allowed returns and the regulatory capital structure are being examined by the regulator; a decision is expected before year-end.

Hydro One's underlying annual capital expenditure program carries financial and operational risk. Although predominantly funded from internal sources, expected capital expenditure (including smart meter investment) in the C$800 million-C$1.2 billion range per year in the next few years will be a drain on the company's cash flow and reduce its financial flexibility. Total capital expenditure of C$691 million in 2005 was below budget but is expected to rebound in 2006 and increase further in 2007 to the higher end of the forecast range. Capital spending estimates include the cost of installing smart meters for all distribution customers by 2010 as well as expected upgrades and expansion of the transmission system to accommodate growth in domestic demand, new generation facilities, and to facilitate increased imports and exports. A decision by the OEB earlier this year clarified that, like its other infrastructure investments, Hydro One's estimated C$600 million-C$1.2 billion investment in smart meters in the next four years will also be added to its revenue-generating regulated asset base.

Short-term credit factors

The short-term rating on Hydro One is 'A-1'. The company has adequate liquidity to meet debt maturities, capital expenditure requirements, and dividend commitments in 2006. Unused and committed bank lines, together with expected strong cash flows, ready access to the debt capital markets, and discretionary spending on capital expenditure, provide Hydro One with sufficient liquidity and the financial flexibility to meet its annual capital expenditure estimate of C$800 million-C$1.2 billion, annual dividend payments of C$250 million-C$300 million, and C$141 million of debt maturing in the remainder of 2006. As of June 30, 2006, the company had C$130 million short-term notes outstanding through its board-approved C$1 billion short-term note program.

In support of Hydro One's liquidity, the company can draw on:

- Committed and largely available bank lines estimated at about C$620 million as of June 30, 2006;
- Expected annual regulated cash flows in 2006, as represented by FFO, of about C$900 million;
- Its well-supported MTN shelf program, which had C$1.95 billion of available credit as of June 30, 2006; and
- Discretionary capital expenditure for 2006 estimated at about 15% of forecast.

Hydro One's bank lines consist of a C$750 million committed demand line of credit, with a syndicate of banks, maturing in August 2007. The committed demand facility also has a two-year term-out option. The bank line is used for general corporate purposes and to support its C$1 billion Canadian CP program.

The company is well within its banking covenant of total debt-to-total capital of 75% and has no material adverse change clauses that could trigger a default. A potential call on liquidity would happen in the event the credit rating on Hydro One fell to the 'BBB' category. This would trigger a tripling of Hydro One's prudential support to the independent market operator by way of bank LOCs, which can vary throughout the year from C$10 million-C$25 million.

Outlook

The stable outlook reflects the low-risk nature of the company's business and greater transparency and predictability of outcomes within the Ontario regulatory environment. Regulatory autonomy also has improved, although the potential for political intervention to override regulatory decisions remains. There are currently no forecast or expected scenarios within the current environment that would result in either a ratings downgrade or upgrade. Significant deterioration in the company's financial and operational performance could put pressure on the ratings, but such a scenario is relatively unlikely. Given the supportive and stable shareholder relationship, modest lowering of allowed returns in future regulatory determinations on the company's cash flow strength and the pressures of upcoming increased capital spending are not expected to lead to a negative outlook. A positive outlook or rating upgrade, although currently not forecast given upcoming capital spending plans, could result from a prolonged period of no political intervention in the regulatory environment governing the company's operations.

Business Description

Hydro One's operations primarily center on its low-risk electricity transmission and distribution operations that account for 99% of its consolidated assets and generate virtually all of its FFO. As part of its distribution operations, the company also undertakes regulated delivery of electricity to 1.3 million customers. In addition, the company markets surplus fiber optic capacity. Hydro One's 28,500-kilometer (km) high voltage provincial transmission grid accounts for about 55% of consolidated assets and is the second largest in Canada and is interconnected to neighboring Canadian provinces and northern states of the U.S. The company's 122,100-km distribution operation is also one of the country's largest. The distribution system covers approximately 75% of Ontario and delivers about 15% of the province's demand load.

The company is wholly owned by the Province of Ontario, which holds all the common and preferred shares outstanding. Hydro One's board of directors is appointed by the province and although the company's business plan and dividend policy are set by the board, they are reviewed by the government before implementation. The company's close relationship with its owner has been demonstrated through the provision of financial support in the past and, although no financial support can be assured in the future, the strategic importance of Hydro One to the economy of Ontario would suggest it is appropriate to factor into the ratings an element of implied support from Hydro One's higher rated owner.

Business Risk Profile

A stable regulatory regime supports credit quality

The OEB undertakes regulatory oversight of Hydro One's monopoly distribution and transmission operations. Hydro One's regulated cash flows are determined on a cost-of-service and rate-of-return methodology and although the relatively low allowed returns limit upside in cash flows and are subject to regulatory lag, nevertheless, they provide relative predictability and security of cash flow. The company's allowed economic return is based on a deemed (for regulatory purposes) equity component in its capital structure of 36%, on which an ROE (currently 9.0% for distribution and 9.88% for transmission in 2006, as compared with 9.88% for both in 2005) is allowed. Indications are that the ROE allowed for in Hydro One's rates for 2007 and beyond could drop further if OEB staff recommendations are adopted by the OEB in its upcoming generic cost-of-capital decision. Hydro One is also permitted to hold 4.0% of its capital in preferred equity on which a dividend rate of 5.5% is earned.

There is a long history of regulated entities in both Ontario and Canada being allowed to recoup unforeseen previously incurred costs (or regulatory assets) after the fact through rate riders. The cash recovery of these costs is subject to a prudency review and regulatory approval. For Hydro One, the current recovery of regulatory assets means additional annual cash flows in the period 2005-2007 of about C$35 million.

The regulatory regime in Ontario has shown signs of improved stability and predictability in recent times but remains subject to the risk of political intervention. The existing regime continues to provide for ministerial intervention, with the Minister of Energy retaining the ability to override decisions of the OEB, which is what occurred under the previous government. The political risk associated with the tariff-setting process weakens the supportive nature of the price regulation and continues to present a risk to the cash flows of electricity network operators such as Hydro One.

Hydro One's regulated retail services, undertaken as part of its distribution operations, are protected from commodity price and volume risk by OEB-regulated prices. The establishment of the government-sponsored Ontario Power Authority in 2004 to manage, among other functions, variance accounts for the regulated retail function of local distribution companies (LDCs) further removes a risk to Hydro One's cash flows and reduces demands on working capital. Customers not eligible for the regulated energy price pay the wholesale commodity price. Any regulatory or government action to remove the direct pass-through mechanism, or to require Hydro One to take on an obligation to ensure adequate supplies of energy to end-use customers, would have a negative influence on the ratings on Hydro One.

Ontario is Hydro One's primary market

Hydro One's primary market is the growing province of Ontario, which accounts for close to 40% of Canada's GDP. Although Hydro One's transmission operations service the entire province, the company's distribution business, apart from its Brampton network on the outskirts of Toronto, is largely rural based. Ontario's economy posted moderate growth of 2.8% in 2005 following 2.6% real GDP growth in 2004. The province is forecasting economic growth to remain in low gear, with real GDP expected to slow to 2.3% in 2006 and 2.5% in 2007, reflecting the impact of the sharp appreciation of the Canadian dollar, high oil prices, and deceleration of growth in the U.S. economy. GDP growth in Ontario, which has generally performed better than the national average, has also been reflected in higher throughput and growth in customer connections for Hydro One. Growth in distribution throughput was 4.0% in 2005 to 29,677 GWh, up from 2.0% growth experienced in 2004, while the company's distribution customer base of almost 1.3 million increased at a more modest rate of 1.2%, down slightly from 1.6% in 2004 and 2003.

The diversity of Hydro One's customer base supports the stability of its revenues and limits its exposure to any particular customer or customer class. A breakdown of contributors to the company's total revenue highlights the diversity of its customer base, with its province-wide transmission business contributing about 30% of revenues, residential customers of the distribution business contributing about 37%, commercial customers about 23%, and large industrials and embedded distributors about 3% and 6%, respectively. The company's top-10 customers are predominately LDCs and, although they account for a disproportionate percentage of energy delivered, their percentage of gross revenue is only about 2%. Furthermore, the vast majority of the larger LDCs supplied are investment-grade credits.

Operations are dominated by low-risk transmission and distribution

Hydro One's low-risk transmission and distribution businesses dominate its operations. The transmission business represents about 55% of fixed assets, and contributes about 60% of cash flow, while its distribution business largely comprises the remaining assets and cash flows. The company's regulated retail services, as part of its distribution operations, represent a small portion of assets and, despite contributing a significant amount of revenue, provide minimal cash flow benefits because of the direct pass-through of all energy costs to consumers. The company has a small telecommunications business that leases surplus fiber optic capacity. The telecommunications business represents only a minor part of Hydro One's operations, providing less than 1% of gross revenues and a similar portion of the company's fixed assets.

The operational performance of the company's transmission assets is quite good; however, the performance of its distribution assets is adversely affected by operational challenges not generally faced by more urban-based utilities in the Canadian industry and generally underperform relative to comparable utilities in the industry, as measured by the Canadian Electricity Association composite index (see table 1). A mitigating factor for the cash flows of the distribution business is the absence of penalties for underperformance.

SAIFI—System average interruption frequency index. N.A.—Not available.

Hydro One's capital expenditure could increase about 1.5x in the next several years, from about C$800 million in 2006 to in excess of C$1.2 billion in 2007 and 2008, with about 55% being spent on its transmission assets. The focus of the capital expenditure is on developing, upgrading, and reinforcing the transmission and distribution systems, and on ensuring safety and reliability. Although the timing of these projects remains uncertain and the spending is significant, the company is not expected to undertake major projects without previous regulatory approval.

With a transmission network tariff levied on the basis of peak load, and its distribution tariff levied on per unit of energy delivered, a risk to Hydro One's cash flows is fluctuations in volumes of energy delivered. This risk has been highlighted in recent years with weather-induced reductions in volume contributing to falls in expected revenues. Although the variability in gross revenues is not overly significant relative to the company's total cash flows, the government's push for greater demand-side management has the potential to lower peak demand and slow down growth in electricity distributed, leading to marginally lower returns for the business.

A medium- to long-term risk to Hydro One's business and financial profiles is the impact of potential rationalization within the Ontario LDC sector in the coming years. Although not viewed as an immediate issue for the rating, Hydro One's expected active participation in such a scenario could present future financing, execution, and integration risks.

Asset-intensive nature of Hydro One's monopoly business reduces competitive risk

Although some competitive pressures exist, Hydro One's natural monopoly transmission system is largely shielded from direct competition. The company does not hold a legal monopoly over its service territory and there is no restriction on other transmission businesses building and operating transmission networks in Ontario; however, the company's cost-reflective pricing and the capital cost involved in large-scale duplication of the network reduce the risk of bypass. Furthermore, the OEB-approved uniform transmission pricing across Ontario mitigates the risk of bypass from competing transmitters and should a bypass occur, tariffs would be rebalanced across remaining customers with minimal financial impact on the company. Of greater concern is the company's exposure to the risk of lost revenue from embedded generation arising from high wholesale electricity prices.

Noncontiguous service territories of LDCs expose Hydro One to competition for new services in nondesignated areas adjacent to its distribution service territories. The issue presents a competitive challenge for the company, but a decision by the OEB in mid-2004 would appear to limit the risk to greenfield development at the border of existing service territories and not put at risk cash flows secured by Hydro One's existing network.

Profitability largely dictated by regulatory directives

Given the cost-plus nature of its regulatory framework, Hydro One's profitability is largely dictated by regulatory directives that currently provide the company with the ability to earn an ROE on a stable capital structure. The equity returns allowed for in the determination of rates are already low by international benchmarks and, subject to an OEB hearing in the fall of 2006, could decrease further and pressure the company's cash flow interest and debt coverages. Unlike its distribution network business, which has typically not earned its allowed ROE, the company's transmission assets have historically achieved more than the allowed ROE. An earnings sharing mechanism for the transmission business only was introduced by the regulator in 2006 with the utility to split, on a 50-50 basis, excess earnings above its allowed rate of ROA.

Financial Risk Profile

Accounting—it's business as usual

Hydro One's consolidated financial statements are prepared in accordance with Canadian GAAP. No material changes to Canadian GAAP or the accounting policies adopted by Hydro One are expected in the foreseeable future that would materially alter the financial statements as presented by Hydro One. Standard & Poor's Ratings Services treats Hydro One's C$323 million 5.5% cumulative preferred shares as equity. The shares are held by the province, and are entitled to an annual cumulative dividend of C$18 million. The shares rank in priority above the common shares upon liquidation. The adjusted interest coverage ratios (as presented in tables 2 and 3) reflect an interest expense that includes C$58 million in amortization of a refinancing discount, representing about 18% of total interest expense. In its analysis, Standard & Poor's removes the amortization expense from the interest expense to capture the cash cost of the interest paid.

*Adjusted by capital operating leases. NCF—Net cash flow.

Cash flow adequacy

Hydro One's annual FFO of close to C$900 million is sufficient to meet its expected dividend payments of close to C$300 million and the bulk of the company's capital expenditure program in 2006. The company's annual capital expenditure, however, is expected to increase from about C$800 million to C$1.3 billion in the next few years and will require partial debt funding. The company's net cash flow-to-capital expenditure is expected to range between 70%-80%.

Capital structure and financial flexibility

Hydro One's move to address structural deficiencies in its debt portfolio in recent times has reduced the level of financing risk the company faces. As of Dec. 31, 2005, 62% (C$3.1 billion) of Hydro One's debt still had a maturity date of up to seven years, with the remaining 38% maturing in 24 years or more. Maturing debt in any one year, however, does not represent more than 15% of the company's total long-term debt outstanding of C$5.2 billion as of June 30, 2006. The company's liability management strategy is to target an average term for its debt portfolio of 10 to 15 years. In the past few years, the company has increased its previously short, average term for its debt of about four years to the current weighted-average term of 14 years.

Further reducing financial risk for the company is its policy of hedging interest rate and foreign exchange exposure. The company generally maintains less than 20% of debt (including debt maturing within the year) at floating rates and carries no material foreign exchange exposure, with all debt in Canadian dollars. The weighted-average coupon rate of Hydro One's debt at year-end 2005 was 5.6%.

The lack of diversity of Hydro One's funding sources is not a ratings concern. The company relies heavily on the Canadian debt capital markets as its main funding source and although such reliance poses a concentration risk, the company's well-supported position in the market mitigates this somewhat. The debt capital markets provide the vast majority of Hydro One's financing, with the company relying on bank facilities largely for general corporate purposes and as a backup to its CP program. Maturing debt is to be financed through the company's C$2.5 billion MTN shelf program. As of June 30, 2006, C$1.95 billion remained available until July 2007.

As it has done since 1999, Hydro One's leverage, as measured by total debt-to-total capital, is expected to remain stable in the next few years at about 54%. Debt could increase annually by as much as C$300 million-C$700 million in the period 2007-2008, as it will be used to partially fund capital expenditure. All debt is unsecured and supported by a negative pledge. As of mid-2006, the company's capital structure comprised C$5.3 billion in debt, C$4.4 billion in common shares and retained earnings, and C$323 million in preferred shares.

Ease of access to the debt capital markets and bank debt, an ability to defer a portion of capital expenditure, and the company's close relationship with its owner support Hydro One's financing flexibility. The company has good access to the debt funding through its C$1 billion CP program, its committed but unused bank lines, and the remaining availability on its MTN shelf program. In addition to its ability to tap debt markets, Hydro One can defer about C$100 million of forecast capital expenditure per year, close to one-third of its annual interest expense. The government, as shareholder, is a further potential source of financing and provider of backup liquidity for the company. Hydro One is unlikely to have ready access to new equity in the form of cash injections; however, the flexibility afforded to it to defer annual common dividend payments of as much as C$300 million mitigates this financing constraint somewhat. The deferral of the dividend and discretionary capital expenditure is more than sufficient to meet forecast annual cash interest costs of about C$300 million-C$330 million.

STANDARD & POOR'S RatingsDirect

RESEARCH

Research Update:

Hydro One Inc. Outlook Revised To Positive; 'A' Ratings Affirmed

Publication date: 26-Mar-2007
Primary Credit Analyst: Nicole Martin, Toronto (1) 416-507-2560; nicole_martin@standardandpoors.com
Secondary Credit Analyst: Kenton Freitag, CFA, Toronto (1) 416-507-2545; kenton_freitag@standardandpoors.com

Rationale

On March 26, 2007, Standard & Poor's Ratings Services revised its outlook on utility holding company, Hydro One Inc., to positive from stable. At the same time, Standard & Poor's affirmed its 'A' long-term corporate credit rating and senior unsecured debt ratings on Hydro One. The revised outlook primarily reflects clearer evidence of regulatory stability and no expectation of disruptive market restructuring that would affect its local distribution company (LDC) credit quality. An outlook is not necessarily a precursor of a rating change. (For more details on the credit positive trends affecting the sector please refer to our commentary "Shining A Light On The Positive Outlook For Ontario Electricity Distributors" to be published following this research update, on RatingsDirect, the real-time Web-based source for Standard & Poor's credit ratings, research, and risk analysis.)

The ratings reflect the company's low-risk monopoly electricity transmission and distribution networks, secure and relatively predictable regulated cash flows, and the support of its owner, the Province of Ontario (AA/Stable/A-1+). These strengths are offset by an intermediate financial profile that will be further challenged by the company's large capital expenditure program in the next several years. Hydro One had C$5.2 billion in long-term debt outstanding as of Dec. 31, 2006.

Hydro One's monopoly position, the asset intensive nature of its businesses, and regulatory oversight limit competitive risk. Toronto-based Hydro One is the incumbent electricity transmission business and largest distributor of electricity in Ontario. The company owns and operates more than 97% of the province's transmission network as measured by revenue, and its distribution network service territory covers about 75% of the province.

Hydro One's debt-servicing capacity is supported by the regulated returns it receives from its electricity delivery businesses. Secure and relatively predictable regulated cash flows are supported by cost-of-service and rate-of-return regulation. The company can expect to recover all prudent costs incurred and earn a modest return on its capital investment. Furthermore, the company faces limited risk related to commodity price and volume variability. Although Hydro One's distribution business bills customers for the cost of the commodity consumed, the company has no obligation to ensure adequate electricity supply.

The province's ownership of Hydro One enhances the utility's credit quality. Although Ontario does not formally guarantee Hydro One's debt obligations, the strategic nature of the company within the provincial economy and the government's demonstrated willingness to financially assist the business under extraordinary circumstances in the past bode well for future support.

Hydro One has an intermediate financial profile and cash flow interest and debt coverages could weaken in the next few years. Pension-adjusted funds from operations (FFO) interest coverage of 4.7x in 2006 was up from 4.4x in 2005 largely as a result of distribution rate increases in 2005 and 2006. AFFO interest coverage could drift downward in the next several years but is not

Filed: August 15, 2007
EB-2007-0681

expected to fall below 4.0x. Cash flow strength in coming years will depend on: the outcome of an upcoming transmission rate hearing, regulatory approvals of budgeted capital expenditures, and the impact of weather variability on revenue. FFO-to-total debt is expected to remain with the 15%-20% range as compared with its 2006 level of 20%. The company is expected to debt finance 20% or more of forecast capital expenditure during the upcoming period of significant expansion. Hydro One's leverage, as measured by pension-adjusted total debt-to-total capital, is also likely to creep back up to the historical level of about 65%, compared with 60% in 2006.

Although predominantly funded from internal sources, capital spending during the next few years will be a drain on the company's cash flow and reduce its financial flexibility. Capital expenditure of C$1.2 billion is budgeted for 2007, a 40% increase compared with the C$863 million spent in 2006, and higher-than-historical average. This period of increased capital spending is a result of planned upgrades and expansion of the transmission system to accommodate: growth in domestic demand, new generation facilities, and facilitate increased imports and exports. The 2007 capital program also includes a portion of the estimated C$600 million-C$1.2 billion investment that Hydro One will make in smart meters for all distribution customers by 2010 in the next four years. Subject to a prudency review and like its other infrastructure investments, Hydro One's investment in smart meters will also be added to its revenue-generating regulated asset base.

Short-term credit factors

The short-term rating on Hydro One is 'A-1'. Unused and committed bank lines, together with strong cash flow from operations and ready access to the debt capital markets, provide Hydro One with sufficient liquidity and the financial flexibility to meet its forecast capital expenditure estimate of C$1.25 billion, annual dividend payments of C$250 million to C$350 million, and C$395 million of debt maturing in 2007. As of Dec. 31, 2006, C$60 million had been drawn from the company's C$1 billion short-term note program. The company remains well within its banking covenant of total debt-to-total capital of 75% and has no material adverse change clauses that could trigger a default.

In support of Hydro One's liquidity, the company can draw on:

- A committed C$750 million bank line of which C$690 million was available as of Dec. 31, 2006. The bank line is used for general corporate purposes and to support its C$1 billion Canadian CP program. The line matures in August 2007 and has a two-year term-out option;
- Its expected annual regulated cash flows in 2007, as represented by unadjusted FFO, of about C$860 million;
- An MTN shelf program, maturing in July 2007, which had C$1.725 billion of available credit as of Dec. 31, 2006; and
- Discretionary capital expenditure estimated in the range of C$150 million- C$200 million in 2007.

Outlook

The positive outlook reflects a steady improvement in Hydro One's business risk profile. The improvement is largely a result of steadily increasing clarity and stability with regards to regulatory methodology and timetables that influence both the transmission and distribution business, and the continued absence of disruptive market restructuring and political involvement in the regulatory process. Should this trend continue it could result in a positive rating action, but more than a single-notch improvement is highly unlikely. Given the supportive and stable shareholder relationship, the expected temporary downward pressure on the company's cash flow strength due to the pressures of upcoming increased capital spending should not lead to a revised outlook. A negative rating action could result from a material change in the company's financial or business risk profile, possibly from an adverse regulatory ruling, market restructuring, or its shareholder relationship.

The Company
Hydro One Inc., through its wholly owned subsidiaries, owns and operates electric transmission and distribution assets, as well as a fibre-optic network across most of Ontario. Hydro One is the largest transmission and distribution operator in Ontario (servicing over 95% of the Province's transmission throughput). The Company is wholly owned by the Province of Ontario (rated AA).

Confirmed & Trend Change

Rating

Debt Rated	Rating	Rating Action	Trend
Commercial Paper	R-1 (middle)	Confirmed	Stable
Senior Unsecured Debentures	A (high)	Confirmed	Stable

Rating Rationale

DBRS has confirmed the rating of Hydro One Inc.'s (Hydro One or the Company) Commercial Paper at R-1 (middle) and its Senior Unsecured Debentures at A (high), both with Stable trends. The rating confirmations reflect Hydro One's low level of business risk stemming from its regulated electric transmission and distribution operations, accompanied by a solid financial profile underpinned by its robust balance sheet and strong credit metrics. The rating confirmations also consider the aggressive capital expenditure program being implemented throughout Hydro One's system, combined with the negative impact from the recent transmission rate decision in which the Ontario Energy Board (OEB) reduced the regulatory-approved return on equity (ROE) by 153 basis points to 8.35% from 9.88% in 2006, for both F2007 and F2008. However, Hydro One's rate base was increased by 11% to $6,344 million ($5,718 million in 2006), and its equity thickness was increased by 4% to 40%. Overall, DBRS expects transmission rate charges to be reduced by approximately $80 million to $100 million, which is approximately a 7% reduction from F2006 net revenues. This will place temporary pressure on interest coverage ratios, with a 35 to 45 basis point reduction in EBIT/interest anticipated from the rate order, but a measurable change in the Company's financial profile is not expected. DBRS anticipates a number of Hydro One's regulatory-approved capital projects to be completed and in service by the 2009/2010 rate years, thereby increasing the rate base and, subsequently, its earnings profile. (Continued on page 2.)

Rating Considerations

Strengths

(1) Low-risk, regulated electric transmission and distribution businesses
(2) Solid balance sheet and credit metrics
(3) Strong and extensive transmission and distribution franchise area
(4) Top quartile for transmission reliability

Challenges

(1) Substantial capital expenditure program
(2) Significant external financing required
(3) Approved ROE sensitive to interest rates
(4) Earnings sensitive to monthly peak demand for electricity and, to a lesser extent, to the volume of electricity sold
(5) Managing construction execution risk with large capital projects
(6) Lack of access to equity capital markets

** CFO before working capital.*** Gross free cash flow = CFO - capital expenditures - dividends.

Rating Rationale (Continued from page 1.)

Despite the impact to earnings, the decision remains in line and reasonably consistent with previous decisions rendered for electric distribution companies (LDCs), with respect to regulatory treatment of equity thickness and ROE methodology. The regulatory-approved ROE methodology highlights the formulaic sensitivity to long-term interest rate volatility, which could continue to challenge ROE levels and subsequently earnings and cash flows going forward if rates move downward.

Furthermore, on the regulatory front, DBRS expects Hydro One's distribution operations to file a rate application for a mid-year rate adjustment in 2008, outlining its capital plan while addressing the additional capital investment currently not included in its rate base. The regulatory framework for LDCs under the 2nd Generation Incentive Regulation Mechanism (IRM) and Cost of Capital is viewed by DBRS as reasonable, providing sufficient earnings and cash flow stability.

Hydro One is entering a significant capital investment cycle, driven primarily by the increasing reliability needs, replacement of aging assets and changing supply-mix initiatives in Ontario. As a result, DBRS expects capital expenditures to remain elevated over the medium term, averaging between $1.1 billion to $1.5 billion, which, combined with dividends, is expected to exceed operating cash flows by approximately $500 million to $800 million per year. These free cash flow deficits are expected to be entirely debt financed, which will put temporary pressure on the Company's balance sheet and coverage ratios, as the invested capital is not included in the rate base until the completion of the projects. Also, given that a material portion of Hydro One's capital expenditures are for large transmission projects that involve lengthy construction times and there is potential for delays caused by the intervenor process, timely project completion within budget is important to maintain the Company's financial health.

DBRS views the expected pressure on the Company's earnings and balance sheet as temporary, and expects Hydro One's financial metrics to remain within a range supportive of the assigned ratings, given its low level of business risk, solid financial profile, strong balance sheet and experienced management team.

Rating Considerations Details

Strengths

(1) Hydro One is a regulated electric transmission and distribution utility. As such, the Company's business risk profile is low, due to the following factors: (1) Hydro One can recover all prudently incurred operating costs and approved capital project costs within a reasonable time frame as revenue requirements are predetermined based on forward-looking cost of service; (2) the Company will not undertake large capital expenditures without a reasonable expectation of recovering them in its rates; and (3) the regulatory environment continues to become more transparent with respect to the regulatory treatment of equity thickness and ROE methodology. DBRS believes that the OEB will be supportive in the recovery of capital costs as well as operating expenses that are necessary for a safe and reliable electric system.

(2) Hydro One's credit metrics remain solid for an A (high) regulated utility: Debt-to-capital ratio is 53.7%, EBIT/interest coverage is 2.77 times and cash flow-to-debt is 16.2%. Although DBRS expects coverage ratios to experience some downward pressure given the lower approved revenue requirements for its transmission business coupled with higher overall capital expenditures driving sizable free cash flow deficits, the Company's financial metrics are expected to remain within a range that is consistent with its business risk level and the assigned ratings.

(3) Hydro One owns and operates substantially all of Ontario's electric transmission system and is linked to five adjoining jurisdictions, accommodating imports of about 4,000 MW and exports of approximately 5,800 MW of electricity. The Company's distribution system is the largest in Ontario and spans roughly 75% of the province, serving approximately 1.3 million rural and urban customers and 48 large industrial customers. The large geographic area and low population density translates into a higher rate of service for its distribution business relative to other electricity distribution companies.

(4) Hydro One's transmission business continues to achieve top quartile reliability measures, which should facilitate a healthy relationship with the regulator going forward.

Challenges

(1) Hydro One is entering an aggressive build-out program over the next several years, in which DBRS expects a measurable increase in capital investment from present levels to a range of $1.1 billion to $1.5 billion per year through 2009. This, combined with dividends, is expected to cause a cash flow deficit of an estimated $500 million to $800 million per annum. These sizable free cash flow deficits, combined with lengthy construction times, will put temporary pressure on the balance sheet and coverage ratios during the build-out. DBRS notes that capital projects are spread out over time, which helps to minimize liquidity issues that accompany such large projects.

(2) Hydro One will have to go to the debt market in significant size to fund its considerable free cash flow deficits and refinance a heavy-but-manageable debt repayment schedule over the medium term. Maintaining adequate access to the public debt market and adequate availability under its credit facility ($750 million) is important during this build-out period.

(3) Regulatory-approved ROE levels are low and could continue to trend lower if long-term interest rates decline. Approved ROE for the transmission operation declined to 8.35% for both F2007 and F2008, from 9.88% in 2006, while the distribution segment remained at 9.00% in 2007, down 88 basis points from 9.88% in 2005.

(4) Earnings and cash flows for the transmission segment, and to a lesser extent distribution operations, are sensitive to monthly peak demand and volume of electricity sold, given that rates typically include a variable rate component. Seasonality, economic cyclicality, weather patterns and Conservation Demand Management (CDM) programs directly impact the volume of electricity sold or peak monthly electrical demand, and hence, revenue earned from electricity sales.

(5) The size and magnitude of Hydro One's upcoming designated projects (e.g., the Bruce Project, estimated at $613 million), combined with the continued increases in material and labour costs and the significant number of intervenors involved, could potentially expose Hydro One to rising project costs beyond the amount forecasted in its regulatory applications. There is no assurance that cost overruns beyond the regulatory-approved amounts will be recovered if deemed imprudent by the OEB. However, DBRS notes that Hydro One is experienced in managing projects and is focused on mitigating the risk of cost overruns.

(6) Due to provincial ownership, Hydro One is unable to access the equity capital markets. This limits the Company's financial flexibility, as free cash flow deficits will likely be financed through its $750 million Commercial Paper (CP) program (fully backstopped by a credit facility) or debt issuance under its remaining $2.2 billion medium-term notes (MTNs) program. Also, the Company has historically paid out a high level of dividends (a five-year average of 64% of net income). Given the increasing liquidity requirements, DBRS anticipates some dividend management may be required going forward as Hydro One is committed to investing heavily in its electricity system.

Regulation

Hydro One's electricity distribution operations are regulated by the OEB under the *Ontario Energy Board Act*, 1998 (the OEB Act), as modified by the following noteworthy amendments:
• The *Electricity Pricing, Conservation and Supply Act*, 2002 (Bill 210) – December 9, 2002.
• The *Ontario Energy Board Amendment Act* (Electricity Pricing), 2003 (Bill 4) – December 18, 2003.
• The *Electricity Restructuring Act*, 2004 (Bill 100) – December 9, 2004.

Currently, the capital structure and ROE methodology used by the OEB to establish transmission and distribution rates is based on a deemed debt-to-equity structure of 60-40 and the long Canada bond forecast rate.

Transmission
In August 2007, the OEB reduced Hydro One's base transmission rates, retroactive for the period January 1, 2007 to December 31, 2008, resulting in approximately a 7% reduction in base revenue requirements relative to F2006 net revenues. The methodology used by the OEB to establish the transmission rates was based on a rate base of $6,344 million ($5,718 million from 2000 to 2006), a deemed debt-to-equity structure of 60-40, an approved weighted-average debt rate of 5.80% and an allowed ROE of 8.35%. Also, the OEB approved Hydro One's operations, administration and capital expenditure budgets, along with the expensing and recovery of the carrying costs of the Niagara Reinforcement Project, until the project is completed and placed into service; however, the OEB did not approve the request for allowing certain capital expenditures into rate base before project completion. New transmission rates are retroactive to January 1, 2007, and were implemented on November 1, 2007 (with $85 million in over recovery from Jan. 1, 2007 to Oct. 31, 2007, allocated back on a monthly basis).

Distribution
Hydro One's distribution business operates under a performance-based incentive mechanism with a deemed ROE of 9.0% based on a forward-looking cost of service for the mid-year rate decision.

On December 20, 2006, the OEB issued a 2007 rate adjustment model (2nd Generation IRM and Cost of Capital) and corresponding instructions to distributors for the purpose of adjusting distributor rates effective May 1, 2007. As a result, base distributions rates, exclusive of rate riders, were adjusted formulaically to reflect an allowance for inflation of 1.9%, a fixed productivity offset of 1.0% and removal of the federal large corporation tax. As such, no major financial impact for distributors is expected due to the inflation factor generally being slightly higher than the productivity factor. In each of three subsequent years, one-third of the electricity distributors will have their distribution rates reviewed and reset by the OEB through a cost-of-service type of rate proceeding. LDCs re-based in 2008 will be subject to an IRM applied in succeeding years up to the 2010 rate year. By 2010, all electricity distributors in Ontario will have undergone a re-basing of rates.

The net effect of the OEB decision in 2007 was to provide for approximately a 0.5% increase in base distribution rates to all customer classes for the May 1, 2007 to April 30, 2008 period. DBRS notes that, as of May 1, 2007, the OEB approved an amount of $0.93 per month from metered customers as part of the delivery charge on their bill, related to the implementation of the province's Smart Meter Program. The delivery charge effectively pre-funds the Company's OM&A cost, while defraying a portion of its financing costs, until meters are installed and included in its rate base.

(1) Interest expense on short-term and long-term debt balances, excludes deferred financing charges.

* DBRS adjusted Transmission earnings for non-cash items to normalize the impact from the recent OEB rate decision.

Summary

Despite higher year-over-year net revenues, EBITDA and EBIT remained relatively flat as modest earnings growth from Hydro One's distribution operations offset the negative impact from increasing overall maintenance-related expenditures and lower 2006 transmission earnings on the earnings sharing mechanism implemented by the OEB.

- Operating costs continue to trend higher, having increased approximately 10% per year since 2005, which highlights the increased work programs needed to maintain the current capability of the system as well as higher information technology requirements. DBRS expects operating costs to continue to trend higher over the medium term.
- During F2006, the OEB applied an earnings sharing mechanism (ESM) to any transmission earnings in excess of the approved rate of return of 9.88%. This had a negative impact on transmission EBIT, leading to a notable decline from the F2005 level. The ESM was discontinued for 2007.

Interest expense has incrementally trended upward, largely tracking higher debt levels.

Overall, earnings remain robust and relatively stable as Hydro One continues to earn its allowed ROE, underscoring continued focus on productivity and cost-effectiveness.

Outlook

Earnings are expected to be pressured over the near to medium term, stemming from the recent OEB rate decision, which is anticipated to impact transmission revenues by approximately $80 million to $100 million over each of the next two years. However, earnings should improve beyond 2008 from the reduced levels, reflecting the following factors:

- A number of regulatory-approved transmission projects are expected to be completed and in service by the 2009 rate year, thereby increasing the rate base and, subsequently, its earnings profile.
- Also, Hydro One will have its distribution rates reviewed and reset through a forward-looking cost-of-service type rate proceeding in 2008, with an IRM applied in succeeding years up to 2010. The rate base should reflect the additional capital expenditures over the next couple of years.

The paradigm of lower ROE levels and the subsequent impact on earnings should be largely offset by higher respective rate bases and increased equity thickness, going forward.

Financial Profile

(1) DBRS-adjusted for operating lease debt and interest expense equivalents. DBRS-adjusted for preferred shares (20% debt/ 80% equity).

Summary

Operating cash flow has remained reasonably stable, with the recent modest decline largely tracking net income. However, the continued growth in sustaining and development capital spending, combined with dividends, has resulted in increasing gross free cash flow deficits over the last two years.

To date, the Company has effectively managed the size of its capital expenditure programs. However, the recent upward trend in capital investment is indicative of the growing reliability needs in Ontario as a number of Hydro One's assets are coming to the end of their useful life. This is further accentuated by the increasing cost of manufactured products for utility infrastructure, coupled with expenditures on higher required generation-related and load customer connection expenditures.

Working capital requirements continue to fluctuate with the timing of the Company receiving or paying a customer rebate (pass-through of the commodity cost of electricity) from the Independent Electricity System Operator (IESO).

Despite the increasing free cash flow deficits, key credit metrics remain relatively stable, as higher debt levels have been largely offset with a growing equity base. The credit metrics remain solidly within the current rating category for a low-risk regulated utility with debt-to-capital at 53.7%, fixed charge coverage at 2.57 times and cash flow-to-debt at 16.2%.

Outlook

Hydro One's financial profile is expected to deteriorate over the medium term, given the measurable growth in its capital expenditure budget, driving higher free cash flow deficits.

Cash flow from operations is expected to decrease modestly, as lower net income is partially offset by higher depreciation, trending in line with higher capital expenditures.

With Hydro One entering a significant capital build-out program, DBRS expects the following to occur:

- Annual capital expenditures are expected to average approximately $1.1 billion to $1.5 billion from 2007 to 2009, with the majority related to transmission development projects, smart meter deployment and replacement of aging assets. However, there continues to be some uncertainty around the timing and scope of these capital expenditures within this time horizon. DBRS notes that capital will not be committed unless Hydro One obtains regulatory approval for cost recovery.
- With the significant ongoing replacement of aging assets, the increases in future sustaining capital expenditures are expected to abate beyond 2008.
- Common dividends are declared at the sole discretion of the Hydro One board of directors and are recommended by management based on financial conditions and liquidity requirements, which should provide some flexibility for dividend management, as the Company is committed to investing heavily in its electricity system.
- As such, the Company's leverage is expected to increase over the medium term, as the substantial capital expenditure program and dividend policy will result in sizable free cash flow deficits. These deficits and the subsequent higher leverage in the capital structure – in a longer-term range of 55% to 58% – will temporarily pressure cash flow-to-debt and interest coverage ratios, from present levels. DBRS does not expect the Company's financial profile to change significantly, with credit metrics remaining adequate for the assigned ratings.

Capital Expenditures: Designated Projects

Source: OEB Transmission Rate Decision EB-2005-0501, Exhibit D1, Schedule 4, Tab 1

Designated Projects	Historic	Test	Total	
(CAD millions)	2004-2006	2007-2008	(including future years)	%
Bruce Project	0	57	613	69%
Quebec Intertie	1	113	115	13%
Static Var Compensators	0	10	54	6%
Niagara Reinforcement	97	2	101	11%
Total	**98**	**182**	**883**	**100%**

Niagara Reinforcement project reinforces the transmission system in the Niagara region and provides access to new sources of generation. The project was substantively completed in F2006, with final completion delayed by the aboriginal land dispute in the Caledonia area. The OEB has allowed Hydro One to recover its carrying cost of the project until the asset is in-service and included in the Company's rate base. DBRS expects this to occur in the 2009 rate application.

Québec Interconnection project, in which Hydro One is collaborating with Hydro-Québec, will allow the transfer of 1,250 MW between the two provinces when it is completed in 2010. The Hydro One and Hydro-Québec grids are not synchronous, so for power to be exchanged it must be converted to the requirements of the receiving grid. The total estimated project cost is $808 million, of which $115 million is earmarked for Hydro One's capital budget.

Bruce to Milton project is in the preliminary stages of seeking the necessary provincial permits to have the estimated $613 million, 500 kV, 180 km line connection from the Bruce Power nuclear plants on Lake Huron to the Milton switching station west of Toronto. The proposed project could serve to deliver up to an additional 3,000 MW of generation capacity.

Long-Term Debt Maturities and Bank Lines

Long-term principal repayments as at September 30, 2007		
Year	%	(CAD millions)
2007	0.8%	40
2008	9.4%	500
2009	7.5%	400
2010	7.5%	400
2011	4.7%	250
Thereafter	70.1%	3,725
Total		5,315

(CAD millions) As at September 30, 2007	Committed	Outstanding	Available	Maturity
Commercial Paper backup facility*	750	161	589	8/10/2010

* Multi year revolving standby credit facility with a syndicate of banks.

Long-Term Debt

Hydro One finances its operations and capital programs with long-term debt (Senior Unsecured, $5.315 billion as at September 30, 2007) and a $750 million CP program (fully backed up by a credit facility).

- The debt repayment schedule is heavy but manageable over the next five years as Hydro One will have to refinance approximately 30% of its outstanding debt. Refinancing the debt should be well within Hydro One's financing capacity given its solid financial profile and good access to the public debt markets.
- DBRS anticipates that Hydro One will target a weighted-average long-term debt life between 12 and 18 years, with evenly spread out maturities, thus providing more flexibility while limiting refinancing risk.
- In June 2007, Hydro One filed a $2.5 billion MTNs program under the Preliminary Short-Form Base Shelf Prospectus. As at October 25, 2007, $2.2 billion was available.
- The Trust Indenture pertaining to all senior unsecured issuance includes the following covenants, subject to customary exceptions:
  - Any additional indebtedness is subject to a 75% capitalization ratio test.
  - Negative pledge clause.
  - Limitations on ability to sell principle properties.

Liquidity

Liquidity requirements will increase over the medium term to accommodate higher capital expenditures and regulatory working capital needs. DBRS notes that Hydro One has sufficient flexibility to accommodate the increasing liquidity needs, with its authorized CP program and availability under its MTNs program. However, the Company recently issued $300 million under its MTNs program to redeem the outstanding CP with the remainder for general corporate purposes. As of September 30, 2007, the Company currently has $589 million in unused capacity under the credit facility.

- As of August 1, 2007, Hydro One was able to meet prudential support obligations for power purchases through the IESO using only parental guarantees, which will further boost liquidity by releasing current $10 million letters of credit.
- Hydro One's board has authorized a CP limit of $1 billion; however, the Company has set the limit of its CP program at $750 million, matching the limit of the revolving credit facility.
- The credit facility is a multi-year facility that matures in 2010. The Company has the ability to increase the facility to $1 billion upon the mutual agreement with its lenders.

Rationale

The ratings on Ontario-based Hydro One Inc. reflect the company's low-risk monopoly electricity transmission and distribution networks, secure and relatively predictable regulated cash flows, and the support of its owner, the Province of Ontario (AA/Stable/A-1+). Offsetting these strengths is an intermediate financial risk profile that will face the challenges of a lower rate of return on its transmission rate base and the company's large capital expenditure program in the next several years. Hydro One had C$5.2 billion in long-term debt outstanding as of Dec. 31, 2006.

Hydro One's monopoly position, the asset intensive nature of its businesses, and regulatory oversight limit competitive risk. It is the key electricity transmission provider and largest distributor of electricity in the province. The company owns and operates more than 97% of Ontario's transmission network as measured by revenue, and its predominantly rural distribution service territory incorporates about 75% of the province as measured by surface area.

Hydro One's debt-servicing capacity relies on secure and relatively predictable regulated cash flows supported by cost-of-service plus rate-of-return regulation. The company can expect to recover all prudent costs incurred and earn a modest return on its capital investment. Furthermore, the company faces limited risk related to commodity price and volume variability. Although Hydro One's distribution business bills customers for the cost of the commodity consumed, the company has no obligation to ensure adequate electricity supply.

Provincial ownership enhances the utility's credit quality. Although Ontario does not formally guarantee Hydro One's debt obligations, the company's strategic nature within the provincial economy and the government's demonstrated willingness to financially assist the business under extraordinary circumstances in the past bode well for future support.

Hydro One has an intermediate financial risk profile. We expect weaker cash flow interest and debt coverage in the next few years due to a recent transmission revenue decision that lowered the allowed ROE on transmission assets to 8.35% from 9.88%, further exacerbated by the upcoming period of higher-than-normal capital expenditures. Adjusted funds from operations (AFFO) interest coverage of 4.6x in 2006 was up from 4.4x in 2005 largely as a result of distribution rate increases in 2005 and 2006 and regulatory asset recovery. AFFO interest coverage will drift downward in the next several years, and could fall below 3.5x. AFFO-to-total debt could also weaken to the 14%-17% range, compared with its 2006 level of 20%. The extent of the deterioration will depend on the timing of regulatory approvals and execution of budgeted capital expenditures, and the impact of weather variability on revenue. The company expects to debt finance 20% or more of forecast capital expenditure during the upcoming period of significant expansion. During this period, Hydro One's leverage, as measured by adjusted total debt-to-total capital, could creep back up closer to the historical level of about 64%, compared with 60% in 2006.

Although predominantly funded from internal sources, capital spending during the next few years will be a drain on the company's cash flow and reduce its financial flexibility. Hydro One has budgeted C$1.4 billion in capital expenditure for 2008, a 70% increase compared with the C$823 million spent in 2006, and higher-than-historical average. This period of increased capital spending is a result of planned upgrades and expansion of the transmission system to accommodate: growth in domestic electricity demand, the connection of new generation facilities, and facilitate increased imports and exports. The 2008 capital program also includes a portion of the estimated C$700 million investment that Hydro One will make in smart meters for all distribution customers by 2010 in the next four years. Like its other infrastructure investments, Hydro One's investment in smart meters will also be added to its revenue-generating regulated asset base.

Short term credit factors

The short-term rating on Hydro One is 'A-1'. Unused and committed bank lines, together with strong cash flow from operations and ready access to the debt capital markets, provide the utility with sufficient liquidity and the financial flexibility to meet its forecast capital expenditure estimate of C$1.2 billion, annual dividend payments of C$250 million to C$350 million, and C$355 million of debt maturing in 2007. As of Sept. 30, 2007, C$161 million had been drawn from the company's C$1 billion short-term note program. The company remains well within its banking covenant of total debt-to-total capital of 75% and has no material adverse change clauses that could trigger a default.

In support of Hydro One's liquidity, the company can draw on:

- A committed C$750 million bank line of which C$589 million was available as of Sept. 30, 2007. The bank line is used for general corporate purposes and to support its C$1 billion Canadian CP program. The line matures in August 2010;
- Its expected annual regulated cash flows as represented by unadjusted FFO of about C$860 million in 2007;
- C$2.2 billion remaining capacity on a C$2.5 billion MTN shelf program, maturing in July 2009; and
- Discretionary capital expenditure estimated at C$150 million- C$200 million.

Outlook

The positive outlook reflects a steady improvement in Hydro One's business risk profile. The improvement is largely a result of steadily increasing clarity and stability with regards to regulatory methodology and timetables that influence both the transmission and distribution business, and the continued absence of disruptive market restructuring and political involvement in the regulatory process. Should this trend continue it could result in a positive rating action, but more than a single-notch improvement is highly unlikely. Given the supportive and stable shareholder relationship, the temporary downward pressure on the company's cash flow strength due to the pressures of upcoming increased capital spending should not lead to a revised outlook. A negative rating action could result from a material change in the company's financial or business risk profile or its shareholder relationship, an adverse regulatory ruling, or unfavorable market restructuring.

Opinion

Company Profile

Hydro One Inc. (HOI) is wholly owned by the Province of Ontario. Its revenues and cash flows are almost completely derived from its transmission and distribution businesses, both of which are regulated by the Ontario Energy Board (OEB or the Board). HOI owns and operates virtually all of Ontario's electricity transmission system, and is responsible for a substantial portion of regulated electricity distribution in the province.

Recent Developments

On August 16, 2007 the OEB rendered its decision with respect to HOI's transmission rates for 2007 and 2008. The decision resulted in a reduction in the transmission business' allowed ROE to 8.35% from the existing 9.88% and the 10.5% level sought in HOI's September 12, 2006 application. The decision was retroactive to January 1, 2007 with rate decreases taking effect November 1, 2007. Over-collections from January 1, 2007 to October 31, 2008 are to be returned to customers through rates by December 31, 2008. Moody's believes that this decision will have a significant negative impact on HOI's key credit metrics and could create downward pressure on HOI's Baseline Credit Assessment (BCA).

On August 15, 2007 HOI filed its cost-of-service distribution revenue requirement application for 2008 seeking a net distribution rate increase of approximately 4%. Moody's does not expect an OEB decision in this proceeding before the second quarter of 2008

In its 2007 Integrated Power System Plan (IPSP), the Ontario Power Authority (OPA) forecasts that approximately $4 billion in transmission capital expenditures will need to be made between 2010 and 2025 to facilitate the connection of renewable generation projects and promote system reliability. Although the OPA believes that in the near-term, transmission proponents will need to undertake development work in connection with the transmission projects recommended in the IPSP, it does not foresee significant expenditures in respect of these project until 2010 or later. While the OPA does not assign responsibility for future transmission projects, Moody's believes that HOI is ideally positioned for and will actively pursue the right to undertake a significant portion of these expenditures. Accordingly, Moody's expects that HOI's capital expenditures and financing requirements, which will be elevated in the near-term, are likely to remain at elevated levels through the medium-term.

On November 23, 2007, HOI's board of directors announced that Laura Formusa, Acting President and Chief Executive Officer since December 8, 2006, had been appointed President and Chief Executive Officer of HOI. In May 2007, the Agency Review Panel (ARP) published its report and recommendations on executive compensation at Ontario's government owned/created electricity sector institutions. In June 2007, the Ontario Government announced its acceptance of the ARP's recommendations including those that, over time, are expected to result in 25-30% reductions in senior management compensation at Ontario electricity sector institutions including HOI. Moody's believes that the appointment of Ms. Formusa and the Ontario Government's adoption of the ARP's recommendations are not likely to have a material impact on HOI's credit profile.

Rating Rationale

In accordance with Moody's Government Related Issuer (GRI) rating methodology, the Aa3 ratings of HOI reflect the combination of the following inputs:

- Baseline Credit Assessment (BCA) in the range of 5 to 7 (on a scale of 1 to 21, where 1 represents the equivalent risk of a Aaa, 2 a Aa1, 3 a Aa2 and so forth)

- Aa1 local currency rating of the province of Ontario

- High default dependence

- High probability of extraordinary support

The BCA range of 5 to 7 reflects the following key ratings drivers.

SIGNIFICANT BUSINESS POSITION IN A RELATIVELY STABLE LEGISLATIVE BUT EVOLVING REGULATORY ENVIRONMENT

Moody's considers HOI's regulatory and business positions to be in the A category, reflecting its stable and predictable cash flows and the low business risk of its regulated wires businesses. Virtually all of HOI's activities are regulated with the exception of its telecommunications business, which represents less than 1% of total assets. HOI is the largest transmission operator in Ontario, owning and operating roughly 96% of the province's transmission capacity. HOI is also the largest electricity distributor in Ontario with a geographically dispersed and largely rural service territory; however, the BCA also recognizes the potential that HOI, which is 100% owned by the Province of Ontario, can be utilized as an instrument of public policy. Moody's notes that public policy goals are not always completely aligned with the interests of debt holders.

HOI deals with a single provincial regulator, the OEB, which regulates both the transmission and distribution segments of its business. The legislative environment in Ontario has been relatively stable since 2005 but the regulatory framework continues to evolve and suffers from significant regulatory lag. HOI completed it first cost-of-service proceeding for the Transmission segment in 2007. The OEB's August 16th decision came almost a year after the company's application was filed. The decision is expected to have a materially negative impact on HOI's 2008 financial metrics due to its retroactive nature which goes back to January 1, 2007. With rate adjustments going into effect on November 1, 2007, Moody's expects HOI's 2008 metrics to be impacted not only by rising capital expenditures and the lower transmission rates applicable to 2008 but also by the refund in 2008 of over-collections related to 2007. As noted below, Moody's expects that HOI's future CFO pre-WC/Interest could be in the range of 3.5x while CFO pre-WC/Debt could fall to roughly 13%. Any deterioration of CFO pre-WC/Interest below 3.5x and/or CFO pre-WC/Debt below 13% would likely result in a decrease in HOI's BCA Rates in HOI's distribution segment will be established pursuant to a cost-of-service proceeding in 2008 following which rates are expected to be adjusted in accordance with the OEB's yet-to-be finalized 3rd Generation Incentive Regulation Mechanism (IRM). While the regulatory environment in Ontario continues to evolve, Moody's anticipates that there will be increased transparency and predictability of rate decisions for HOI after 2008 as we expect that the distribution rates will be established pursuant to a formula driven mechanism under the OEB's 3rd Generation IRM. Moody's also expects that the adoption of formula driven IRM should reduce or eliminate regulatory lag post-2008.

FLEXIBILITY TO RECOVER COSTS AND EARN RETURNS

Moody's considers HOI's flexibility to recover costs and earn returns to be in the A category. Within HOI's distribution segment (approximately 42% of total assets) commodity costs are a full pass-through to customers.

HOI filed a distribution rate application for its 2008 revenue requirement with the Board, on August 15, 2007. Moody's does not expect a decision in this proceeding until the second quarter of 2008. As previously noted, rates subsequent to 2008 are expected to be set in accordance with the OEB's 3rd Generation IRM subject to periodic rebasing.

DIVERSIFIED OPERATIONS WITHIN ONTARIO

Moody's considers HOI's diversification to be in the Baa category. While all of the company's operations are located in the Province of Ontario and are subject to regulation by a single regulator, HOI's transmission and distribution assets are substantial and geographically dispersed across Ontario. HOI's $7.2 billion transmission segment is comprised of a network of approximately 28,600 circuit-kilometres representing approximately 96% of Ontario's transmission capacity and servicing virtually every region of the province. It includes significant interties with adjacent jurisdictions such as Quebec, Manitoba, New York and Michigan. The $5.3 billion distribution segment is comprised of approximately 124,700 circuit-kilometres servicing approximately 1.3 million customers, predominantly in rural areas of the province.

VIRTUALLY NO UNREGULATED BUSINESS

Moody's considers HOI's unregulated business characteristics to be in the Aa category, reflecting the fact that virtually all of HOI's activities are regulated by the OEB. HOI's only unregulated operations consist of a small telecommunications operation representing less than 1% of total assets.

FINANCIAL METRICS EXPECTED TO WEAKEN WITH LOWER ROEs; LIQUIDITY CHALLENGED BY LARGE CAPEX PROGRAM

As a result of declining ROEs in both the distribution and transmission segments as well as undertaking increased capital expenditures, HOI's financial metrics are expected to weaken during 2008 and 2009. Moody's expects that CFO pre-WC/Interest could be in the range of 3.5x while CFO pre-WC/Debt could fall to roughly 13%. At these levels, Moody's would consider HOI's financial metrics to be in the low Baa/high Ba range and weak relative to HOI's current BCA which is in the range of 5 to 7. Any deterioration of CFO pre-WC/Interest below 3.5x and/or CFO pre-WC/Debt below 13% would likely result in a decrease in HOI's BCA.

HOI expects to have large capital expenditure needs for a number of years. Maintenance capital expenditures, particularly in the transmission segment, are expected to rise significantly in coming years reflecting the age of HOI's system and an increased proportion of end-of-life assets as well as rising materials and labour costs. HOI also expects to make significant growth capital expenditures in support of provincial policy objectives such as smart metering and increased renewable generation. Elevated levels of capital expenditures are expected to add to the stress on HOI's credit metrics caused by declining ROEs. Major projects require the investment of debt and equity capital in the near-term while it could be several years before they begin generating cash flow to service the invested capital. Given the province's ownership of HOI, the company has limited ability to raise equity. Moody's estimates that, in the absence of a significant reduction in its dividend payout, HOI's cash flow metrics will come under further pressure as a result of the company's capital expenditure plans.

In evaluating a company's liquidity, Moody's typically assumes that the company loses access to the capital markets (both short and long term) for a period of 12 months. In this context, we then evaluate the company's various sources and uses of cash including the flexibility to defer or reduce uses of cash such as capital expenditures and dividends. HOI's commercial paper (CP) program is rated Prime-1 (Aa) based on the stable cash flow generated by its regulated transmission and distribution operations. We anticipate that the company will generate funds from operations of approximately $1.8 billion in aggregate during 2008 and 2009. After dividends of about $500 million and capital expenditures and working capital changes of approximately $3 billion, Moody's expects the company to be free cash flow negative by approximately $1.7 billion over the 2008 to 2009 period. HOI intends to fund its free cash flow shortfalls and approximately $540 million of scheduled debt maturities in the next twelve months primarily with issuances under its $2.5 billion MTN shelf filed June 21, 2007. Following HOI's $300 million MTN issuance on October 18, 2007, $2.2 billion remained available under the shelf. Given scheduled debt matruities of $500 million in June 2009, Moody's expects that HOI will renew its MTN shelf prior to its July 2009 expiry.

In addition to the MTN shelf, HOI has a $1 billion CP program. In support of its CP program, the company maintains a syndicated committed $750 million 3-year bank facility which currently matures in August 2010. The facility contains a maximum debt to total capitalization ratio covenant of 75%. At September 30, 2007, availability under the company's bank facility was approximately $480 million, given approximately $160 million of outstanding CP, $15 million of drawn bank debt, and $93 million of LCs outstanding. While it is somewhat unusual that HOI's CP back-up facility is smaller than its CP program size, Moody's notes that HOI has stated that it will not issue more than $750 million under its CP program without increasing the size of the CP back-up line to ensure that it has 100% coverage of the CP outstandings.

Based on the company's forecasted capital expenditures Moody's estimates that HOI's borrowing requirements over the next twelve months could, without a significant reduction in the company's dividend payout or timely issuances of additional MTN debt, exceed the amount available under the company's committed credit facilities. In the normal course, Moody's expects that the company will proactively access the term debt markets and/or pursue other measures to ensure that it has sufficient short-term liquidity to support its Prime - 1 (Aa) short-term rating.

Moody's recognizes that HOI has some degree of flexibility in the timing of roughly $500 million of its planned operating and capital expenditures. These expenditures could be deferred for a period of time in the event that access to additional capital became constrained. However, Moody's notes that these OEB-approved expenditures can only be deferred for a finite period and that any such deferral would likely have adverse consequences for future system reliability and operating costs. Moody's also recognizes that some of the forecasted capital expenditures in future years have yet to be approved by either HOI's board or the OEB and, as such, might not materialize. Notwithstanding, Moody's believes most of the forecasted capital spending will be approved and will ultimately take place with the result that HOI's capital expenditures will remain elevated through the medium-term. Accordingly, Moody's believes that HOI's liquidity requirements have increased in a semi-permanent basis. Similarly, Moody's considers the company to be significantly more dependent upon continued access to the public debt markets than it has been in recent years.

CHALLENGES ASSOCIATED WITH AN AGING WORKFORCE

The extent of HOI's capital expenditures over the next few years highlights another challenge that HOI and many other utilities face: that of an aging workforce. At HOI's December 31, 2006 year-end, the company estimated that, approximately 25% of its workforce would become eligible for retirement by the end of 2008. The availability and cost of skilled labour necessary to successfully complete the work required under HOI's substantial capital expenditure plans as well its ongoing system operation and maintenance could prove to be a challenge.

DEFAULT DEPENDENCE HIGH

High default dependence reflects the importance of the issuer to the provincial economy and its operating and financial proximity to the government.

EXTRAORDINARY SUPPORT

Moody's expectation of high probability of extraordinary support reflects the strategic importance of the issuer to the province, the government's history of providing support through dividend deferrals in its capacity as the shareholder of the company and the government's history of intervening in the electricity sector.

Rating Outlook

The stable outlook reflects the fact that HOI's weak credit metrics are largely balanced by its low business risk profile and dominant business position in the Ontario electricity market. It also reflects Moody's expectation that HOI will significantly improve its liquidity resources in the context of its forecasted significant and growing capital expenditure profile.

What Could Change the Rating - Up

- While considered unlikely at this time, a sustainable improvement in cash flow metrics (CFO pre-WC/Interest exceeding 6.0x, CFO pre-WC/Debt exceeding 30% and (CFO pre-WC less Dividends)/Debt exceeding 25%) could result in an increase in both HOI's BCA and published rating.

What Could Change the Rating - Down

One or more of the following could result in a reduction of either HOI's BCA or its published rating:

- A material reduction in the perceived probability of extraordinary support

- A sustained weakening of cash flow metrics such as CFO pre-WC/Interest coverage below 3.5x, CFO pre-WC/Debt below 13% and/or CFO pre-WC/Debt below 9%

- Failure of the company to ensure sufficient sources of liquidity in support of its growing capital expenditure program

- Actions on the part of the shareholder that impede the company's ability to act in a commercial manner

- Material changes in the ownership, governance or management structures

- Further restructuring of the electricity sector that increases HOI's business or financial risk profiles

Medium Term Notes
(unsecured)

Hydro One Inc. may offer and issue from time to time medium term notes (the "Notes") in an aggregate principal amount of up to $2.5 billion in Canadian currency (or the equivalent thereof in other currencies or currency units at the time of issue) during the twenty-five months from the date of issuance of the receipt for this short form shelf prospectus.

The Notes will have a term to maturity of not less than one year and will be issuable in Canadian currency (or in other currencies or currency units at the time of issue) in fully registered definitive or global form, in which case the Notes will be exchangeable only under certain conditions for definitive Notes.

Notes issued hereunder will be direct unsecured obligations of our company, will be issued under a trust indenture in any number of series or separate issues thereof, and will at their respective dates of issue rank *pari passu* with all other unsecured and unsubordinated Indebtedness (as defined below) of our company then outstanding, except as to any sinking fund which pertains exclusively to any particular Indebtedness of our company.

The specific variable terms of an offering of Notes (including the aggregate principal amount of the Notes being offered, the currency or currencies, the issue and delivery date, the form, the maturity date, the interest rate (either fixed or floating and, if floating, the manner of calculation thereof), the issue price, the interest payment date(s), any redemption or repayment provisions, any provisions entitling our company to extend the maturity date of the Notes, whether the Notes are exchangeable or convertible into other securities issued by our company or, subject to appropriate regulatory approval, by another corporation, partnership, unincorporated syndicate or organization, trust or other entity, the name(s) of the dealer(s) offering the Notes, the commission payable to such dealer(s), the method of distribution and the net proceeds to our company) will be set forth in a prospectus supplement or pricing supplement which will accompany this short form shelf prospectus. Unless otherwise indicated in a prospectus supplement or pricing supplement, the Notes will not be listed on any securities exchange.

This short form shelf prospectus does not qualify the issuance of Notes: (i) entitling the holder to exchange or convert the Notes into securities issued by another entity (other than our company); or (ii) in respect of which the payment of principal and/or interest may be determined, in whole or in part, by reference to one or more underlying interests including, for example, an equity or debt security, a statistical measure of economic or financial performance including, but not limited to, any currency, consumer price or mortgage index, or the price or value of one or more commodities, indices or other items, or any other item or formula, or any combination or basket of the foregoing items. For greater certainty, however, this short form shelf prospectus does qualify for issuance Notes in respect of which the payment of principal and/or interest may be determined, in whole or in part, by reference to published rates of a central banking authority or one or more financial institutions, such as a prime rate or a bankers' acceptance rate, or to recognized market benchmark interest rates, such as CDOR, LIBOR or EURIBOR.

There is no market through which these securities may be sold and purchasers may not be able to resell securities purchased under this short form shelf prospectus. This may affect the pricing of the securities in the secondary market, the transparency and availability of trading prices, the liquidity of the securities, and the extent of issuer regulation. See "Risk Factors".

RATES ON APPLICATION

The Notes may be offered severally by one or more of BMO Nesbitt Burns Inc., Casgrain & Company Limited, CIBC World Markets Inc., HSBC Securities (Canada) Inc., Laurentian Bank Securities Inc., National Bank Financial Inc., RBC Dominion Securities Inc., Scotia Capital Inc. and TD Securities Inc. pursuant to the dealer agreement referred to under the heading "Plan of Distribution" or such other dealers as may be selected from time to time by our company (the "Dealers"), in each case acting as agent of our company or as principal. Where the Notes are offered by the Dealer(s) as agent, the commissions payable in connection with sales of such Notes shall be agreed from time to time between our company and any such Dealers. Where the Notes are purchased by the Dealer(s) as principal, the Notes shall be purchased at such prices and with such commissions as may be agreed from time to time between our company and any such Dealer(s) for resale to the public at prices to be negotiated with each purchaser. Such resale prices may vary during the distribution period and as between purchasers. In each case, the commissions payable, if any, will be set forth in a prospectus supplement or pricing supplement that will accompany and be incorporated by reference in this short form shelf prospectus. Each Dealer's compensation will increase or decrease by the amount by which the aggregate price paid for Notes by purchasers exceeds or is less than the price paid by the Dealer, acting as principal, to our company. We may also offer the Notes directly to potential purchasers pursuant to applicable statutory exemptions at prices and upon terms negotiated between the purchaser and our company.

BMO Nesbitt Burns Inc., CIBC World Markets Inc., HSBC Securities (Canada) Inc., Laurentian Bank Securities Inc., National Bank Financial Inc., RBC Dominion Securities Inc., Scotia Capital Inc. and TD Securities Inc. are subsidiaries or affiliates of lenders (the "Banks") that have made a credit facility available to our company. As of June 21, 2007, there is no outstanding indebtedness under this credit facility, however, if and when there is outstanding indebtedness to the Banks under the credit facility or any future credit facility with the Banks, our company may be considered a connected issuer of such dealers for purposes of securities laws in certain Canadian provinces. See "Plan of Distribution".

The offering of Notes is subject to the approval of certain legal matters on behalf of our company by Osler, Hoskin & Harcourt LLP and on behalf of the Dealers by Blake, Cassels & Graydon LLP.

TABLE OF CONTENTS

Unless the context otherwise requires, all references herein to currency are references to Canadian dollars.

DOCUMENTS INCORPORATED BY REFERENCE

The following documents, which have been filed with the securities commission or similar authority in each of the provinces of Canada, are specifically incorporated by reference in this short form shelf prospectus:

(a) the renewal annual information form of our company dated February 16, 2007;

(b) the comparative audited consolidated financial statements of our company, and the notes thereto, as at and for the fiscal years ended December 31, 2006 and 2005, together with the report of the auditors thereon;

(c) management's discussion and analysis of financial results ("MD&A") for the year ended December 31, 2006; and

(d) the comparative unaudited consolidated financial statements of our company, and the notes thereto, as at March 31, 2007 and for the three month periods ended March 31, 2007 and March 31, 2006 together with MD&A for those periods.

Updated earnings coverage ratios, as required, will be filed quarterly with the appropriate securities regulatory authorities either as prospectus supplements or as part of our company's unaudited interim and audited annual consolidated financial statements and will be deemed to be incorporated by reference into this short form shelf prospectus for the purposes of the offering of Notes hereunder.

Any documents of the types referred to in paragraphs (a) through (d) above, and any material change reports (except confidential material change reports) and business acquisition reports filed by our company with the securities regulatory authorities in Canada since the end of the financial year in respect of which our then current AIF is filed, shall be deemed to be incorporated by reference into this short form shelf prospectus. Upon a new annual information form and new annual financial statements and related MD&A being filed by our company with, and where required, accepted by, the applicable securities regulatory authorities during the currency of this short form shelf prospectus, the previous annual information form, the previous annual financial statements and related MD&A, and all previous interim financial statements and related MD&A filed prior to the commencement of our company's financial year in which the new annual information form, new annual financial statements and related MD&A are filed shall be deemed no longer to be incorporated into this short form shelf prospectus for purposes of future offers and sales of Notes hereunder.

A pricing supplement or prospectus supplement containing the specific variable terms for an issue of Notes will be delivered to purchasers of such Notes together with this short form shelf prospectus and will be deemed to be incorporated by reference into this short form shelf prospectus as of the date of the pricing supplement or prospectus supplement, solely for the purposes of the Notes issued under that pricing supplement or prospectus supplement .

Any statement contained in this short form shelf prospectus or in a document incorporated or deemed to be incorporated by reference herein shall be deemed to be modified or superseded and not incorporated by reference, for purposes of this short form shelf prospectus, to the extent that a statement contained herein or in any other subsequently filed document which also is or is deemed to be incorporated by reference herein modifies or supersedes such prior statement. The modifying or superseding statement need not state that it has modified or superseded a prior statement or include any other information set forth in the document that it modifies or supersedes. The making of a modifying or superseding statement shall not be deemed an admission for any purposes that the modified or superseded statement, when made, constituted a misrepresentation, an untrue statement of a material fact or an omission to state a material fact that is required to be stated or that is necessary to make a statement not misleading in light of the circumstances in which it was made. Any statement so modified or superseded shall not constitute a part of this short form shelf prospectus, except as so modified or superseded.

FORWARD-LOOKING INFORMATION

This short form shelf prospectus, including the documents incorporated by reference herein, contains forward-looking statements that are based on current expectations, estimates, forecasts and projections about the business of our company and the industry in which it operates and includes beliefs and assumptions made by the management of our company. Such statements include, but are not limited to, statements about the general development of our business; recent regulatory developments including the installation of smart meters; our strategy as it relates to safety, reliability, productivity and cost efficiency; expectations regarding key capital expenditures; expectations regarding developments in the legislative and operating framework for electricity distribution and transmission in Ontario including changes to codes, licences, rate orders and rate structures in both our transmission and distribution businesses; the nature of our relationship with our shareholder, the Province of Ontario; environmental matters; and legal proceedings in which we are currently involved. Words such as “expect”, “anticipate”, “intend”, “attempt”, “may”, “plan”, “will”, “believe”, “seek”, “estimate”, and variations of such words and similar expressions are intended to identify such forward-looking statements. These statements are not guarantees of future performance and involve assumptions and risks and uncertainties that are difficult to predict. Therefore, actual outcomes and results may differ materially from what is expressed, implied or forecasted in such forward-looking statements. While we do not know what impact any of these differences may have, our business, results of operations, financial condition and credit stability may be materially adversely affected. We do not intend, and we disclaim any obligation to update any forward-looking statements, whether written or oral, or whether as a result of new information, future events or otherwise.

These forward looking statements are based on a variety of factors and assumptions including, but not limited to: no unforeseen changes in the legislative and operating framework for Ontario’s electricity market; favourable decisions from the Ontario Energy Board concerning outstanding rate and other applications; no unforeseen changes in rate orders or rate structures for our distribution and transmission businesses; a stable competitive environment; and no significant event occurring outside the ordinary course of business such as a natural disaster or other calamity. These assumptions are based on information currently available to our company including information obtained by our company from third-party industry analysts. Factors that could cause actual results or outcomes to differ materially from the results expressed or implied by forward-looking statements include, among other things:

- the risks associated with being controlled by the Province of Ontario including potential conflicts of interest that may arise between us, the Province of Ontario and related parties;
- the risks associated with being subject to extensive regulation including risks associated with Ontario Energy Board action or inaction;
- the potential for service disruptions and increased costs if we fail to maintain and improve our aging asset base;

- the risks to our facilities posed by severe weather, other natural disasters or catastrophic events, and our limited insurance coverage for losses resulting from these events;

- the potential failure to achieve anticipated reductions in operating costs from our outsourcing arrangement with Inergi LP;

- the inability to further improve our labour productivity and the risks associated with labour disputes;

- the risks related to the high number of retirements anticipated over the next few years and our potential inability to hire and recruit replacement staff;

- the potential for substantial and currently undetermined environmental costs and liabilities;

- the risk that we are not able to arrange sufficient cost effective financing to repay maturing debt and to fund capital expenditures, dividends and other obligations;

- the risk that we may be required to make substantial contributions to our pension plan;

- the risk that we may be subject to significant costs to complete the transfer of transmission, distribution and other assets located on Indian lands; and

- the impact of the acquisition by the Province of Ontario of owned lands underlying our transmission system.

We caution you that the above list of factors is not exclusive. Some of these and other factors (including factors you should consider concerning an investment in the Notes) are discussed in more detail under "Risk Factors" in this short form shelf prospectus and in the section entitled "Risk Factors" in our annual information form and the section entitled "Risk Management and Risk Factors" in our MD&A. You should review these sections in detail.

CREDIT RATINGS

The Notes have been rated A by Standard & Poor's Ratings Services ("S&P"), A (high) by DBRS Limited ("DBRS") and Aa3 by Moody's Investors Services, Inc. ("Moody's"). The following information relating to credit ratings is based on information made available to the public by the rating agencies.

Credit ratings are intended to provide investors with an independent measure of the credit quality of an issue of securities. The rating agencies rate long-term debt instruments by rating categories ranging from a high of AAA to a low of D (C in the case of Moody's). Long-term debt instruments which are rated in the A category by S&P mean the obligor has a strong capacity to meet its financial commitments but are considered somewhat more susceptible to the adverse effects of changes in circumstances and economic conditions than obligations in higher rated categories. However, the obligor's capacity to meet its financial commitments and obligations is still strong. S&P utilizes a plus or a minus modifier to indicate the relative standing within the rating category. Long-term debt instruments which are rated in the A category by DBRS are considered to be of a satisfactory credit quality, with substantial protection of interest and principal. Entities in the A category, however, are considered to be more susceptible to adverse economic conditions and have greater cyclical tendencies than higher-rated securities. The "high" modifier indicates relative standing within this rating category by DBRS. Long-term debt instruments which are rated in the Aa category by Moody's are judged to be of high quality and are subject to very low credit risk. Moody's applies numerical modifiers to each generic rating classification from Aa to Caa. The modifier 3 indicates a ranking in the lower end of that generic rating category.

The ratings mentioned above are not a recommendation to purchase, sell or hold our company's debt securities including the Notes and do not comment as to market price or suitability for a particular investor. There can be no assurance that the ratings will remain in effect for any given period of time or that the ratings will not be revised or withdrawn entirely by any or all of S&P, DBRS and Moody's at any time in the future if in their judgment circumstances so warrant.

ELIGIBILITY FOR INVESTMENT

In the opinion of Osler, Hoskin & Harcourt LLP, counsel to our company, and Blake, Cassels & Graydon LLP, counsel to the Dealers, unless otherwise specified in the applicable prospectus supplement or pricing supplement, the Notes, if issued on the date hereof, would be qualified investments under the *Income Tax Act* (Canada) (the "Tax Act") and the regulations thereunder for a trust governed by a registered retirement savings plan, registered retirement income fund, registered education savings plan or deferred profit sharing plan (other than a trust governed by a deferred profit sharing plan for which any employer is our company or an employer who does not deal with our company at arm's length).

OUR COMPANY

We are the leading electricity transmission and distribution company in Ontario. We own and operate substantially all of Ontario's electricity transmission system, accounting for approximately 96% of Ontario's transmission capacity as measured by revenues for the year ended December 31, 2006. Our transmission system is one of the largest in North America based on assets as at December 31, 2006. Our distribution system is the largest in Ontario based on assets as at December 31, 2006 and spans approximately 75% of Ontario, serving approximately 1.3 million customers. We have three reportable segments: (1) our transmission business; (2) our distribution business; and (3) our other business.

Our transmission business, which represented approximately $6.97 billion of our total assets of $12.23 billion as at December 31, 2006, transmits electricity through an approximately 28,600 circuit-kilometre high-voltage network. We transmit electricity from generators to our own distribution network, 51 local distribution companies and 64 large industrial customers directly connected to our transmission system. We also own and operate 26 facilities that interconnect our transmission system with systems in neighbouring provinces and states.

Our distribution business, which represented approximately $5.17 billion of our total assets of $12.23 billion as at December 31, 2006, distributes electricity through our approximately 124,700 circuit-kilometre low-voltage distribution system, including phase multipliers to municipalities and in rural areas. Customers of our distribution business include 34 local distribution companies that are not directly connected to our transmission system, 48 large industrial customers and approximately 1.3 million rural and urban customers. Hydro One Brampton Networks Inc. is our urban distribution company, serving approximately 120,000 customers in the Greater Toronto Area with approximately 4,845 circuit-kilometres of lines with phase multiplier. We also operate through our subsidiary, Hydro One Remote Communities Inc., 18 small, regulated generation and distribution systems in 20 remote communities across Northern Ontario that are not connected to Ontario's electricity grid.

Our other business segment is primarily represented by the operations of Hydro One Telecom Inc. This subsidiary markets dark and lit fibre-optic capacity to telecommunications carriers and commercial customers with broadband network requirements. The assets of this segment constituted $99 million of our total assets of $12.23 billion as at December 31, 2006.

The Ontario Energy Board regulates our transmission and distribution businesses and issues rate orders to establish the revenue requirements required to cover the approved cost of these businesses plus a specified rate of return.

The address of the head and registered office and principal place of business of our company is 483 Bay Street, North Tower, 15th Floor, Toronto, Ontario, M5G 2P5.

EARNINGS COVERAGE RATIOS

For the twelve months ended December 31, 2006 and the twelve months ended March 31, 2007, our company's consolidated income before provision for payment in lieu of corporate income taxes and interest expensed was $929 million and $948 million, respectively. Interest expense for these periods was $295 million and $295 million, respectively. Preferred share dividends declared for these periods were $18.0 million and $18.0 million, respectively.

The following table sets forth the earnings coverage ratio for our company for the twelve month period ended December 31, 2006, based on audited information, and for the twelve month period ended March 31, 2007, based on unaudited information, in each case without giving effect to any Notes to be issued under this short form shelf prospectus:

	December 31, 2006	March 31, 2007
Earnings coverage on long-term debt obligations(1)(2)	2.65	2.72

(1) The earnings coverage ratio has been calculated as the sum of net income, interest expense (which is net of capitalized interest) and provision for payments in lieu of corporate income taxes divided by the sum of interest plus preferred dividends declared.

(2) The earnings coverage ratio has been adjusted to give effect to the issuance on March 13, 2007 of $400 million of 4.89% medium term notes due March 13, 2037, as if such notes had been issued at the beginning of each respective twelve month period noted above. For purposes of calculating the earnings coverage ratio for periods noted above, it has also been assumed that the proceeds of such notes were used to repay medium term notes maturing in May 2007.

DESCRIPTION OF THE NOTES

The following is a summary of the material attributes and characteristics of the Notes, and does not purport to be complete and is qualified in its entirety by reference to the Notes and the Trust Indenture (as defined below).

The terms and conditions set forth in this section "Description of the Notes" will apply to each Note unless otherwise specified in the applicable prospectus supplement or pricing supplement. We reserve the right to set forth in a prospectus supplement or pricing supplement specific variable terms of or amendments to the Notes which are not within the options and parameters set forth in this short form shelf prospectus. References in this section "Description of the Notes" refer to all medium term notes of our company which have previously been or are to be issued under the Trust Indenture.

This short form shelf prospectus qualifies the distribution of $2.5 billion aggregate principal amount of Notes in Canadian currency (or the equivalent thereof in other currencies or currency units at the time of issue) which have been authorized for issue under the Trust Indenture. This amount is subject to amendment from time to time as determined by our company. Our company has previously issued $1.175 billion aggregate principal amount of medium term notes under our short form shelf prospectus dated June 24, 2005. Upon the issuance of a final receipt for this short form shelf prospectus, we will not qualify for distribution any additional Notes under the June 24, 2005 prospectus.

Notes issued hereunder will have a term to maturity of not less than one year and will be issuable in Canadian currency (or in other currencies or currency units at the time of issue) in fully registered definitive or global form, in which case the Notes will be exchangeable only under certain conditions for definitive Notes (as described under the subheading "Global Notes" below). Each interest-bearing Note will bear interest at either a fixed rate (a "Fixed Rate Note") or a floating rate (a "Floating Rate Note"). Notes will be issued from time to time at such rates of interest and at par, at a premium or at a discount, may be subject to redemption or repayment prior to maturity, and may include terms entitling the holder to exchange or convert the Notes into other securities issued by our company, or to extend the maturity dates of the Notes, which terms shall be determined by our company based on a number of factors, including advice from the Dealers. The Notes will be unsecured and will at their respective dates of issue rank *pari passu* with all other unsecured and unsubordinated Indebtedness and obligations of our company then outstanding, except as to any sinking fund which pertains exclusively to any particular Indebtedness of our company.

Neither the aggregate principal amount of Notes which will be issued and sold nor the issue price to the public of the Notes has been established as the Notes will be issued at such times, in such amounts and at such prices as our company determines from time to time. Notes issued hereunder will be offered and sold during the twenty-five months from the date of issuance of the receipt for this short form shelf prospectus at prices negotiated with the purchasers, and the prices at which the Notes will be offered and sold may vary as between purchasers and during the distribution period. The Notes will be issued from time to time at the discretion of our company in an aggregate principal amount not to exceed $2.5 billion in Canadian currency, or the equivalent thereof calculated at the applicable rates of exchange prevailing at the time of issue of Notes issued in currencies other than Canadian currency.

The specific variable terms of any offering of Notes, including, in the case of Floating Rate Notes, the information necessary for the calculation of interest thereon, will be set forth in a prospectus supplement or pricing supplement to this short form shelf prospectus. Where Notes are offered and sold in currencies other than Canadian dollars, the Canadian dollar equivalent of the offering price and the rate of exchange at the last feasible date will be included in the applicable prospectus supplement or pricing supplement.

Trust Indenture

The Notes will be issued under a trust indenture dated as of June 4, 2001, as supplemented or modified from time to time (the "Trust Indenture") between our company and Computershare Trust Company of Canada, as trustee (the "Trustee", which term shall include, unless the context requires, its successors and assigns). The following is a brief summary of the material attributes and characteristics of the Trust Indenture. This summary does not purport to be complete and reference should be made to the Trust Indenture for more detailed information.

The Trust Indenture permits the issuance from time to time of additional unsecured medium term notes without limitation as to aggregate principal amount, subject to compliance with the covenants contained therein.

The Notes will be direct obligations of our company and will rank *pari passu* with all other medium term notes from time to time issued and outstanding under the Trust Indenture and with other present and future unsubordinated and unsecured Indebtedness of our company, except as to any sinking fund which pertains exclusively to any particular Indebtedness of our company. The Notes will not be secured by any mortgage, pledge or charge, except in the circumstances referred to under the heading "Negative Pledge".

Negative Pledge

The Trust Indenture contains provisions to the effect that our company will not, nor will it permit any Designated Subsidiary (as defined below) to, create, assume or suffer to exist any Security Interest (as defined below) on any of our or the Designated Subsidiary's assets to secure any Obligation (as defined below) unless at the same time it shall secure all the Notes then outstanding on an equal basis. This covenant is, however, subject to the following exceptions:

- any Security Interest that secures the Obligations of a Designated Subsidiary which exists prior to the date on which it becomes a Designated Subsidiary and which (a) was not incurred in contemplation of that person becoming a Designated Subsidiary and (b) was not applicable to our company or any other Designated Subsidiary or the properties or assets of our company or any other Designated Subsidiary;

- any Security Interest granted by our company or a Designated Subsidiary to secure the Notes;

- any Purchase Money Mortgage (as defined below) or Capital Lease Obligation (as defined below) of our company or any Designated Subsidiary;

- any Security Interest on a property or asset acquired by our company or a Designated Subsidiary that secures the Obligations of a person, whether or not that Obligation is assumed by the acquiring person, which Security Interest exists at the time that property or asset is acquired and which (a) was not incurred in contemplation of that property or asset being acquired and (b) was not applicable to our company or any other Designated Subsidiary or the properties or assets of our company or any other Designated Subsidiary;

- any Security Interest given in the ordinary course of business by our company or a Designated Subsidiary to any bank or banks or other lenders to secure any Indebtedness payable on demand or maturing within 18 months of the date that Indebtedness is incurred or of the date of any renewal or extension of that Indebtedness;

- any Security Interest granted by any Designated Subsidiary in favour of our company or any Wholly-Owned Designated Subsidiary (as defined below);

- any Security Interest on or against cash or marketable debt securities pledged to secure any non-speculative Financial Instrument Obligation (as defined below) which hedges Indebtedness of our company or of a Designated Subsidiary;

- any Security Interest for taxes, assessments, government charges or claims that are being contested in good faith and in respect of which appropriate provision is made in our consolidated financial statements in accordance with Canadian generally accepted accounting principles ("Canadian GAAP");

- Security Interests securing appeal bonds or other similar Security Interests arising in connection with contracts, bids, tenders or court proceedings, including, without limitation, surety bonds, security for costs of litigation where required by law and letters of credit, or any other instruments serving a similar purpose;

- a Security Interest in cash or marketable debt securities in a sinking fund account established by our company in support of a series of Notes;

- a lien or deposit under workers' compensation, social security or similar legislation or good faith deposits in connection with bids, tenders, leases, contracts or expropriation proceedings, or deposits to secure public or statutory obligations or deposits of cash or obligations to secure surety and appeal bonds;

- any lien or privilege imposed by law, such as builders', carriers', warehousemen's, landlords', mechanics' and material men's liens and privileges, and any lien or privilege arising out of judgments or awards with respect to which our company or a Designated Subsidiary at the time is prosecuting an appeal or proceedings for review and with respect to which it has secured a stay of execution pending that appeal or proceedings for review; or any liens for taxes, assessments or governmental charges or levies not at the time due and delinquent or the validity of which is being contested at the time by our company or a Designated Subsidiary in good faith; or undetermined or inchoate lien privileges and charges incidental to current operations which have not at such time been filed pursuant to law against our company or a Designated Subsidiary or which relate to obligations not due or delinquent; or the deposit of cash or securities in connection with any lien or privilege referred to in this clause;

- any minor encumbrance, such as easements, rights-of-way, servitudes or other similar rights in land granted to or reserved by other persons, rights-of-way for sewers, electric lines, telegraph and telephone lines, oil and natural gas pipelines and other similar purposes, or zoning or other restrictions as to our company's use of real property, which do not in the aggregate materially detract from the value of that property or materially impair its use in the operation of the business of our company or a Designated Subsidiary;

- any right reserved to or vested in, whether by statutory provision or otherwise, any municipality or governmental or other public authority to terminate, purchase assets used in connection with or require annual or other periodic payments as a condition to the continuance of, any lease, license, franchise, grant or permit acquired by our company or a Designated Subsidiary;

- any lien or right of distress reserved in or exercisable under any lease for rent and for compliance with the terms of that lease;

- any Security Interest granted by our company or a Designated Subsidiary to a public utility or any municipality or governmental or other public authority when required by that utility, municipality or other authority in connection with the operations of our company or a Designated Subsidiary;

- any reservation, limitation, proviso or condition, if any, expressed in any original grants to our company or a Designated Subsidiary from the Crown; and

- any extension, renewal, alteration, substitution or replacement, in whole or in part, of any Security Interest referred to in the foregoing clauses, provided that the Security Interest is limited to all or part of the same property that secured the Security Interest, the principal amount of the secured Obligations is not increased by that action, the term of the secured Indebtedness is not shortened and the terms and conditions are no more restrictive in any material respect than the Security Interest so extended.

In addition to the Security Interests permitted above, our company or any Designated Subsidiary may create, assume or suffer to exist any Security Interest on any of its assets if, after giving effect to that Security Interest, the aggregate amount of Indebtedness secured by the Security Interests permitted only by this paragraph does not at that time exceed 5% of the Consolidated Net Worth (as defined below) of our company.

Limitation on Funded Obligations

So long as any of the Notes issued under the Trust Indenture remain outstanding, neither our company nor any of its Designated Subsidiaries will, directly or indirectly, guarantee, incur, issue or become liable for or in respect of any Funded Obligations (as defined below) unless after giving pro forma effect to that guarantee, incurrence, issuance or liability, including the application or use of the resulting net proceeds, the aggregate principal amount of Consolidated Funded Obligations (as defined below) does not exceed 75% of the Total Consolidated Capitalization (as defined below). This covenant, however, will not prevent the incurrence of Capital Lease Obligations, Purchase Money Obligations and non-speculative Financial Instrument Obligations.

Ceasing to be a Designated Subsidiary

The Board of Directors of our company may elect that any Designated Subsidiary cease to be a Designated Subsidiary, except that an election may not be made in respect of any Designated Subsidiary:

- if the Designated Subsidiary owns any Funded Obligations of our company or any shares, voting interests or Funded Obligations of any other Designated Subsidiary;

- if the Designated Subsidiary owns or has any ownership interest in any Principal Property (as defined below); or

- if, after giving effect to the election, our company would not be entitled to issue Funded Obligations in the principal amount of at least $1.00.

Mergers, Consolidations and Sales of Assets

Our company will not enter into any transaction in which all or substantially all of our property and assets would become the property of any other person, whether by way of reorganization, consolidation, amalgamation, arrangement, merger, transfer, sale or otherwise, unless:

- our company shall be the surviving person, or the person, if other than our company, formed by the amalgamation, consolidation or into which our company is merged or that acquires by disposition all or substantially all of the property or assets of our company shall be a company organized and validly existing under the federal laws of Canada or any of its provinces or territories and shall expressly assume, by a supplemental indenture executed and delivered to the trustee in form satisfactory to the Trustee, all of our company’s obligations under the Trust Indenture;

- immediately before and after giving effect to the transaction, no Event of Default or event that with the passing of time or the giving of notice, or both, would constitute an Event of Default shall have occurred and be continuing; and

- neither our company nor any successor, either at the time of or immediately after the consummation of any such transaction, will be insolvent or generally fail to meet, or admit in writing its inability or unwillingness to meet, its obligations as they generally become due.

Events of Default

The following are Events of Default under the Trust Indenture with respect to Notes of any series:

(1) failure to pay any principal or premium, if any, on any Notes when due, at maturity, upon redemption or otherwise and the continuance of such default for a period of five days;

(2) failure to pay any interest on any Notes when due and the continuance of that default for a period of 45 days;

(3) the sale, transfer or other disposition of all or substantially all of our undertaking or assets other than in accordance with the covenant described above under "Mergers, Consolidations and Sales of Assets";

(4) default in the performance or breach of any other covenant or agreement of our company under the Trust Indenture, any supplemental indenture or the Notes and the continuance of that default for a period of 60 days after written notice to our company by the Trustee or by holders of at least 25% of all Notes issued under the Trust Indenture;

(5) default by our company or any Material Subsidiary (as defined below), whether as primary obligor, guarantor or surety, on any payment of principal, premium, if any, or interest on any Indebtedness, the outstanding principal amount of which Indebtedness exceeds $100 million in the aggregate, beyond any applicable grace period or failure to perform or observe any other agreement, term or condition contained in any agreement under which that Indebtedness is created, or if any default, failure or other event under that agreement shall occur and be continuing, and the effect of that default, failure or other event is to cause $100 million or more of that Indebtedness to become due or to be required to be repurchased prior to any stated maturity;

(6) the rendering of a judgment or judgments, not subject to appeal, against our company or any Material Subsidiary in an aggregate amount in excess of $100 million by a court or courts of competent jurisdiction, which judgment or judgments remain undischarged and unstayed for a period of 60 days; and

(7) specified events of bankruptcy, insolvency or reorganization affecting our company or any Material Subsidiary.

If an Event of Default applicable only to the issued and outstanding Notes of a series occurs and is continuing, either the Trustee or the holders of not less than 25% in principal amount of Notes of that series then outstanding may declare the principal of, and interest and premium, if any, on all Notes of that series to be due and payable immediately.

If, however, an Event of Default applicable to all Notes issued and outstanding under the Trust Indenture, or an Event of Default described in clause (5), (6), or (7) above occurs and is continuing, either the Trustee or the holders of not less than 25% in principal amount of all issued and outstanding Notes, treated as one class, may declare the principal amount of all the Notes then outstanding to be due and payable immediately.

Subject to the provisions of the Trust Indenture relating to the duties of the Trustee, in case an Event of Default applicable to any Notes shall occur and be continuing, the Trustee will be under no obligation to exercise any of its rights or powers under the Trust Indenture at the request or direction of any of the holders of those Notes, unless those holders shall have offered to the Trustee reasonable indemnity. Subject to such provisions for the indemnification of the Trustee, the holders of a majority in principal amount of Notes of all series affected by an Event of Default will have the right to direct the time, method and place of conducting any proceedings for any remedy available to the Trustee or exercising any trust or power conferred on the Trustee in respect of the Notes of all series affected by that Event of Default.

Defeasance

The Trust Indenture requires the Trustee to release our company from its obligations under the Trust Indenture relating to a particular series of Notes if specified conditions are satisfied. Among other things, our company must deposit money or securities for the payment of all principal of and interest and any other amounts on that series of Notes as well as for the payment of the expenses of the Trustee. The deposited money or securities must be denominated in the currency in which principal of these Notes is payable and, in the case of deposited securities, must constitute direct obligations of Canada or specified provinces of Canada or an agency or instrumentality of Canada.

Amendments and Waivers

The Trust Indenture provides that our company and the Trustee may enter into supplemental indentures ("Supplemental Indentures") without the consent of the holders of the Notes of any or all series to:

- add limitations or restrictions to be observed upon the amount or issue of Notes, provided that such limitations or restrictions shall not be materially adverse to the interests of the holders of the Notes;
- add covenants for the protection of the holders of the Notes of any series;
- provide for any additional Events of Default;
- make such provisions not inconsistent with the Trust Indenture as may be necessary or desirable with respect to matters or questions arising thereunder, including the making of any modifications in the form of the Notes which do not affect the substance thereof and which it may be expedient to make, provided that such provisions and modifications will not adversely affect the holders of Notes;
- provide for the issue of Notes of any one or more series and establish the form and terms of any series of Notes;
- evidence the succession, or successive successions, of successors to our company and the covenants and obligations assumed by any such successor, in accordance with the provisions of the Trust Indenture; and
- giving effect to any extraordinary resolution or ordinary resolution of the holders of Notes in accordance with the Trust Indenture.

Other amendments and modifications of the Trust Indenture, Supplemental Indentures and Notes may be made by our company and the Trustee with the consent of the holders of not less than 66⅔% (and in certain circumstances, a majority) in principal amount of Notes of all series voting on such amendment or modification and, if the rights of holders of Notes of a particular series of Notes would be affected differently than rights of holders of Notes of other series, not less than 66⅔% (and, in certain circumstances, a majority) in principal amount of Notes of the series so affected by that modification or amendment voting on such amendment or modification, in each case, voting as one class. However, no modification or amendment may, without the consent of the holder of each outstanding Note of the affected series,

- reduce the principal amount at maturity of, extend the fixed maturity of, or alter the redemption provisions of, those Notes;
- change the currency in which those Notes or any premium or accrued interest is payable;
- reduce the percentage in principal amount at maturity outstanding of those Notes that must consent to an amendment, supplement or waiver or consent to take any action under the Trust Indenture, Supplemental Indenture or those Notes;

- impair the right to institute suit for the enforcement of any payment on or with respect to those Notes;
- waive a default in payment with respect to those Notes;
- reduce the rate or extend the time for payment of interest on those Notes;
- affect the ranking of those Notes in a manner adverse to the holders; or
- make any changes to the Trust Indenture, Supplemental Indentures or those Notes that would result in our company being required to make any withholding or deduction from payments made under or with respect to those Notes.

The holders of 66⅔% in principal amount of the Notes of all series with respect to which an Event of Default shall have occurred and be continuing, voting as one class, may waive any Event of Default, except in the case of a default in payment of principal with respect to the Notes or except, further, in respect of a covenant or provision which cannot be modified or amended without the consent of the holder of each outstanding Note affected.

<u>Definitions</u>

In addition to the definitions set out above, the Trust Indenture contains definitions substantially to the following effect:

"Capital Lease Obligation" means any monetary obligation of our company or a Designated Subsidiary under any leasing or similar arrangement which, in accordance with Canadian GAAP, would be classified as a capital lease and for the purposes of the Trust Indenture, the amount of Capital Lease Obligations will be the capitalized amount thereof, determined in accordance with Canadian GAAP;

"Consolidated Funded Obligations" means the aggregate amount of all Funded Obligations of our company and its Designated Subsidiaries determined on a consolidated basis in accordance with Canadian GAAP;

"Consolidated Net Worth" means, as at any date, the consolidated shareholders' equity of our company and its Designated Subsidiaries as at that date determined in accordance with Canadian GAAP;

"Contingent Liability" means any agreement, undertaking or arrangement by which any person guarantees, endorses or otherwise becomes or is contingently liable upon (by direct or indirect agreement, contingent or otherwise, to provide funds for payment, to supply funds to, or otherwise to invest in, a debtor, or otherwise to assure a creditor against loss) the Obligation of any other person (other than by endorsements of instruments in the course of collection), or guarantees the payment of dividends or other distributions upon the shares of any other person. The amount of any person's obligation under any Contingent Liability will, subject to any limitation contained in that Contingent Liability, be deemed to be the outstanding principal amount (or maximum principal amount, if larger) of the debt, obligation or other liability guaranteed thereby;

"Designated Subsidiary" means any subsidiary which is designated as such by the directors of our company, provided that any such subsidiary may only be so designated if, after giving effect thereto, our company would be entitled under the Supplemental Indenture to issue Funded Obligations in the principal amount of at least $1.00 and further provided that a subsidiary cannot be so designated if any of its shares are owned by a subsidiary which is not itself a Designated Subsidiary;

"Financial Instrument Obligations" means, with respect to any person at any time, the obligations of that person under any transaction that is a rate swap, basis swap, forward rate transaction, commodity swap, commodity option, commodity future, equity or equity index swap or option, bond, note or bill option, interest rate option, forward foreign exchange transaction, cap, collar or floor transaction, currency swap, cross-currency rate swap, swaption, currency option or any other similar transaction, including any option to enter into any of the foregoing, or any combination of the foregoing to the extent of the net amount due to or accruing due by the person under that obligation, determined by marking that obligation to market at that time in accordance with its terms;

"Funded Obligations" means all Indebtedness created, assumed or guaranteed, which matures by its terms on, or is renewable at the option of the obligor to, a date more than 18 months after the date of the original creation, assumption or guarantee thereof;

"Indebtedness" means, without duplication, with respect to any person,

(1) all obligations of that person for borrowed money, including obligations with respect to bankers' acceptances and contingent reimbursement obligations, excluding Preferred Securities issued by that person;

(2) all obligations issued or assumed by that person in connection with its acquisition of property in respect of the deferred purchase price of that property;

(3) all Capital Lease Obligations and Purchase Money Obligations of that person; and

(4) all Contingent Liabilities of that person in respect of any of the foregoing;

"Material Subsidiary" means, as at any date, a Designated Subsidiary,

(1) the total assets of which represent more than 10% of the total assets of our company determined on a consolidated basis as shown in the most recently publicly released consolidated financial statements of our company; or

(2) the total revenues of which represent more than 10% of the total revenues of our company determined on a consolidated basis as shown in the most recently publicly released consolidated financial statements of our company;

"Obligations" means, without duplication, with respect to any person, all items which, in accordance with Canadian GAAP, would be included as liabilities on the liability side of the balance sheet of that person as of the date at which Obligations are to be determined, other than Preferred Securities issued by that person; and all Contingent Liabilities of that person in respect of any of the foregoing;

"Preferred Securities" means:

(1) securities which on the date of issue by a person (a) have a term to maturity of more than 30 years, (b) are unsecured and rank subordinate to the unsecured and unsubordinated Indebtedness of that person outstanding on that date, (c) entitle that person to satisfy the obligation to pay the principal or face amount by issuing common shares, (d) entitle that person to defer the payment of interest for more than four years without causing an event of default to occur, and (e) entitle that person to satisfy the obligation to make payments of interest by issuing common shares; and

(2) shares of any class in the capital of a corporation or securities representing ownership interests in any person other than a corporation which, in either case, are not common shares;

"Principal Property" means any of our company's and our subsidiaries' fixed assets used for the transmission, transformation and distribution of electricity in Ontario as of June 4, 2001 (the date of the Trust Indenture);

"Purchase Money Mortgage" means any security interest, mortgage, pledge, charge or other encumbrance created, issued or assumed by our company or a Designated Subsidiary to secure a Purchase Money Obligation; provided that the security interest, mortgage, pledge, charge or other encumbrance is limited to the property (including associated rights) acquired, constructed, installed or improved using the funds advanced to our company or a Designated Subsidiary in connection with that Purchase Money Obligation;

"Purchase Money Obligation" means Indebtedness of our company or a Designated Subsidiary incurred or assumed to finance the purchase price, in whole or in part, of any property (except any Indebtedness which constitutes a Funded Obligation and which was incurred or assumed to finance the purchase price, in whole or in

part, of any shares, bonds or other securities) or incurred to finance the cost, in whole or in part, of construction or installation of or improvements to any real property or fixtures provided that such Indebtedness is incurred or assumed within 24 months after the purchase of such real property or fixtures or the completion of such construction, installation or improvements, as the case may be, and includes any extension, renewal or refunding of any such Indebtedness, so long as the principal amount thereof outstanding on the date of such extension, renewal or refunding is not increased;

"Security Interest" means any assignment, mortgage, charge (whether fixed or floating), hypothec, pledge, lien, or other encumbrance on or interest in property or assets that secures payment of Indebtedness or Obligation;

"Total Consolidated Capitalization" means, at any time and from time to time, without duplication, the sum of (1) the principal amount of all Consolidated Funded Obligations at the time outstanding, and (2) the total share capital of our company at the time outstanding, based upon the stated capital on the books of our company, and (3) the principal amount of all outstanding Preferred Securities referred to in clause (1) of the definition of "Preferred Securities" plus the total amount of (or less the amount of any net deficits in) the contributed or capital surplus of our company and the retained earnings of our company and all Designated Subsidiaries in accordance with Canadian GAAP after adding back the amount shown on the consolidated balance sheet of our company and its Designated Subsidiaries for minority interests applicable to Designated Subsidiaries and eliminating all intercorporate items, plus the amount of any premium on capital of our company not included in its surplus, and less the amount, if any, by which the capital account of our company or the consolidated capital surplus account of our company and all Designated Subsidiaries (determined in the manner described above) has at any time been increased as a result of any write-up in the value of the shares of a subsidiary which is not a Designated Subsidiary to reflect the equity of our company in its retained earnings or otherwise, or as a result of a restatement of the amount at which any other assets of our company or any Designated Subsidiary are recorded on its books. The amount of Total Consolidated Capitalization of our company and all Designated Subsidiaries at any time shall be ascertained in Canadian dollars; and

"Wholly-Owned Designated Subsidiary" means a Designated Subsidiary, all of the outstanding shares in the capital of which are owned, directly or indirectly, by or for our company and/or by or for one or more other Wholly-Owned Designated Subsidiaries.

Global Notes

Notes denominated in Canadian or United States dollars may be issued in the form of fully registered global notes ("Global Notes") held by, or on behalf of, CDS Clearing and Depository Services Inc. or another corporation performing similar services that is acceptable to the Trustee (the "Depository") as custodian of the Global Notes and, in such event, Notes will be registered in the name of the Depository or its nominee (a "Nominee"). Purchasers of Notes represented by Global Notes will not receive Notes in definitive form ("Definitive Notes"). Instead, ownership of such Notes will be constituted through beneficial interests in the Global Notes, and will be represented through book-entry accounts of institutions (including the Dealers), as direct and indirect participants of the Depository ("participants"), acting on behalf of the beneficial owners of such Notes. Each purchaser of a Note represented by a Global Note will receive a customer confirmation of purchase from the Dealer from or through whom the Note is purchased in accordance with the practices and procedures of such Dealer. The Depository will be responsible for establishing and maintaining book-entry accounts for its participants having interests in Global Notes.

Currently, CDS Clearing and Depository Services Inc. only allows depository eligibility for securities denominated in Canadian or United States dollars. Any Notes denominated in a currency other than Canadian or United States dollars will be represented by Definitive Notes until such time as the Depository allows depository eligibility for issues of securities denominated in such currencies.

If Global Note(s) are issued and the Depository notifies our company that it is unwilling or unable to continue as depository in connection with the Global Notes, or if at any time the Depository ceases to be a clearing agency or otherwise ceases to be depository and our company and the Trustee are unable to locate a qualified replacement, or if our company elects to terminate the book-entry system, beneficial owners of Notes represented by Global Notes will receive Definitive Notes.

Fixed Rate Notes

Each Fixed Rate Note will bear interest from its original issue date at the rate per annum on the face thereof until the principal amount thereof is paid or made available for payment. Interest on a Fixed Rate Note will be calculated and payable monthly, quarterly, semi-annually or annually in arrears on the dates specified in such Fixed Rate Note, or other such dates as may be agreed to between the purchaser of the Note and our company (each, an "Interest Payment Date") and at maturity or upon earlier redemption or repayment. Interest Payment Dates will be set forth in the applicable prospectus supplement or pricing supplement for the Fixed Rate Note. Each payment of interest in respect of an Interest Payment Date will include interest accrued to but excluding such Interest Payment Date.

Floating Rate Notes

Each Floating Rate Note will bear interest from its original issue date at rates described in the Floating Rate Note and specified in the applicable prospectus supplement or pricing supplement.

The rate of interest on each Floating Rate Note will be reset monthly, quarterly, or as otherwise specified in the Floating Rate Note and applicable prospectus supplement or pricing supplement. Interest on each Floating Rate Note will be payable monthly, quarterly or as otherwise specified in the Floating Rate Note and applicable prospectus supplement or pricing supplement. Unless otherwise specified in the Floating Rate Note and applicable prospectus supplement or pricing supplement, our company will be the calculation agent with respect to the Floating Rate Notes. Upon request of the holder of any Floating Rate Note, our company will provide the interest rate then in effect.

Payment of Interest and Principal

Interest on each interest bearing Note will be payable on such periodic basis or at maturity and on such date or dates as may be agreed upon by our company and the purchaser of the Note. Payments of interest on each interest bearing Definitive Note will be made by cheque payable on the interest payment date and mailed to the address of, or if so directed by the holder, funds representing the interest payable will be forwarded by electronic funds transfer on the interest payment date to the account of, the holder appearing on the registers maintained by Computershare Trust Company of Canada, as registrar and transfer agent (the "Transfer Agent", which term shall include such other registrar or transfer agent as may from time to time be appointed by our company) at the close of business in the City of Toronto on the tenth business day (being a day other than Saturday, Sunday, or a day on which financial institutions at the place of payment are authorized or obligated by law or regulation to close) prior to the interest payment date or such other day specified to the Trustee by our company and reflected in a Supplemental Indenture for a particular series of Notes. Payment of principal will be made at any branch in Canada of the bank designated in a Definitive Note against surrender of the Note.

Payment of interest and principal on each Global Note will be made to the Depository or the Nominee, as the case may be, as the registered holder of the Global Note. Interest payments on Global Notes will be made by wire transfer on the date interest is payable and delivered to the Depository or the Nominee, as the case may be, two business days before the date interest is payable. Principal payments on Global Notes will be made by wire transfer on the maturity date delivered to the Depository or the Nominee, as the case may be, at maturity against receipt of the Global Note. As long as the Depository or the Nominee is the registered owner of a Global Note, the depository or the Nominee, as the case may be, will be considered the sole owner of the Global Note for the purposes of receiving payment on the Note and for all other purposes under the Trust Indenture and the Note.

Our company expects that the Depository or Nominee, upon receipt of any payment of principal or interest in respect of a Global Note, will credit participants' accounts, on the date principal or interest is payable, with payments in amounts proportionate to their respective beneficial interests in the principal amount of such Global Note as shown on the records of the Depository or the Nominee. Our company also expects that such payments of principal and interest by participants to the owners of beneficial interests in such Global Note held through such participants will be governed by standing instructions and customary practices, as is the case with securities held for the accounts of customers in bearer form or registered in "street name" and will be the responsibility of such participants. The responsibility and liability of our company and the Trustee in respect of Notes represented by

Global Notes is limited to making payment of any principal and interest due on such Global Notes to the Depository or the Nominee.

Payments of interest and principal will be made in the currency in which the Note is denominated unless otherwise specified in the applicable prospectus supplement or pricing supplement.

If the payment date for any amount of principal or interest on any Note is not, at the place of payment, a business day such payment will be made on the next business day and the holder of such Note shall not be entitled to any further interest or other payment in respect of such delay.

Transfers

The registered holder of a Definitive Note may transfer such Note upon payment of taxes incidental thereto, if any, by executing the form of transfer provided on the reverse side of the Note and surrendering the Note to the Transfer Agent at its principal office in the City of Toronto, upon which one or more new Definitive Notes will be issued in authorized denominations in the same aggregate principal amount as the Note so transferred, registered in the name or names of the transferee or transferees.

Transfers of beneficial ownership in Notes represented by Global Notes will be effected through records maintained by the Depository for such Global Notes or the Nominee (with respect to the interest of participants) and on the records of participants (with respect to the interest of beneficial owners other than participants). Beneficial owners of an interest in a Note represented by a Global Note who are not participants in the Depository's book-entry system, but who desire to purchase, sell or otherwise transfer ownership of or other interests in Global Notes, may do so only through participants in the Depository's book-entry system. A purchaser's interest in a Note represented by a Global Note will only be exchangeable for Definitive Notes in the limited circumstances set forth under the subheading "Global Notes" above and in accordance with the procedures established by the Depository or the Nominee.

The ability of a beneficial owner of an interest in a Note represented by a Global Note to pledge the Note or otherwise take action with respect to such owner's interest therein other than through a participant may be limited due to the lack of a physical certificate.

No transfer of a Note will be registered during the 10 business days immediately preceding any date fixed for payment of interest on such Note or payment of the principal amount thereof.

PLAN OF DISTRIBUTION

The Notes may be offered for sale severally and on a continuous basis by one or more of BMO Nesbitt Burns Inc., Casgrain & Company Limited, CIBC World Markets Inc., HSBC Securities (Canada) Inc., Laurentian Bank Securities Inc., National Bank Financial Inc., RBC Dominion Securities Inc., Scotia Capital Inc. and TD Securities Inc. pursuant to an agreement dated June 21, 2007 among such dealers and our company (the "Dealer Agreement") or such other dealers as may be selected from time to time by our company, in each case acting as agent of our company or as principal. Where the Notes are offered by the Dealer(s) as agent(s), the commission payable by our company shall be agreed from time to time between our company and any such Dealer(s). Where the Notes are purchased by the Dealer(s) as principal, the Notes shall be purchased at such prices and with such commissions as may be agreed from time to time between our company and any such Dealer(s) for resale to the public at prices to be negotiated with each purchaser. Such resale prices may vary during the distribution period as between purchasers. Each Dealer's compensation will increase or decrease by the amount by which the aggregate price paid for Notes by purchasers exceeds or is less than the price paid by the Dealer, acting as principal, to our company. The commission payable in connection with sales of Notes shall be no higher than 1.5% and shall be set forth in a prospectus supplement or pricing supplement that shall accompany this short form shelf prospectus. Our company has agreed to reimburse the Dealers for certain expenses and to indemnify each Dealer against certain liabilities.

Our company may also offer the Notes directly to potential purchasers pursuant to applicable statutory exemptions at prices and upon terms negotiated between the purchaser and our company.

Our company and, if applicable, the Dealers, reserve the right to reject any offer to purchase the Notes in whole or in part. Our company also reserves the right to withdraw, cancel or modify the offering of the Notes under this short form shelf prospectus without notice. In addition, the obligations of the Dealers to purchase any particular issue of Notes may be terminated at the discretion of the Dealers upon the occurrence of certain stated events as set out in detail in the Dealer Agreement. However, the Dealers are obligated to take up and pay for all Notes of a particular issue if any of the Notes of that issue are purchased under the Dealer Agreement.

In connection with any offering of Notes, the Dealers may, when acting as an agent or purchasing as principal, over-allot or effect transactions which stabilize or maintain the market price of the Notes offered at a level above that which might otherwise prevail in the open market. Such transactions, if commenced, may be discontinued at any time.

The Dealers may from time to time purchase and sell the Notes in the secondary market but are not obliged to do so. There is no market through which Notes may be resold and purchasers may not be able to resell Notes purchased under this short form shelf prospectus. The offering price and other selling terms for any sales in the secondary market may, from time to time, be varied by the Dealers.

The offering of Notes hereunder is directed only to residents of the provinces of Canada and in the United States in certain circumstances exempt from the provisions of the United States Securities Act of 1933, as amended (the "Securities Act"). The Notes have not been and will not be registered under the Securities Act and may not be offered or sold within the United States except in certain transactions exempt from the registration requirements of the Securities Act, including transactions under Rule 144A under the Securities Act. The Dealers have agreed not to buy or offer to buy, to sell or offer to sell, or solicit any offer to buy any Notes in the United States of America, its territories or possessions except to "qualified institutional buyers" pursuant to the exemption in Rule 144A under the Securities Act. In addition, until 40 days after the commencement of the offering of an issue of Notes, an offer or sale of that issue within the United States by any Dealer (whether or not participating in the offering) may violate the registration requirements of the Securities Act if such offer or sale is made otherwise than in accordance with an exemption under the Securities Act. Terms used in this paragraph have the meanings given to them by Regulation S under the Securities Act.

BMO Nesbitt Burns Inc., CIBC World Markets Inc., HSBC Securities (Canada) Inc., Laurentian Bank Securities Inc., National Bank Financial Inc., RBC Dominion Securities Inc., Scotia Capital Inc. and TD Securities Inc. are subsidiaries or affiliates of Canadian chartered banks (the "Banks") which are lenders to our company under an amended and restated credit facility dated August 13, 2004, of up to $1.0 billion (as amended and restated from time to time, the "Credit Facility") which is used to backstop the issuance of commercial paper. As of June 21, 2007, there was no outstanding Indebtedness under the Credit Facility. Proceeds from the sale of particular series or issues of Notes in which such Dealers are acting as principals or agents may be used to repay Indebtedness under the Credit Facility, on the basis of each Bank's rateable portion of the Credit Facility. Consequently, if and when there is outstanding Indebtedness to the Banks under the Credit Facility, our company may be considered to be a connected issuer of each such Dealer for purposes of the securities laws of certain Canadian provinces. Other than payment of their portion of the commissions, if applicable, or as set forth above in respect of the Credit Facility, none of the proceeds of such offerings of Notes will be applied, directly or indirectly, for the benefit of BMO Nesbitt Burns Inc., CIBC World Markets Inc., HSBC Securities (Canada) Inc., Laurentian Bank Securities Inc., National Bank Financial Inc., RBC Dominion Securities Inc., Scotia Capital Inc., TD Securities Inc. or their affiliates. See "Use of Proceeds".

USE OF PROCEEDS

The net proceeds from the sale of Notes will be added to the general funds of our company and, together with funding from other sources, including internally generated funds and other external financings, will be used to finance our company's working capital requirements, to repay outstanding bank loans which may include indebtedness under the Credit Facility, debentures, notes or other Indebtedness, to make advances to subsidiaries of our company, to finance our company's capital expenditure program, to make acquisitions and for other general corporate purposes. Where appropriate, a prospectus supplement or pricing supplement will contain more specific information about the use of proceeds from each sale of Notes. All expenses relating to an offering of Notes, including any compensation paid to the Dealers, will be paid out of our company's general funds. Our company may from time to time issue debt instruments and incur additional Indebtedness otherwise than through the issue of Notes pursuant to this short form shelf prospectus.

RISK FACTORS

In addition to the other information contained and incorporated by reference in this short form shelf prospectus, a purchaser should consult its own financial and legal advisors and should carefully consider the following risk factors before investing in the Notes. Notes will not be an appropriate investment for a purchaser if the purchaser does not understand the terms of the Notes or financial matters in general. A purchaser should not purchase Notes unless the purchaser understands, and can bear, all of the investment risks involving the Notes. For a discussion of the risks to which our business and industry are subject, please see the section entitled "Risk Factors" in our company's renewal annual information form and the section entitled "Risk Management and Risk Factors" in our annual MD&A. In addition to those risks, an investment in the Notes is subject to the following additional risks:

We Must Receive Dividends and Other Payments from Our Subsidiaries in Order to Make Payments to Holders of Notes

We are a holding company that has no significant assets or operations other than the debt and equity of our subsidiaries. Our most significant subsidiary is Hydro One Networks Inc., a regulated wholly-owned subsidiary which owns and operates our transmission and distribution assets. We are dependent on dividends, interest, loans and other payments from this and other subsidiaries to meet our debt service and other obligations.

Our subsidiaries are separate legal entities and have no obligation to pay any amounts due under the Notes and, except for their respective obligations under existing intercompany debt obligations owing to us, have no obligation to make funds available to us, whether by dividends, interest, loans or other payments. In addition, these subsidiaries have not guaranteed the Notes. In the event of bankruptcy, liquidation or reorganization of any of our subsidiaries, the creditors of these subsidiaries will generally be entitled to the payment of their claims before any assets are made available for distribution to us, except to the extent that we are recognized as a creditor of those subsidiaries.

Our subsidiaries currently are not restricted in terms of their ability to pay dividends or make other payments to us, other than by solvency provisions under generally applicable Ontario corporate law. However, they could become so restricted in the future by, among other things, other laws as well as agreements to which they may become parties in the future.

The Notes Have No Existing Trading Market and May Be Subject to Trading Price Fluctuations

The Notes are new issues of securities for which there is no existing trading market. We do not intend to list the Notes on any Canadian, U.S. or other securities exchange. We cannot predict whether any trading market will develop for the Notes.

Even if a trading market develops for the Notes, the Notes could trade at prices that may be higher or lower than their initial offering prices, depending on many factors, including prevailing interest rates, our results of operations and financial position, the ratings assigned to the Notes and our other debt securities, and the markets for similar debt securities.

Foreign Currency Risks

An investment in Notes that are denominated or payable in other than Canadian dollars entails significant risks that are not associated with a similar investment in a security denominated in Canadian dollars. Such risks include, without limitation, the possibility of significant changes in rates of exchange between the Canadian dollar and the applicable foreign currency unit, the possibility of the imposition or modification of foreign exchange controls by either the Canadian or foreign governments, and potential illiquidity in the secondary market. These risks will vary depending upon the currency or currencies involved and, where appropriate, will be more fully described in a prospectus supplement.

The Notes will be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein. A judgment by a Canadian court relating to any Note may be awarded only in Canadian currency and such judgment may be based on a rate of exchange in existence on a day other than the day of payment.

This short form shelf prospectus does not describe all the risks of an investment in the Notes denominated or payable other than in Canadian dollars, and prospective investors should consult their own financial and legal advisor as to the risks entailed with respect thereto. Notes denominated in other than Canadian dollars are not appropriate investments for investors who are unfamiliar with foreign currency transactions.

Interest Rate Risks

Prevailing interest rates will affect the market price or value of the Notes. Generally, the market price or value of the Notes will decline as prevailing interest rates for comparable debt instruments rise, and increase as prevailing interest rates for comparable debt instruments decline. Fluctuations in interest rates may also impact borrowing costs of our company which may adversely affect its creditworthiness.

Changes in Creditworthiness or Credit Ratings

The perceived creditworthiness of our company and changes in credit ratings of the Notes may affect the market price or value and the liquidity of the Notes. In addition, negative changes in our company's credit rating may affect the credit ratings of the Notes.

Risks Associated with Floating Rate Notes

Investments in Floating Rate Notes entail risks not associated with investments in Fixed Rate Notes. The resetting of the applicable rate on a Floating Rate Note may result in a lower interest rate as compared to a Fixed Rate Note issued at the same time. The applicable rate on a Floating Rate Note will fluctuate in accordance with fluctuations in the instrument or obligation or other measure on which the applicable rate is based, which in turn may fluctuate and be affected by a number of interrelated factors, including economic, financial and political events over which our company has no control.

LEGAL MATTERS

Certain legal matters in connection with any offering hereunder will be passed upon by Osler, Hoskin & Harcourt LLP for our company and by Blake, Cassels & Graydon LLP for the Dealers. The partners and associates of the foregoing law firms beneficially own, directly or indirectly, less than one percent of the securities of our company or any associate or affiliate of our company.

AUDITORS, REGISTRAR AND TRANSFER AGENT

The auditors of our company are Ernst & Young LLP, Ernst & Young Tower, P.O. Box 251, 222 Bay Street, Toronto-Dominion Centre, Toronto, Ontario M5K 1J7. Ernst & Young LLP is independent in Ontario in accordance with its rules of professional conduct.

Registers for the registration and transfer of the Notes issued in registered form are kept at the principal offices of the Transfer Agent in the City of Toronto.

PURCHASERS' STATUTORY RIGHTS

Securities legislation in certain of the provinces of Canada provides purchasers with the right to withdraw from an agreement to purchase securities. This right may be exercised within two business days after receipt or deemed receipt of a prospectus and any amendment. In several of the provinces, securities legislation further provides a purchaser with remedies for rescission or, in some jurisdictions, damages if the prospectus and any amendment contains a misrepresentation or is not delivered to the purchaser, provided that the remedies for rescission or damages are exercised by the purchaser within the time limit prescribed by the securities legislation of the purchaser's province. The purchaser should refer to any applicable provisions of the securities legislation of the purchaser's province for the particulars of these rights or consult with a legal adviser.

AUDITORS' CONSENT

We have read the short form base shelf prospectus of Hydro One Inc. (the "Corporation") dated June 21, 2007 relating to the issue of up to $2,500,000,000 aggregate principal amount of medium term notes (unsecured) of the Corporation. We have complied with Canadian generally accepted standards for an auditor's involvement with offering documents.

We consent to the use through incorporation by reference in the above-mentioned prospectus of our report dated February 14, 2007 to the shareholder of the Corporation on the consolidated balance sheets of the Corporation as at December 31, 2006 and 2005 and the consolidated statements of operations, retained earnings and cash flows of the Corporation for each of the years then ended.

Toronto, Ontario

CERTIFICATE OF HYDRO ONE INC.

Dated: June 21, 2007

This short form prospectus, together with the documents incorporated in this prospectus by reference, will, as of the date of the last supplement to this prospectus relating to the securities offered by this prospectus and the supplement(s), constitute full, true and plain disclosure of all material facts relating to the securities offered by this prospectus and the supplement(s) as required by the securities legislation of all of the provinces of Canada. For the purpose of the Province of Québec, this simplified prospectus, together with documents incorporated herein by reference and as supplemented by the permanent information record, will contain no misrepresentation that is likely to affect the value or the market price of the securities to be distributed.

(Signed) Laura Formusa
President and
Chief Executive Officer (Acting)

(Signed) Beth Summers
Chief Financial Officer

On behalf of the Board of Directors:

(Signed) Rita Burak
Chairman of the Board of Directors

SUMMARY OF HYDRO ONE DISTRIBUTION POLICIES

1.0 INTRODUCTION

Hydro One Distribution has a number of policies that apply to distribution customers, assets and systems, and financial management. Policies are subject to periodic review and/or revision as a result of statutory or regulatory change, or as the business evolves. The objectives of these policies are to ensure:

- compliance with statutory and regulatory obligations;
- fair and consistent commercial relationships with customers;
- efficient management of assets;
- consistent criteria for decision making;
- compliance with generally-accepted accounting principles;
- consistency for transaction processing; and,
- accurate and timely recording and reporting of financial information.

2.0 CHANGES TO POLICIES

In keeping with good corporate governance, Hydro One has reviewed and revised the following policies and procedures since the Board's review of Distribution Rates for 2006 (RP-2005-0020/EB-2005/0378).

- Procurement Policy
- Procurement Procedure
- Corporate Policy on Consultants
- Corporate Procedure for Retention of Consultants
- Corporate Charge Card Procedure

- •• Policy on Employee Business Expenses
- •• Employee Business Expenses Procedure

The following represent significant changes to the company's key policies since the RP-2005-0020/EB-2005-0378 Board review.

2.1 Comprehensive Income, Financial Instruments and Hedging

Effective January 1, 2007, Networks adopted four new accounting standards comprising the Canadian Institute of Chartered Accountants' (CICA) Handbook Sections 1530, *Comprehensive Income*; 3855, *Financial Instruments – Recognition and Measurement*; 3861, *Financial Instruments – Disclosure and Presentation;* and 3865, *Hedges*. The adoption of these new standards required changes in the accounting for financial instruments and hedges, and the recognition of certain transition adjustments that are recorded in opening accumulated other comprehensive income (AOCI). Comprehensive income is composed of the Company's net income and other comprehensive income (OCI). OCI includes the amortization of unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date.

Under the new financial instruments standards, all financial instruments are classified into one of five categories: held-to-maturity investments, loans and receivables, held-for-trading, other liabilities or available-for-sale. Networks' classification of existing financial instruments is summarized in the notes to its 2007 first quarter financial statements.

All derivative instruments, including embedded derivatives, are carried at fair value on the balance sheet unless exempted from derivative treatment as a normal purchase and sale. All changes in fair value are recorded in financing charges unless cash flow hedge accounting is used, in which case changes in fair value are recorded in OCI to the extent that the hedge is effective. Where there is an economic hedge, Networks has selected to apply the fair value option without hedge accounting. All financial instrument transactions are recorded at trade date.

Upon adoption of the new standards, the Company reclassified unamortized hedging losses on cash flow hedges that had been discontinued prior to the transition date to AOCI. The hedging losses are amortized through OCI over the term of the hedged debt. Previously these unamortized gains and losses were disclosed net with long-term debt.

Transaction costs for financial assets and liabilities that are classified as other than held-for-trading, are added to the carrying value of the asset or liability and amortized over the expected life of the instrument. Previously such costs incurred as a result of the issuance of long-term debt were disclosed as a separate long-term asset on the Balance Sheet.

2.2 Accounting for Conditional Asset Retirement Obligations

Effective April 1, 2006, Networks adopted new accounting recommendations for Conditional Asset Retirement Obligations issued by the Emerging Issues Committee of the CICA. Most of these obligations are not currently estimable because final retirement and removal dates cannot be determined as the related assets are expected to be used on an ongoing basis. Networks did determine that is has an estimable but immaterial liability associated with the disposal of treated wood utility poles.

SUMMARY OF INITIATIVES BASED ON LEGISLATIVE CHANGES

1.0 INTRODUCTION

Hydro One Inc. is subject to direction from its shareholder (the Government of Ontario), Ontario Energy Board decisions and government legislation and regulations. Each one of these sources has the potential to be a driver for change affecting Hydro One policies, processes and work programs, with associated cost implications. Hydro One complies with all regulatory and legislative requirements and incurs costs to do so. When new legislation or regulations are passed, or when OEB decisions are released, Hydro One responds to the directive by developing appropriate programs or initiatives to implement the required changes in a cost-effective fashion. As the electricity industry in Ontario continues to evolve, Hydro One actively participates in the design of industry-related changes with the intent of ensuring that costs are reasonable and that the impacts on customers are manageable. The costs of implementing the outcomes of ongoing industry changes include communicating changes to customers and modifying the impacted business processes, information systems, policies and procedures and staff training programs. The remainder of this Exhibit provides a brief summary of the key pieces of legislation, regulatory requirements, standards and guidelines to which Hydro One's Distribution Business must respond.

2.0 THE DISTRIBUTION SYSTEM AND RETAIL SETTLEMENT CODES

Hydro One is bound by the terms of its Distribution licence to adhere to the requirements of the Distribution System Code (DSC) and the Retail Settlement Code (RSC), both of which are administered by the Ontario Energy Board.

The DSC provides the minimum conditions a distributor must meet in carrying out its obligation to operate, maintain, manage and expand distribution systems and requires Hydro One to operate and maintain its system in accordance with "good utility practice." The DSC sets out the obligations of electricity distributors with respect to their customers, including the rules governing the economic evaluation of distribution system connections and expansions and also the minimum standards for facilities connected to a distribution system. It also includes guidance on the form of the Connection Agreement for load customers, and includes a Connection Agreement template for generator customers, which covers the technical and commercial responsibilities for both Hydro One and the customer.

The RSC sets the minimum obligations that distributors and retailers must meet in determining the costs of electricity services. It sets the rules for Hydro One's customer billing process and its interactions with retailers. The main aspects of the RSC include rules for processing service transaction requests, calculating distribution losses on customer bills, meter reading and billing cycles, and defining and setting timelines for billing options (such as retailer consolidated bills).

Both codes have been periodically amended over time. Hydro One has incorporated, or is in the process of incorporating, these amendments into its work practices and procedures. Recent changes include updates in 2006 to facilitate distributed generation and net metering, and updates in 2007 to connections and expansions, smart metering, and the elimination of Long Term Load Transfers.

3.0 ENVIRONMENTAL MANAGEMENT

Hydro One Distribution is subject to a wide range of legislation. The following are the major acts that govern Hydro One Distribution's activities. Many others can apply in specific circumstances but the following are applicable to most distribution work.

3.1 Federal Legislation

- *Canadian Environmental Protection Act*, which regulates the management of hazardous substances such as Polychlorinated Biphenyls ("PCBs").
- *Fisheries Act*, which regulates fish habitat and pollution prevention in and around water bodies that support fish.

3.2 Provincial Legislation

- *Environmental Protection Act*, which regulates waste management/disposal, spills and Certificates of Approval.
- *Ontario Water Resources Act*, which regulates discharges, sewage works and water works.
- *Pesticides Act*, which regulates the storage, use and application of pesticides.
- *Environmental Assessment Act*, which regulates the planning and environmental approvals of projects, such as high voltage stations that step down to distribution voltages.

3.3 Municipal Legislation

Many municipal by-laws regulate noise, discharges to sewers, pesticide use and the upkeep/maintenance of properties. The application of these will vary depending on the municipality.

3.4 Environmental Management and Governance

In order to comply with all legislated requirements, Hydro One Distribution has developed a number of environmental management programs. In addition, governance activities such as management system maintenance, program monitoring and reporting are provided by staff in the Health, Safety & Environment function.

The following is a summary of the major programs:

3.4.1 Land Assessment and Remediation

- Land and groundwater contamination is a legacy issue from spills, leaks and historical use of persistent herbicides at distribution stations for vegetation control. Underground tanks for fuel storage and dispensing have also been a cause of land and water contamination. At the time that these herbicides were used by the former Ontario Hydro, they were commonly used by North American utilities, and were compliant with regulatory requirements in place at the time. There was no knowledge of their potential negative environmental impact.
- Program management and funding requirements are described in Exhibit C1, Tab 2, Schedule 2.

3.4.2 Management of hazardous materials and wastes

- Hazardous materials such as PCBs and wastes (oils, solvents, etc.) are managed in accordance with regulatory requirements and good management practices;
- PCBs are a contaminant in a small percentage of oil-filled electrical equipment. The amount of PCBs has declined due to a program of PCB phase-out and destruction, which began in the mid-1980s. The continued removal of equipment from service in the future will ensure that Hydro One Distribution becomes a PCB-free utility;
- Occasionally spills, leaks and fires occur as a result of equipment failure, adverse weather or other causes. Most spills involve mineral oil from electrical equipment such as transformers. The environmental impact of spills is mitigated by a well-developed spill reporting and response system. This involves the timely reporting of spills to all appropriate authorities and the clean-up and remediation of areas impacted by the spill.
- Management of these programs and funding requirements are described in Exhibit C1, Tab 2, Schedule 2.

3.4.3 Vegetation Management (Herbicide Use)

- Herbicide use is an integral part of the vegetation management program associated with maintenance of the distribution system, including rights-of-way and stations. Environmental impacts are minimized through the use of approved product types, and approved methods and procedures for application. Property owner approval is obtained prior to the application of any herbicide on private properties. Vegetation management programs and funding requirements are fully described in Exhibit C1, Tab 2, Schedule 2.

4.0 ELECTRICAL SAFETY AUTHORITY

The Electrical Distribution Safety Regulation 22/04 established objective-based electrical safety requirements for the design, construction and maintenance of electrical distribution systems owned by licensed distributors. It requires:

- Approval of equipment, designs and plans.
- Inspection and certification of construction before it is put into use.
- An assessment of plant based on the Ontario Electrical Safety Code prior to selling plant to non-distributors.
- Approval by the utility to place objects at a distance less than CSA clearance standards from distribution lines.
- Disconnection of unused lines.
- Reporting of serious electrical incidents.
- Annual compliance audits of processes.
- Safety due diligence inspections conducted by the ESA to ensure safety standards are met.

Electrical safety is a very high priority for Hydro One Distribution as indicated in the strategic goals in Exhibit A, Tab 3, Schedule 1. To address this priority Hydro One Distribution has implemented comprehensive training programs to ensure all Electrical Distribution Safety Regulations are adhered to across the corporation. The associated program management and costs are described in Exhibit C1, Tab 2, Schedule 2.

5.0 SMART METERS

The Government of Ontario, as part of achieving a conservation culture, is proceeding with time-of-use (TOU) electricity pricing and the installation of smart meters throughout

Ontario by 2010. The enactment of the *Energy Conservation Leadership Act*, and changes to the *Electricity Act* and the *Ontario Energy Board Act*, along with new regulations, have defined the Government's Smart Meter Initiative, prescribed the technical and functional requirements of the smart meter solutions (Advanced Metering Infrastructure – AMI), and set the path for mass deployment of the meters across Ontario.

Regulations passed in August, 2006 (O. Reg. 425/06, 426/06 and 427/06), designate the smart metering activities of Hydro One Networks Inc. (among those of other utilities) as authorized discretionary metering activities and prescribe:

- the criteria and requirements for all smart meters and related equipment, systems and technology,
- the principles for related procurement activities and
- the principles and process for cost recovery.

In line with the legislative and regulatory requirements, Hydro One has begun full implementation of its smart metering program, including smart meter deployment, communication network development, and updating the customer information system (CIS) and associated processes to enable it to support TOU and Regulated Price Plan (RPP) implementation. These activities will require on-going investments in 2008 and beyond, as identified in Exhibits C1, Tab 2, Schedule 2 and D1, Tab 3, Schedule 2.

Hydro One's smart metering costs for 2005 through 2007 are included in a deferral account that is being requested in Exhibit F1, Tab 1, Schedule 1.

6.0 CONSERVATION AND DEMAND MANAGEMENT

The CDM program which Hydro One developed to utilize its Market Adjusted Rate of Return (MARR) funding will be substantially complete by the deadline of September 30, 2007. However, on May 22, 2007, Hydro One obtained an extension through April 30, 2008 and will dedicate the additional time to the completion of its Low Income/Social Housing program and also to complete the work on its Distribution Loss Reduction program.

Hydro One has participated in all four of the OPA sponsored CDM initiatives: Summer Savings; Residential and Small Commercial Demand Response; Business Incentive Program; and the Great Refrigerator Roundup. Hydro One intends to continue participating in future OPA-administered CDM programs and will look for opportunities to expand those programs, as appropriate, including possibly extending relevant programs to Transmission customers. Hydro One is also actively involved in implementing in-house power cost monitoring devices and a "Double Returns" program, which was in place last Winter and will be adopted for Summer 2007. Initial feedback from these programs shows they were successful, and Hydro One will consider extending these programs into future year, as appropriate. Funding for these initiatives will be recovered through the OPA and is not included in revenue requirement requested in this Application.

7.0 BILL 198 – INTERNAL CONTROLS, DECEMBER 9, 2002

Bill 198 requires that the controls that oversee the processes and systems that impact how the company initiates, records, processes, and reports transactions in significant accounts must be documented and evaluated on an annual basis. The Ontario Securities Commission (OSC) responded to Bill 198 with new Multilateral Instruments (MI) that govern internal controls. These require the CEO and CFO of Hydro One Inc. (as a public debt issuer) to attest to the appropriateness and effectiveness of internal financial controls and financial disclosure processes for the Company's consolidated financial information.

By the end of 2006, Hydro One completed its project to ensure compliance with Bill 198 requirements. This entailed changes to processes and technologies to ensure appropriate documentation is in place for the first year of compliance (2007). In addition, a unit has been put in place to sustain the Bill 198 requirement on an on-going basis. The Company is currently completing its 2007 compliance process. Further details of Hydro One's work in this area are provided in Exhibit A, Tab 12, Schedule 1, with associated costs in Exhibit C1, Tab 2, Schedule 6.

8.0 DISTRIBUTION CONNECTED GENERATION

The Provincial Government's objective to achieve a cleaner supply mix, and OPA procurement programs in support of this, have and will substantially increase Hydro One Distribution work and investments related to new generation connecting to the distribution system. The Renewable Energy Standard Offer Program (RESOP), which was launched in November, 2006, has generated some 1,000 projects expressing interest in potential connection to Hydro One's system, and of these, the Company has had several hundred applications for full Connection Impact Assessments. The OPA has also recommended a Clean Energy Standard Offer Program (CESOP) for combined heat and power and other projects. This project will be launched in the Fall of 2007. Its impact on Hydro One Distribution is uncertain at this time.

Assessing the feasibility of connecting so many potential projects to the system, and particularly the cumulative impact of such projects, has proven to be a technical and administrative challenge. Further challenges are anticipated as projects move to the phase of requesting cost estimates and potentially signing agreements to connect. Hydro

One Distribution has undertaken a number of initiatives to deal with this as outlined in Exhibit D1, Tab 3, Schedule 3.

9.0 ACCESS TO INFORMATION (FIPPA) AND PERSONAL PRIVACY (PIPEDA)

On December 10th, 2003, Hydro One Inc. became subject to Ontario's Freedom of Information and Protection of Privacy (FIPPA) legislation. On January 1st, 2004, Hydro One Inc. also became subject to Canada's Protection of Individual Privacy and Electronic Documents Act (PIPEDA). And most recently, on November 1st, 2004, the Corporation also became subject to Ontario's Personal Health Information Protection Act.

These pieces of legislation require that the Corporation provide public access to business records, as well as appropriate access to (and protection of) personal information. The personal information of customers and, in specific circumstances, employees, is now subject to legislated standards of protection.

Funding for these on-going activities is included in Shared Services OM&A (see Exhibit C1, Tab 2, Schedule 6).

10.0 BILL 100 ELECTRICITY RESTRUCTURING ACT, 2004

Bill 100, the Electricity Restructuring Act, 2004, which was passed at the end of 2004, enabled changes to electricity market settlement and billing processes. These changes included the implementation of the Provincial Benefit for customers billed on spot market commodity price and the introduction of the RPP. Hydro One made changes to its billing and settlement systems in order to calculate, settle and bill the Provincial Benefit, and the RPP. This included adjusting the two-tiered pricing and consumption thresholds in May and November of each year, plus changes to settlements with the IESO due to differences between the spot price and the two-tiered regulated price. Costs for this initiative are included in the Customer Care OM&A expenditures for 2008 that are detailed in Exhibit C1, Tab 2, Schedule 5.

PLANNING PROCESS

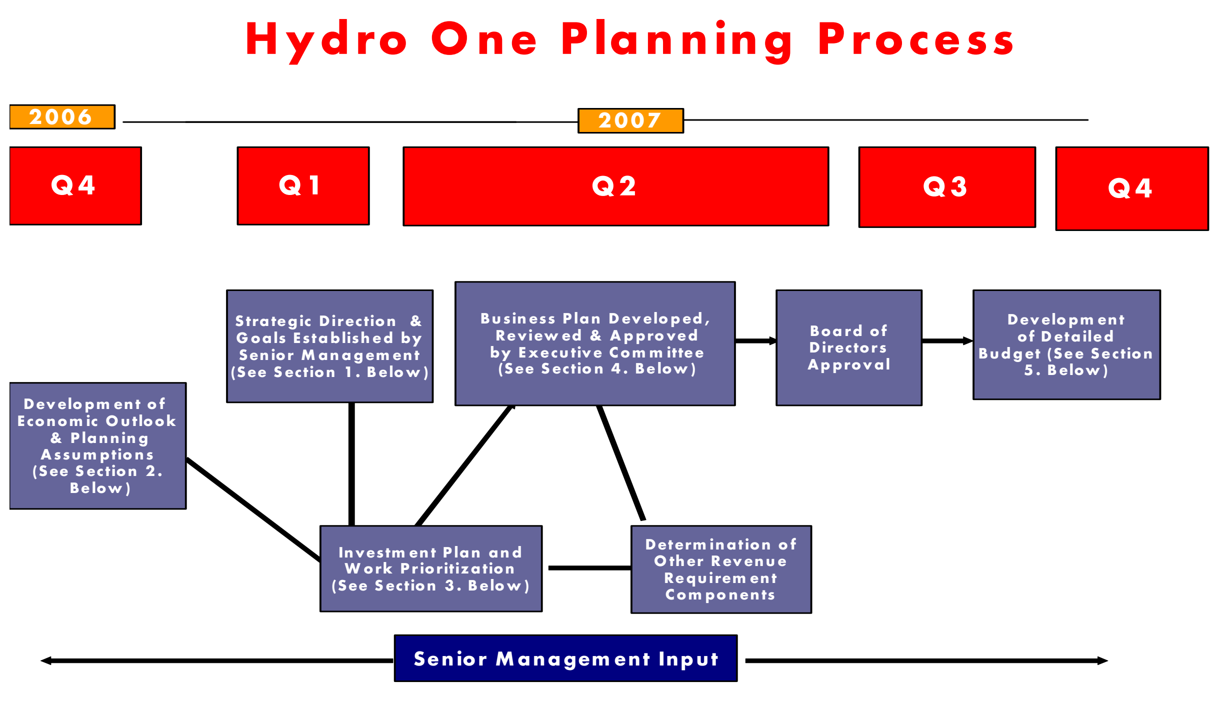
INTRODUCTION

Business planning is performed annually and focuses on the development of a five-year plan which comprises a detailed plan for the first three years in the planning cycle and a less detailed outlook for the remaining two year period. The planning cycle in 2007 pertained to the 2008-2012 period. The results as they apply to 2008 (the test year) form the basis for the rate submission.

The annual planning cycle consists of five phases:

1. Confirmation of corporate strategy;
2. Development of economic outlook and forecast assumptions;
3. Investment plan development;
4. Development of plans and work programs; and,
5. Refinement of plan into a detailed budget.

The following chart provides an overview of the planning process:



The key dates applicable to the 2008-2012 planning cycle include:

Date	Action
December 2006	Strategic goals confirmed
March 2007	Business plan instructions issued
May 2007	Investment Plan prioritized
June 2007	Lines of business submit business plans to Executive Committee
June 2007	Executive Committee holds business plan review meetings with lines of business vice presidents
August 2007	Hydro One Inc. Board approval of business plan
November 2007	Hydro One Inc. Board approval of detailed budget

1. Strategic Direction and Goals Established by Senior Management

Hydro One Distribution's strategic direction and goals are reviewed and confirmed by the CEO and other members of the senior management team. The strategic goals are included in the business planning instructions for reference by planners as the business plan is being developed. Please see Exhibit A, Tab 3, Schedule 1 for a description of the Company's strategic goals.

2. Development of Economic Outlook and Planning Assumptions

To facilitate the preparation of the business plan, an economic outlook and customer load forecast is developed and included with the planning instructions issued. This includes forecasts of key economic statistics, interest rates, labour escalation rates, income tax rates, cost allocation percentages, and cost rates for benefits. The assumptions used for the 2008 business plan are attached to this exhibit as Appendix A. A detailed discussion of the economic indicators is filed at Exhibit A, Tab 14, Schedule 2.

3. Investment Plan and Work Prioritization

As part of the investment planning phase, a work prioritization is completed to provide assurances as to the level of work accomplishments that should be undertaken to ensure an acceptable level of risk with respect to meeting the strategic goals. Customer needs (including anticipated load growth requiring new system capability), operational performance and asset conditions are examined to identify areas requiring investments. Investments are identified in advance and are included in a set of work or reference plans that are consistent with Hydro One Distribution's strategic goals and take into account customer, financial, operational, environmental, safety, regulatory and legal considerations. These result in an investment plan that is then submitted to Hydro One senior management for review and approval. The investment plan prepared during 2007 provides the basis for the 2008 forecast. Please see Exhibit A, Tab 14, Schedule 5 for a more detailed description of the work prioritization process.

4. Development of Plans and Work Programs

During the planning process, plans and work programs are further refined consistent with the economic and forecast assumptions. As part of this process, sufficient detail is provided to facilitate preparation of the 2008 Rate Application. At the end of this process, the Hydro One senior management team provides direction as necessary in order to balance the various factors under consideration including customer service levels, rate impacts and economic considerations.

The operations, maintenance and administration ("OM&A") budget and the capital budget that result from this planning process are discussed at Exhibit C1, Tab 2 and Exhibit D1, Tab 3 respectively. Refer to Exhibit A, Tab 14, Schedule 4 for an overview of the project and program approval process for Hydro One Distribution.

The financial plan is prepared, incorporating OM&A and capital work program levels consistent with the investment plan, as well as forecasts of revenue, cost of power, depreciation and amortization expense, financing charges, income tax, and working capital.

The resulting plan is reviewed by the Executive Committee of Hydro One Inc. As necessary, underlying assumptions are modified and the results finalized and presented for approval to the Hydro One Inc. Board of Directors.

5. Development of Detailed Budget

The final phase in the planning cycle is the budgeting phase, which focuses on fine-tuning of near-term, detailed information to facilitate plan implementation and monitoring of results for the year immediately following. During the budgeting phase, the cost impacts of any updated assumptions or work program requirements are examined and factored in as necessary.

APPENDIX A

2008 BUSINESS PLAN ASSUMPTIONS

1.0 ECONOMICS

	2008	2009	2010	2011	2012
CPI – Ontario (%)	1.9	2.2	2.2	2.0	2.0
Tx cost escalation for Construction (%)	1.0	1.0	1.3	2.0	2.8
Tx cost escalation for Operations & Maintenance (%)	1.5	0.6	0.4	1.2	1.6
Dx cost escalation for Construction (%)	1.9	1.4	1.5	2.2	2.4
Dx cost escalation for Operations & Maintenance (%)	0.9	-1.0	-0.6	1.1	1.6
Exchange Rate (CDN$/US$)	1.116	1.107	1.104	1.101	1.101

CPI-Ontario, and US cost escalators forecasts were based on the Global Insight November 2006 forecast. The exchange rate forecast was based upon the Global Insight October 2006 Long-Term Forecast and Analysis.

2.0 INTEREST RATES

	2008	2009	2010	2011	2012
HO1 5-Year Bond Rate (%)	4.77	5.17	5.27	5.27	5.37
HO1 10-Year Bond Rate (%)	5.01	5.41	5.51	5.51	5.61
HO1 30-Year Bond Rate (%)	5.37	5.77	5.87	5.87	5.97
90-Day Banker's Acceptance Rate (%)	4.49	4.60	4.62	4.62	4.62
Interest Capitalized Tx (%)	5.1	5.5	5.6	5.6	5.7
Interest Capitalized Dx (%)	5.1	5.5	5.6	5.6	5.7
Interest Capitalized Common (%)	5.1	5.5	5.6	5.6	5.7

H1 bond rates for 2008 were prepared based on the May 2007 Consensus Forecasts; the remaining years were based on the April 2007 Consensus Forecasts long term forecast. Hydro One credit spreads are based on an average of indicative new issue spreads for April 2007 from the dealers in Hydro One's medium term note syndicate.

The 90-Day Banker's Acceptance Rate for 2008 was prepared based on the Consensus Economics May 2007 forecast; the remaining years were based upon the Global Insight April 2007 Long-Term Forecast and Analysis.

Interest cap rates:
Forecast of Scotia Capital All-Corp Mid-Term Yield (from Treasury – May 31, 2007).

3.0 LABOUR ESCALATION

Specific details on annual labor escalation are provided below.

(a) Society Staff

1% performance (merit) pay in fiscal 2008. Assume +1% performance (merit) pay in each following year. Anticipate 3% economic increases effective April 1, 2008 and 3% each following year effective April 1st.

(b) PWU staff

Anticipate economic increases of 3% effective April 1, 2008. Assume 3% increases effective on April 1st of each subsequent year.

Step progressions - past experience (i.e. 2005) indicates that 9.9% of PWU receive progressions annually and that progressions result in a salary increase of 4.35% (note that trades progressions are higher than weekly salaried, and due to apprentice hiring over the past few years, the proportion of trades progressions has increased).

(c) MCP staff

4% annual increase per year in base pay for the entire period.

(d) Incentive Plan Payouts

All incentive plans have been discontinued, with the exception of the MCP Short Term Incentive Plan. Payout under that plan is assumed to be 20% in all years.

4.0 INCOME & CAPITAL TAX RATES

	2008	2009	2010	2011	2012
Federal Tax Rate	20.50%	20.00%	19.00%	19.00%	19.00%
Federal Surtax Rate	NIL	NIL	NIL	NIL	NIL
Provincial Rate	14.00%	14.00%	14.00%	14.00%	14.00%
Total Statutory Tax Rate	34.50%	34.00%	33.00%	33.00%	33.00%
Large Corporation Tax (LCT)	NIL	NIL	NIL	NIL	NIL
Capital Tax Rate	0.285%	0.225%	NIL	NIL	NIL

5.0 BENEFIT COSTS RATES (PAYROLL BURDEN)

Company	Category	2008	2009	2010	2011	2012
Networks	Non-Regular Staff % of total earnings*	5.6%	5.6%	5.6%	5.6%	5.7%
	Regular Staff % of total earnings* % of base pensionable earnings**	5.6% 37.2%	5.6% 37.0%	5.6% 36.8%	5.6% 36.7%	5.7% 36.5%
	Pension % of base pensionable earnings	29.8%	29.6%	29.4%	29.2%	29.0%

*CPP, Emp, Insurance, Emp. Health Tax, Workers' Compensation Schedule 1 Premiums
**Health, Dental, Life Insurance, Maternity, Retirement Bonus, Post-Retirement Health, dental, Life Insurance, OPRB (for Inergi where applicable)
Base Pensionable Earnings includes pensionable bonus.
Total Earnings includes base pay, bonus, overtime, taxable benefits and taxable allowances.

ECONOMIC INDICATORS

1.0 INTRODUCTION

Appendix A of Exhibit A, Tab 14, Schedule 1 provides the costing assumptions underlying the 2008 Business Plans. This exhibit provides additional background with respect to these assumptions.

2.0 ECONOMIC INDICATORS

2.1 Distribution Cost Escalation for Construction, Operations and Maintenance

The Distribution Cost Escalation for Construction, Operations & Maintenance provides a broad average measure of the industry-wide yearly price changes by tracking a representative basket of equipment and labour for these areas of business. This basket of goods is comprised of the following types of equipment and labour:

- Operation;
- Supervision and Engineering;
- Load Dispatching;
- Station Expenses;
- Lines;
- Meters;
- Customer Installations;
- Maintenance;
- Structures;
- Station Equipment;
- Overhead Lines;
- Underground Lines;

- Line Transformers; and
- Miscellaneous.

The data in Table 1 was provided by Global Insight, Power Planner, Third-Quarter 2006.

Table 1

	Historic			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Distribution Cost Escalation for Construction (%)	5.8	8.0	7.9	3.7	1.9
Distribution Cost Escalation for Operations & Maintenance (%)	5.0	5.9	6.5	3.5	0.9

The Distribution Cost Escalation for Construction, Operations & Maintenance is used as a planning tool to predict expenditure level changes for distribution materials and services.

2.2 Consumer Price Index

The Consumer Price Index (CPI) provides a broad measure of the cost of living. Through the monthly CPI, Statistics Canada tracks the change in retail price of a representative shopping basket of about 600 goods and services from an average household's expenditure: food, housing, transportation, furniture, clothing, and recreation.

Hydro One Distribution operates wholly in the Province of Ontario, Canada. As a result, the CPI–Ontario exhibits the inflationary environment in which Hydro One Distribution operates. The CPI forecast is from Global Insight's November 2006 forecast and can be found in Table 2.

Table 2

	Historic			Bridge	Test
	2004	2005	2006	2007	2008
CPI – Ontario (%)	1.9	2.2	1.8	1.5	1.9

The CPI is used as a planning tool to forecast expenditure level changes for items such as fleet and sundry costs.

2.3 Exchange Rate (CDN$/US$)

Table 3 provides the 2004, 2005 and 2006 average exchange rates based on actual daily closing rates. The exchange rate forecast for 2007 and 2008 is based on the Global Insight October 2006 Long-Term Forecast and Analysis.

Table 3

	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Exchange Rate (CDN$/US$)	1.301	1.212	1.134	1.135	1.116

While the exchange rate forecast is not directly used to forecast costs or other variables, it is an important variable affecting the performance of the Canadian and Ontario economies.

3.0 INTEREST RATES

Interest rate forecasts are used to determine the cost of capital for Hydro One Distribution as described in Exhibit B1, Tab 1, Schedule 1.

3.1 Long-Term Debt Rates

Table 4 contains Hydro One Inc.'s historical and forecast long-term interest rates. For 2004, 2005 and 2006 each rate is derived by adding the average actual daily closing Government of Canada bond yield for the applicable term (i.e. 5 year, 10 year or 30 year) to the corresponding Hydro One Inc. average actual credit spread.

Table 4

	Historic			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
5-Year					
Government of Canada %	3.81	3.58	4.10	4.13	4.43
Hydro One Credit Spread %	0.33	0.31	0.33	0.34	0.34
Hydro One Bond Interest Rate %	4.15	3.89	4.43	4.47	4.77
10-Year					
Government of Canada %	4.58	4.07	4.21	4.20	4.50
Hydro One Credit Spread %	0.54	0.50	0.51	0.51	0.51
Hydro One Bond Interest Rate %	5.12	4.57	4.72	4.71	5.01
30-Year					
Government of Canada %	5.13	4.43	4.27	4.25	4.55
Hydro One Credit Spread %	0.84	0.81	0.83	0.82	0.82
Hydro One Bond Interest Rate %	5.98	5.24	5.10	5.07	5.37

For 2007 and 2008, each rate is derived by adding the forecast Government of Canada bond yield to the corresponding Hydro One Inc. credit spread. The 10-year Government of Canada bond yield forecast for 2007 and 2008 is based on the May 2007 Consensus Forecasts. Other rates and spreads are determined as described below.

The 5 and 30-year Government of Canada bond yield forecasts are derived by adding the April 2007 average spreads (5-year to 10-year for the 5 year forecast and 30-year to 10-year for the 30-year forecast) to the 10-year Government of Canada bond yield forecast. This derivation is consistent with the Board's methodology in establishing the forecast for the 30-year Government of Canada yield, as employed in the formula based return on common equity approach for regulated utilities. Consistent with this methodology, Hydro One's credit spreads over the Government of Canada bonds are based on the average of indicative new issue spreads for April 2007 obtained from our Medium Term Note program dealer group for each planned issuance term.

3.2 Deemed Long-Term Debt Rate

The deemed long-term debt rate is calculated as the Long Canada Bond Forecast plus the average spread on "A/BBB" rated corporate bonds as per the *Report of the Board on Cost of Capital and 2nd Generation Incentive Regulation for Ontario's Electricity Distributors*, December 20, 2006 (Cost of Capital Report). The forecast for 2007 and 2008 is shown in Table 5 below. The 30-year Government of Canada forecast is obtained from Table 4 above and is added to the April 2007 average spread between 30-year Government of Canada bonds and the Long-Term Average Weighted Bond Yield (Scotia Capital Inc.) – All Corporates from the Bank of Canada.

Table 5

	Bridge 2007	**Test 2008**
30-year Government of Canada %	4.25	4.55
All Corporates Long-Term Bond Spread %	1.14	1.14
Deemed Long-Term Debt Rate %	5.39	5.69

3.3 Deemed Short-Term Debt Rate

The deemed short-term debt rate is the average of the 3-month bankers' acceptance (BA) rate plus a fixed spread of 25 basis points, as per the Cost of Capital Report.

The 3-month BA rates shown for 2004, 2005 and 2006 in Table 6 below are the average of the actual daily closing rates for each respective year. The forecast for 2007 and 2008 is based on the May 2007 Consensus Forecasts of the Government of Canada 3-month treasury bills, adjusted by the April 2007 average spread between 3-month BAs and 3-month treasury bills.

Table 6

	Historic			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
3-month BA Rate %	2.30	2.81	4.16	4.39	4.49

3.4 Allowance for Funds Used During Construction

For construction work in progress (CWIP), Hydro One Distribution capitalizes interest at the Scotia Capital Inc. All Corporate Mid-Term Average Weighted Bond Yield as per the methodology approved by the Board in its letter dated November 28, 2006 in proceeding EB-2006-0117.

For 2007 and 2008, this is calculated in Table 7 as the 10-year Government of Canada forecast from the above table plus the April 2007 average spread between the 10-year Government of Canada bond yield and the Scotia Capital Inc. Mid-Term Average Weighted Bond Yield (Scotia Capital Inc.) – All Corporates from the Bank of Canada.

Table 7

	Bridge	**Test**
	2007	**2008**
10-year Government of Canada %	4.20	4.50
All Corporates Mid-Term Bond Spread%	0.60	0.60
All Corporates Mid-Term Yield%	4.80	5.10

4.0 INCOME AND CAPITAL TAX RATES

The historical and forecast tax rates are presented in Table 8. Please refer to Exhibit C2, Tab 6, Schedule 1, for the calculation of Hydro One Distribution's income taxes and Exhibit C2, Tab 4, Schedule 1, for forecast year capital taxes.

Table 8

	Historic			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Federal Tax Rate (%)	21.00	21.00	21.00	21.00	20.50
Federal Surtax Rate (%)	1.12	1.12	1.12	1.12	n/a
Provincial Rate (%)	14.00	14.00	14.00	14.00	14.00
Total Statutory Tax Rate (%)	**36.12**	**36.12**	**36.12**	**36.12**	**34.50**
Large Corporation Tax Rate (%)	0.200	0.175	n/a	n/a	n/a
Capital Tax Rate (%)	0.300	0.300	0.300	0.285	0.285

5.0 LABOUR ESCALATION RATES

Appendix A of Exhibit A, Tab 14, Schedule 1 provides the labour rate escalation assumptions for Hydro One Distribution's three compensation categories: the Society of Energy Professionals ("Society"), the Power Workers Union ("PWU") and Management Compensation Plan ("MCP") staff.

For Management Compensation employees, escalation factors were provided by Hydro One Distribution senior management. Details regarding management compensation are provided in Exhibit C1, Tab 3, Schedule 2.

Escalation factors for PWU and Society staff reflect the current collective agreements, which both were effective April 1, 2005. (There is a new Society Agreement in place which is consistent with the 2008 escalation factors presented in Exhibit A, Tab 14, Schedule 1, Appendix A.)

6.0 COST RATES FOR BENEFITS

Appendix A of Exhibit A, Tab 14, Schedule 1 provides the benefit cost rates or payroll burden assumptions incorporated in the 2008 Business Plan. These rates are applied to the forecast labour rates.

The "burden rate," expressed as a percentage, estimates employee current and future cost rates for benefits which are attributable to labour in the current period, and allocates such costs across Hydro One legal entities. The benefit costs include:

(a) Other post-retirement benefits (OPRB), such as future health and dental costs;
(b) Other post-employment benefits (OPEB), such as long-term disability;
(c) Supplementary pension plan (SPP);
(d) Pension (funding) contributions;
(e) Employee benefit costs during active employment; and
(f) Statutory benefit payments, such as CPP, EI, etc.

Cost items (a) through (d) are actuarially determined by Hydro One Inc.'s external actuaries, Mercer Consulting Inc., using assumptions recommended by the actuaries and accepted by Hydro One Inc.’s management. Assumptions are determined with reference to past experience and industry norms.

Cost item (e) is based on estimates from Mercer, and from Hydro One Inc.'s insurance provider Great West Life, as to anticipated escalation factors of health and dental costs. These estimates are compared to past experience.

Cost item (f) is based on government schedules of premium rates for CPP, EI, etc.

DISTRIBUTION BUSINESS LOAD FORECAST AND METHODOLOGY

1.0 INTRODUCTION

This exhibit discusses Hydro One Distribution's system load forecast and methodology. It provides information on a distribution total basis that assists Hydro One Distribution in forecasting the work programs that need to be undertaken by Hydro One Distribution to meet customers' growing electricity demands, and to accommodate new customer connections.

Hydro One Distribution uses a number of methods, such as econometric models, end-use models, and customer forecast surveys to produce the forecasts required for its distribution business. Similar methods are used by major utilities throughout North America.

All forecasts presented in this section are weather-normal, i.e. abnormal weather effects are removed from the base year for load forecasting purposes so that the forecast assumes typical weather conditions based on the average of the last 31 years. The weather correction methodology used by Hydro One Distribution is a proven technique that has performed well in past years. The same methodology was reviewed and approved by the Board in the Distribution Cost Allocation Review (EB-2005-0317) and for Hydro One's 2006 Distribution Rate case (RP-2005-0020/EB-2005-0378).

All forecasts produced are internally consistent. This means that the forecasts for all customer groups add up to the total for the entire customer base served by Hydro One Distribution distribution system. Also, the forecasts presented in this exhibit are consistent with the economic assumptions which are used in the business planning process and that are described in Exhibit A, Tab 14 Schedule 2.

Hydro One Distribution’s load forecast staff has significant experience in preparing provincial and local electricity demand forecasts and load profiles. The methodology described in this exhibit is similar to Hydro One’s 2006 Distribution Rate case (RP-2005-0020/EB-2005-0378). The performance of Hydro One Distribution’s system load forecast, since Hydro One Distribution’s separation from the former Ontario Hydro, has been fairly consistent as shown in Table 1 below.

Table 1

Comparison of Hydro One Distribution Forecast with Actual
(Variance of forecast expressed as percent of actual on weather corrected basis)

Forecast made for Plan Year	Variance for Plan Year	Variance for 2nd Year	Variance for 3rd Year
1997	0.12	-2.03	1.91
1998	-2.03	-3.39	-2.02
1999	-0.85	0.73	-0.15
2000	0.46	-0.03	0.76
2001	-1.80	-1.56	-2.44
2002	1.98	2.39	2.12
2003	-0.82	-1.37	-0.74
2004	0.14	0.62	0.76
2005	0.25	0.12	n/a
2006	-0.06	n/a	n/a
Mean (1997-2001)	-0.82	-1.26	-0.96
One standard deviation (+/-)	1.13	2.57	3.00
Mean (2002-2006)	0.30	0.04	0.09
One standard deviation (+/-)	1.04	2.38	2.74

Note: The forecast performance pertains to Hydro One Retail purchases, which account for about 96 percent of the revenue requirements in the Distribution Rate case. The remaining 4 percent pertains to revenue attributed to load distributed through the system for about 80 embedded Direct and embedded LDC customers.

Over the 2001-2002 period, Hydro One Distribution has acquired some 164,000 customers as part of its acquisition program of embedded LDCs. Therefore for the period leading up to 2002 the comparison of performance reflects a smaller customer base.

Between 1997-2001, the average variance of customers' energy purchase forecast compared to the weather corrected actual energy consumed is within one standard deviation of the forecast, despite large variances resulting from unusual events such as Ice Storm in 1998 and September 11 in 2001. One standard deviation means there is one in three chances that the actual will be outside the plus or minus range (alternatively, there is two in three chances that the actual will fall within the plus or minus range). The performance of the forecast in subsequent years, namely 2002 to 2006, shows that the forecast is tracking very well and certainly well within one standard deviation band for the corresponding energy purchases. The use of the one standard deviation as a measure of forecasting accuracy is an accepted standard in the utility industry.

Section 2 below provides more detailed discussion in respect of the various economic considerations that Hydro One Distribution staff take into consideration when applying the methodology for deriving the load forecasts.

Hydro One Distribution's forecasting methodology comprises a combination of elements that include consensus input, mechanical adjustments to models commonly used in the forecasting business to include changes in economic forecasts, energy prices, population and household trends, industrial development and production, residential and commercial building activities, and efficiency improvement standards. Economic inputs were based on analyses prepared by major economic establishments in the country such as Global Insight, Conference Board of Canada, Centre for Spatial Economics, University of Toronto, Canada Mortgage and Housing Corporation, Clayton Research; efficiency standard assumptions used in the end-use models were based on discussion with Ontario

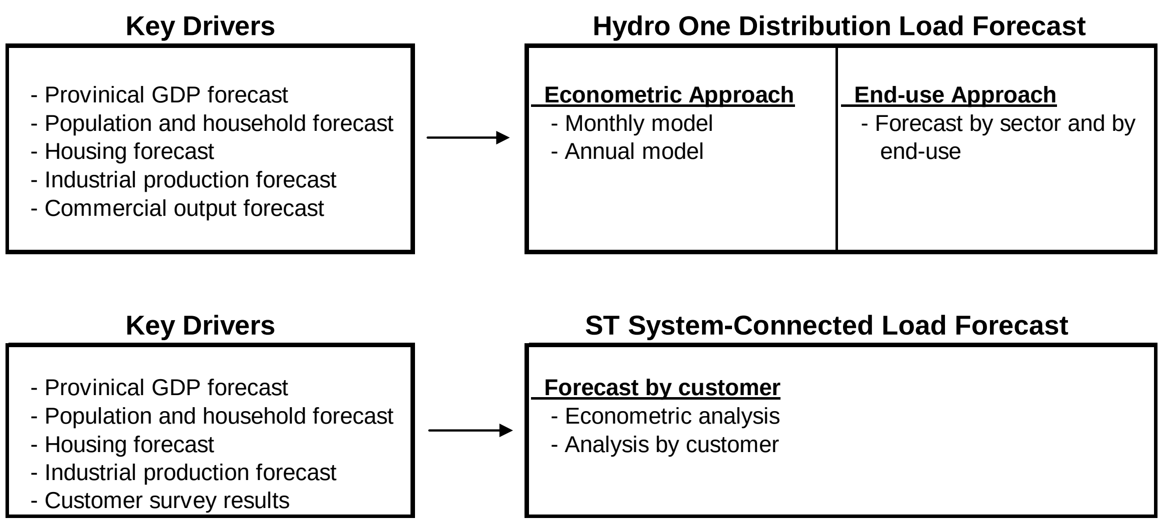
Ministry of Energy staff; specific customer development was based on forecast survey results from major customers. Information provided from these entities is consistent with the economic assumptions used in business planning as described in Exhibit A, Tab 14 Schedule 2. Also, inputs from these entities form the economic database (referred to henceforth as economic forecast) that is used to establish Hydro One Distribution load forecast. Section 3 below provides a detailed description of the methodology used by Hydro One to develop its load forecasts. Detailed modeling equations and definitions are presented in the Appendices.

When applying Hydro One Distribution's forecasting methodology to derive the 2008 requirements, Hydro One Distribution is expected to deliver 40,666 GWh of electricity to some 1,170,000 distribution customers. This represents an increase of 0.14 percent over the 2006 demand forecast and an increase of 1.7 percent over the 2006 customer count. Section 4 below provides more detailed discussion in respect of the comparison of the 2008 forecast in relation to the historic (2006) and bridge (2007) years. Hydro One Distribution's load forecast has incorporated the Board's latest decision for Hydro One Transmission Rate case (EB-2006-0501) to include 350 MW of natural conservation in the provincial CDM target of 1350 MW for 2007. The load forecast in 2008 also accounts for 251 MW of CDM program impacts assumed in the OPA's IPSP that was filed with the Board on August 29, 2007.

2.0 DISCUSSION OF THE ECONOMIC CONSIDERATIONS THAT INFLUENCE HYDRO ONE DISTRIBUTION'S LOAD FORECASTS

In this section we discuss some of the key economic considerations that must be taken into account in the process of developing load forecasts and in the application of forecasting methodologies. The elements of the forecasting process used by Hydro One Distribution are for the most part based on the knowledge of how the major economic drivers that affect the usage of electricity demand are likely to pan out over the forecast period, which in this case is for the year 2008. Consequently for the purpose of this application the focus is on the short term and the load forecast will reflect those impacts that are likely to have a major effect in this respect. The major economic drivers used in the analysis are summarized in Figure 1 below.

Figure 1
Hydro One Distribution Load Forecast Methodology



Key information used in the analysis includes the Ontario GDP, provincial demographic, industrial production and commercial output forecasts and regional analysis included in the economic forecast. Also taken into consideration are Hydro One Distribution CDM plans, which have a direct impact on distribution system energy demands.

The load forecast in support of this application was prepared and released in April 2007 using economic information and forecasts that were available in early 2007. The timing of the load forecast is driven by the needs of the business planning process which in turn are geared to match the timeline for this submission.

2.1 Provincial GDP Forecast

The provincial GDP forecast is a key driver for the load forecast. During the 1990s, the Ontario economy grew faster than the national economy. During the economic slowdown in 2003 and 2004, the Ontario GDP lagged behind the Canadian GDP because of the SARS outbreak and the Blackout in 2003 and rising Canadian dollars in both years for which the provincial manufacturing sector was the hardest hit. Industries that were negatively affected in recent years include the pulp and paper, chemical and auto-related industries. The provincial economy grew 2.8 percent in 2005 but slowed to 1.3 percent of output growth in 2006 due primarily to the high Canadian dollar and slow US economic growth. Based on the consensus forecast, the Ontario GDP is expected to grow 1.7 percent in 2007 and 2.9 percent in 2008. Because of the strong Canadian dollar, Ontario will continue to lag behind the national growth rates.

2.2 Provincial Population Forecast

Ontario population grew 1.7 percent in 2002, 1.1 percent in each of 2003, 2004 and 2005, and 1.0 percent in 2006. Population growth for the province is forecast to continue to outperform the nation in the forecast period. The economic forecast indicated that Ontario population is expected to grow at 1.2 percent in 2007 and 2008. Steady population growth contributes positively to the load forecast.

2.3 Provincial Housing Forecast

Helped by relatively low interest rates, demand for housing remained very strong in the last few years. Housing starts statistics showed growth of 84,000 houses in 2002, 86,000 houses in 2003, 84,000 houses in 2004, 78,000 in 2005, and 74,000 in 2006. Demand for housing is expected to slow in the next 2 years as interest rates continue rising. The consensus forecast indicated that housing starts will slow to about 67,000 units in 2007 and 68,000 units in 2008. This represents about 17 percent decline in housing starts relative to the 2002-2006 period.

2.4 Commercial Output Forecast

With the help of low interest rates, commercial activities remained strong in Ontario in the last five years, averaging about 3 percent a year. With rising Canadian dollar, commercial output growth is expected to soften from 3.3 percent growth achieved in 2006 to 2.3 percent in 2007 and 2.9 percent in 2008. Industries expected to enjoy above-average growth include wholesale and retail trade, financial services and health care services, while tourism-related industries such as accommodations and food services will continue to face some challenging times. Commercial output is important to the load forecast because commercial load comprises about 25 percent of the Hydro One Distribution System.

2.5 Industrial Production Forecast

After a decline of 1.5 percent in 2006, the manufacturing sector in Ontario is forecast to decline further by 0.4 percent in 2007 due primarily to the impact of higher Canadian dollar. Since early 2003, the Canadian dollar has appreciated by about 40 percent relative to the U.S. dollar. Industries that were hardest hit in the past few years include fabricated metals, paper and printing, chemicals, primary metals, machinery and wood. The economic forecast expects industrial production to grow by about 3.0 percent in 2008. The industrial production forecast is important to the load forecast because industrial activity comprised about 10 percent of total load and also because it is prone to economic cycles.

2.6 Conservation and Demand Management

Hydro One Distribution supports the Ontario Government's conservation and demand management (CDM) target to achieve a 1,350 MW of peak reduction by 2007 and a further reduction of 1,350 MW by 2010. Hydro One Distribution used the Board approved 3rd tranche funding of $39.5 million to cover its CDM programs for the 2004-2007 period. After the 3rd tranche funding, Hydro One will rely on the CDM funding from OPA to fund its CDM initiatives in 2008 and beyond.

Table 2 summarizes the cumulative CDM impact since 2004 assumed in Hydro One's distribution system load forecast for 2006, 2007 and 2008. The CDM impact includes programs undertaken by Hydro One Networks and programs implemented by other agencies such as federal and provincial governments, OPA and IESO. Hydro One Distribution's 2007 CDM impact is the same as the 2007 CDM impact approved by the Board for Hydro One's Transmission Rate case (EB-2006-0501) issued on August 16, 2007. A 350 MW reduction to the 2007 provincial CDM target of 1350 MW was made to account for the impact of natural conservation. The 2008 CDM impact is consistent with the OPA's IPSP filed with the Board on August 29, 2007.

Table 2

CDM Impact on Hydro One Distribution Load
(GWh)

Year	Hydro One Retail	Embedded Direct and LDC Customers	Total
2006	194	151	345
2007	311	242	554
2008	437	333	770

CDM programs that have been undertaken in the past two years or are in the process of being initiated include the following initiatives:

- improved building codes for new housing and more stringent efficiency standards for appliances;
- conservation programs to encourage more efficient use of lighting and appliances;
- demand response programs to reduce air conditioning and water heating load in the summer months;
- use of smart metering and TOU rates to encourage consumers to shift consumption patterns to off-peak period; and
- programs to increase supply or reduce demand such as fuel switching, using back-up generation or requesting large industrial customers to reduce consumption on a temporary basis.

The 2006 annual report filed by Hydro One Distribution on CDM (RP-2004-0203/EB-2005-0198) includes detailed program impacts on a bottom-up basis.

Hydro One Distribution does not currently have the data required to do a bottom-up analysis of the CDM impact on Hydro One's load forecast from the various CDM programs driven by various sources such as the Ontario Power Authority, Provincial Government and Federal Government.

2.7 Customer Forecast

In 2007 Hydro One Distribution is expected to serve about 1.17 million customers through its distribution system. Detailed customer information is retained in the Customer Settlement System (CSS) for billing and account management. Customer data are extracted from CSS regularly for tracking, analysis and reporting. Customer forecast was developed on an as-required basis to support the annual business planning process, system development plans and rate submissions to the Board. Active customer accounts and service points are used as the basis from which to prepare the customer forecast by rate class. The customer forecast takes into consideration the new customers requiring distribution services, existing customers moving out, provincial housing demand, population and household forecasts, vacancy rates and specific growth patterns of various customer groups.

Approximately nine to ten thousand customers are added to Hydro One Distribution's customer base on an annual basis. Customer growth in 2007 and 2008 is expected to be approximately 11,000 and 9,400 respectively (2007 customer growth includes an addition of 1,100 customers from Terrace Bay). This compares to an average of about 12,000 customers that were added per year in the period 2002-2006. The lower figure for 2008 is attributed to a reduction in housing starts.

3.0 LOAD FORECASTING METHODOLOGY

Hydro One Distribution system's load forecast is developed using both econometric and end-use approaches. The forecast base-year is corrected for abnormal weather conditions and the forecast growth rates are applied to the normalized base-year value. Thus the forecast is weather-normal in the sense that it predicts the future load under normal weather conditions.

3.1 Weather Correction Analysis

This section discusses the weather correction methodology used by Hydro One Distribution. Weather correction analysis removes the abnormal or extreme weather effects from the load data to yield average conditions that reflect the more normal or expected weather that is used in the forecast. It is essential that abnormal and extreme weather related impacts are removed before establishing the base-case load data, on which basis the load forecast will be developed. The volatility of abnormal or extreme weather conditions would likely adversely impact on the ability to provide a consistent and meaningful forecast for load growth. Hourly load data and hourly weather data of various weather stations across the province are used in the analysis.

Hydro One Distribution's weather correction methodology was developed jointly by forecasting and meteorology staff of the former Ontario Hydro. This weather correction method was used to forecast the total system load since 1988 and for forecasting local electric utility load since 1994. The weather correction methodology used by Hydro One Distribution is a proven technique that has performed well in the past years. The same methodology was reviewed and approved by the Board in the Distribution Cost Allocation Review (EB-2005-0378) and for Hydro One's 2006 Distribution Rate case (RP-2005-0020/EB-2005-0378).

Weather correction is a statistical process designed to remove the impact of abnormal or extreme weather conditions from historical load data. Normal weather data is defined to be data that is based on the average weather conditions experienced over the last 31 years. A weather-normal load forecast is a forecast of load assuming normal weather conditions with a weather-corrected base year. As shown in Table 3, using a fewer number of years for historic weather normalization has only a small impact on the total weather corrected energy consumption. This is an expected outcome since weather normalization has a more significant impact on peak than it does on energy due to the fact that energy consumption is less sensitive to short-term weather conditions.

Table 3

Comparison of Different Time Periods Used for Weather Normalization (in GWh)

Number of Years Used to Calculate Normal Weather	Actual Load for Hydro One Retail Customers in 2006	Weather Correction Required for Hydro One Retail Customers in 2006	Weather Corrected Load for Hydro One Retail Customers in 2006
Last 31 Years *	22485	437	22921
Last 20 Years	22485	367	22852
Last 10 Years	22485	308	22792
Last 5 Years	22485	404	22889

* Used by Hydro One Distribution to normalize the base year (2006) load.

Hydro One Distribution's weather correction methodology uses four years of daily load and weather data to establish a sound statistical relationship between weather and load at the applicable transformer station or delivery point used to supply customer demand. Weather variables used in the analysis include temperature, wind speed, cloud cover and humidity. The estimated weather effects are then aggregated up to the required time interval. Past experience shows that weather correction should best be done on a daily basis, rather than weekly, monthly or annual basis.

Daily weather-correction is preferred because the timing of extreme temperatures combined with wind speed and humidity can have a substantial impact on load that would otherwise not be captured by averages over longer period of time. In particular, when abnormal weather conditions continue for several days, the cumulative impact is much greater than would be the case if the same weather conditions prevailed over a much longer period of time.

The loads that are most impacted by changes in weather conditions are electric space heating and cooling in residential and commercial buildings. Across Ontario, the penetration rate of such loads varies widely, which means the weather sensitivity of load supplied from one transformer station or delivery point may differ quite significantly from that of load supplied from another transformer station or delivery point, even in the same climate zone. The climate in Ontario varies considerably from the Niagara Peninsula to Thunder Bay, so it is important to use data from the appropriate weather stations that are in close proximity to the transformer station or the customer delivery point when correcting for weather effects.

3.2 Hydro One Distribution Forecasting Methodology

Both econometric (top-down) and end-use (bottom-up) models are used to prepare load forecast for Hydro One Distribution. Both monthly and annual econometric models are used to forecast Hydro One Distribution's total distribution system load. End-use models using the results from the provincial end-use models are used to analyse the distribution system load by customer rate class (i.e. various residential and general service customers). Key information used in the analysis includes economic, demographic, industrial production and commercial output forecast provided in the economic forecast. The purpose of using both the econometric and end-use forecast models is to arrive at a balanced forecast that represents a consistent set when looked at from macro (econometric) and micro (end-use) perspectives.

Monthly Econometric Model

The monthly econometric model uses a multivariate time series approach to develop the monthly forecast for the Distribution system load. The model links monthly energy consumption to Ontario GDP and residential building permits. Appendix 1 provides the detailed regression equations and definitions.

Annual Econometric Model

The annual econometric model uses personal disposable income per household, relative energy price and cooling and heating degree-days to prepare the forecast. Appendix 2 provides the detailed regression equations and definitions.

End-Use Model

The end-use models cover the residential (year round and seasonal), commercial, industrial and agricultural sectors. Detailed equations of the end-use models are provided in Appendix 3.

The above models are used to prepare forecast for all existing and proposed rate classes:

Existing Rate Classes

Year Round Residential Customers

- Residential continuous use, high density (R1);
- Residential continuous use, normal density (R2);
- Residential continuous use, urban density (UR);
- Residential customer from acquired LDC's (Res);

Seasonal Residential Customers

- Residential seasonal use, high density (R3);
- Residential seasonal use, normal density (R4);

Agricultural Customers

- Farm customers
    - Farm service, continuous use, normal density, single phase (F1);
    - Farm service, continuous use, normal density, three phase (F3);
- General service and sub-transmission customers

General Service Industrial and Commercial Sectors

- General distribution supply, single phase (G1);
- General distribution supply, urban, (UG);
- General distribution supply, three phase (G3);
- General sub-transmission supply (T);
- General service customers from acquired LDC's (GS)
- Large general service customers from acquired LDC's (MLGS);
- Streetlight.

Proposed Rate Classes

- Urban residential
- Residential, high density
- Residential, normal density
- Seasonal
- General service, energy-billed
- General service, demand-billed
- Urban general service, energy-billed
- Urban general service, demand-billed
- Sub-transmission
- Street lighting
- Sentinel lighting
- Distributed generation

3.3 Methodology for Low Voltage System-Connected Customers

This section discusses the load forecasting methodology used for the analysis of Low Voltage (LV) system connected customers. These are the embedded customers who are directly connected to Hydro One's sub-transmission (ST) system or have a delivery point embedded in Hydro One's distribution service territory and include distribution utilities, industrial and commercial customers. Both econometric and customer analysis based on survey results from the customers, when available, are used in the forecast. This is supplemented by the economic data provided in the economic forecast.

In 2007, Hydro One Distribution conducted a customer load forecast survey with the embedded distribution utilities and embedded industrial customers with more than 5 MW of loads. In addition to questions relating to the total load of the customer, information at each of the delivery point was also collected. The customer survey results are used in preparing the customer forecast.

For embedded distribution utility customers, econometric analysis is used to prepare the load forecast as a group. For industrial customers, several information sources are used to prepare the forecast. These include:

- historical load profile of the customer,
- knowledge of the customer through industry monitoring,
- forecast provided by customer through the survey,
- company information through Hydro One Distribution account executives, industry and company forecasts from industry associations and government agencies, and
- production and industry forecasts provided in the economic forecast.

The econometric approach was used to forecast the load for embedded utilities and industrial analysis was used to forecast the load for the embedded industrial customers. In both cases, results from customer survey, when available, were taken into account in developing the forecast.

3.4 Methodology for Hourly Load Profiles

This section discusses the methodology for generating the hourly load profiles by customer class and for specific customer delivery points.

Hourly Load Shape by Customer Class

Hydro One Load Research team was the project lead undertaking joint load research work on behalf of the Ontario Load Data Research Group consisting of about 45 LDCs in the province. The load research methodology to collect new hourly load data for developing the generic load shapes by customer rate class was examined in detail by the Distribution Cost Allocation Working Group and was approved by the Board in RP-2003-0228 and EB-2005-0317.

The province-wide generic load shapes was prepared by the Hydro One Load Research team under the guidance of Professor Dean Mountain of McMaster University. Hydro One Load Research team subsequently used the generic load shapes to generate utility-specific load profiles for about 80 LDCs in Ontario, including Hydro One Distribution, for their cost allocation review filings under proceeding EB-2005-0317. Appendix 4 summarizes the methodology used by Hydro One Load Research team to weather-normalize the total utility load and for each rate class. Appendix 5 summarizes the methodology used to prepare the utility-specific load shapes using the generic load shapes. Hydro One Distribution used the above methodology to prepare hourly load shapes for all rate classes.

Hourly Load Shape by Customer Delivery Point

Electricity Power Research Institute (EPRI)'s Hourly Electric Load Model (HELM) is used to normalize the hourly load for each of the customer delivery points, taking out abnormal weather effects and load patterns. The customer forecast is used to drive the customer delivery point forecast. Key information used in the analysis includes hourly load and weather data.

The most updated customer totalization table is used to retrieve hourly electricity demand data for each of the customer delivery points connected to the ST system. The totalization table reflects the latest records from Hydro One Networks. For each customer delivery point, at least one full year of hourly data is retrieved and checked for data quality. Hourly weather data is also retrieved to prepare weather sensitivity analysis. Weather data analyzed include temperature, wind speed, cloud cover and humidity. Data for five weather stations across Ontario are used in the analysis. They include Toronto, Windsor, Ottawa, North Bay and Thunder Bay. Each delivery point is linked to the closest weather station.

In preparing the database for the load shape analysis, missing values are estimated by load on a similar day and hour during the same month. For weather-sensitive load, weather conditions are also taken into account in estimating the missing values. To perform the latter task, an hourly regression model (relating load to weather conditions) for each delivery point with missing values is developed.

EPRI's HELM is used to prepare the hourly weather response analysis by each delivery point. The model takes into account differences in load depending upon time of use (that is weekdays, weekends and holidays) and weather conditions. Load of industrial customers is assumed to be insensitive to weather and as such are forecast in relation to load on a similar day and hour during the historical period.

4.0 2008 LOAD FORECAST

Hydro One Distribution' distribution system is forecast to deliver in total 40, 666 GWh in 2008 on a weather-normal basis. Table 4 presents the load forecast before and after deducting the impact of CDM.

Before deducting the impact of CDM, Hydro One Distribution's load forecast is forecast to grow from 40, 955 GWh in 2006 to 41,046 GWh in 2007 and to 41,436 GWh in 2008 on a weather-normal basis. The forecast reflects slow economic growth in 2007 and particularly weak performance from the industrial customers and overall stronger economic growth in 2008.

In 2008, Hydro One Distribution is expected to serve about 1,170,000 customers. This reflects about 1.7 percent growth in the number of customers compared to 2006.

After removing the impact of CDM, Hydro One Distribution's load is forecast to decrease from 40, 609 GWh in 2006 to 40,493 GWh in 2007 and increase to 40,666 GWh in 2008 on a weather-normal basis.

Table 4

Hydro One Distribution Load Forecast Before and After CDM Impact (GWh)

Year	Retail Customers	Embedded Customers	Total
Load Forecast Before Deducting Impact of CDM			
2006	23,115	17,839	40,955
2007	23,256	17,790	41,046
2008	23,494	17,942	41,436
Annual Growth Rates			
2007	0.61	-0.27	0.22
2008	1.02	0.85	0.95
2006-2008	0.81	0.29	0.59
Load Impact of CDM			
2006	194	151	345
2007	311	242	554
2008	437	333	770
Load Forecast After Deducting Impact of CDM			
2006	22,921	17,688	40,609
2007	22,944	17,548	40,493
2008	23,057	17,609	40,666
Growth Rates			
2007	0.10	-0.79	-0.29
2008	0.49	0.35	0.43
2006-2008	0.30	-0.22	0.07

Note: All figures are weather normal and 2006 values after deduction of CDM a

Since the forecast is weather-normal; the actual load could be below or above the forecast depending on the weather conditions and/or a different economic growth pattern. Table 5 presents the upper and lower bands of one standard deviation for the Hydro One Distribution system load forecast. Based on historical data, there is a two in three chance that the actual in 2008 will fall within the upper and lower bands. The bands are derived using Monte Carlo simulation technique relating variations in load to variations in Ontario GDP and weather.

Table 5

One Standard Deviation Uncertainty Bands for Hydro One Distribution Load (GWh)

Year	Lower Band	Forecast	Upper Band
2007	39,789	40,493	41,175
2008	39,827	40,666	41,520

Appendix 1: Monthly Econometric Model

The monthly econometric model uses the State-Space approach in the regression equation, where the left-hand side of the equation represents the energy estimates, and the right-hand side contains the explanatory variables including the dummy variables that are used to capture special events that could affect the energy estimates because these events would likely cause variations in the load. The dummy variables are used to minimize the variability of the energy estimates around the forecast.

LRTLT = f (LGDPONT, LBPONT, D98Jan)

where:

LRTLT = logarithm of Distribution load,
LGDPONT = logarithm of Ontario GDP in constant 1997 dollars,
LBPONT = logarithm of Ontario residential building permits in constant dollar,
D98Jan = dummy variable to account for the load impact of 1998 Ice Storm, equals 1 in January 1998 and zero elsewhere,

The output parameters from the model are presented below. The State-Space (SS) estimated parameters are not associated with standard error and t-ratios (statistical relevance test).

Seasonal Factors	State-Space (SS) parameters:
A[1]	-0.134796
K[1]	-0.568914

Non-Seasonal Factors	SS parameters:
A[1]	0.531829
K[1]	-0.345868
GDPONT[-4]	0.0784784
BPONT[-9]	0.00440215
D98JAN	-0.0150467

R-squared = 0.989, R-squared corrected for mean = 0.989, Durbin-Watson Statistics = 2.31.

The goodness of fit, or the extent to which variability in the energy estimates is captured in the forecast, is measured in terms of R-squared (adjusted for mean), which in this case is close to 1. This result reflects statistical significance of the explanatory variables that are used to explain for the variations in load. In fact, the results show that in this case the fit is very good, and therefore there is confidence that the forecast will produce outcomes that are within the expected range of variability.

Using the forecast values for GDP, building permits and dummy variables, the above parameters are used in the monthly regression equation described on the previous page to generate the forecast for Hydro One Distribution load.

Appendix 2: Annual Econometric Model

Annual econometric model uses personal disposable income per household, relative energy price and cooling and heating degree-days to prepare the forecast. The annual model is expressed in the following regression equation:

LRTLT=C(1)+C(2)*LYPDPHH+C(3)*(LPELRES(-1)-LPGASRES(-1))
+C(4)*LCDD+C(5)*LHDD+C(6)*LRTLT(-1)-C(4)*C(6)*LCDD(-1)-C(5)
*C(6)*LHDD(-1)+C(7)*D99A+C(8)*TR+C(9)*TR2

where:

LRTLT = logarithm of Distribution load,
LYPDPHH = logarithm of Ontario personal disposable income per household in constant $,
LPELRES = logarithm of electricity price for Ontario residential sector,
LPGASRES = logarithm of natural gas price for Ontario residential sector,
LCDD = logarithm of cooling degree days for Pearson International Airport,
LHDD = logarithm of heating degree days for Pearson International Airport,
D99A = dummy variable to account for annexation of retail customers by municipal utilities equals 1 after 1999 and zero elsewhere,
TR = a dummy variable to account for a shift in growth pattern of Distribution load, increases by 1 per year prior to 1989 and no increase afterwards,
TR2 = TR to power 2,
C(1) – C(9) = variable coefficients.

The estimated coefficients and associated statistics are presented below.

	Estimated Coefficient	Standard Error	t-ratio
C(1)	5.548910	1.273869	4.355949
C(2)	0.303905	0.119354	2.546245
C(3)	-0.055342	0.025059	-2.208471
C(4)	0.004952	0.007168	0.690828
C(5)	0.195571	0.043265	4.520272
C(6)	0.286776	0.103890	2.760383
C(7)	-0.020994	0.007506	-2.796974
C(8)	-0.100598	0.023221	-4.332256
C(9)	0.002619	0.000546	4.795182

R-squared = 0.995, Adjusted R-squared = 0,993, Durbin-Watson Statistic = 1.90.

Similar to the regression analysis in the case of the Monthly Econometric model above, the goodness of fit, measured by (Adjusted) R-square for the Annual Econometric Model, is also found to be close to 1. Therefore the assessment on an annual basis also leads to a forecast outcome which provides consistent results, thus giving confidence to the econometric method. The t-ratios show most of the factors used to explain the variations in load are statistically significant.

Using the forecast values for personal disposable income, energy prices, cooling and heating degree days and dummy variables, the above parameters are used in the annual regression equation described on the previous page to generate the forecast for Hydro One Distribution load.

Appendix 3: End-Use Model

The following briefly describes the methodology used in the end-use model.

<u>Residential Sector</u>

The residential energy forecast is determined by forecasting the number of accounts times appliance saturation rates and unit energy consumption expressed in the following equation:

$$USE_{Res} = \sum_i \sum_j N_{i,j} * S_{i,j} * UEC_{i,j}$$

Where

- USE_{Res} is residential energy consumption
- N is the number of residential accounts
- S is the residential appliance saturation rate
- UEC is the unit energy consumption per end use
- I is the index for appliances (space heating, space cooling, water heater and base load)
- J is the index for customer types—year-round residential customers and seasonal residential customers

The following section describes each component of the equation in detail.

- The base-year number of households is taken from Hydro One Distribution billing system. The forecast in the growth of the number of residential accounts is based on a forecast of housing starts. The number of residential accounts is the current number of residential accounts plus the forecast of net additional accounts to be added each year.
- The base-year end-use shares (space heating, water heating and air conditioning), and fuel switching (space/water heating) information are based on Hydro One Residential Appliance Survey conducted in 2005 for year-round and seasonal customers.

- The trends for end-use shares and fuel switching over the forecasting period reflect the provincial trends from the Hydro One provincial residential end-use model, as well as information specific to Hydro One Distribution.
- The base-year end-use UEC's are based on the provincial residential end-use model with adjustments for heating degree days, cooling degree days, income, household size, square footage and household vintage.

Commercial Sector

The commercial energy forecast is based on the following equation:

$$USEcom = USEcom(-1) * (1+\text{Expected annual growth rate})$$

Where

- $USEcom$ is the commercial energy consumption for the forecast year
- $USEcom$(-1) is the commercial energy consumption for the previous year. The base year (2006) consumption is taken from the latest Hydro One Distribution billing system corrected for abnormal weather effects
- Expected annual growth rates are based on the Hydro One provincial commercial end-use model. Where appropriate, the values are adjusted to reflect specific distribution business characteristics.
- The model uses an end-use framework to provide estimates of energy use by building type. The building types include multi-residential, office, elementary and secondary school, college and universities, health, public service, retail, grocery, accommodation, recreation, religious/cultural, warehouse, commercial miscellaneous. non-building related segments and streetlight.

Industrial Sector

The industrial energy forecast is based on the following equation:

$USEind = USEind$ (-1) * (1+Expected annual growth rate)

Where

- $USEind$ is the industrial energy consumption for the forecast year
- $USEind$ (-1) is the industrial energy consumption for the previous year. The base year (2006) consumption is taken from the latest Hydro One Distribution billing system corrected for abnormal weather effects
- Expected annual growth rates are based on the Hydro One provincial industrial end-use model. Where appropriate, the values are adjusted to reflect specific distribution business characteristics.
- The model uses an end-use framework to provide estimates of energy use by industrial segments including Fishing, logging, Forestry Service, Mining, Petroleum, Food and Beverage, Tobacco, Rubber and Plastic, Textile and Clothing, Wood and Furniture, Paper and Printing, Primary Metal, Fabricated Metal Products, Transportation Equipment, Electronics etc.

Agricultural Sector

The Agricultural sector forecast is based on the following equation:

$USEagri = USEagri$ (-1) * (1+Expected annual growth rate)

Where

- $USEagri$ is the agricultural energy consumption for the forecast year
- $USEagri$ (-1) is the agricultural energy consumption for the previous year. The base year (2006) consumption is taken from the latest Hydro One Distribution billing system corrected for abnormal weather effects

- Expected annual growth rates are based on the Hydro One provincial agricultural end-use model. Where appropriate, the values are adjusted to reflect specific distribution business characteristics.
- The model uses an end-use framework to provide estimates of energy use by agricultural segments including Animal Production, Fruit and Vegetable Farming, Grain Farming, Green Housing and Floriculture and Miscellaneous etc.

Appendix 4: Weather Normalization for Total Utility Load and by Rate Class

Weather Normalization for Total Utility Load

Hydro One's weather normalization methodology for total utility load is summarized as follows.

- An equation relating daily energy and daily weather conditions is developed using the latest 4 years of data. This time frame allows the analysis to reflect the most recent load mix while having sufficient data to quantify its weather sensitivity. For example, the share of space cooling energy relative to total energy has increased rapidly over the past decade; using too long a time series of historical data may lead to significant under-estimation of the weather sensitivity of load in the summer.

- To better isolate the impact of weather, systematic changes in daily loads are identified and filtered out before the regression analysis begins. The systematic effects removed include growth trends, cyclical variations, day-of-the-week effects and holiday effects. The objective is to filter the data to weather-related load and noise (random effect).

- Different types of weather data are used in the analysis. For winter loads, weather data include temperature, wind speed and cloud opacity. For summer loads, weather data include temperature, humidity and cloud opacity. Because weather effects cumulate over several days, the temperatures for the current day as well as the previous 3 or 4 days are also used as explanatory variables in the model. The relationship between energy and weather may be represented by the following function:

Weather- Related Energy = f (Weather Conditions) + Random Term (1)

where the random term reflects any remaining variations that are not explained systematically by weather. The random term is assumed to be distributed independently, identically and normally with mean equals to zero.

- The coefficients from Equation (1) are estimated using the most recent 4 years of daily load and weather data. These coefficients indicate the sensitivity of load in the service territory relative to today's temperature, yesterday's temperature and all other weather variables included in the equation. The estimated coefficients are multiplied by the actual weather data for the corresponding weather variable in the equation to determine the estimated weather-related energy for the day. This process is repeated for each day of the period for which weather-correction is performed.

Estimated Weather-Related Energy = f (Actual Weather Conditions and Estimated Coefficients) (2)

- Equation (2) is used to determine what "normal" weather-related loads would be for each day of the year given the current mix of weather-sensitive loads in that service territory. This is done by running the equation with each of the last 31 years of daily weather data for that day plus the seven days on either side of it. The average of the estimated weather-related loads for the 15 days times 31 years (465 observations) is deemed to be the "normal" weather-related energy for that day. Using 31 years of weather history is considered adequate to approximate normal weather.

Normal Weather-Related Energy (for each day) = Average (31 years of Estimated Weather-Related Energy for that Day +/- 7 Days) 3)

- On a daily basis, the weather correction is derived as the difference between the estimated and normal weather- related energy:

  Weather Correction for Energy = Normal Weather-Related Energy – Estimated Weather-Related Energy (4)

- Weather-corrected energy is defined to be actual energy plus the weather correction in any given period. For any period that is more than one day (e.g., a month), the total weather correction is the sum of the daily weather correction.

  Weather-Corrected Energy = Actual Energy + Weather Correction for Energy (5)

- For example, a summer day for which the combination of temperature and humidity are above normal yields a negative weather correction. The weather correction in this case should be viewed as the amount to be subtracted from the above normal actual to get the weather-corrected energy. Similarly, a warm winter day would have a positive weather correction as the weather corrected value for that day should be higher than the below normal actual.

Weather Normalization by Rate Class

Weather correction by rate class is derived from weather correction for the total utility using the electric space heating and cooling shares by rate class or segment as detailed below.

- Weather correction for the total utility load is discussed above using daily energy for the utility. The amount of weather correction is measured on a daily basis.

- Using average daily temperature for each day, the daily weather correction is grouped into "weather correction for space heating" and "weather correction for space cooling". For example, if average daily temperature is -1, the weather correction for that day is allocated to "weather correction for space heating" load. The daily weather correction results are aggregated into annual or monthly weather correction estimates.

- Using load shape analysis and residential appliance saturation estimates for the utility and the region, the amount of space heating and cooling load over a year or month are estimated for each rate class. The weather correction for each rate class is calculated using the space cooling and heating load of that rate class. The methodology used is summarized as follows.

- **Residential cooling/heating load**: Residential load shapes are developed using the generic load shapes (cooling, space heating, electric water heating, etc.) from the Ontario Load Data Research Group. Based on these generic load shapes and specific appliance saturation estimates for the utility and the region, total residential space heating and cooling load are calculated. The generic load shapes may vary by region, reflecting different weather conditions across the province.

- **Non-residential cooling/heating load**: For non-residential rate classes, the generic load shapes from the Ontario Load Data Research Group (or available load shapes from Hydro One for load shapes not covered by the joint load research project) are used to calculate the cooling and heating load percentages by rate-class or segment (e.g., by SIC or industry segment). Again, these generic load shapes may vary by region, reflecting different weather conditions across the province. Some industrial segments may not be weather-sensitive; in this case the space heating and cooling loads would be zero. The corresponding percentages of space cooling and heating load multiplied by rate-class or segment load would provide the cooling and heating load of that rate class or segment.

- **Total cooling/heating load and shares**: Total space heating and cooling load for the utility are calculated by adding residential and non-residential space heating and cooling loads from above. Using this total, the shares of cooling and heating load for each rate class relative to the total cooling and heating load are calculated.

- **Weather correction by rate-class:** For each rate class, the cooling and heating weather correction amount are calculated using the total cooling and heating weather correction amount for the utility multiplied by the corresponding cooling and heating shares calculated from above. Shares of some industrial segments could be zero since they are not weather sensitive. The weather-corrected load for each rate class is estimated by adding the weather correction estimates by rate class to the corresponding (actual) load for each rate class.

Appendix 5: Methodology for Preparing Utility-Specific Load Shapes

Hydro One's method makes use of the following information:

- Generic load shapes prepared for the Ontario Load Data Research Group for residential and general service customers.
    - The residential load shapes have weather-normal profiles for 4 end-use categories (electric space heating, electric water heating, air conditioning and base load) and 4 regions (Central, East, West and North).
    - The general service customer load shapes have load profiles for about 35 industry segments using NAICS-2002 (North American Industry Classification Systems) and by number of working shifts.
- Hydro One weather normalization methodology for total utility load and by rate class.
    - Hydro One weather normalization method, which was approved by the Board in RP-2005-0020/EB-2005-0378 and EB-2005-0317, uses 4 years of daily load and weather data to establish the relationship between weather and load and the average of 31 years of weather data to define typical weather conditions.
    - Weather variables used in the weather correction analysis include temperature, wind speed, cloud cover and humidity. In addition to temperature, wind speed is important in the winter months, while humidity is important for the summer months.
    - Estimation of space heating and cooling loads for residential customers makes use of generic load shapes and appliance saturation estimates.
    - Estimation of space heating and cooling loads for general service customers makes use generic load shapes and industry classification.
- Weather-normalized load shapes for battery mats prepared by the Hydro One Load Research team using information provided by the local cable company. For the informational filing to OEB, weather-sensitive load profiles for battery mats are

required only for LDCs using future test year and not required for LDCs using historic test year in their 2006 EDR applications.

- Results of residential appliance survey undertaken by LDCs using survey questions recommended by the OEB's load research expert. For LDCs opted not to undertake residential appliance survey, estimates of appliance saturation are prepared using monthly energy patterns for each residential customer.
- Deemed street lighting and sentinel lighting load profiles approved by the OEB.
- Interval meter customer load profiles by rate class and by industry classification.
- Special tabulation of Household Equipment Survey results from Statistics Canada.
- Residential appliance survey results undertaken by former Ontario Hydro.

Hydro One's utility-specific load shape methodology is summarized as follows:

Weather correction analysis

- Weather correction analysis is performed for each region and LDC.
- For each region, weather correction analysis is undertaken using the total regional load.
- For each LDC, the weather correction analysis is undertaken for the total utility load as well as by rate class. Weather sensitive loads for space heating and space cooling are determined for each day.
- The relationship of weather sensitivity between the region and the LDC is used to calibrate the utility-specific space heating and cooling loads with the regional estimates.
- Using the weather correction analysis, generic load shapes and monthly profiles, weather-corrected loads are estimated for the total utility load and by rate class.

Residential Customers

- Using number of customers, appliance saturation and generic load profiles, the energy consumption by end-use are estimated.
- The relationship of weather sensitivity between the region and the LDC is used to calibrate the utility-specific energy consumption for space heating and cooling loads.
- The relationship of appliance saturation and housing characteristics between the region and the LDC is used to calibrate the utility-specific profiles for water heating and base loads.
- Weather-normal hourly load shapes are estimated using generic load shapes and energy consumption by end-use.
- Weather-normal energy consumption by end-use will add up to weather-normal residential rate class total.

General Service >50 KW Customers

- General service >50 kW customers are grouped by industry classification excluding interval metered customers.
- Allocation of weather correction is undertaken for industry classifications that are weather sensitive.
- Analysis takes into consideration number of work shifts for each industry classification.
- Weather-normal hourly load shapes are estimated using generic load shapes and energy consumption for each industry classification.
- Weather-normal energy consumption by industry classification will add up to weather-normal general service >50 kW rate class total.

PROJECT AND PROGRAM APPROVAL AND CONTROL

1.0 INTRODUCTION

As described in Exhibit A, Tab 14, Schedule 1, there are a number of key steps within the overall business planning cycle which are typically completed prior to the development of more detailed project and program assessments. These prerequisite steps include: needs identification, project/program prioritization, and development of preliminary work programs, based on estimates of project and program costs and benefits. Once the preliminary plans have been accepted at the proof-of-concept stage and have gone through the work program prioritization process described in Exhibit A, Tab 14, Schedule 5, detailed analysis of preferred alternatives and costs is completed for individual projects, and business cases based on the detailed analysis and cost estimates are prepared for review and approval.

2.0 PROJECT AND PROGRAM APPROVAL

Once the final investment plan proposal and associated funding requirements are established, Senior Management approves the programs included, based on the proof-of-concepts presented during the work program prioritization process. Business cases (Investment Justification Documents (IJD)), are prepared for project proposals, a template for which is provided as Attachment A to this exhibit. This ensures consistent development and assessment of proposals. The IJD template includes such factors as the need for the investment including the implications of not doing the work, the results to be obtained and the recommended solution and its cost. In determining the recommended solution, alternative approaches and project risks are considered. The factors considered include asset condition assessments and performance data as well as other relevant information concerning the long-term needs of the system. The business cases are then reviewed in a series of steps at the management and executive levels, depending on the dollar limit and significance of the investment. Projects and programs are approved consistent with the Organizational Authority Register (OAR -- see Exhibit A, Tab 8, Schedule 2). Strategic investments are reviewed and approved by the Hydro One Board.

3.0 MONITORING AND CONTROL

Each month, management monitors year-to-date expenditures and accomplishments as well as projected year-end expenditures. Deviations from plans are identified and corrective action taken. In the event that spending on a project is expected to be materially different from the amount originally approved, an Interim Review of Variance (IROV) is prepared. An IROV is essentially an amended business case that is reviewed and approved based on the revised set of circumstances (cost, scope, schedule). Approval of the IROV is also in accordance with the limits set out in the OAR. Projects which cannot be re-justified are either scaled back, cancelled or otherwise adjusted to conform to the new situation. Variances on major programs are reviewed on a monthly basis by the Operations Committee. Any resulting re-direction of resources is approved by the Chief Financial Officer and President & CEO.

Hydro One Distribution – Investment Justification

Investment Name

Investment Driver:

Title and DC number. Sentence or Paragraph describing the Investment Driver ($M for the entire business driver).

Investment Name: **In Service:** month/year

Title ($)

Investments ≥ $3.0M, in $M, 1 decimal
Investments < $3.0M, in $K, no decimals

Need: Need section will be 2 paragraphs – the need and risks mitigated

- Need for this particular investment — What is the problem/situation that is being addressed
- Implications of not doing the work — Outline specific risks mitigated and quantify where possible

Investment Summary: (Concise – total of 1-3 paragraphs)

- Context — Importance of this system or this program.
- How did we determine the work? — How did you prioritize or determine the need for specific work, studies, assessments, regulatory requirements, benchmark, any critical assumptions, etc.
- Conclusion — What is going to be done.

Results: (3-4 bullets – quantified, high level)

Expected results of the investment. Must link the work to the "needs & risks" identified above.

Costs:

Include a statement if contribution is being made to another part of Hydro One (i.e., DX to TX) and that these costs are included below. If costs are recoverable, no need to identify here as there is a separate line below.

	200X ($M)	**200X** ($M)	**Total** ($M)	**Net Present Value*:** **Profitability Index*:**
Capital and MFA				
OM&A and Removals				
Gross Investment Cost				
Recoverable (e.g., capital contribution)				
Net Investment Cost				

* NPV and PI provided for new load connections or productivity-enhancing projects.

WORK PROGRAM PRIORITIZATION

1.0 OVERVIEW

The investment prioritization process is part of the overall company planning process. (see Exhibit A, Tab 14, Schedule 1). The prioritization process converts Hydro One Distribution business values (consistent with the strategic goals set out in Exhibit A, Tab 3, Schedule 1) and key performance indicators in Table 1 into investment criteria and guidelines that are used for managing risk and facilitating trade-offs between investments. At the core of the process is a multi-criteria analysis, which is used to help decision-makers understand and quantify business risks and uncertainties so that objective decisions can be made respecting priorities.

Capital and OM&A investments are prioritized on an annual basis. The investments included in the process have been developed in response to asset, customer and business needs. The process incorporates risk tolerances consistent with corporate direction and also considers resource constraints.

The output of the prioritization process is an investment plan proposal. While this proposal is prepared at a specific time of the year, the resulting plan is modified as new risks or opportunities emerge, conditions change, and/or priorities shift throughout the year. A redirection process, described in Section 2.5 of this Exhibit, enables the incorporation of such modifications.

The investment plan proposal is composed of a list of prioritized program/project investments, both capital and OM&A. Program/project descriptions for 2008 capital investments in excess of $1 million are provided in Exhibit D2, Tab 2, Schedule 3.

2.0 INVESTMENT PRIORITIZATION PROCESS

The current investment prioritization process was implemented in 2001, in response to utility best practice and to address factors such as aging infrastructure, customer demand for higher reliability, changing regulations, funding pressures, etc. Since 2001, the process has seen continuous improvements using the experience gained in each subsequent year. For example, the prioritization methodology has been expanded over the years to cover a broader scope of program areas. Also, program execution issues such as outage availability, effective work bundling, etc. have been more fully included in the development of the proposed expenditures, which has resulted in investment proposals that are more accurate from an implementation perspective.

The prioritization process uses the business values to rank proposed investment levels in accordance to the benefits they provide, and facilitates the preparation of an investment plan proposal. This annual process consists of the following steps:

- Define business values
- Develop multiple levels of investments to meet business values while mitigating identified risks
- Determine the cost and benefits for each level
- Prioritize the levels across all areas
- Assess the results and build the investment plan

These steps are described in the remainder of this exhibit.

2.1 Business Values

The Business Values (BVs) are designed to enable the achievement of the strategic goals set out in Exhibit A, Tab 3, Schedule 1. They form the basis of the criteria used to develop investments, manage risk and facilitate trade-offs between investments.

BVs are defined by key success factors and measured by a set of key performance indicators (KPIs). The BVs and associated key success factors represent the objectives that are to be factored into the decision making, while the KPIs represent how the impact on the BVs is to be measured. The table below shows the BVs and KPIs used in 2007 to establish the 2008 investment plan proposal.

Table 1
Business Values, Key Success Factors and Key Performance Indicators

Business Value (BV)	Key Success Factor	Measure / Key Performance Indicator (KPI)
Safety and Environment	Keep our People, Service Providers and the Public Safe; Limit Impact on the Environment	• Deficiencies in Health and Safety Managed System • Public Safety • Environmental Impact
Customer	Improve Overall Customer Satisfaction	• Customer Satisfaction Survey
Reliability	Ensure Reliable Delivery of Electricity	• SAIDI • SAIFI
Financial	Meet Hydro One's Profitability Target	• Net Income • Net Present Value
Efficiency & Effectiveness	Increase Hydro One Competitiveness	• Work Program Accomplishment • Unit Cost Reduction • Competent and Skilled Staff
Reputation	Strengthen Hydro One's Reputation	• Public Profile • Shareholder Confidence
Regulatory Relationship	Meet All Compliance Standards	• Regulator's Confidence • Distribution System Code Requirements • Legal Violations

The KPIs form the basis of the multi-criteria analysis used to prioritize investments by measuring the impact on BVs if the associated investment is not made. For each impact level, there is a likelihood of the impact occurring. The process incorporates a five-point scale to determine the impact ratings for each KPI: Minor, Moderate, Major, Severe and Worst Case.

BVs, success factors and KPIs are reviewed yearly to ensure that they remain aligned with Hydro One's strategic goals. The review follows the strategy phase of the overall planning process (see Exhibit A, Tab 14, Schedule 1). Following the review, strategic goals, BVs, success factors and KPIs are formally issued to contributors to the investment prioritization process.

2.2 Multiple Investment Levels

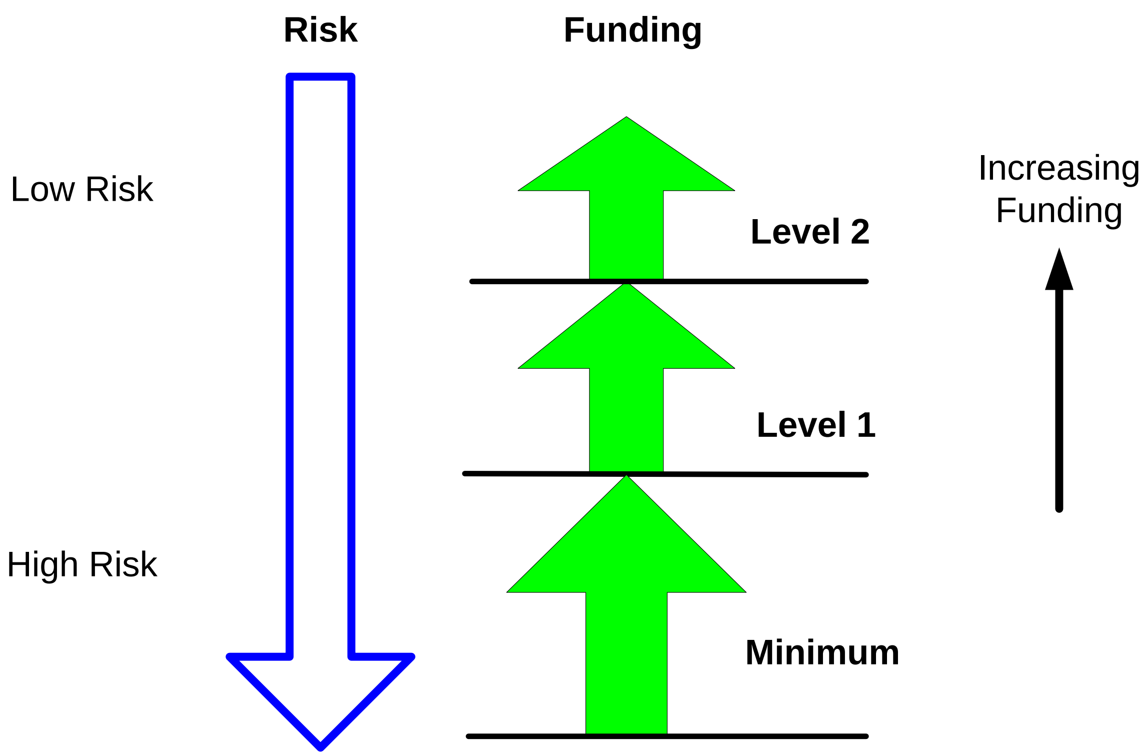
Customer, asset and business needs, risks and objectives guide ongoing planning activities. Investment proposals are developed to address these needs, risks and objectives, which are then input into the prioritization process. However, the scope and level of most investments – and the accomplishments those investments deliver – will vary depending on the level of risk mitigated. Therefore, besides prioritizing investments that address different needs, risks and objectives, there is also a need to prioritize different levels of accomplishments within an investment area.

Increasing levels of accomplishment representing decreasing levels of risk to the BVs are established for each area. For example, increasing investment funding so that 7,000 substandard wood poles are replaced in a year compared to a level of funding which results in replacement of 4,000 substandard wood poles results in a lowering of risks related to reliability and safety. In other cases, reduced accomplishment levels can create longer term sustainability issues, resulting in higher long term costs. There are also minimum levels of accomplishment which are necessary to avoid unacceptable risk to the

BVs. For example, if accomplishments fall below a certain level for a particular program, meeting applicable safety, regulatory or legal requirements may be at risk. In the example above, the prioritization process could identify that replacing less than 4,000 poles per year would represent an unacceptable reliability and safety risk. Another example would be accomplishments necessary to meet the minimum requirements prescribed by the Distribution System Code.

The approach is illustrated in Figure 1 below.

Figure 1
Accomplishment Levels versus Risk



Accomplishment levels are established and evaluated for a period of five years to allow for, among other things (see section 2.5 below), the long-term management of resources. Short-term constraints, such as scheduling of skilled staff or outages, are also considered when establishing the levels of work that are undertaken.

2.3 Investment Costs and Benefits

Total funding requirements to carry out the accomplishments established for each level of investment are determined using current year costs as the basis.

In some cases, there are identified linkages between particular investment areas which are factored in to the plans for those investment areas. For example, additional vegetation management accomplishments should over time reduce the number and extent of trouble calls and damage during storms, thus reducing the future funding required for trouble calls and storm damage. The total net cost is used in the resulting investment plan.

The benefits of each investment are determined by its level of accomplishment and its ability to mitigate risk to the BVs. The KPIs provide a common set of criteria to measure the impact, or consequence, of the investment on the BV. However, risk is the product of the consequence and the probability of occurrence, so this probability also has to be established. The process makes use of five likelihood ratings to establish probabilities: very likely, likely, medium, unlikely and remote. BV risk is identified in a two-dimension table as shown in Table 2. Using this approach, the change in risk for each BV as a result of the investment is established.

Table 2
Business Value Evaluation Matrix

	Minor	Moderate	Major	Severe	Worst Case
Very Likely (>95%)				**Unacceptable Risk Zone**	
Likely (65 to 95%)					
Medium (25 to 65%)					
Unlikely (5 to 25%)		Decreasing Risk			
Remote (< 5%)					

2.4 Investment Prioritization

The needs, objectives, accomplishments, costs, and risk assessment for each level of investment are documented. Asset managers and other stakeholders within Hydro One then review the information. The review ensures the full integration of the numerous investment proposals, and uniformity in the use of the risk assessment model.

The information provides the necessary cost and risk mitigation data required to conduct the prioritization. All investment levels are prioritized, with the exception of the minimum levels, which are automatically placed in the investment plan proposal. The prioritization methodology then gives priority to investments based on their ability to mitigate significant risk to the BVs.

A preliminary investment plan proposal is prepared based on the results of the prioritization of capital and OM&A investments. The proposal reflects considerations related to how effectively the investments mitigate risk to the BVs, and overall affordability of the proposal. The previous year's business plan is used as a reference point.

The preliminary investment plan proposal is assessed by Senior Management, where the residual risk to the business (i.e., the risk to the BVs that remains after the investments are made) is considered before the final investment plan proposal and associated funding requirements are established.

2.5 Investment Plan and Redirection

A five-year planning period is used for the investment plan proposal. A shorter period would not adequately recognize those investments that tend to deliver benefits over longer periods. This is particularly the case for investments that maintain or replace existing assets. The five-year period also allows for the longer term management of resources and allows for redirection of investments between years.

While the investment plan proposal is the product of extensive planning and analysis, it must at the same time be dynamic and flexible. Redirection may be required for a number of reasons, including changing customer needs, changing asset priorities based on new information, changing external requirements, major events (e.g., extensive storms, equipment failures), and affordability issues. All of these considerations can impact on the subsequent business planning process. This is why the actual plan that is implemented may be modified during the business planning process, and also throughout the year as new risks or opportunities emerge, conditions change, and priorities shift. This redirection of work allows adjustments to be made to the investment plans. For example, distribution line emergency restoration work required to repair damage caused by storms or equipment failures can be significant in any given year, and it is imperative to redirect the required funds and field resources from other investment areas to correct the damage.

SERVICE QUALITY INDICATORS

1.0 INTRODUCTION

Hydro One Distribution monitors and reports service quality indicators as required in Chapter 15 of the Ontario Energy Board 2006 Electricity Distribution Rate Handbook. The six customer service indicators and three service reliability indices are tracked monthly. Results are reported internally on a monthly basis. Reports are provided to the OEB annually in accordance with the 2006 Electricity Distribution Rate Handbook.

Hydro One Customer Service and Service Reliability results and targets from 2004 to 2008 are shown in Tables 1 and 2. Over the historical period, Hydro One Distribution met all OEB targets with the exception of one reliability measure in 2004 excluding *force majeure*[1] impacts.

1.1 Customer Service Indicators

Hydro One consistently tracks, analyzes and reports the six customer service indicators on a monthly basis as part of our internal performance scorecard process. This process identifies areas of concern so that they can be immediately addressed and brought back in line with OEB requirements.

Analysis of monthly and annual result trends provides valuable information for corporate planning, program planning and services management of resources.

The definitions of these indicators are provided in Section 2.1.

[1] Hydro One deems a *force majeure* to have occurred when 10% or more of Hydro One customers have been interrupted by an event. See Page 4 for further information about *force majeure*.

1.2 Service Reliability Indicators

Customer interruptions are analyzed and reported internally throughout the year.

Interruption data is collected and recorded in the Distribution Operations & Maintenance Centre (part of Ontario Grid Control Centre), through communications with field staff involved in the interruption restoration. It is input into a database system called Outage Response Management System which provides data for in-depth performance analysis to drive strategy and business investment decisions.

Interruption data is used to calculate OEB reliability indices (see Section 2.2 for definitions) monthly which are reported internally.

There is ongoing analysis of approximately 40,000 annual interruptions. Trends of frequency, duration, cause of interruptions, feeders, location, etc. are analyzed to allow prioritization of maintenance, sustainment and capital programs on the distribution system.

2.0 DEFINITIONS

2.1 Customer Service Indicators

The six Customer service indicators are as follows:

2.1.1 <u>Appointments:</u>

The percentage of appointments met (as requested in the morning or afternoon of a particular date) includes appointments for high bill investigations, engineering investigations, change service only and meter readings.

2.1.2 Connection of New Services:

The percentage of customer connections of new services completed within 5 working days from the day on which all conditions of service are satisfied.

2.1.3 Emergency Response:

The percentage of responses to emergency trouble calls (including fire, ambulance, police) met within 120 minutes for Rural utilities, and 60 minutes for urban utilities. Due to the predominantly rural nature of its distribution system, Hydro One Distribution is required to meet the 120 minutes response time. The elapsed time is measured from the call to the arrival of Hydro One qualified service personnel.

2.1.4 Telephone Accessibility:

The percentage of calls answered by the call center within 30 seconds.

2.1.5 Underground Locates:

The percentage of underground cable locates completed within 5 days. The days elapsed is measured from the customer service request until the completion of the underground cable locate.

2.1.6 Written Response to Inquiries:

The percentage of responses to customers' (or an agent of the customer) requests for written information regarding their accounts that are met within 10 days of the request.

2.2 Service Reliability Indicators

The three Service Reliability Indicators are:

2.2.1 Frequency of Interruptions (SAIFI):

The average number of times that Distribution customers served by Hydro One were interrupted in the year.

2.2.2 Duration of Interruptions (SAIDI):

The average numbers of hours that Distribution customers served by Hydro One were without power in the year.

2.2.3 Average Interruption Time (CAIDI):

The average interruption duration (in hours) of Distribution customers who were interrupted.

The above reliability indices measure all interruptions caused by planned and unplanned interruptions of 1 minute or more.

2.3 Force Majeure

Hydro One deems a *force majeure* to have occurred when 10% or more of Hydro One customers have been interrupted by an event.

An event may be a storm (usually the case), the Aug 14 blackout or any other problems that interrupt 10% or more customers and cause a change in the normal restoration business processes.

All Hydro One customers interrupted throughout the duration of the event while normal restoration business processes are suspended are counted in the determination of the numerator of the percent interrupted. The denominator is the total number of customers served at the end of the month when the force majeure occurred. Details of all *force majeure* events that have occurred from 2004 to 2006 are provided in Section 3.2.

3.0 RESULTS

The results of the six Customer Service Indicators and the three Service Reliability Indicators are attached in Tables 1 and 2 respectively.

3.1 Customer Service Indicators

Table 1 indicates customer service results, overall, remain consistent over the historical period and are better than the minimum OEB targets.

Table 1
Customer Service Indicators

Performance Measure	OEB Target	2004 Actual	2005 Actual	2006 Actual	2007 OEB Target	2008 OEB Target
Appointments (% met as agreed with customer)	**≥ 90**	**93**	**90**	**92**	**≥ 90**	**≥ 90**
Connection of New Services (% completed in ≤ 5 days)	**≥ 90**	**94**	**93**	**91**	**≥ 90**	**≥ 90**
Emergency Response (% responded to in ≤ 120 min)	**≥ 80**	**91** **90***	**86** **73***	**92** **65***	**≥ 80**	**≥ 80**
Telephone Accessibility (% answered in ≤ 30 seconds)	**≥ 65**	**74**	**72**	**77**	**≥ 65**	**≥ 65**
Underground Cable Locates (% completed in • •5 days)	**≥ 90**	**93**	**93**	**92**	**≥ 90**	**≥ 90**
Written Response to Inquiries (% responded to in ≤ 10 days)	**≥ 80**	**100**	**100**	**100**	**≥ 80**	**≥ 80**

*Emergency Response results including the impact of Force Majeure. The values without the * are the values with *force majeure* removed.

3.2 Service Reliability Indicators

Table 2 shows that through the period 2004 to 2006, SAIFI remained relatively constant at or better than the minimum OEB target, excluding *force majeure* impacts with one exception. However, in 2004, SAIFI missed the OEB target due to exceptional weather. During December 2004, six large impact weather systems passed through the province over 14 days. In total, these weather systems impacted 26% of customers and added 0.3 to our SAIFI, however no single weather system met the *force majeure* criteria. The worst storm impacted 7% of our customers. Our December SAIFI result of 0.4 is significantly higher than our seven-year historical December average of 0.2.

Table 2
Service Reliability Indicators

Performance Measure	2004 OEB Tgt	2004 Act	2005 OEB Tgt	2005 Act	2006 OEB Tgt	2006 Act	2007 OEB Tgt	2008 OEB Tgt
SAIFI *Frequency of Interruptions* (#of interruptions per customer)	• •3.0	3.1	• •3.1	2.9	• •3.1	2.9	• •3.1	• •3.1
SAIFI including *Force Majeure*		3.2**		3.9†		5.2††		
SAIDI *Duration of Interruptions* (hrs of interruption per customer)	• •9.4	6.5	• •9.4	8.0	• 8.0	7.1	• •8.0	• •8.0
SAIDI including *Force Majeure*		6.9**		14.5†		28.4††		
CAIDI *Average Interruption Time* (#of hrs per interruption)	• •3.1	2.1	• •3.0	2.8	• •2.6	2.4	• •2.6	• •2.6
CAIDI including *Force Majeure*		2.2**		3.7†		5.5††		

**See explanation in section “2004 Force Majeure Events”
† See explanation in section “2005 Force Majeure Events”
†† See explanation in section “2006 Force Majeure Events”

Over the same historical period SAIDI has varied from 6.5 to 9.4 hours. The 2004 results represent a significant improvement over OEB targets for duration of outages. The good performance was a result of fewer significant events lasting longer than 4 hours resulting in a 50% improvement in the duration values for these types of interruptions, as well as our operational focus on reliability.

The SAIDI performance over the 2004-2006 period drove a similar performance in CAIDI. Since CAIDI is dependent on both SAIDI and SAIFI (mathematically CAIDI = SAIDI / SAIFI), the reduction in SAIDI (i.e. the duration of interruptions) and the consistency of SAIFI (i.e. the number of interruptions) resulted in a reduction in CAIDI (i.e. the average interruption duration).

The consistencies in reliability (i.e. SAIDI, SAIFI and CAIDI) are credited to the focus that was placed on distribution reliability and the number of improvement initiatives that continue to be undertaken such as:

- Detailed feeder analysis to assess feeder reliability and customer impact and develop the appropriate investment recommendations,
- Assigning of crews to summer peaking storm locations to improve storm response time, and
- Scheduled work in high probability storm locations to improve restoration time.

3.3 2004 Force Majeure Events

In 2004 there was only 1 *force majeure* event that met the 10% of customers affected definition. This was the result of a storm on April 18 & 19, 2004 that interrupted 10.4 % of our customers. A violent spring storm brought high winds gusting up to 85 km/h and thunderstorms to Central and Southern Ontario. Winds were strong enough to uproot trees and ruin barns.

The effect of this storm resulted in a contribution to the annual SAIDI of 0.4 hours and annual SAIFI of 0.1 interruptions per customer, with a CAIDI of about 4.0 hours.

3.4 2005 Force Majeure Events

In 2005 there were four *force majeure* events that met the 10% of customers affected definition. The storms occurred on April 2nd, September 29th, November 10th and

November 13th. Each of those days, respectively they interrupted the following percentages of customers: 23%, 15%, 35% and 23%.

On April 2nd to 4th, 2005 a storm consisting of wet snow, freezing rain and high winds caused widespread damage in Southern Ontario, 23% or about 265,000 customers were affected.

On September 29th to 30th a fast moving storm front crossed Southern Ontario with high winds and rain/thunderstorms affecting 15% or about 172,000 customers.

In November there were two back to back fast moving storm fronts. On November 6th to 10th the first storm crossed Southern Ontario with high powerful winds and rain/ thunderstorms that affected 35% or about 409,000 customers.

The second front crossed from Georgian Bay to the Quebec border on November 13th to 17th again with high winds and snow, rain/thunderstorms affecting 23% or about 266,000 customers.

The effect of these storms resulted in a contribution to the annual SAIDI of 6.5 hours and annual SAIFI of 1.0 interruption per customer, with a CAIDI of about 6.5 hours.

3.5 2006 Force Majeure Events

In 2006 there were eight *force majeure* events that met the 10% of customers affected definition. The storms occurred on February 4th, February 16th, March 13th, July 17th, August 2nd, September 24th, October 28th and December 1st Each of those days, respectively they interrupted the following percentages of customers: 44%, 13%, 10%, 42%, 47%, 29%, 14% and 23%.

On February 4th to 8th, 2006 a storm consisting of heavy wet snow and wind (up to 60 km/hr) spread across the province from Lake Huron to Sudbury to Ottawa causing widespread damage in Southern Ontario affecting 44% or about 505,000 customers.

This was followed on February 16th to 17th with rain, freezing rain, snow and winds up to 75 km/hr affecting 13% or about 155,000 customers in an area from Windsor to Ottawa.

On March 13th to 15th a storm throughout Southern Ontario had winds gusting up to 80 km/hr, torrential rains, diving temperatures and snow squalls affecting 10% or about 120,000 customers.

The storm starting on July 17th with restoration efforts to the 22nd, was labeled by Environment Canada as the third worst storm in Canada in 2006. This southern Ontario storm of high winds (up to 80 km/hr), rain and thunderstorms that left a swath of damage about 400 km long affecting 42% or about 483,000 customers.

August 2nd to 9th, 2006 was also included in Environment Canada's third worst storm list. This storm system triggered 10 tornadoes as it hop scotched through cottage country and into Quebec affecting 47% or about 545,000 customers.

On September 24th to 30th, severe winds gusting up to 90 km/hr, started at Georgian Bay and moved east across the province affecting 29% or about 334,000 customers

October 28th to 29th saw an early winter storm consisting of snow and winds gusting up to 100 km/hr move from Georgian Bay and North Eastern Ontario to Ottawa affecting 14% or about 164,000 customers

December 1st to 3rd had snow, freezing rain and winds gusting up to 50 km/hr affecting 23% or about 264,000 customers throughout Southern Ontario.

The effect of these storms resulted in a contribution to the annual SAIDI of 21.3 hours and annual SAIFI of 2.3 interruptions per customer, with a CAIDI of about 9.3 hours.

DISTRIBUTION BENCHMARKING STUDIES

In its Decision on Hydro One's 2006 Distribution rates (RP-2005-0020/EB-2005-0378, dated April 12, 2006), the Ontario Energy Board directed Hydro One to engage an independent party to develop a list of comparable North American companies with similar business models, to submit a report on high level comparative performance and cost information for Hydro One and these companies as part of its next Distribution rate application. The Board also directed the submission of a comparison of labour rates and overtime policies amongst Hydro One, other comparative Ontario electricity distributors and other Canadian utilities as identified in the high level benchmarking study.

Accordingly, Hydro One engaged independent consultants to provide the expertise and experience needed to complete the necessary studies. The PA Consulting Group and Hay Group were selected to undertake the Distribution Benchmarking and Comparison of Labour Rates and Overtime Policy studies, respectively.

Distribution Benchmarking Study

The resulting high level Distribution Benchmarking study, Attachment A to this Exhibit, presents the results of Hydro One Distribution's performance among 13 "peer" utilities in North America, across a range of cost, reliability and safety measures. When measures are utilized which take into account the long, radial nature of Hydro One's distribution system and the low customer density of its service territory, overall performance is good to very good.

Comparison of Labour Rates and Overtime Policy Study

The Comparison of Labour Rates and Overtime Policy study is Attachment B to this Exhibit. As part of its response to the OEB directives on benchmarking from the 2006 Distribution rates proceeding, Hydro One met with stakeholders as part of the process for preparing its 2006 Transmission application to get guidance on the positions to be benchmarked and the approach to be taken in this study. Consequently, this study compares three representative utility job functions among 14 “peer” Canadian electrical utilities. In Hydro One these positions, which represent a large component of its workforce, are staffed by three different employee groups: trades (Power Workers Union), professional (the Society), and management. It should be noted that executive positions are not considered in this study as their future compensation will reflect the Government-directed implementation of its Agency Review Panel (the “Arnett Panel”) recommendations in this matter.

The benchmarking study compares the range of minimum to maximum hourly wages for each of the three representative utility job functions. The results indicate that Hydro One’s management function (Field Operations Manager position) wage is below the sample average; the professional function (Design Engineer position) wage is at about the sample average; and the trades function (Powerline Maintainer position) wage range is below the sample average minimum and above the average maximum.

In terms of overtime policies, the survey results show that Hydro One is in line with the majority of survey respondents for each of the three positions.

Customer Care Services Benchmarking

The Customer Care services delivered through the outsourcing contract with Inergi LP are not included in the benchmarking studies being conducted for this Application. These services include contact handling, billing, collections, and other back-office support activities, which were part of the Customer Service Benchmarking Report, *Review of Hydro One-Inergi Customer Service Pricing*, completed in 2005 and submitted to the Ontario Energy Board during the Hydro One Distribution 2006 rate proceeding, RP-2005-0020/EB-2005-0378. The results of the 2005 benchmarking study showed the annual prices paid by Hydro One for Inergy's services were within 1% of the average fair market value. As such, no additional benchmarking was pursued beyond that required in the Inergi agreement, which established benchmarking at years three, six and nine, of the 10-year agreement. The year six benchmarking is planned to be initiated in the last quarter of 2007.

TABLE OF CONTENTS

1. EXECUTIVE SUMMARY

Hydro One commissioned execution of a high-level Distribution benchmarking study, with the purpose of understanding its relative position among a group of "peer" utilities across a range of cost, reliability, and safety metrics. PA Consulting Group has performed that study, with the attached report as the result. We briefly outline below the approach taken to the study, the types of results found, and some steps to be taken in the future.

Background and Study Objectives

Hydro One was asked by the Ontario Energy Board to perform a high-level benchmarking study in support of revenue requirements in a rates proceeding. That request came as part of the decision published April 12, 2006 by the OEB in response to Hydro One's Distribution Rates Application and was reinforced in the recent decision on Hydro One's Transmission Application. Hydro One took the opportunity to perform the study to meet the directive of the OEB, while at the same time investigating two specific areas within its distribution operations (vegetation management and meter reading) that may offer improvement opportunities.

Approach

The approach followed a direct series of steps designed to identify an appropriate peer panel of utilities for comparison while simultaneously selecting a group of performance measures for tracking the performance of the companies. These steps were followed by data collection from the selected peer group of companies, and summary and analysis of the resulting data. The summary consisted of development of charts and graphs showing the outcomes for the performance measures, and then review of what those results say about the performance of Hydro One.

A key element of the approach to the project was in selecting the appropriate metrics for tracking success in a distribution company characterized by a very low density service territory. A low density territory requires substantial amounts of electric system assets to serve each customer, and therefore the appropriate performance metrics are required to address that fact of the electric system. Measures based on, or normalized by, the length of distribution lines are appropriate for a company like Hydro One.

Findings and Conclusions

The overall results of the benchmark comparisons are the following:

Cost

When compared on a per-km of line basis, Hydro One's costs are in line with the norm of the group, and in some cases even leading. Their costs are higher than average for the comparison panel when measured on a per-customer basis. Where capital spending is concerned, particularly with respect to per-km metrics, the costs are below the mean for the group.

Asset Replacement Rate

Hydro One's asset replacement rate is low in comparison to the group. This is measured in terms of the amount of capital spending in relationship to the existing asset base. A very low value for the long term could indicate underinvestment in the electric system.

Reliability

When the reliability figures are normalized for the km of line, Hydro One's performance is in line with the norms of the group. Hydro One has comparatively poor reliability within the panel group, when measured by metrics such as SAIDI and SAIFI.

Safety

Safety performance for Hydro One is overall about average for the group of utilities who reported data for the study, but the results are mixed. When reviewing recordable incidents, Hydro One falls above (worse than) the average performance for the panel of companies. On the lost-time incident rate, Hydro One is significantly better than the average of the group.

Meter Reading

Meter reading costs for Hydro One are relatively low compared to the panel, when normalized by distance. When viewed on a per-customer or per-read basis, the costs are very high. This is reasonably explained by the very low density of the territory, which leads to long distances, either walking or driving, between meters for reading.

Tree Trimming

For vegetation management, the Hydro One costs are higher than the average for the comparison panel. The service territory demographics (e.g. size and density of territory, vegetation coverage, electric system configuration) substantially influence the performance results for this area.

Summary

The study has produced some useful results for the company. In particular, the results provide an accurate portrayal of the performance of the company, while at the same time demonstrating the importance of measuring and reporting performance in an appropriate manner to fit the individual situation for each utility. Hydro One's service territory has some unique characteristics, most notably its low density, and the performance of the company appears different depending on whether or not those characteristics are taken into account in measuring performance. Overall performance of the company rates as "good to very good" when performance is normalized by the volume of assets (e.g. km of line). However, when measures that are normalized by customer base (e.g. spending or customer hours per customer served) are used, Hydro One performance appears to be less efficient. The low density/rural nature of the Hydro One system leads to this, since customer-normalized metrics tend to favor higher density systems.

In using the results of this (or any other benchmarking study), it is important to understand both the benefits and limitations of the work. This is a high-level study, and it is important to take care in analyzing and applying the results, assuring a substantial degree of understanding of the underlying data and analysis.

2. INTRODUCTION

2.1 STUDY BACKGROUND

The Ontario electricity industry has undergone significant restructuring over the past seven years. On December 9, 2004, the Ontario Legislature passed the *Electricity Restructuring Act, 2004* to stabilize prices for consumers that reflect the full cost of electricity, facilitate new supply additions, and promote conservation and demand management. The act also created the Ontario Power Authority (OPA), which has a mandate to ensure an adequate, long-term supply of electricity in Ontario. Under the new market structure, wholesale electricity consumers pay a blend of regulated, contracted and wholesale spot market prices for electricity.

The Transmission and Distribution Businesses are separately regulated by the Ontario Energy Board (OEB); and cost allocation approaches are used within the company to appropriately assign costs to the Businesses. The OEB sets rates in proceedings through oral or written public hearings based on the level of revenue required to operate the regulated businesses and to earn the approved rate of return. The OEB, in its April 12, 2006 decision regarding Hydro One's Distribution Rates Application, identified a desire for Hydro One to pursue additional benchmarking studies. The OEB directed Hydro One to submit the results of these studies with the next Distribution Rates Application. A specific related excerpt from the April 12th Distribution rates decision is as follows:

> "While the Board is not prepared to order a comprehensive benchmarking study, the Board sees value in a high level benchmarking study for initial review at the next rate proceeding. The Board directs Hydro One to engage an independent party to develop a list of comparable North American companies with similar business models (transmission and/or distribution) and to report on high level comparative performance and cost information for Hydro One and these companies. In future rate cases, this information may assist with determination of areas for a more comprehensive benchmarking review. The Board does not anticipate that the high level benchmarking study will be overly costly. The Board anticipates that Hydro One will want to consult with interveners regarding the scope of the study. The independent study should be submitted as part of Hydro One's next main application for distribution rates."

With the above information as the drivers, Hydro One Networks, Inc. has prepared a filing in support of a rate review, as directed by the OEB. Hydro One engaged PA Consulting Group as the "independent party" identified above to perform a benchmark study of distribution companies with similar characteristics to Hydro One. This report summarizes the execution of that study, and the resulting conclusions.

The OEB reinforced the need to carry out performance benchmarking studies in their decision on Hydro One's 2007and 2008 Transmission Business Revenue Requirement Application and stated they expect the performance and compensation benchmarking study deficiencies in past studies will be corrected for 2009 Transmission rate filing if not possible for 2008 Distribution filing.

2.2 GOALS AND OBJECTIVES

The primary goal of the study was to provide a high-level set of benchmarks of cost and business performance for Hydro One that could be used in the 2008 Distribution rates proceeding. This involved determination of how to select both an appropriate comparison panel of utilities and an appropriate set of performance measures for use in the comparisons. Appropriate peer utilities in this case means, to the extent possible, those whose operating circumstances are similar to those faced by Hydro One, so that the resulting performance results can be compared with minimal levels of adjustment. Appropriate performance measures means a sufficient sample of measures which accurately represents the overall performance of the distribution utility, recognizing the need for a balanced view, including costs, service levels, and employee safety.

2.3 THE PROJECT TEAM

The project team that performed the study was made up of consultants from PA Consulting Group, augmented by a few of its former employees, and with input from several individuals from Hydro One. The consultants were drawn from the team that created and performed for many years the annual PA Benchmarking studies, while the Hydro One individuals were from the Performance Analysis Department within Hydro One. The support provided by Hydro One was primarily with respect to scope of the study, and to provide Hydro One operations data for comparison against those of the other utilities in the comparison panel. The PA team then executed the study, analyzed the results, and prepared this report.

The primary reason PA Consulting was selected for the engagement is because of their experience in executing benchmarking studies in the utility industry. The two primary consultants engaged in the project have between them almost 40 years of experience in performing such studies, including developing appropriate performance metrics and analyzing results across a broad array of different companies. Many of the elements of comparison for this project were built on the experiences of the project team in executing other studies in the past.

Ken Buckstaff was the primary architect and leader of an electric transmission & distribution benchmarking study which has been run annually since 1989, and similarly developed and led an annual utility customer service study since 1992. In the course of performing those studies, it was possible to build and test dozens of hypotheses about the various impacts of density, size, voltage levels and many other variables on the resulting performance of utilities.

Debi McLain has been the key person actually performing the data handling and analytics for the annual benchmarking studies described above for the past 18 years. Her deep familiarity with the kinds of data availability and potential inaccuracies is invaluable in assuring that proper comparisons are made and that appropriate data are used.

Understanding the interactions between different elements is a critical point in being able to produce appropriate benchmark studies, including the right types of performance metrics, ways to evaluate success based on individual company circumstances, and how to assure the right demographics are considered. In addition to the annual studies, the project team for this engagement has performed dozens of individual benchmark studies ranging in scope from high-level studies such as the one that is the subject of this report down to very detailed analyses of the best practices in place for such narrowly-scoped subjects as substation maintenance or construction project management. That experience makes the team uniquely qualified to execute this project for Hydro One.

2.4 ABOUT HYDRO ONE

Hydro One is a unique distribution company in many ways, from the organization and operating structure to the regulatory regime it works under to the physical circumstances of its service territory. The service territory situation particularly drives a lot of the management and operating decisions, as well a much of the results achieved in terms of costs and service levels. A few of the external circumstances which have an impact on the results achieved by the company include the following:

- Large, low-density service territory
- Weather patterns
- Tree density/vegetation
- Operating structure

Described below are some of the impacts of these features.

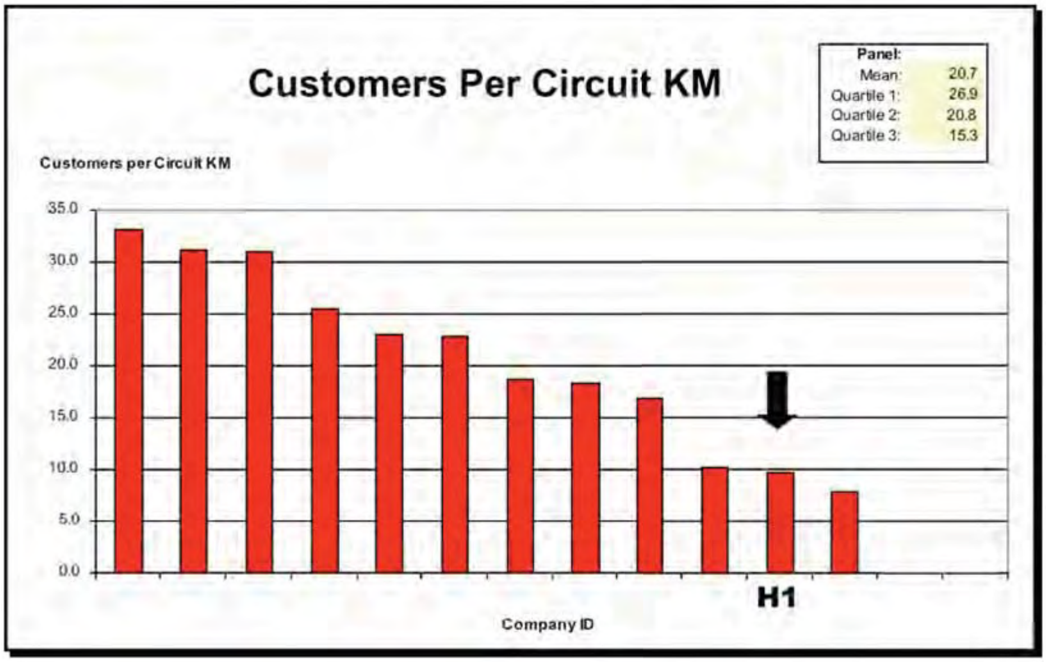
2.4.1 Large, low-density service territory

The Hydro One service territory is very large, with extended geographical areas with very few customers. In selecting utilities for comparison to Hydro One, it was a challenge to find others with the low density that characterizes Hydro One's territory. The sheer size of the territory imposes some requirements on the company for staffing in remote locations, including people, equipment, and facilities, all of which are difficult to effectively utilize at the level that would be possible in a more densely-populated area.

The chart titled "Customers per circuit km" highlights the customer density situation for the utilities in a panel of companies selected for comparison to Hydro One. As can be seen, Hydro One (black arrow) is at the low end for density, even within a selected a panel of companies with similar characteristics.

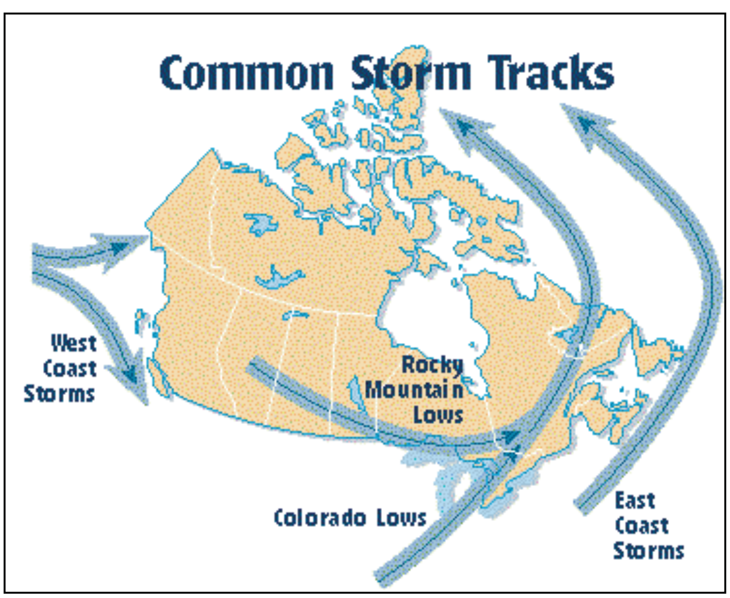
The low density of the service territory also imposes some practical realities on the design of the electric system. The costs associated with putting lines underground are economically unjustifiable for the majority of the Hydro One electric system, with long lines serving relatively few customers. Similarly, it is most economical to design the system in a low density area as a radial-feed system for most of the circuits. The net result is a radial-design, overhead-line system which has substantial exposure to weather, trees, and ordinary wear and tear that might be avoided or minimized in a different service territory.

The system design affects both the costs and reliability achievable by Hydro One. With substantial exposure comes a higher outage frequency for the system. With the long drives to get to parts of the system comes extended outage durations. The net result is poorer reliability than might otherwise be the case.



2.4.2 Weather Patterns

Hydro One is in an area of North America which experiences some weather extremes. Prevailing storm patterns that come across the Hydro One service territory include both the Rocky Mountain Lows and the Colorado Lows, as shown in the map below. Both of these affect the Hydro One customers around the Great Lakes. The Colorado Lows tend to cause the most severe damage to the Hydro One Distribution system.

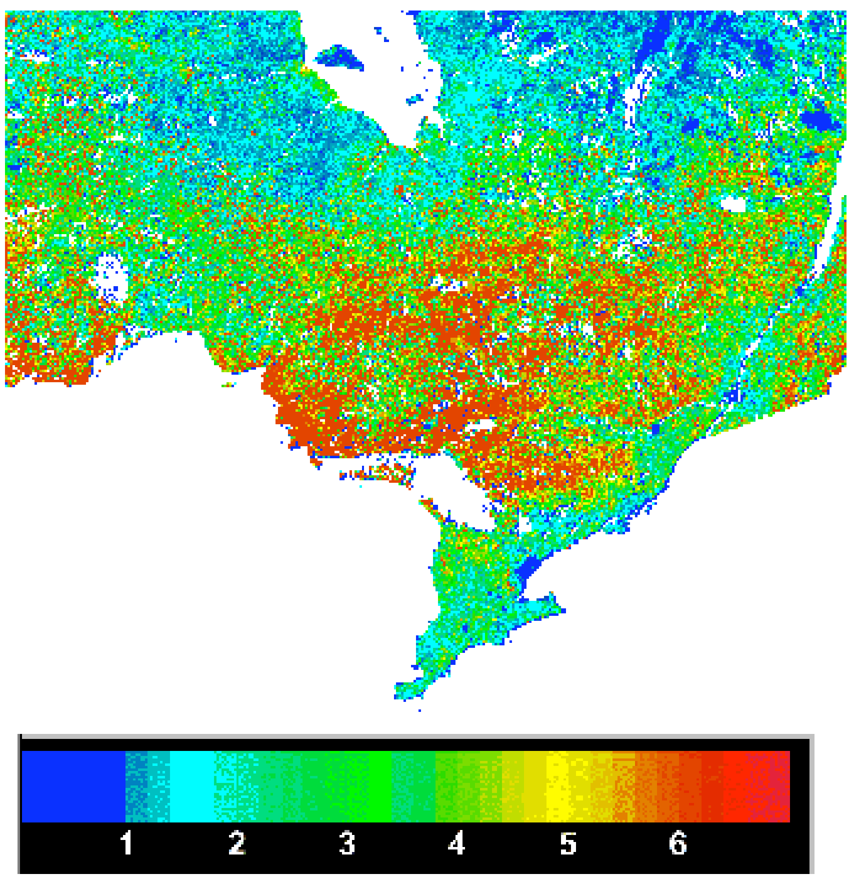


Hydro One's province-wide presence results in a situation where a major storm can actually impact multiple locations in the service territory. The net effect of these storm patterns is a regular storm frequency that is higher than many other utilities in North America experience. In turn, that high frequency and severity of storms creates reliability problems for Hydro One.

2.4.3 Tree Density/Vegetation

Another important factor in electric system operation and performance is the density of forestry within the service territory. Trees tend to have both a cost and reliability impact on an electric system. Failure to trim the trees adequately leads to reliability problems, when tree limbs contact the electric lines. Trimming the trees to keep them from affecting the lines is one of the more expensive activities in the maintenance program. Particularly with a predominantly overhead system, Hydro One's system is exposed to substantial tree-related problems, and the company is therefore required to spend significant amounts of money for this maintenance effort.

The service territory served by Hydro One is characterized by a relatively high density of trees. The leaf index map below shows the concentration of trees in Ontario. As can be seen from the map, Hydro One is affected by a large number of trees that have impact on its electric system. In the map, red (6) is the highest density, with blue (1) low density and most of the red areas in Ontario are serviced by Hydro One. As the map shows, the path of the weather patterns goes through the highest density areas.



Ontario Leaf Density

2.4.4 Operating Structure

The operating structure of the industry within Ontario has some influence on Hydro One. Because Hydro One is the largest distribution company supplying power to most rural locations and local communities that may have their own Local Distribution Company (LDC), there are some responsibilities created which might not otherwise be there. In particular, Hydro One is in the position of providing sub-transmission delivery services and utilizing its distribution network for large deliveries of power to over 30 smaller embedded utilities (LDC's) in the province. The net result of this additional responsibility is that the Hydro One distribution network has to be bigger and more robust than it would need to be to serve the needs of Hydro One alone. The need to build and maintain the line, transformation and spare assets required to service the embedded LDC's makes Hydro One's costs look higher than they might otherwise be if it also had responsibility for serving just end-use customers. The per-customer performance metrics do not always address this issue since the LDC's end-use customers are discounted and instead each LDC is treated as "one customer" for the purpose of normalizing Hydro One's results.

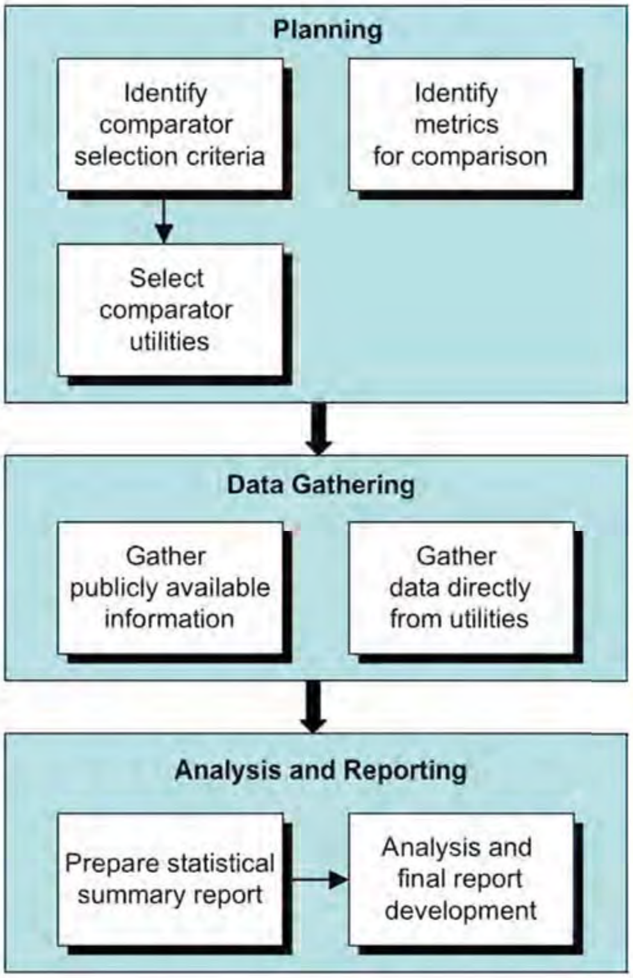
2.4.5 Summary of Introduction

As with every utility, Hydro One has some similarities to other utilities, and some unique characteristics. This introduction has attempted to identify some of the unique aspects of the Hydro One service territory and business situation. In selecting peers for comparison to Hydro One, these features have had influence on the selection criteria, in order to maximize the probability of achieving a true "peer" group. The most important of these characteristics is the low density of the service territory, since that drives the electric system design, and the need to disperse its resources over a wide area. These factors have a substantial impact on the long-term costs of operating the system, as well as the reliability performance of the system. The remainder of this report explains the benchmarking study and outcomes for Hydro One.

3. APPROACH

The approach to this study involved several steps, as shown in Figure 1 below:

Figure 1
Project Approach



The first major step in the project was a planning step, designed to determine the right companies to compare Hydro One against for performance results, and then to determine the right performance metrics for actually making the comparisons. The second major step involved collection of comparative data from all available sources, particularly the comparator companies themselves. The final step in the project was the analysis of the data gathered in the preceding step, developing conclusions leading to this final report.

3.1 COMPARATOR/PEER SELECTION

Using the basic project plan and schedule, the project began with peer selection. This required two major steps. First was development and final agreement as to the appropriate criteria for selecting peer companies. Second required actually applying those criteria against a population of utilities to determine which companies to use for a comparison panel. The key purpose was to find a collection of utilities with similarities to Hydro One, so that the affects of differences of circumstance could be minimized, and the team could focus on the differences in performance levels.

An alternative approach would have been to select from a broader array of potential comparator companies, and then attempt to adjust for the many differences among the resulting comparison panel. Given the difficulties in determining the appropriate adjustment factors for the many external variables which can affect performance, the team concluded that it was better to start with a more comparable panel to begin with.

The project team brainstormed potential selection criteria for use in determining similarity of circumstance, explored each, and then narrowed down the criteria to a relatively small group. The criteria needed to be tight enough to narrow the field of potential comparators, but loose enough to assure a broad enough panel of participants to allow robust comparison and analysis. In order to achieve this large enough final panel, it required the identification of a somewhat larger group of potential comparators than might otherwise be the case, since it is clear that some companies, when approached, would not be willing to participate in this type of study.

The final criteria included:

- Size of company, as measured by
  - Size of service territory
  - Customer Count
  - MWH Sales
  - Number of kilometers of distribution line
  - Distribution capacity
- Geography/weather characteristics (regional location)
- Customer Density
  - Customers per km of distribution line
  - Customers per sq. km
- Business structure (although here the goal was to get some similar and some not-so-similar companies)

The criteria used were as shown in the following table. The specific decision points for each of the criteria are shown in the second column of the table.

Service Territory size	More than 100,000 Sq KM
Customer Count	Between 500k and 5.2M
Customer Density	Fewer than 30 customers per Sq KM

Customers per distribution KM	Less than 40 customers per Pole KM
MWH Sales	More than 30,000,000 MWh Sales
Regional location	Some were chosen for proximity to Hydro One thus sharing weather conditions, others were chosen for similar vegetation density

For the business structure criterion, the goal was to gather some utilities with a fully-integrated transmission & distribution (T&D) wires business, and some with the functions more fully separated. In all cases the goal included companies who supply both Transmission and Distribution, but wanted a mix of operating structures for balance in the peer group.

In the case of the "MWH Sales" criterion, it was used based on publicly available data. Once the companies were selected, the number of MWH *transported* was used as a normalizing factor, rather than the MWH sales. The logic was that the MWH sales was reasonably available and useful for selection, while the MWH transported would be a better normalizing factor, and could be gathered once the study began.

A few additional criteria were suggested, but for either analytic or practical reasons, were not included. An example in this category is the condition of the distribution assets. Without a site visit/survey of each possible utility, it would be impossible to have a proper understanding of the condition of each utility's system, so that criterion, although intellectually appropriate, was rejected as impractical. Using the criteria finally selected, the project team identified a group of North American utilities that fit those criteria, and approached them to participate in the project.

Within the identified group of approximately 35 utilities, we were able to get commitments for participation from a total of 13 of them, in addition to Hydro One. Within that group of 13, not all companies were able to provide all of the data elements desired for the project, but the majority of the questions received enough answers to provide adequate information for comparisons. The group of companies who are represented in the comparison panel for the project includes the following:

- ATCO Electric
- BC Hydro
- Energie NB Power
- Fortis BC
- Hydro Quebec
- Manitoba Hydro
- National Grid
- Northwestern Energy
- Nova Scotia Power
- Oncor Energy Delivery
- Pacific Gas & Electric
- WE Energies
- Westar

Observing the final group of companies, it is a reasonable panel for comparison for Hydro One, and certainly effective for use in providing peer comparisons for the analysis.

3.2 METRIC SELECTION

Metric selection presented the next challenge to the project team. As directed by the OEB the goal was to provide a high-level set of metrics, to allow comparisons of final performance, while also allowing the team to understand differences among the utilities that drive some of the performance differences. A comprehensive set of metrics would allow all the desirable comparisons. Conversely, a brief set of metrics would make the data collection effort manageable, and thereby encourage more companies to participate, as well as meeting the OEB's guidance of a study that would not be overly costly.

The team, drawing upon years of experience in performing benchmark studies for distribution companies, established a provisional set of indicators. It covered the key areas of cost, reliability, and safety. Further refinements resulted in a final listing of metrics which were then pursued through the rest of the study. The final list is shown along with the resulting values in Section 4 of this report.

The metrics the project team decided upon fell into 4 major categories:

- Cost
  - Compared against several normalizing factors (customers, km of lines, asset base, MWh delivered, etc.)
  - Differentiating between investment (capital) versus consumption (expense)
- Asset Replacement Rates
  - Replacement rates are tracked as a means of indicating capital efficiency and asset utilization
- Reliability
  - The primary means of measuring service levels delivered
- Employee Safety
  - Measured using recordable and lost-time incident rates

At a more detailed level, some additional information was gathered about vegetation management, since that is the largest contributor to maintenance costs, and a significant contributor to reliability metrics. Similarly, some information was gathered in the area of meter reading.

The employee safety metrics identified are based on the reports done in the U.S. for OSHA, the Occupational Safety and Health Administration. OSHA specifies the reporting requirements as “recordable incidents” and “lost-time incidents”. Recordables are those incidents which are noted as safety problems, and which typically result in very minor injuries. They are “recorded” in order to highlight the frequency of potentially serious safety incidents. These incidents do not result in the employee needing to take any time off from the job. “Lost-time” incidents, conversely, are in fact injuries that do result in the employee needing to take time off. For most companies, these are much less frequent occurrences than recordable incidents, but of course, they represent more serious injuries.

In the cost and service level categories, care was taken to address the central issue of the Hydro One electric system, the fact of the very low-density service territory. In each of the areas, metrics were selected that track success based on “per-km” values. These give an accurate picture of the performance of the company in terms of the variables they can control.

The asset replacement metrics are measures of investment related to the existing asset base. In the tables in section 4 and Appendix D of this report, the asset replacement metrics are described as “excluding new business”. The point of these measures is to track the amount of money being invested to replace or rehabilitate the existing asset base, not the investment in adding new customers or capacity. To that end, the capital investment for additions of customers has been excluded from the calculation, thus leaving the “replacement capital investment”. While the measure isn’t perfect, because some amount of the replacement capital might also enhance capacity, it is directionally correct, and very useful.

3.3 DATA GATHERING

Data collection also involved a number of steps, with two primary parallel work activities. The first of these was gathering of publicly available data, through use of published financial statements, regulatory reports, and other available information. The second was gathering of data directly from the comparator companies themselves.

Gathering data directly from the target companies began with contacting each potential participant company, both to determine the right individual to work with for the project, and to determine their level of interest and willingness to gather and supply the data for the project.

Following initial contact and solicitation, the participants were provided the partially-completed data collection sheet identifying the information the project required. The companies gathered and verified the information, and submitted it for analysis and inclusion in the report. The data collection sheet provided guidelines and definitions for what costs to include, and how to summarize the data. During the course of the data collection period, it became clear that some clarifications were needed to the guidelines and instructions, and these were provided. The resulting definitions for the data collection are shown in Appendix A to the report. Appendix B provides a listing of FERC accounts that gave guidance for collecting cost data for the project.

The project team determined that the best approach to gathering accurate, representative data would be to assemble data for a 3-year period. Experience in other studies has shown that an individual year might show substantial anomalies for an individual company, both in costs and in other performance areas. For example, a significant one-year investment in construction of a major substation would inaccurately suggest that the company routinely invests large amounts of capital annually, or a large storm that would affect reliability results for that year can skew the outcome for an otherwise relatively reliable electric system. By using a 3-year figure, one-year anomalies can be mitigated. At the other extreme, trying to gather (for example) 5 years of data becomes onerous for the participating companies. 3-year figures were agreed upon as representative of recent, relevant performance, while bypassing the risks associated with a one-year assessment.

3.4 ANALYSIS AND REPORTING

The data were summarized into a statistical report (shown as appendix C to this report) showing the various performance metrics in graphical form, so that each of the companies could see where it stood on the costs and performance metrics. Analysis of the submitted data has led to the development of this report.

Within the analysis of the data that the companies provided, there was a specific need to convert the data to a single currency. The final results have been converted to Canadian dollars for all companies. The currency conversion rates were chosen to fit the three individual years for which we gathered data. Those conversion rates changed about 7% across this three-year period, from 1.22 Canadian$/US$ to 1.13 Canadian$/US$. The net result is that the Canadian companies have tended to look less and less cost-efficient over the three-year period. The exchange rates used for the three years, as provided by the U.S. Treasury Department, are the following:

2004 -- .8178
2005 -- .8759
2006 -- .8818

No adjustments have been made in the analysis for inflation of the costs during the 3-year period. Inflation would have been relatively consistent across the panel of companies, and would therefore not have a significant impact on the relative performance of the companies.

For reliability, industry standard metrics (SAIDI, SAIFI) were used, along with some designed to include the factors associated with extended lines for delivery. The standard metrics are generally comparable between companies, although there are a few potential differences. In particular, though the industry has been working to standardize, there are still differences among companies in the definition of “major events” for exclusion from reliability statistics. These have no impact on metrics that include all outages, but can have an impact where major events are excluded. Similarly, there are different definitions of “sustained” or conversely “momentary” outages. These range in duration from 1 minute to 2 minutes to 5 minutes. These different definitions typically make very little difference in the SAIDI value but they can have an impact of about 10% on the SAIFI value.

Analysis of the costs began at the top level, measuring total costs (capital plus O&M) for the entire electric system, and then splitting them out to individually cover capital and O&M. Those elements were compared against the basis of km of line, asset base, MWH transported, and number of customers. In the tables shown in section 4, the terminology “lines and subs” is used throughout the table. That is to describe the electric system in terms of distribution lines and distribution substations, which are significantly different classes of assets, although both are needed to serve customers. In the case of the asset replacement measures, separate measures were used for lines versus substations, to get an understanding of the replacement rates for the two types of asset.

4. FINDINGS AND CONCLUSIONS

4.1 FINDINGS FROM THE BENCHMARK ANALYSIS

The following table has been developed from the statistical report. The table shows the high-level results from the benchmark data collection. While the statistical report provides the detailed graphs showing all responses from the panel companies, the table represents the key summary statistics that the project team decided were the most important to use in reviewing performance. The metrics are listed in the same order here as they are shown in the statistical report in Appendix C. All monetary figures in the table are shown in Canadian dollars. Value judgments are evident in the table in the rankings. Lower rankings (e.g. 3 of 10) indicate better performance than higher rankings.

The asset replacement rates are calculated based on the capital additions for the year, excluding the portion of capital additions that went toward adding facilities for new customers. In broad terms, the remaining capital spending is designed to capture that portion of the annual capital expenditure related to replacements of existing assets, not to growth of the system to meet needs of new customers. It therefore provides an indication of the overall rate of replacement of the existing infrastructure. It is slightly overstated, to the extent that capital expenditures are used to enhance reliability or otherwise upgrade the system, rather than simply replace existing aged assets.

	Mean	Median	1st Q	Std Dev	H-1	Rank
Cost Metrics						
3-yr Avg Dist Lines & Subs Capital + O&M Spending per Pole KM	$5,774	$6,387	$4,000	$2,521	$3,707	3 of 10

3-yr Avg Customer Interruptions per Circuit KM (Exclude Major Events)	34.6	29.7	28.1	20.5	28.7	4 of 9
3-yr Avg SAIDI (Exclude Major Events)	3.0	2.6	2.0	1.7	7.2	12 of 12
3-yr Avg SAIFI (Exclude Major Events)	1.8	1.4	1.2	0.8	3.0	11 of 12
Safety						
3-yr Avg Recordable Incident Rate - Total Corporate	3.45	3.13	1.49	2.35	4.76	8 of 10
3-yr Avg Lost Time Incident Rate - Total Corporate	0.82	0.93	0.42	0.45	0.40	3 of 10
3-yr Avg Recordable Incident Rate - Distribution	3.94	3.04	1.61	2.41	6.60	8 of 9
3-yr Avg Lost Time Incident Rate - Distribution	1.05	0.65	0.52	1.13	0.52	3 of 9

The summary figures in the table are built on a 3-year average for each of the cost metrics. Both the 3-year values and the values showing only the most recent year were calculated during the course of the study. Given the long-term nature of capital investments for distribution assets, it was deemed important to base conclusions on the 3-year figures shown in the table.

The table provides a view of both the critical results and the variability in those results. In particular, by showing the values for mean, median, and first quartile, as well as the standard deviation, a reader can discern how the figures vary across the panel. Finally, the last two columns show the results for Hydro One on each of the metrics, and what rank that performance level places Hydro One in within the panel group.

During the course of the project, the team also looked at the costs associated with meter reading, and with tree-trimming/vegetation management. The results of that investigation are shown in the table below. In the case of tree-trimming, only about one third of the companies were able to provide the cost data for their vegetation management programs, but the information is still directionally useful. In the case of these two areas, costs were only captured for the most recent year, so unlike the numbers above, these figures are only for a 1-year period (2006), rather than a multi-year average.

	Mean	Median	1st Q	Std Dev	H-1	Rank
Meter Reading						
1-yr Meter Reading Expense per Pole KM	$200.14	$187.79	$150.48	$117.10	$160.77	3 of 8
1-yr Meter Reading Expense per Customer	$9.16	$9.07	$6.58	$3.78	$13.97	8 of 8
1-yr Meter Reading Expense per Read	$1.43	$0.87	$0.59	$1.21	$3.65	9 of 9

1-yr Tree Trimming Expense per KM Trimmed	$3,392	$3,061	$2,796	$792	$4,367	5 of 6
1-yr Cycle Time Actuals	5.3	5.5	3.7	3.4	11.5	7 of 7

When viewing the 1-year figures, care is needed, since particularly for tree-trimming, the process is a long-term process, but the program can be changed quickly, leading to significant swings for an individual company from year to year. As noted, only a third of the companies could provide the data for a single year, so asking for multiple years wasn't a viable option. Even though this is a very important aspect of both costs and reliability for electric system operation, it remains a relatively poorly-measured activity within the industry.

4.2 DISCUSSION

In terms of outcomes for Hydro One, a review of the tables above suggests several observations:

- Hydro One's costs compare favorably to the peer group, particularly when measured on a per-kilometer basis. This is also true when the measurements are made on a per-asset basis or a per-kWh transported basis. As a result of Hydro One's low customer density, costs are noticeably higher than average when they are compared on a per-customer basis.
- When normalized by the circuit KM of line, Hydro One's reliability results fall into the middle of the group of companies. Hydro One's reliability is generally poor in comparison to the group when measured only by SAIDI and SAIFI.
- Hydro One's safety performance is about average for the group of companies, both at the corporate level and at the Distribution level. The recordable incident rate is higher than average, while the lost-time incident rate is better than average.
- Hydro One's meter reading costs are in the low end of the group when they are normalized by distance (pole km). When measured on a per-customer or a per-read basis, the costs appear high.
- For the tree-trimming/vegetation management area, Hydro One's costs are high in comparison to the panel. In this particular area, the number of companies with

adequate data for comparison is relatively small, but the results provide an indication of the relative position for Hydro One.

As with all utilities, the demographics of the service territory served by Hydro One have a substantial impact on their operating performance. The density (or lack thereof) of the territory drives the radial design of the electric system, and the prevailing weather patterns influence both costs and reliability levels. At the more detailed level, the high density of trees creates a need for substantial amounts of tree-trimming and brush clearance, which drives costs and reliability. When the performance is normalized for the added exposure created by the long electric lines needed to serve the territory, Hydro One's performance is in line with that of its peers.

4.2.1 Costs

The cost results for Hydro One indicate good performance in managing costs when the circumstances of the service territory and electric system design are considered. Except on a cost-per-customer basis, almost all of the overall cost metrics fall at or below the mean values for the panel of companies, and some are very low. In general terms, and with all other items held equal, this would be considered good.

4.2.2 Asset Replacement Rates

In the area of asset replacement rates, the low cost numbers provide some reason for concern. In particular, Hydro One is replacing its assets at a very low rate, both in comparison to the panel and in general. While the figures investigated are only on a 3-year average basis, if the replacement rate is indicative of the long-term capital replacement rate, it would indicate an extraordinarily long life expectancy for some of the electric system.

4.2.3 Reliability

Reliability is typically measured using metrics such as SAIDI and SAIFI. These track the average customer experience in terms of outage frequency and duration. For this study, these metrics were tracked, and then additional metrics were provided, to follow the frequency and duration of outages as normalized by km of line. Both methods of measurement have merit in this circumstance, given the exposure levels created by Hydro One's operating circumstances.

For Hydro One, using reliability metrics as modified for line length, which better represents the rural nature of the Hydro One electric system, shows Hydro One performance is average, with reasonable expectations of improvements. Using SAIDI and SAIFI metrics, the electric system reliability compared against its peers is poor on a "customer experience" basis. Given the nature of the service territory, the ability to compare favorably on the customer experience basis is very limited. It is possible to improve on the current performance, but it would be extraordinarily expensive to achieve first-quartile performance on the SAIFI/SAIDI metrics.

4.2.4 Safety

In the safety area, Hydro One's performance is average for the panel. Recordable incidents are somewhat high, while lost-time incidents are relatively low. The net is average performance. "Average" performance within the utility industry is actually quite good when compared against other industries with similar hazards, where the safety records aren't as good. In comparisons made outside of this study, the utility industry has shown to be an overall leader in terms of safety performance.

At any rate, safety is an area where the status quo is never acceptable, because even the top-performing companies can improve, and there is a clear target of having no injuries. For Hydro One, a continued emphasis on maintaining and improving on the current safety record will serve the company and its employees well.

4.2.5 Meter Reading

The costs of manually reading meters are highly affected by the service territory characteristics. In the case of Hydro One, the meter reading costs are relatively low compared to the group, when normalized by the distance meter readers have to travel (pole KM). However, when viewed on a per-customer or per-read basis, the costs are at the high end of the panel of companies. This is reasonably explained by the very low density of the territory, which leads to long distances, either walking or driving, between meters for reading.

4.2.6 Tree Trimming

Tree-trimming appears as a high-cost activity for Hydro One. The costs for Hydro One would be expected to be high, given the long distribution lines through substantially forested areas. With average tree density, the exposure levels for the extensive system would create large amounts of tree-trimming requirements. With the high tree density levels in the Hydro One territory, the exposure is that much greater.

The above comments notwithstanding, it would appear there is an opportunity to improve the overall costs of tree-trimming for Hydro One. The key metrics shown in the table above measure the costs on a per-tree or per-km basis, and could be expected to be roughly comparable across companies. However, as noted below, there are differences between utilities in the factors impacting tree trimming performance.

The only variable about the tree-trimming practices which was tracked for this study is the length of the tree-trimming cycle for each of the companies. Hydro One has by far the longest cycle time between consecutive trimming of each tree. It would be worth investigating to see whether that has led to greater difficulty in performing the trimming when the time comes for each tree or circuit. It is also conceivable that this long cycle leads to more "hot-spot" trimming than usual, which is typically more expensive than routine cycle trimming. Previous studies executed by PA Consulting have indicated that the optimum tree-trimming cycle length is nearer to 5-6 years than to the 11 currently in practice at Hydro One.

One additional area of interest for further study would be the relationship between the long cycle time of tree-trimming and the reliability results. Shortening of the cycle time will probably have the benefit of reducing the frequency of tree-caused outages for circuits and customers. It would require further investigation of the % of interruptions caused by trees, and how much those could be reduced by a differently-structured tree-trim program.

4.2.7 Summary

Overall, this benchmarking effort has provided some valuable insights for Hydro One. Clearly it has highlighted some areas of opportunity, as well as some of the circumstances that create challenges for achieving superior performance. By carefully analyzing the results, Hydro One can target some improvement opportunities. At the same time, there are issues to be considered in using the study results, as discussed in Section 5 of this report.

5. CONSIDERATIONS IN USE OF THE STUDY RESULTS

This is a high-level study, providing a comparison of Hydro One versus a panel of comparable utilities. When reviewing the results it is necessary to appreciate that several factors can affect the results. Among those factors are the shift in the US/Canadian $ exchange rate through the three year survey period of the study; the variation in the age and design of systems run by each of the utilities; variations in the provision of services (e.g. delivery across the distribution network for other distributors) by the various distribution companies; as well as potential accounting differences in the cost data provided by the companies.

As there are a limited number of truly comparable distribution operators, the comparison panel is by definition limited. However, the number of companies against whom Hydro One is compared provides a useful group against which to compare results and highlight Hydro One performance. The study can be quite useful in providing directional guidance, but should not be used to create definitive numeric targets.

As noted in section 3.4 above, the currency exchange rate between Canadian and U.S. currency changed about 7% during the course of the 3 years under study. This came on the heels of an even larger shift in the two years immediately preceding this study. This has caused the Canadian companies in the study to see their relative performance in the overall panel slip somewhat, even for those whose underlying performance really didn't change at all.

A longer-term factor influencing the comparisons is the combined impact of the variation in the age and design of systems run by each of the utilities. Put simply, the average age and demographic profile of the equipment in each utility's system will have an impact upon cost results and reliability. For instance a utility whose average equipment age is before midlife will probably be spending less on capital replacements and O&M repairs as well as have higher reliability levels than a utility whose average equipment age is well beyond the midlife time frame. Similarly, with regards to system design, if due to low population density levels a distribution system is characterized by a large proportion of radial lines, it will have lower reliability performance than a system with a larger proportion of parallel and redundant pathways to customers. PA has been unable to gather adequate data through survey techniques in past studies about age and condition of electric systems. Utility records have proven inadequate to produce "average age" information, and there is no industry standard regarding definitions of equipment condition. As noted in 3.1, it wasn't practical to perform an inspection of each company's electric system to develop an objective, consistent view of system conditions, so this factor has been entirely left out of the analysis. Such an analysis would also be a very costly exercise.

Finally, there are differences in the accounting structures between utilities, both within Canada and between Canadian utilities and U.S. utilities. These manifest themselves in differences in what is treated as capital versus what is treated as O&M, as well as in differences in depreciation rates, etc. By looking at the total of capital and O&M, the majority of impact of these differences has been negated, so this is considered a relatively minor issue for this study.

In closing, this benchmarking study has taken the steps necessary to meet the requirements of providing a high level comparison of distribution utilities for Hydro One. However, as in any benchmarking study, one must be careful in reviewing and applying these results without a substantial degree of understanding of the underlying data and analysis.

APPENDIX A: DEFINITIONS

Glossary of terms

Term	Definition
Accumulated Depreciation	a.k.a. FERC form page 219, section B, column B. The total amount of depreciation calculated for all assets which are still in service.
CAIDI	Customer Average Interruption Duration Index. Total # of Sustained Customer Hours of Interruption / Total # of Customer Sustained Interruptions.
Capital Additions	Capital additions for any of the following: to hook up a specific new customer at the distribution level to generate additional revenues, to replace in kind, to improve reliability, or to meet general increase in system load.
Clearance distances	The distance in meters between the power lines and the closest point on the tree
Corporate Safety Statistics	Include the safety statistics of your entire corporation (customer service, T&D, corporate services, administrative, etc.)
Cycle time	Years between consecutive trim of dist. circuits
Distribution Circuit KM	Physical kilometres of line multiplied by the number of circuits per line. For purposes of this survey circuit kilometres refers to both overhead and underground line. One structure kilometre with 2 circuits = 2 circuit 2 circuit kilometres
Distribution End-Use Customer	Please provide the count reported on your FERC Form 1. If you do not report to FERC, use the following definition: an entity (usually defined as a metered point of delivery) who receives electric distribution services.
Distribution Fleet Ops & Maint.	Fleet operations and maintenance expense for trucks used only by Distribution field staff.
Distribution Line KM	Physical kilometres line irrespective of the number of circuits. For purposes of this survey structure kilometres refers to both overhead pole kilometres and underground trench kilometres.
Distribution Plant in Service	FERC Accts 360 to 374 or Total Asset base for the following: Land and Land Rights, Structures & Improvements, Station Equipment, Poles, Towers & Fixtures, Overhead Conductors, Line Transformers, Services, Meters, Installation on Customer Premises, Leases.
Electric Meter Reads	Total Reads for Year. A meter read 12 times per year would contribute 12 reads to the total.
Gross Plant in Service	Original installation costs of distribution assets, before any depreciation.
Line KM	Physical kilometres of line irrespective of the number of circuits. For purposes of this survey structure kilometres refers to both overhead pole kilometres and underground trench kilometres.
Load distribution	Percent of customers served by each voltage level
Loop circuits	Circuits with more than one feed, such that an outage on a line can be mitigated by switching around the failure point.
Lost Time Incident Rate	Rate for Total Lost time Incidents calculated: ((Total of OSHA 300A Column H) x 200,000) / Total Hours Worked

Maintenance Expense	Includes FERC accounts 590 to 598 or Maintenance of Distribution Substations and Transformers, OH Line, UG Line, Street Lighting and Signals, Meter, Structures, Misc Dist. Plant and other.
Maintenance Expense (cont.)	Includes activities such as Supervision & Engineering, Vegetation Management
Meter Read Inaccuracy	Error rates per 1000 meter reads
Meter Reading Expense (Electric Only)	a.k.a. FERC account 902. O&M cost for reading meters, including scheduling, routing, and data handling as well as the physical reading.
Minimum time counted as a sustained outage (Hours)	Definition for when an outage is considered sustained, rather than momentary.
MWh Sales	Total Megawatt Hours Sold to end-use customers. (Refer to FERC Form No. 1 page 300, line 10, column d.)
MWh Transported on Distribution Circuit KM	Total MWh moved across the distribution network, whether to your end-use customers or for another utility.
Network, network circuits	Lead cable, downtown/metropolitan network.
New Business Capital Additions	Capital additions primarily to hook up a specific new customer at the distribution level to generate additional revenues. Does not include expenditures to replace in kind, to improve reliability, or to meet general increase in system load.
Number of Trees Managed	Includes all of the trees in your service territory that you monitor, trim, inventory, etc.
Number of Trees Trimmed	Only those trees actually trimmed in the given year.
Operations Expense	Includes FERC accounts 581 to 589 or Operations or Installation Distribution Substations and Transformers, OH Line, UG Line, Street Lighting and Signals, Meter, Customer Installation Expenses, Rents and other.
Operations Expense (cont.)	Includes activities such as Load Dispatching, Supervision & Engineering and Mapping & Drafting, Trouble calls, Line patrols
Radial circuits	Circuits with only one feed for the circuit, such that a line failure of any type leads to an outage for all customers "downstream" of the failure point.
Read Completion Rate	Meters that were actually read that were assigned/scheduled to be read.
Recordable Incident Rate	Rate for Total Recordable Incidence calculated: ((Total of OSHA 300A Columns G + H + I + J) x 200,000) / Total Hours Worked
SAIDI	System Average Interruption Duration Index. Total # of Sustained Customer Hours of Interruption / Total # of Customers.
SAIFI	System Average Interruption Frequency Index. Total # of Sustained Customer Interruptions / Total # of Customers.
Trouble Call Response Expense	Costs associated with incoming trouble calls, dispatch, field activity and reporting related to trouble calls.
Vehicle Accident Rate	Total of vehicle accidents or collisions to total kilometres driven calculated: (total # of accidents x 1,000,000) / (total kilometers driven)

APPENDIX B: FERC ACCOUNT DESCRIPTIONS

This appendix contains the listing of FERC account descriptions for the cost categories under study for this project. It was used by the participating companies as they gathered the cost data for Hydro One.

580 Operation supervision and engineering.

This account shall include the cost of labor and expenses incurred in the general supervision and direction of the operation of the distribution system.

Direct supervision of specific activities, such as station operation, line operation, meter department operation, etc., shall be charged to the appropriate account. (For Major utilities, see operating expense instruction 1.)

581 Load dispatching (Major only).

This account (the keeping of which is optional with the utility) shall include the cost of labor, materials used and expenses incurred in load dispatching operations pertaining to the distribution of electricity.

ITEMS

Labor:

1. Directing switching.
2. Arranging and controlling clearances for construction, maintenance, test and emergency purposes.
3. Controlling system voltages.
4. Preparing operating reports.
5. Obtaining reports on the weather and special events.

Expenses:

6. Communication service provided for system control purposes.
7. System record and report forms.
8. Meals, traveling and incidental expenses.

581.1 Line and station supplies and expenses (Nonmajor only).

582 Station expenses (Major only).

583 Overhead line expenses (Major only).

584 Underground line expenses (Major only).

Accounts 581.1 through 584 shall include, respectively, the cost of labor, materials used and expenses incurred in the operation of overhead and underground distribution lines and stations.

ITEMS

Line Labor:

1. Supervising line operation.
2. Changing line transformer taps.
3. Inspecting and testing lightning arresters, line circuit breakers, switches and grounds.
4. Inspecting and testing line transformers for the purpose of determining load, temperature or operating performance.
5. Patrolling lines.
6. Load tests and voltages surveys of feeders, circuits and line transformers.
7. Removing line transformers and voltage regulators with or without replacements.
8. Installing line transformers or voltage regulators with or without change in capacity provided that the first installation of these items is included in account 368, Line transformers.
9. Voltage surveys, either routine or upon request of customers, including voltage tests at customers' main switch.
10. Transferring loads, switching and reconnecting circuits and equipment for operation purposes.
11. Electrolysis surveys.
12. Inspecting and adjusting line testing equipment.

Line Supplies and Expenses:

13. Tool expenses.
14. Transportation expenses.
15. Meals, traveling and incidental expense.
16. Operating supplies, such as instrument charts, rubber goods, etc.

Station Labor:

1. Supervising station operation.
2. Adjusting station equipment where such adjustment primarily affects performance, such as regulating the flow of cooling water, adjusting current in fields of a machine, changing voltage of regulators or changing station transformer taps.
3. Keeping station log and records and preparing reports on station operation.
4. Inspecting, testing and calibrating station equipment for the purpose of checking its performance.
5. Operating switching and other station equipment.
6. Standing watch, guarding and patrolling station and station yard.
7. Sweeping, mopping and tidying station.
8. Care of grounds, including snow removal, cutting grass, etc.

Station Supplies and Expenses:

9. Building service expenses.
10. Operating supplies, such as lubricants, commutator brushes, water and rubber goods.
11. Station meter and instrument supplies, such as ink and charts.
12. Station record and report forms.
13. Tool expenses.
14. Transportation expenses.
15. Meals, traveling and incidental expenses.

NOTE (MAJOR ONLY): If the utility owns storage battery equipment used for supplying electricity to customers in periods of emergency, the cost of operating labor and of supplies, such as acid, gloves, hydrometers, thermometers, soda, automatic cell fillers, acid proof shoes, etc., shall be included in this account. If significant in amount, a separate subdivision shall be maintained for such expenses.

585 Street lighting and signal system expenses.

A. For Nonmajor utilities, this account shall include the cost of labor, materials used and expenses incurred in the operation of street lighting and signal system plant.

B. For Major utilities, this account shall include the cost of labor, materials used and expenses incurred in: (a) The operation of street lighting and signal system plant which is owned or leased by the utility; and (b) the operation and maintenance of such plant owned by customers where such work is done regularly as a part of the street lighting and signal system service.

ITEMS

Labor:

1. Supervising street lighting and signal systems operation.
2. Replacing lamps and incidental cleaning of glassware and fixtures in connection therewith.
3. Routine patrolling for lamp outages, extraneous nuisances or encroachments, etc.
4. Testing lines and equipment including voltage and current measurement.
5. Winding and inspection of time switch and other controls.

Materials and Expenses:

6. Street lamp renewals.
7. Transportation and tool expense.
8. Meals, traveling, and incidental expenses.

586 Meter expenses.

This account shall include the cost of labor, materials used and expenses incurred in the operation of customer meters and associated equipment.

ITEMS

Labor:

1. Supervising meter operation.
2. Clerical work on meter history and associated equipment record cards, test cards, and reports.
3. Disconnecting and reconnecting, removing and reinstalling, sealing and unsealing meters and other metering equipment in connection with initiating or terminating services including the cost of obtaining meter readings, if incidental to such operation.
4. Consolidating meter installations due to elimination of separate meters for different rates of service.
5. Changing or relocating meters, instrument transformers, time switches, and other metering equipment.
6. Resetting time controls, checking operation of demand meters and other metering equipment, when done as an independent operation.
7. Inspecting and adjusting meter testing equipment.
8. Inspecting and testing meters, instrument transformers, time switches, and other metering equipment on premises or in shops excluding inspecting and testing incidental to maintenance

Materials and Expenses:

9. Meter seals and miscellaneous meter supplies.
10. Transportation expenses.
11. Meals, traveling, and incidental expenses.
12. Tool expenses.

NOTE: The cost of the first setting and testing of a meter is chargeable to utility plant account 370, Meters.

587 Customer installations expenses.

This account shall include the cost of labor, materials used and expenses incurred in work on customer installations in inspecting premises and in rendering services to customers of the nature of those indicated by the list of items hereunder.

ITEMS

Labor:

1. Supervising customer installations work.
2. Inspecting premises, including check of wiring for code compliance.
3. Investigating, locating, and clearing grounds on customers' wiring.
4. Investigating service complaints, including load tests of motors and lighting and power circuits on customers' premises; field investigations of complaints on bills or of voltage.
5. Installing, removing, renewing, and changing lamps and fuses.
6. Radio, television and similar interference work including erection of new aerials on customers' premises and patrolling of lines, testing of lightning arresters, inspection of pole hardware, etc., and examination on or off premises of customers' appliances, wiring, or equipment to locate cause of interference.
7. Installing, connecting, reinstalling, or removing leased property on customers' premises.
8. Testing, adjusting, and repairing customers' fixtures and appliances in shop or on premises.
9. Cost of changing customers' equipment due to changes in service characteristics.
10. Investigation of current diversion including setting and removal of check meters

and securing special readings thereon; special calls by employees in connection with discovery and settlement of current diversion; changes in customer wiring and any other labor cost identifiable as caused by current diversion.

Materials and Expenses:

11. Lamp and fuse renewals.
12. Materials used in servicing customers' fixtures, appliances and equipment.
13. Power, light, heat, telephone, and other expenses of appliance repair department.
14. Tool expense.
15. Transportation expense, including pick-up and delivery charges.
16. Meals, traveling and incidental expenses.
17. Rewards paid for discovery of current diversion.

NOTE A: Amounts billed customers for any work, the cost of which is charged to this account, shall be credited to this account. Any excess over costs resulting therefrom shall be transferred to account 451, Miscellaneous Service Revenues.

NOTE B: Do not include in this account expenses incurred in connection with merchandising, jobbing and contract work.

588 Miscellaneous distribution expenses.

This account shall include the cost of labor, materials used and expenses incurred in distribution system operation not provided for elsewhere.

ITEMS

Labor:

1. General records of physical characteristics of lines and substations, such as capacities, etc.
2. Ground resistance records.
3. Joint pole maps and records.
4. Distribution system voltage and load records.
5. Preparing maps and prints.
6. Service interruption and trouble records.
7. General clerical and stenographic work except that chargeable to account 586, Meter expenses.

Expenses:

8. Operating records covering poles, transformers, manholes, cables, and other distribution facilities. Exclude meter records chargeable to account 586, Meter Expenses and station records chargeable to account 582, Station Expenses (For Nonmajor utilities, account 581.1, Line and Station Expenses), and stores records (For Nonmajor utilities, station records) chargeable to account 163, Stores Expense Undistributed (For Nonmajor utilities, account 581.1, Line and Station Expenses).
9. Janitor work at distribution office buildings including snow removal, cutting grass, etc.

Materials and Expenses:

10. Communication service.
11. Building service expenses.
12. Miscellaneous office supplies and expenses, printing, and stationery, maps and records and first-aid supplies.
13. Research, development, and demonstration expenses (Major only).

589 Rents.

This account shall include rents of property of others used, occupied, or operated in connection with the distribution system, including payments to the United States and others for the use and occupancy of public lands and reservations for distribution line rights of way. (See operating expense instruction 3.)

590 Maintenance supervision and engineering (Major only).

This account shall include the cost of labor and expenses incurred in the general supervision and direction of maintenance of the distribution system. Direct field supervision of specific jobs shall be charged to the appropriate maintenance account. (See operating expense instruction 1.)

591 Maintenance of structures (Major only).

This account shall include the cost of labor, materials used and expenses incurred in maintenance of structures, the book cost of which is includible in account 361, Structures and Improvements. (See operating expense instruction 2.)

592 Maintenance of station equipment (Major only).

This account shall include the cost of labor, materials used and expenses incurred in maintenance of plant, the book cost of which is includible in account 362, Station Equipment, and account 363, Storage Battery Equipment. (See operating expense instruction 2.)

592.1 Maintenance of structures and equipment (Nonmajor only).

This account shall include the cost of labor, materials used and expenses incurred in maintenance of structures, the book cost of which is includible in account 361, Structures and Improvements, account 362, Station Equipment, and account 363, Storage Battery Equipment. (See operating expense instruction 2.)

593 Maintenance of overhead lines (Major only).

This account shall include the cost of labor, materials used and expenses incurred in the maintenance of overhead distribution line facilities, the book cost of which is includible in account 364, Poles, Towers and Fixtures, account 365, Overhead Conductors and Devices, and account 369, Services. (See operating expense instruction 2.)

ITEMS

1. Work of the following character on poles, towers, and fixtures:

a. Installing additional clamps or removing clamps or strain insulators on guys in place.

b. Moving line or guy pole in relocation of pole or section of line.

c. Painting poles, towers, crossarms, or pole extensions.

d. Readjusting and changing position of guys or braces.

e. Realigning and straightening poles, crossarms, braces, pins, racks, brackets, and other pole fixtures.

f. Reconditioning reclaimed pole fixtures.

g. Relocating crossarms, racks, brackets, and other fixtures on poles.

h. Repairing pole supported platform.

i. Repairs by others to jointly owned poles.

j. Shaving, cutting rot, or treating poles or crossarms in use or salvaged for reuse.

k. Stubbing poles already in service.

l. Supporting conductors, transformers, and other fixtures and transferring them to new poles during pole replacements.

m. Maintaining pole signs, stencils, tags, etc.

2. Work of the following character on overhead conductors and devices:

a. Overhauling and repairing line cutouts, line switches, line breakers, and capacitor installations.

b. Cleaning insulators and bushings.

c. Refusing line cutouts.

d. Repairing line oil circuit breakers and associated relays and control wiring.

e. Repairing grounds.

f. Resagging, retying, or rearranging position or spacing of conductors.

g. Standing by phones, going to calls, cutting faulty lines clear, or similar activities at times of emergency.

h. Sampling, testing, changing, purifying, and replenishing insulating oil.

i. Transferring loads, switching, and reconnecting circuits and equipment for maintenance purposes.

j. Repairing line testing equipment.

k. Trimming trees and clearing brush.

l. Chemical treatment of right of way area when occurring subsequent to construction of line.

3. Work of the following character on overhead services:

a. Moving position of service either on pole or on customers' premises.

b. Pulling slack in service wire.

c. Retying service wire.

d. Refastening or tightening service bracket.

594 Maintenance of underground lines (Major only).

This account shall include the cost of labor, materials used and expenses incurred in the maintenance of underground distribution line facilities, the book cost of which is includible in account 366, Underground Conduit, account 367, Underground Conductors and Devices, and account 369, Services. (See operating expense instruction 2.)

ITEMS

1. Work of the following character on underground conduit:

a. Cleaning ducts, manholes, and sewer connections.

b. Moving or changing position of conduit or pipe.

c. Minor alterations of handholes, manholes, or vaults.

d. Refastening, repairing, or moving racks, ladders, or hangers in manholes or vaults.

e. Plugging and shelving ducts.

f. Repairs to sewers, drains, walls, and floors, rings and covers.

2. Work of the following character on underground conductors and devices:

a. Repairing circuit breakers, switches, cutouts, network protectors, and associated relays and control wiring.

b. Repairing grounds.

c. Retraining and reconnecting cables in manholes including transfer of cables from one duct to another.

d. Repairing conductors and splices.

e. Repairing or moving junction boxes and potheads.

f. Refireproofing cables and repairing supports.

g. Repairing electrolysis preventive devices for cables.

h. Repairing cable bonding systems.

i. Sampling, testing, changing, purifying and replenishing insulating oil.

j. Transferring loads, switching and reconnecting circuits and equipment for maintenance purposes.

k. Repairing line testing equipment.

l. Repairing oil or gas equipment in high voltage cable systems and replacement of oil or gas.

3. Work of the following character on underground services:

a. Cleaning ducts.

b. Repairing any underground service plant.

594.1 Maintenance of lines (Nonmajor only).

This account shall include the cost of labor, materials used and expenses incurred in the maintenance of distribution line facilities, the book cost of which is includible in account 364, Poles, Towers and Fixtures, account 365, Overhead Conductors and Devices, account 366, Underground Conduit, account 367, Underground Conductors and Devices, and account 369, Services. (See operating expense instruction 2.)

ITEMS

1. Work of the following character on poles, towers, and fixtures:

a. Installing additional clamps or removing clamps or strain insulators on guys in place.

b. Moving line or guy pole in relocation of pole or section of line.

c. Painting poles, towers, crossarms, or pole extensions.

d. Readjusting and changing position of guys or braces.

e. Realigning and straightening poles, crossarms, braces, pins, racks, brackets, and other pole fixtures.

f. Reconditioning reclaimed pole fixtures.

g. Relocating crossarms, racks, brackets, and other fixtures on pole.

h. Repairing pole supported platform.

i. Repairs by others to jointly owned poles.

j. Shaving, cutting rot, or treating poles or crossarms in use or salvage for reuse.

k. Stubbing poles already in service.

l. Supporting conductors, transformers, and other fixtures and transferring them to new poles during pole replacement.

m. Maintaining pole signs, stencils, tags, etc.

2. Work of the following character on overhead conductors and devices:

a. Overhauling and repairing line cutouts, line switches, line breakers, and capacitor installations.

b. Cleaning insulators and bushings.

c. Refusing line cutouts.

d. Repairing line oil circuit breakers and associated relays and control wiring.

e. Repairing grounds.

f. Resagging, retying, or rearranging position or spacing of conductors.

g. Standing by phones, going to calls, cutting faulting lines clear, or similar activities at times of emergencies.

h. Sampling, testing, changing, purifying, and replenishing insulating oil.

i. Transferring loads, switching, and reconnecting circuits and equipment for maintenance purposes.

j. Repairing line testing equipment.

k. Trimming trees and clearing brush.

l. Chemical treatment of right of way area when occurring subsequent to construction of line.

3. Work of the following character on underground conduit:

a. Cleaning ducts, manholes, and sewer connections.

b. Moving or changing position of conduit or pipe.

c. Minor alterations of handholes, manholes, or vaults.

d. Refastening, repairing or moving racks, ladders, or hangers in manholes or vaults.

e. Plugging and shelving ducts.

f. Repairs to sewers, drains, walls and floors, rings and covers.

4. Work of the following character on underground conductors and devices:

a. Repairing circuit breakers, switches, cutouts, network protectors, and associated relays and control wiring.

b. Repairing grounds.

c. Retraining and reconnecting cables in manhole including transfer of cables from one duct to another.

d. Repairing conductors and splices.

e. Repairing or moving junction boxes and potheads.

f. Refireproofing cables and repairing supports.

g. Repairing electrolysis preventive devices for cables.

h. Repairing cable bonding systems.

i. Sampling, testing, changing, purifying and replenishing insulating oil.

j. Transferring loads, switching and reconnecting circuits and equipment for maintenance purposes.

k. Repairing line testing equipment.

l. Repairing oil or gas equipment in high voltage cable system and replacement of oil or gas.

5. Work of the following character on services:

a. Moving position of service either on pole or on customers' premises.

b. Pulling slack in service wire.

c. Retying service wire.

d. Refastening or tightening service bracket.

e. Cleaning ducts.

595 Maintenance of line transformers.

This account shall include the cost of labor, materials used and expenses incurred in maintenance of distribution line transformers, the book cost of which is includible in account 368, Line Transformers. (See operating expense instruction 2.)

596 Maintenance of street lighting and signal systems.

This account shall include the cost of labor, materials used and expenses incurred in maintenance of plant, the book cost of which is includible in account 373, Street Lighting and Signal Systems. (See operating expense instruction 2.)

597 Maintenance of meters.

This account shall include the cost of labor, materials used and expenses incurred in the maintenance of meters and meter testing equipment, the book cost of which is includible in account 370, Meters, and account 395, Laboratory Equipment, respectively. (See operating expense instruction 2.)

598 Maintenance of miscellaneous distribution plant.

This account shall include the cost of labor, materials used and expenses incurred in maintenance of plant, the book cost of which is includible in accounts 371, Installations on Customers' Premises, and 372, Leased Property on Customers' Premises, and any other plant the maintenance of which is assignable to the distribution function and is not provided for elsewhere. (See operating expense instruction 2.)

ITEMS

a. Work of similar nature to that listed in other distribution maintenance accounts.

b. Maintenance of office furniture and equipment used by distribution system department.

901 Supervision (Major only).

This account shall include the cost of labor and expenses incurred in the general direction and supervision of customer accounting and collecting activities. Direct supervision of a specific activity shall be charged to account 902, Meter Reading Expenses, or account 903, Customer Records and Collection Expenses, as appropriate. (See operating expense instruction 1.)

902 Meter reading expenses.

This account shall include the cost of labor, materials used and expenses incurred in reading customer meters, and determining consumption when performed by employees engaged in reading meters.

ITEMS

Labor:

1. Addressing forms for obtaining meter readings by mail.
2. Changing and collecting meter charts used for billing purposes.
3. Inspecting time clocks, checking seals, etc., when performed by meter readers and the work represents a minor activity incidental to regular meter reading routine.
4. Reading meters, including demand meters, and obtaining load information for billing purposes. Exclude and charge to account 586, Meter Expenses, or to account 903, Customer Records and Collection Expenses, as applicable, the cost of obtaining meter readings, first and final, if incidental to the operation of removing or resetting, sealing, or locking, and disconnecting or reconnecting meters.
5. Computing consumption from meter reader's book or from reports by mail when done by employees engaged in reading meters.
6. Collecting from prepayment meters when incidental to meter reading.
7. Maintaining record of customers' keys.
8. Computing estimated or average consumption when performed by employees engaged in reading meters.

Materials and Expenses:

9. Badges, lamps, and uniforms.
10. Demand charts, meter books and binders and forms for recording readings, but not the cost of preparation.
11. Postage and supplies used in obtaining meter readings by mail.
12. Transportation, meals, and incidental expenses.

903 Customer records and collection expenses.

This account shall include the cost of labor, materials used and expenses incurred in work on customer applications, contracts, orders, credit investigations, billing and accounting, collections and complaints.

ITEMS

Labor:

1. Receiving, preparing, recording and handling routine orders for service, disconnections, transfers or meter tests initiated by the customer, excluding the cost of carrying out such orders, which is chargeable to the

Appendix C

Statistical Report - Charts & Graphs

Data updated: as of October 15, 2007

3 year values are 2004-2006, 1 year values are 2006.

Cost Metrics

3 year values are 2004-2006, 1 year values are 2006.

3-yr Avg Dist Lines & Subs Capital + O&M Spending per Pole KM

2007 Comparison of Labour Rates and Overtime Policy

FINAL REPORT

October, 2007

Prepared By:

Karl Aboud
Stephanie Hudakoc

Table of Contents

Section

Appendices

I. Introduction

Purpose

The Ontario Energy Board (OEB) directed Hydro One Networks (Hydro One) to engage an independent party to, "Develop a comparison of labour rates and overtime policies amongst Hydro One, other comparative Ontario electricity distributors, and other Canadian utilities as identified in the high level benchmarking survey." As a result, Hydro One issued a Request for Proposal (RFP) from which Hay Group was selected to conduct a custom survey on labour rates and overtime policies of three benchmark positions among a selected group of organizations. The purpose of this report is to provide comparisons of Hydro One pay values relative to those of the market.

Survey Benchmark Positions

The following three positions were selected as the survey benchmark positions as they represent a large component of the workforce and are typical of job classifications across the utility industry (see Appendix A for full descriptions):

1. Field Operations Manager
2. Design Engineer
3. Powerline Maintainer

II. Executive Summary

Field Operations Manager

Hydro One is below market on both the hourly wage rate minimum and maximum. Hydro One's hourly wage rate minimum of $35.55 is 24% below the market's average of $46.92, while Hydro One's hourly wage rate maximum of $56.73 is 10% below the market average of $62.96. The Field Operations Manager at Hydro One is not eligible for overtime. Two out of the eleven market survey participants that matched to Field Operations Manager are eligible for overtime. Neither Hydro One nor any of the market survey participants have union representation for the Field Operations Manager.

Design Engineer

Hydro One is in-line with market on both the hourly wage rate minimum and maximum. Hydro One's hourly wage rate minimum of $37.22 is comparable to the market's average of $37.16, while Hydro One's hourly wage rate maximum of $53.38 is 4% above the market average of $51.55. The Design Engineer at Hydro One is eligible for overtime. Seven out of the fourteen market survey participants that matched to Design Engineer are eligible for overtime. Hydro One and four out of the fourteen market survey participants have union representation for the Design Engineer.

Powerline Maintainer

Hydro One's hourly rate wage minimum of $18.72 is considerably below the market on the hourly wage rate minimum, however the hourly wage rate maximum is above the market. Hydro One's hourly wage rate minimum of $18.72 is 30% below the market's average of $26.76, while Hydro One's hourly wage rate maximum of $36.10 is 12% above the market average of $32.31. The Powerline Maintainer at Hydro One is eligible for overtime. All of the thirteen market survey participants that matched to the Powerline Maintainer are eligible for overtime. Hydro One and all of the thirteen organizations that matched to the Powerline Maintainer have union representation.

III. Survey Participation & Organizational Profile

Reference Market

Hay Group contacted seventeen prospective organizations to be invited to participate in the survey. The selected comparator market is a statistically relevant sample, comprised of the following fourteen organizations that agreed to participate in the survey:

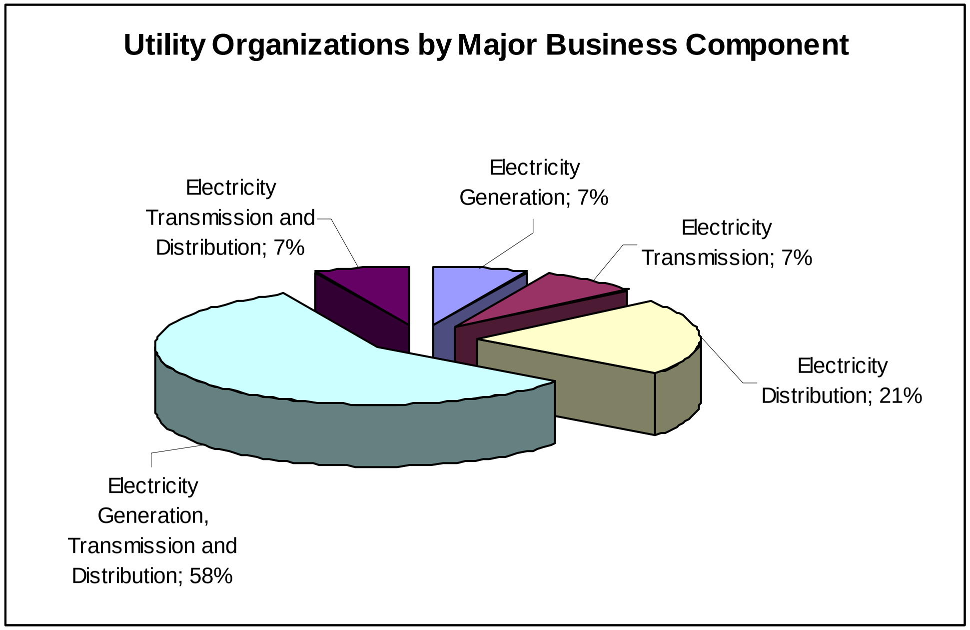
- ATCO Electric
- British Columbia Hydro and Power Authority
- EPCOR
- FortisAlberta Inc.
- FortisBC Inc.
- Hydro Ottawa Limited
- Hydro-Québec
- Manitoba Hydro
- New Brunswick Power Corporation
- Newfoundland Power Inc.
- Nova Scotia Power Inc.
- Ontario Power Generation Inc.
- SaskPower
- Toronto Hydro Corporation

Organization Profile

The average and median organizational profiles of the fourteen organizations are as follows:

Statistical Reference	Gross Revenue / Operating Budget ($Millions)	Total Assets ($Millions)
Hydro One	***$4,545.0***	***$12,234.0***
Average	$2,255.4	$9,018.1
Median	$1,456.0	$3,408.0

The chart below summarizes the major business component of the participating utility organizations:



IV. Terms and Methodology

Compensation Elements and Overtime Principles

This report provides comparative data for specific elements of cash compensation and overtime principles as defined below.

Hourly Rate Minimum – The minimum hourly wage rate that the organization is willing to pay an incumbent for the job in question.

Hourly Rate Maximum – The maximum hourly wage rate that the organization is willing to pay an incumbent for the job in question.

Number of Wage Steps – The number of hourly wage rate steps for each job, including minimum and maximum.

Standard Length of Time From Minimum to Maximum Wage Rate – The number of months an incumbent must be in the job in order to progress from the minimum to the maximum hourly wage rate.

Number of Hours in a Standard Work Week – The standard number of hours that an incumbent in the job is required to work each week.

Overtime Eligibility – Whether the job is eligible for overtime.

Overtime Wage Standards and Rates – The applicable levels of overtime rates.

Union Representation – Staff represented by a union.

Statistical References

Market data are reported using the following statistics:

P90	– **the 90th percentile**, below which 90% of the values fall (requires a minimum of 11 organizations to illustrate).
P75	– **the 75th percentile**, below which 75% of the values fall (requires a minimum of 7 organizations to illustrate).
P50	– **the 50th percentile (Median)**, below which 50% of the values fall (requires a minimum of 4 organizations to illustrate).
P25	– **the 25th percentile**, below which 25% of the values fall (requires a minimum of 7 organizations to illustrate).
P10	– **the 10th percentile**, below which 10% of the values fall (requires a minimum of 11 organizations to illustrate).
Average	– **the arithmetic mean** of all values (requires a minimum of 3 organizations to illustrate).

Methodology

Hay Group designed and sent a custom survey questionnaire. For each benchmark position, a brief profile was developed, which is included in Appendix A. Participants were asked to match positions in their organization with the benchmark position profiles and to provide more insights into their jobs, such as the number of overall reports and other accountabilities not specified in the profile. The survey also included questions regarding the organization's overtime policies. Once the completed surveys were returned to Hay Group, participants were contacted for data verification as necessary. Hay Group also initiated a number of follow-up actions to clarify information provided by the participants.

Using the Hay Job Evaluation Method, a Hay Group consultant evaluated the three Hydro One benchmark positions and the matched positions submitted from each of the survey participants. A summary of the Hay Evaluation Method is provided in Appendix B. The evaluation points assigned to each of the three Hydro One benchmark positions are as follows:

Field Operations Manager	543 Total Points (i.e., the standard Price Point for any Hydro One Band 7 position)
Design Engineer	479 Total Points
Powerline Maintainer	203 Total Points

The job comparisons from the various organizations were "point-adjusted" to account for the different aspects of the total job content, defined as Know-How, Problem Solving and Accountability.

The submitted survey data were either annual salary dollars or hourly wage rates. To eliminate any skewing of results due to different weekly hours, the results were presented as hourly wage rates rather than annual salary.

The aggregate wage rate data were adjusted to Hydro One's specific point levels of each of the three jobs in order to account for the differences amongst the matched jobs. The raw data was compiled into dollar per Hay point ratios and then multiplied by Hydro One's points.

The following example illustrates the adjustment methodology that was used, which is a standard approach by which to adjust for complexity and responsibility differences amongst generally similar jobs in the marketplace.

Example of adjustment methodology using hypothetical data:

Participants	Maximum Hourly Wage Rate Not Adjusted for Hay Points	Hay Points Assigned	Maximum Hourly Wage Rate Per Hay Points Assigned	Maximum Hourly Wage Rate Adjusted for Hay Points (i.e., Hay Points x Wage Rate Per Point)
A	50.22	469	0.107	54.61
B	60.63	450	0.135	68.71
C	60.40	539	0.112	57.15
D	59.00	438	0.135	68.70
E	58.67	469	0.125	63.80
Client	**53.48**	**510**		**53.48**
Median	59.00			63.80
Average	57.78	473		62.59
N	5			5
vs Market Average	**-7.4%**			**-14.6%**

V. Benchmark Position Survey Results

Job Evaluation Results

The table following summarizes the findings collected from the selected organizations in setting the evaluation points for each benchmark position surveyed.

Summary of Job Evaluation Results

Survey Code	Survey Position	Hydro One Evaluation	Average Market Evaluations	Comparable Job Findings
1	Field Operations Manager	543	491	– 2 have more points than Hydro One's job – 2 have similar points than Hydro One's job – 7 have less points than Hydro One's job
2	Design Engineer	479	455	– 1 has more points than Hydro One's job – 9 have similar points than Hydro One's job – 4 have less points than Hydro One's job
3	Powerline Maintainer	203	204	– 1 has more points than Hydro One's job – 12 have similar points than Hydro One's job

Survey Results

This section compares Hydro One to the average wage values, overtime policies and union representation for each of the surveyed positions.

Summary of Market Comparison

Survey Position	Hourly Wage Rate Minimum			Hourly Wage Rate Maximum			Overtime Policies		Union Representation	
	Hydro One	Market Average*	Variance from Market Average*	Hydro One	Market Average*	Variance from Market Average*	Hydro One (# yes)	Market (# yes)	Hydro One (# yes)	Market (# yes)
Field Operations Manager	35.55	46.92	-24%	56.73	62.96	-10%	0	2	0	0
Design Engineer	37.22	37.16	0%	53.38	51.55	4%	1	7	1	4
Powerline Maintainer	18.72	26.76	-30%	36.1	32.31	12%	1	13	1	13

** Market data have been adjusted at Hydro One's Hay Point Values.*

Detailed Market Comparisons

The three following tables illustrate the full array of comparable data and aggregate statistical values for each job relative to the marketplace.

Survey Position 1: Field Operations Manager

Adjusted to Hay Points at 543

	Hay Points	Adjusted Minimum Hourly Wage Rate	Adjusted Maximum Hourly Wage Rate	No. of Wage Rate Steps	Standard Length of Time From Minimum to Maximum Wage Rate (Months)	No. of Hours in the Standard Work Week
Hydro One Networks Inc.	543	35.55	56.73	0		40.0

VI. Discussion/Analysis

The data collected for each of the three benchmark positions included the minimum and maximum hourly wage rates that an organization is willing to pay an incumbent for the job in question, overtime eligibility and policies, and union representation. Each of these factors is important for any organization as they provide the framework for making salary decision. The following results were found for each of the benchmark positions:

Field Operations Manager

Hydro One is below market on both the hourly wage rate minimum and maximum. Hydro One's hourly wage rate minimum of $35.55 is 24% below the market's average of $46.92, while their hourly wage rate maximum of $56.73 is 10% below the market average of $62.96. The Field Operations Manager at Hydro One is not eligible for overtime, while two out of the eleven market survey participants that matched to Field Operations Manager provide their job overtime. Neither Hydro One nor the market survey participants have union representation for the Field Operations Manager.

Design Engineer

Hydro One is in-line with market on both the hourly wage rate minimum and maximum. Hydro One's hourly wage rate minimum of $37.22 is comparable to the market's average of $37.16, while their hourly wage rate maximum of $53.38 is 4% above the market average of $51.55. The Design Engineer at Hydro One is eligible for overtime, while seven out of the fourteen market survey participants that matched to Design Engineer provide their job overtime. Hydro One and four out of the fourteen market survey participants have union representation for the Design Engineer.

Powerline Maintainer

Hydro One's hourly rate wage minimum of $18.72 is considerably below the market on the hourly wage rate minimum, however the hourly wage rate maximum is above the market. Hydro One's hourly wage rate minimum of $18.72 is 30% below the market's average of $26.76, while their hourly wage rate maximum of $36.10 is 12% above the market average of $32.31. The Powerline Maintainer at Hydro One and all thirteen market survey participants is eligible for overtime. Hydro One and all of the thirteen organizations that matched to the Powerline Maintainer have union representation.

VII. Conclusion

The custom survey of labour rates and overtime policies collected data on each of the three benchmark positions from fourteen organizations. Each submission was reviewed by Hay Group and job evaluation comparisons were made to account for the differences of the jobs. The market data was adjusted at Hydro One's Hay point values for each of the three jobs to account for these differences.

For the Field Operations Manager, Hydro One is below market on both the hourly wage rate minimum and maximum. For the Design Engineer, Hydro One is in-line with market on both the hourly wage rate minimum and maximum. For the Powerline Maintainer, Hydro One's hourly rate wage minimum is considerably below the market on the hourly wage rate minimum, however the hourly wage rate maximum is above the market.

Hydro One's overtime eligibility, overtime policies and union representation seem generally similar to the norms of the market survey participants.

Appendix A Benchmark Position Profiles

1. Field Operations Manager

Responsible for the provision of a wide range of electrical services such as connections, upgrades and emergency repairs, construction program and project activities within a specific geographic zone. Manage and supervise staff, organize schedule and assign routine and special duties to clerical, technical, trades and engineering staff, providing instruction, guidance and inspections as necessary to ensure work quality and accuracy and conformity to governing regulations.

Representative Activities / Responsibilities

1. Supervise Operations Centre technical activity by planning and directing the day-to-day prevention and maintenance to lines, new customer connects, service upgrades and new construction.
2. Supervise Operations Centre office, ensuring the appropriate processes related to accounting and clerical activities associated with the billing and collection of authorized charges relative to the installation of services and/or revenue from sale of power, the maintenance of area stores and accounting for tools and office equipment.
3. Responsible for the environmental practices and compliance with approved legislation by ensuring that adequate security, fire and safety measures are taken and precautions are observed in the Operations Centre; and personnel are provided adequate training, workloads are monitored and measures are taken to maintain operating efficiency.
4. Participate in meetings of both local and province-wide scope and contribute to the formulation of new or revised policy affecting Provincial Lines and Zone operations.
5. Provide advice and recommendations on service capabilities, price, service levels and other deliverables as part of negotiation of Service Level Agreements or Contracts.
6. Assist with the customer service requirements by providing advice to customers relative to their electrical problems, interpreting wiring code, drawing attention to hazards, dealing with complaints, and advising new customers on new construction, rates and application procedure and costs. React to storm activity through ensuring efficient restoration of power grid to associated customers.
7. Manage assigned work processes, monitor, evaluate and recommend changes and/or improvements to ensure efficient and effective completion of work. Ensure necessary Transport and Work Equipment is available for the efficient completion of the work.
8. Interact with municipal and ministry officials (Ministry of Transportation, Ministry of Labour, Ministry of Environment), as single point of contact for customer and contractual issues.

Typical Reporting Relationship

Reports to a Superintendent of Lines.

2. Design Engineer

Responsible for the development of structural/mechanical/electrical designs for major and/or complex transformer, switching, frequency changer and condenser stations projects, and all associated systems. Achieves the concepts, layouts, and requirements as specified for the project and provides technical guidance and work supervision to junior engineers.

Representative Activities / Responsibilities

1. Collaborate with development/construction/operations staff in the various phases leading to the final design, prepare sketches, instructions and other data as required for drawing production, and provide advice and guidance as required throughout.
2. Responsible for examining concepts, equipment and material tenders to ensure that design, equipment, or purchase agreements, meet the intent and requirements of the structural/mechanical/electrical design and collaborate with various groups within and external to the company to complete any necessary changes.
3. Investigate and aid in the resolution of design problems that arise during construction by visiting field locations and providing design revisions as required.
4. Recommend the need for new or revised design standards and assist in their development.
5. Provide expert advice and guidance as a design “specialist”, to various internal and external parties on designs pertinent to transformer, switching, frequency changer, and condenser stations, and the switchyard features of generating stations.
6. Periodically supervise staff assigned to assist on major or complex projects, attending to the assigning of work or areas of responsibility.
7. Requires eight to ten years of practical experience in the respective design field to ensure familiarity with the practical approaches, methods and techniques pertinent to structural/mechanical/electrical design for stations projects, and appreciation of the application and characteristics of various types of station equipment, and the requirements for drawing production, standards and practices. Also requires field experience to fully appreciate construction and installation practicalities.

Typical Reporting Relationship

Reports to a Supervisor.

3. Powerline Maintainer

Responsible for performing duties as necessary to work on the construction and maintenance of transmission and distributed lines and associated apparatus, using a range or mechanical and electrical skills and knowledge. Typically reports to Union Trades Supervisor.

Representative Activities / Responsibilities

1. Understand and has a working knowledge of the limits and capacities of electrical apparatus, hydraulic equipment and motorized vehicles, such as radial boom derricks, aerial devices, tension-stringing equipment and portable generators, and make minor repairs.
2. Understand and is familiar with operating procedures, standards manuals associated with the trade, and procedures related to the use of live-line tools and equipment.
3. Erect towers, poles and structures for power lines; install conductors and associated apparatus.
4. Perform maintenance of service, troubleshoot and restore electrical power during emergencies to municipal, industrial and rural customers.
5. Install, connect, troubleshoot and repair underground, submarine and overhead conductors to service customers.
6. Repair and maintain power line towers, poles, structures and conductors at various heights.
7. Install, operate and maintain line apparatus, i.e., transformers, regulators, reclosures, sectionalizers, capacitors, airbreak switches and fused cutouts.
8. Perform approved live-line work using live-line tools, rubber gloves and barehand techniques.
9. Install various types of metering equipment including power meters, current and potential transformers for municipal, industrial and rural customers.

Typical Reporting Relationship

Reports to a Union Trades Supervisor.

Appendix B Hay Guide Chart-Profile Method

Our Hay Guide Chart-Profile Method is a worldwide standard that has been used in thousands of profit and non-profit organizations around the world to evaluate jobs at every level and for all types of work. It is comprised of four standardized factors:

Know-How

This Guide Chart measures the total of every kind of knowledge and skill, however acquired, needed for acceptable job performance. It consists of three dimensions:

- practical procedures and knowledge, specialized techniques, and learned skills;
- the real or conceptual planning, coordinating, directing, and controlling of activities and resources associated with an organizational unit or function; and,
- active, practicing, person-to-person skills in the area of human relationships.

Problem Solving

This Guide Chart measures the thinking required in the job by considering two dimensions:

- environment in which the thinking takes place; and,
- challenge presented by the thinking to be done.

Accountability

This Guide Chart measures the relative degree to which the job, performed competently, can affect the end results of the organization or of a unit within the organization. It reflects the level of decision-making and influence of the job through consideration, in the following order of importance, of:

- nature of the controls that limit or extend the decision-making or influence of the job;
- immediacy of the influence of the job on a unit or function of the organization; and,
- the magnitude of the unit or function most clearly affected by the job.

DISTRIBUTION LINE LOSS

1.0 INTRODUCTION

This exhibit presents a discussion on the types of line losses, the reason they exist, an estimate of the technical and non-technical line loss associated with Hydro One's Distribution System as a whole, recommended Distribution Loss Factors and how Hydro One manages distribution line losses.

The term "distribution line losses" refers to the difference between the amount of energy delivered to the distribution system from the transmission system and the amount of energy customers are billed. Distribution line losses are comprised of two types: technical and non-technical (the description of each type is presented in the sections below).

It is important to know the magnitude and causality factors for line losses because the cost of energy lost is recovered from customers.

As a result of the composition and scale of the Hydro One distribution system it is not economic to provide metering and the supporting processes capable of measuring line losses directly. Since energy meters do not total data for the same periods, and load varies over time, a direct measurement of actual losses is not feasible. Instead, Hydro One relies on studies which are designed to calculate the magnitude, composition and allocation of system losses based on annual aggregate metering information for energy purchases, energy sales and system modeling methods. These studies are conducted with the assistance of industry experts in this field to ensure appropriate scientific methods and modeling techniques are utilized in establishing the magnitude, composition and allocation of losses.

This exhibit also addresses the three directives from the 2006 Distribution rates proceeding RP-2005-0020/ EB-2005-0378 related to losses, which are discussed in Exhibit A, Tab 17, Schedule 1 and repeated below for convenience:

1. The Board is of the view that either a less expensive metering program, or a second effort to evaluate line losses using current load data and local experience, may provide loss factor estimates that are more acceptable and credible to stakeholders.

2. The Board does accept the submissions of intervenors regarding the expected benefits of the $4.75 million expenditure and directs Hydro One to include in its next main rates case filing a budget and a work plan to implement all the cost-effective line-loss reduction suggestions contained within the Kinetrics study. If Hydro One concludes that any of the recommendations in the Kinetrics study should not be implemented, it must clearly demonstrate the reasons for that position, and an accompanying budget and work plan for its preferred implementation plan.

3. The Board expects Hydro One to continue its efforts to refine line loss factors as they affect the bills of individual LV customers

2.0 TECHNICAL LOSSES

Technical losses on distribution systems are primarily due to heat dissipation resulting from current passing through conductors and from magnetic losses in transformers. Losses are inherent to the distribution of electricity and cannot be eliminated.

Hydro One issued a Request for Proposals (RFP) to carry out an independent assessment of technical losses on Hydro One's distribution system. The work was awarded to Kinectrics Inc., a leading authority on distribution systems and distribution losses in particular.

The report prepared by Kinectrics and entitled "2007 Recalculation of Distribution System Energy Losses at Hydro One" is presented in Appendix A of this Exhibit. Consistent with the requirements of the first Board directive noted in Section 1.0, the Kinectrics report uses new load profiles that became available in 2006 for determining customer group (i.e. Sub-Transmission, Primary, and Secondary) losses, as well as considering new customers that were identified as part of the work to update the study.

This report forms the basis for Hydro One's estimates on the magnitude, composition and allocation of losses on the System. The report establishes the Distribution Loss Factors (DLFs) for the various customer groups and also provides the rationale for Hydro One's distribution loss reduction program.

Hydro One owns primarily a rural distribution system with some pockets of urban development. Hydro One's distribution system technical losses are estimated to be 5.86 percent of the energy delivered to the distribution system and consist of estimated 5.26 percent for losses incurred in the distribution system and 0.6 percent of losses that relate to transformer losses at transmission stations and high-voltage distribution stations, which supply the distribution system.

Losses occur on subtransmission lines, distribution lines, station transformers, distribution transformers and secondary services to customers. Transformer losses include no-load losses that are independent of transformer loading and load losses that are dependent on the loading.

2.1 Comparison of Typical Urban vs Rural Losses

The losses breakdown by equipment components for the distribution system of typical urban and rural utilities is shown in the table below. Typical urban area losses are 3.6, on average, of energy sold and can range from 2 percent to 5 percent. Typical rural area losses are 7.3 percent, on average, of energy sold and can range from 4 percent to 10 percent.

Table 1: Typical Urban vs. Rural Losses by Equipment*

Component	**Estimated Loss as a Percentage of Energy Sold**	
	Typical Urban	**Typical Rural**
Subtransmission lines	0.1	0.7
Station power transformers	0.1	0.7
Distribution lines	0.9	2.5
Distribution line transformers no load	1.2	1.7
Distribution line transformers load	0.8	0.8
Secondary lines	0.5	0.9
Total	3.6	7.3

* From Table 4 on page 46 in Attachment A, "2007 Recalculation of Distribution System Energy Losses at Hydro One."

2.2 Hydro One Losses Estimate

Hydro One's distribution system losses, as determined by the Kinectrics study presented in Appendix A, are summarized in the table below.

Table 2: Hydro One Losses Estimate by Equipment*

Component	Estimated Loss as a Percent of Energy Sold
Subtransmission lines	2.24
LV Distribution station transformers no load	0.21
LV Distribution station transformers load	0.19
Distribution lines	1.49
Distribution line transformers no load	0.78
Distribution line transformers load	0.16
Secondary lines	0.19
Total	**5.26**

* From Table 1 on page 1 in Attachment A, "2007 Recalculation of Distribution System Energy Losses at Hydro One." Note: This table does not include transformation losses (0.6%) from transmission stations and high-voltage distribution stations (HVDSs), which are included in Hydro One's Total Distribution Loss Factors.

The total annual energy loss in Hydro One's distribution system is estimated to be about 5.26 percent of the energy sales, which compares to a value of 5.05 percent in the 2005 Kinectrics study. The main reason for the difference is attributed to the use of improved load profile information used with the current study. This is in line with typical losses incurred by other utilities considering Hydro One's mix of rural and urban customers.

3.0 NON-TECHNICAL LOSSES

Non-technical losses occur as a result of theft, metering inaccuracies and unmetered energy. The following sections are a discussion on each of these items.

3.1 Theft of Power Losses

Theft of power is energy delivered to customers that is not measured by the energy meter for the customer. This can happen as a result of meter tampering or by bypassing the meter.

Hydro One manages theft of power by inspection of the meter for tampering or bypassing during meter reading activities, monitoring anomalies during bill preparation and in cooperation with police activities.

3.2 Metering Inaccuracies Losses

Losses due to metering inaccuracies are defined as the difference between the amount of energy actually delivered through the meters and the amount registered by the meters. All energy meters have some level of error which requires that standards be established. Measurement Canada, formerly Industry Canada, is responsible for regulating energy meter accuracy.

Hydro One manages energy losses due to metering inaccuracies through a meter accuracy verification program.

3.3 Unmetered Losses

Unmetered losses are situations where the energy usage is estimated instead of measured with an energy meter. This happens when the loads are very small and energy meter installation is economically impractical. Examples of this are street lights and cable television amplifiers.

3.4 Estimate of Non-Technical Losses

Non-technical losses have been established by reviewing losses from theft, meter inaccuracies and unmetered energy in other jurisdictions. Based on the Kinectrics analysis which included reviewing the non-technical losses value from utilities across North America, United Kingdom and Australia, a value of 1.2% was recommended as a reasonable estimate. This is the same value as in the previously filed 2005 Kinectrics report.

4.0 LOSS ALLOCATION

To appropriately allocate the cost of losses to the different rate classes applied to distribution customers, it is necessary to estimate the losses in Hydro One's distribution system attributable to sub-transmission, primary distribution and secondary distribution sub-systems.

Within each of the sub-transmission, primary distribution and secondary distribution groups of customers, there are differences among the losses incurred by customers in relation to the energy used. For example, delivering electricity to a customer at the end of a long secondary distribution line would entail more loss than a customer using the same amount of electricity upstream on that line.

Although different customers will have characteristically different loss factors, individual customers are not billed by individual loss factors. It is not practical to accurately measure or model each specific customer's loss factor. Therefore, losses are allocated to customers based on those customers using similar elements of the distribution system, and they are billed at a Distribution Loss Factor (DLF) based on the losses incurred by that entire group.

The estimated values for the DLF for each of the customer classes are based on the Kinectrics study presented in Appendix A of this Exhibit.

4.1 Sub-transmission System Customers

To serve sub-transmission class customers, electricity flows through sub-transmission feeders, which operate at relatively high voltage levels that range between nominal voltages of 44kV and 13.8 kV. Since lines operating at higher voltage levels experience less energy loss per amount of energy delivered than lower voltage lines, serving sub-transmission class customers generally involves lower losses as a percent of energy delivered, compared to customers served from lower voltage facilities. Almost all distribution customers will be served from a feeder that originates from the sub-transmission system, so their DLF will include the losses from sub-transmission equipment.

Consistent with the third Board directive noted in Section 1.0, Hydro One asked Kinectrics to provide a study to identify site specific losses for sub-transmission connected (i.e. LV) customers and will include the results of this study in the evidence to be submitted as part of the rates portion of this Application to be filed in October 2007.

4.2 Primary Distribution Customers

These customers are connected to primary distribution lines, which function at voltage levels ranging between 12.5 kV and 2.4 kV. At these lower voltages, for every unit of energy delivered, primary distribution lines generally lose more energy (per length of line) than sub-transmission lines. Moreover, most primary class customers are served through Low Voltage Distributing Stations (LVDS), who in turn receive supply from the sub-transmission system further upstream. Energy is lost within both the LVDS transformers and in the lines emanating from them. This results in more energy lost per amount delivered to this Primary class of customers than to Sub-transmission customers.

4.3 Secondary Distribution Customers

These customers receive electricity after it has passed through the sub-transmission system, primary distribution lines and LVDSs. This results in several stages of transformation before being sent at low voltage through secondary distribution lines that operate at voltages as low as 120/240V. Pole-top, pad-mount and underground step-down transformers that step-down voltage from primary distribution system to the secondary distribution system generally lose more energy per quantity delivered than do low voltage distribution stations. The pole-top, pad-mount and underground transformers function at much lower load factors because they serve less diverse groupings of lower-volume customers (e.g. a small number of residences). Therefore, they often operate at little or no load, though still drawing power for their operation thus sustaining relatively high losses per energy delivered. In addition to all the losses associated with the transformation to the secondary voltage, the secondary distribution lines themselves lose a substantial amount of energy per unit delivered.

The total losses attributable to the secondary distribution customers also include the losses in the sub-transmission and primary distribution systems upstream in the delivery chain. As a result, these customers generally incur higher losses per unit delivered than any other customer class.

4.4 Comparison of the Estimated Total Loss Factor with the Total Loss Factor in the Existing Rate

The table below compares Total Loss Factors (TLF), applicable to the existing rates, with the ones estimated in the Kinectrics study for the three customer classes.

Table 3: Comparison of Existing TLF with TLF from Revised Study*

Customer Type	TLF in Existing Rates	Estimated TLF from 2007 Study
Embedded LDC and Subtransmission Customers	3.4%	4.4 %
Primary Customers	6.1%	7.4%
Secondary Customers	9.1%	10.0%

* From table on page viii in Attachment A, "2007 Recalculation of Distribution System Energy Losses at Hydro One."

TLFs include the Distribution Loss Factor (DLF) and the 0.6% for transformer station losses.

For all the customer classes the TLFs based on the Kinectrics study results are higher than the TLFs included in the existing rate. The difference is due to the use of an improved methodology which includes losses of detailed system elements thereby providing more accurate results for the different customer classes and total distribution losses.

Hydro One has been applying practices and continues to apply practices that mitigate financial impacts on future rates to the extent that it is economically feasible. These practices are described below.

5.0 HYDRO ONE LOSS MANAGEMENT

5.1 General Practices

Hydro One manages losses in the following ways, where it is cost-effective to do so:

1. Technical evaluation of projects - When Hydro One evaluates projects, the cost of losses is considered in selecting the preferred alternative. Standard planning practices include the development of options, which would reduce system losses. These include consideration of more efficient and larger conductors, distribution at higher voltages, phase balancing and power factor correction where it is economical to do so.

2. Voltage conversion projects – In many cases, by-passing and thus providing capacity relief for distribution stations by supplying some of the incremental loads from high voltage feeders (typically 27.6 kV) is considered as an alternative, with benefits of loss reduction. These projects are also considered as an alternative when distribution stations need to be replaced due to end of life considerations.

3. Reducing load on heavily loaded feeders – Unloading heavily loaded feeders by installing capacitors, or transferring load to alternate feeders or new feeders can also be an effective means of reducing losses and is utilized, where economic.

4. Ongoing System Loading Reviews – This is standard planning practice that identifies system performance, assets where loads are approaching rated capacities and identifies opportunities for loss reductions. Resulting projects may include phase balancing, voltage improvement, power factor correction, voltage

upgrades, conductor upgrades and larger system modifications. The system planning approach is outlined in Exhibit C1, Tab 2, Schedule 3.

5.2 Specific Initiatives

The existing Hydro One distribution system was designed and built assuming specific load growth rates and loading patterns. However, in some cases these assumptions do not materialize as forecasted. As a result, some feeders end up loaded in a sub-optimal manner from a perspective of minimizing losses. This situation presents an opportunity to further minimize losses on the Hydro One distribution system.

To uncover the extent of these opportunities Hydro One contracted Kinectrics in 2005, as part of 2006 Distribution rates proceeding RP-2005-0020/EB-2005-0378, to identify cost effective initiatives for Hydro One to reduce its distribution system losses. The 2005 Kinectrics study identified $12.75 million in economical investments that could be made to reduce line losses. In the 2006 Distribution rates proceeding Hydro One Distribution proposed $8 million in economic loss reduction initiatives, which have been substantially completed as part of the CDM program, as discussed in Exhibit D1, Tab 3, Schedule 5. The $8 million expenditure was based on the practicalities (available resources and equipment) to achieve a program of this magnitude involving numerous designs, with the intention of follow-up assessments concerning the feasibility of completing the remaining high level loss reductions identified by Kinectrics.

As part of the follow-up exercise, Hydro One requested Kinectrics to confirm their estimate of economic loss reduction initiatives based on new load profile data that became available in 2006 and greater detailed information on the Hydro One distribution system. The updated estimate of economic loss reductions is included in the 2007 losses study provided in Attachment A to this Exhibit. The updated Kinectrics' study has identified economic loss reductions to be about $6.5 million. The updated Kinectrics' scope of work is consistent with Hydro One's loss reduction initiatives that are underway, and as such, no further specific loss reduction initiatives, over and above the on-going efforts described in Section 5.1 above and in the paragraph below, are proposed in this Application.

Hydro One Distribution currently evaluates all relevant aspects of the distribution system including conductor size, loading, phase balance and other situations with a view to minimizing losses, as described in Section 5.1. Kinectrics' 2007 study recommendations on the benefits of changing out conductors will be incorporated into our general practices, where appropriate. Hydro One will also undertake a review of purchasing agreements to ensure that the purchasing practices do obtain the most cost effective transformers, taking into consideration Kinectrics' work on this topic.

2007 RECALCULATION OF DISTRIBUTION SYSTEM ENERGY LOSSES AT HYDRO ONE

Kinectrics Inc. Report No.: K-013111-001-RA-0001-R01

July 27, 2007

EXECUTIVE SUMMARY

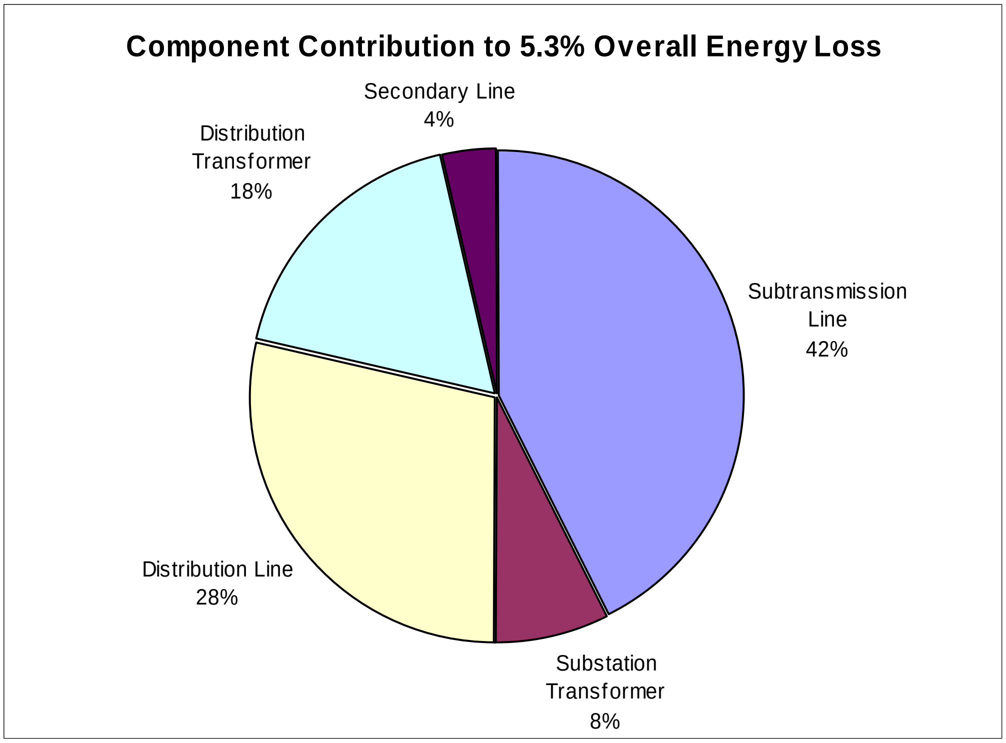
As part of the support for the rate application to the OEB, Hydro One requested a study of the energy losses on its electric power distribution system. The project included an overall assessment of technical energy losses on various components of the distribution system, an allocation of losses to three different rate classes resulting in distribution loss factors for each class, and development of a program to reduce energy losses. The original project report was filed in 2005.

In 2006, new data became available for load profiles. Some results from detailed circuit modeling of loss savings from capacitors and load balancing also became available. This report recalculates the energy losses based on the new information.

The high level system modeling using system component inventories, updated class load profiles and loading data from 2005 and 2004, has shown that the best estimate of the annual energy loss in Hydro One distribution systems is 5.3% of energy sales, with an outside range of 4.1 to 6.4% based on input parameter sensitivity modeling. The contribution of different system components to this total is shown in the pie chart on the following page.

The distribution system energy loss has been allocated to the major rate classes to produce several technical loss factors. The estimate for non-technical losses has been added to produce an estimate of the distribution loss factor (DLF). The supply facilities loss factor has then been added to produce an estimate of the Total Loss Factors (TLF). The comparison of these new TLFs with those that have been used previously is shown in the table on the following page. The changes are due to the improved load profile data.

The recommended loss management program for Hydro One is based on a combination of shunt capacitor installation and phase balancing. A program with an overall benefit to cost ratio of 2.2 to1 has been designed based on a combination of $5.1 million in capital spending on shunt capacitors, $1.3 million in O&M costs on phase balancing over the next two years. Hydro One Networks commenced work on this program in 2006. The benefits of changing out conductor and improving distribution transformer efficiency and sizing have been estimated and these areas are recommended for further detailed costing study by Hydro One.



Customer Type	TLF in Present Rates	New Estimate of Technical Losses (2007 study)	New Estimate of DLF (2007 study)	New Estimate of TLF (2007 study)
Embedded LDC and Subtransmission Customers	3.4%	2.6%	3.8%	4.4%
Primary Customers	6.1%	5.6%	6.8%	7.4%
Secondary Customers	9.1%	8.2%	9.4%	10.0%

* Note: The TLFs include technical losses and non-technical losses on the distribution system and the supply facilities loss factor (0.6%) for losses on the transmission system supply transformer. In the Present Rates in column 2 the non-technical losses are estimated as 10% of the technical losses. In the new 2007 analysis in columns 4 and 5, non-technical losses are included as 1.2% of the energy sold.

2007 RECALCULATION OF DISTRIBUTION SYSTEM ENERGY LOSSES AT HYDRO ONE

1 CONCLUSIONS AND RECOMMENDATIONS

1.1 OVERALL TECHNICAL LOSS ESTIMATE

A high level computation in this 2007 study using the latest system component inventories, updated class load profiles and component loading data has shown that the best estimate of the annual energy technical loss on Hydro One distribution systems is 5.3% of energy sales, with an expected range of 4.1 to 6.4%.

The change in the estimated breakdown of loss by power system component is shown in the following table. The largest changes are in power and distribution transformer load losses, and distribution and secondary line losses. These changes are primarily caused by the change in load profiles used in the calculation.

Table 1 Estimated Energy Loss

Component	2005 Study Estimated Loss as a Percent of Total Energy Sold	2007 Study Estimated Loss as a Percent of Total Energy Sold
Subtransmission Lines	2.33	2.24
Power Transformers No Load	0.21	0.21
Power Transformers Load	0.12	0.19
Distribution Lines	1.18	1.49
Distribution Transformers No Load	0.78	0.78
Distribution Transformers Load	0.19	0.16
Secondary Lines	0.24	0.19
Total	5.05	5.26

1.2 TOTAL LOSS FACTORS

The change in Total Loss Factors (TLFs) calculated based on these technical losses are shown in the following table and compared to the previous TLF values used by Hydro One.

Table 2 Calculated Total Loss Factors

Customer Type	TLF in Present Rates	New Estimate of Technical Losses (2007 study)	New Estimate of DLF (2007 study)	New Estimate of TLF (2007 study)
Embedded LDC and Subtransmission Customers	3.4%	2.6%	3.8%	4.4%
Primary Customers	6.1%	5.6%	6.8%	7.4%
Secondary Customers	9.1%	8.2%	9.4%	10.0%

* Note: The TLFs include technical losses and non-technical losses on the distribution system and the supply facilities loss factor (0.6%) for losses on the transmission system supply transformer. In the Present Rates in column 2 the non-technical losses are estimated as 10% of the technical losses. In the new 2007 analysis in columns 4 and 5, non-technical losses are included as 1.2% of the energy sold.

1.3 TECHNICAL LOSS REDUCTION PROGRAM

The expected benefits of the proposed distribution loss reduction program are summarized in the table below. These estimates are based on the characteristics of the Hydro One distribution system and the avoided costs for generation, transmission, and distribution based on the OEB's Total Resource Cost Guide. The costs and benefits of the program over the next two years have been included. The present value of the benefits for these programs has been calculated over twenty years. The overall benefit to cost ratio of the program is 2.2 to1. Hydro One Networks commenced work on this program in 2006.

Table 3 Loss Reduction Program Summary

Program	Maximum Reduction in Annual Energy Loss GW-hr	Avoided Energy and Demand Costs PV $M	Cost of Program $M	Profitability Index
PF Correction Capacitors - install cap banks on 278 feeders	9.8 *(53)**	8.7 *(52.9)*	5.1 *(10.3)*	1.7 *(4.2)*
Phase balancing - balance 314 circuits -2 years of a 6 year program	7.6 *(15)*	5.2 *(11.4)*	1.3 *(2.2)*	4.0 *(5.4)*

* Note: The values from the study filed in 2005 are shown in brackets and smaller font for comparison. The large change in the capacitor program is due to the change in assumed load profile reducing the number of circuits on which large capacitor banks could be installed. The large change in the phase balancing program is also due to a reduction in the estimated circuits that can achieve significant energy savings in the next two years.

1.4 REVIEW OF LOSS MODELING AND LOSS REDUCTION ANALYSIS

The detailed loss modeling techniques used by Hydro One have been reviewed and found to be appropriate.

The estimate of potential loss reduction on the Hydro One system has been revised to reflect the latest load profile information available.

The benefits of changing out conductor and improving distribution transformer efficiency and sizing have been estimated and these areas are recommended for further detailed costing study by Hydro One.

Program	Maximum Reduction in Annual Energy Loss GW-hr	Avoided Energy and Demand Costs PV $M
Conductor Change Out - 1 km of 8 circuits - 2 yeas of a ten year program	2.0	5.4
Transformer Sizing and Efficiency - normal replacements for two years	6.8	6.4

2 INTRODUCTION

In 2005 Kinectrics prepared a report on the annual energy losses on the Hydro One distribution system. In 2006 new data on the load profiles of the different customer classes and a few distribution circuits became available. Furthermore the results of detailed circuit modelling conducted by Hydro One on the reduction of losses through installation of capacitor banks and phase load balancing also became available. This report includes results of a recalculation of the energy losses and potential savings including the new information. All the other information on which the estimate of energy losses is based remains the same. The previous report filed in 2005 is included as Appendix A for convenience in making comparisons.

As well as recalculating the results of the previous report, this report presents the results of new analysis into the potential energy savings from reconductoring, and changing distribution transformer purchasing and loading procedures.

There were four major project tasks:

- Review Existing Methods of Loss Modeling and Loss Reduction Analysis
- Recalculate Capacitor and Phase Balancing Savings
- Estimate Savings of Improved Efficiency Distribution Transformers
- Estimate Savings of Conductor Replacement for Loss Reduction
- Review Cost Models for Loss Reduction

3 REVIEW EXISTING METHODS OF LOSS MODELING AND LOSS REDUCTION ANALYSIS

3.1 SUMMARY OF NEW INFORMATION

The new data on load profile that became available in 2006 consisted primarily of load profiles for a company wide aggregation of all customers within a specific customer class and the total for all classes. This aggregation of all customers together produces a smooth load profile that is representative of the entire Hydro One system and the heavier loaded transmission and subtransmission lines. This load profile is smoother than can be expected on distribution circuits. The most appropriate load and loss factors, based on the best available data, are shown in Table 4, along with the values used in the 2005 report for comparison.

The load profiles for secondary lines are based on data of specific load classes or groups of similar load classes. The load profile for each component is a combination of the profiles of all the customer classes that use that component weighted by the proportion of energy sold in a year to each of those classes. Two alternative load profiles are given for distribution lines, because the heavier loaded lines will have a smoother profile than the lightly loaded lines. Examples of both of the recommended load profiles for distribution lines have been found in the limited data available from a distribution station automation field trial. The power transformer load profiles are different for HONI transformers and customer transformers because of the different data for the load classes served by these two types of transformer.

Table 4 Recommended Load and Loss Factors

Component	2005		2007	
	Load Factor	Loss Factor	Load Factor	Loss Factor
Secondary Lines – Residential Rural	0.367	0.179	0.46	0.23
Secondary Lines – Residential Urban	0.367	0.179	0.48	0.25
Secondary Lines - Seasonal	0.165	0.076	0.40	0.18
Secondary Lines – Farms	0.510	0.303	0.43	0.22
Secondary Lines – General Service <5 MW	0.517	0.329	0.58	0.35
Distribution Transformers	0.422	0.226	0.40	0.175
Distribution Lines – Average	0.422	0.226	0.40	0.175
Distribution Lines – Heavy Loaded	0.422	0.226	0.56	0.33
Power Transformer – Customer	0.715	0.521	0.70	0.49
Power Transformer – HONI	0.715	0.521	0.40	0.175
Subtransmission Line	0.715	0.521	0.66	0.45

3.2 HYDRO ONE'S DETAILED CIRCUIT MODELING

Hydro One has conducted detailed modeling of distribution circuits to identify the circuits requiring load balancing and the optimal locations for installation of the capacitor banks and to confirm the savings estimated in the Kinectrics report in 2005. The result of detailed modeling on 240 circuits was provided for use in this project. From this detailed modeling, potential capacitor bank installations have been identified on 122 of the circuits with an average reduction in peak loss of 5.6 kW. Load balancing opportunities have been identified on 158 circuits with an average reduction in peak loss of 8.5 kW per circuit.

The majority of the recommended capacitor bank installations are 150 kVar. Comments by the technical staff doing the modeling indicate that the most frequent reasons that larger banks cannot be installed is that they would produce a leading power factor when the load is 30% of the peak or lower. Another common limitation is that the phase unbalance in Var flow limits the size of one phase of the bank. The unbalance in the Var flow is caused by unbalanced currents or unbalanced power factors.

The detailed modeling was conducted using a commercial software package (PSS ADEPT) to calculate the loss at peak load. Load can be balanced by moving single phase connections. Capacitors can then be added to reduce the loss. The optimal capacitor location is sometimes selected by the software program but often has to be chosen by trial and error. The loss at peak load is then converted to an energy loss by multiplying by a loss factor. The models are checked for potential voltage problems from the application of the capacitors.

The choice of loss factor has a major impact on the estimate of energy saved. The peak power savings are estimated quite accurately by the software, limited only by the accuracy of the input data. Suspicious input data have been confirmed by requests for field verifications. However, the most appropriate value for the loss factor is not well known. It depends on the load profile of the circuit, that is on how the current varies from hour to hour over the entire year.

A review of the individual circuit models and the comments of the analysis technicians, has found that the modelling techniques for the detailed circuit models are appropriate.

Examination of the model files and comments by the modelers indicates the following modeling techniques were used:

1. A power factor of 0.95 is assumed for all loads (0.9 for summer peaking)
2. A loading of measured peak+10% is assumed
3. Loads are lumped at the ends of most lines
4. Phase balancing is assumed to have been completed
5. The loss at peak load is calculated with PSS ADEPT
6. Capacitor is sized to produce no leading PF at 30% of peak load
7. Energy loss is calculated from loss at peak with a loss factor of 0.33 at first, now 0.23 to match the value used by Kinectrics in the 2005 report.

The techniques listed above were evaluated by Kinectrics and the results of the detailed modeling were compared to the 2005 high level analysis by Kinectrics.

Technique 1 is reasonable. The power factors of the loads in the models are a large source of uncertainty. The power factor is known for a few of the large loads, but for most loads it is assumed to be 0.95. Although the best information available indicates that this is the overall average power factor for Hydro One distribution circuits, there is a wide range. Assuming 0.95 will limit the size of capacitor bank that is recommended for circuits whose actual power factor is less. This will not produce uncertainty in the estimated energy savings, since the smaller bank will actually be installed. On circuits whose actual power factor is 0.99 there may be high voltage problems after the capacitor bank is installed. The model will not predict this voltage problem because it is assuming a lower power factor. This will produce some error in the estimate of energy savings, since the capacitors on these circuits will need to be reduced in size or removed.

Technique 2 is reasonable. It accounts for the measurement not necessarily being on peak day.

Technique 3 is reasonable. It will over estimate loss for single phase lines by a factor of 1.5, but 80% of loss is on three phase lines. It will not significantly over estimate the loss savings on three phase lines because only a small fraction of the load is distributed along the line. It will not over estimate the energy savings because most capacitors are installed on three phase lines, producing no saving on single phase lines.

The loads in the model distributed according to the connected kVA which is known for each switch. The loads are then scaled so that the current at the station matches the measured data. The larger loads that have individual load data available are not scaled. This is a reasonable procedure.

Technique 4 is reasonable, but Kinectrics previous estimate did not assume this. The effect of applying this to the Kinectrics estimate depends on the amount of final imbalance. If perfect balance were achieved, the Kinectrics estimate of loss savings from capacitors would be decreased by 33%. In the studied circuits (240) the final imbalance is 5%. At this imbalance the Kinectrics loss savings estimate would be reduced by 30%.

Technique 5 is reasonable.

Technique 6 is reasonable but uncertain. The Barrie field trial data shows minimum load ranging from 0.16 to 0.61 but most are within 0.3 to 0.4. Based on this data the detailed study assumption of 0.3 is probably best.

Technique 7: the loss factor is probably reasonable. The major source of uncertainty in the estimate of energy savings from the detailed modeling is the loss factor used to calculate the annual energy saving from the peak power saving calculated by the detailed model. The loss factor varies with different load profiles on different circuits. Measured data is available on only a few circuits. It indicates that the annual load factor can vary from 0.33 to 0.63 and the corresponding loss factor can vary from 0.12 to 0.41 (data from the Barrie Automation Field Trial at Midhurst, Angus, and Drayton DSs). The average was a load factor of 0.5 and a loss factor of 0.27.

The previous load profile used by Kinectrics was built up from customer load profiles, with no smoothing due to diversity and had a load factor of 0.49 and a loss factor of 0.23. It produced the correct amount of energy sold when used in the total system model, with little alteration of the peak loading on the circuit. It is therefore appropriate for a "typical" circuit. However, capacitors are used only on heavier loaded circuits which will have a smoother profile.

The conclusion is that there is some uncertainty regarding the most appropriate loss factor to use. The loss factor of 0.23 used previously is probably too low. It could be as high as 0.41 or more. A value of 0.33, which was used originally in the detailed studies, is recommended for the heavier loaded circuits where capacitor banks are installed.

3.3 METHOD OF SELECTING CIRCUITS FOR DETAILED ANALYSIS

Hydro One's present method of identifying lines for analysis is to select the lines with the largest imbalance, that also meet a minimum current level criteria and to select the circuits with the largest currents. This method has been used because each circuit is analyzed for both imbalance and capacitor bank application. Some of the circuits analyzed are therefore not expected to require a capacitor bank since they are being analyzed primarily for imbalance.

To select the most likely circuits for capacitor bank application, it should be the circuits with the worst power factors, the highest minimum loads, and the longest three phase lines with the least branching; but the circuits with these characteristics are not known. These circuits could be indicated by using the circuits with the largest minimum loads. These are also not known. They could also be indicated by the circuits with the largest loads in MW or MVA. This is the best, feasible approach given the presently available data. Using the peak power level is a slight improvement on using current to select circuits to study since the higher voltage lines will be able to accept a capacitor bank at a lower current level than the lower voltage lines. Alternatively a different minimum current level could be used for different voltages.

4 RECALCULATION OF OVERALL TECHNICAL LOSS ESTIMATE

Based on the new information on load profiles the overall technical loss estimate has been recalculated in 2007. The calculation method remained the same as earlier estimates in 2005 and is described in Appendix A. The results of the recalculation are shown in Table 5. The previous estimates are shown in smaller font and italics.

Table 5 Summary of Loss Estimation Results

	Peak Power (delivered by component) (MW)	Annual Energy (delivered by component) (GW-h)	Power Loss at Peak (MW)	Power Loss at Peak (% of total)	Annual Energy Loss (GW-hr)	Annual Energy Loss (% of total)	Annual Energy Loss as % of total energy sold
Subtransmission Line	8,950 *8,600*	34,100 *35,000*	220 *200*	30 *34*	877 *913*	43 *46*	2.24 *2.33*
Power Transformer No Load	5,060 *3,270*	19,800 *20,500*	9.4 *9*	1.3 *2*	82 *82*	4.0 *4*	0.21 *0.21*
Power Transformer Load	5,060 *3,270*	19,800 *20,500*	24 *11*	3 *2*	73 *48*	3.5 *2*	0.19 *0.12*
Distribution Line	4,710 *4,530*	18,900 *18,750*	382 *233*	52 *40*	585 *461*	28 *23*	1.49 *1.18*
Distribution Transformer No Load	3,780 *4,290*	16,900 *16,900*	35 *35*	4.7 *6*	304 *304*	15 *15*	0.78 *0.78*
Distribution Transformer Load	3,780 *4,290*	16,900 *16,900*	29 *37*	3.9 *6*	63 *74*	3.1 *4*	0.16 *0.19*
Secondary Line	3,480 *4,290*	16,800 *16,800*	37 *62*	5.1 *11*	76 *93*	3.7 *5*	0.19 *0.24*
Totals			740 *587*	100 *100*	2,060 *1,976*	100 *100*	5.26 *5.05*

The total annual energy delivered by the subtransmission lines is less than the total purchased from the transmission grid (39,165 GWh) because some of the energy purchased flows through high voltage substations supplied directly from 115 kV. Similarly the total energy delivered by distribution lines is less than the energy delivered by distribution transformers and secondary lines plus the primary customers because some of those distribution transformers are directly connected to 27.6 kV subtransmission lines in south west Ontario.

5 RECALCULATION OF TOTAL LOSS FACTORS

The method for calculation of the total loss factors (TLFs) has not changed from the previous 2005 computation and is described in Appendix A.

The data for the total energy sales to each customer class was 19,089 GWh to embedded LDC and Subtransmission, 3,249 GWh to primary customers (considered to be three phase farm, three phase general service and acquired large users) and 16,827 GWh to secondary customers. The total energy of 39,165 GWh is therefore sold 48.7% to embedded LDC and subtransmission, 8.3% to primary customers and 43% to secondary customers.

The method will be illustrated with an example for primary customers. The total annual energy loss on subtransmission lines and power transformers (877 +82+73 from Table 5) is 8.3% allocated to primary customers. Since only primary and secondary customers use the distribution lines that loss (585 from Table 5) is allocated to primary customers at 16.2% (3249/(3249+16827). The allocation of loss is then 180 GWh (0.083 x (877+82+73)+0.162 x 585). The technical losses are then 5.6% (180/3249). Adding 1.2% for non-technical losses gives a distribution loss factor (DLF) of 6.8%. Adding 0.6% for the supply facilities gives a total loss factor (TLF) of 7.4%.

This TLF would apply to primary customers whose energy meter is on the high voltage side of the customer's transformer. If the energy meter is actually on the low voltage side of the customer transformer then the TLF must be increased by the average distribution transformer loss of 0.94% of energy sold (.78+.16 from the last column of Table 5). This would increase the TLF for these customers from 7.4% to 8.3%.

Table 6 shows the effect of the recalculation based on the new information.

Table 6 Comparison of TLFs

Customer Type	TLF in Present Rates	New Estimate of Technical Losses (2007 study)	New Estimate of DLF (2007 study)	New Estimate of TLF (2007 study)
Embedded LDC and Subtransmission Customers	3.4%	2.6%	3.8%	4.4%
Primary Customers	6.1%	5.6%	6.8%	7.4%
Secondary Customers	9.1%	8.2%	9.4%	10.0%

* Note: The TLFs include technical losses and non-technical losses on the distribution system and the supply facilities loss factor (0.6%) for losses on the transmission system supply transformer. In the Present Rates in column 2 the non-technical losses are estimated as 10% of the technical losses. In the new 2007 analysis in columns 4 and 5, non-technical losses are included as 1.2% of the energy sold.

The 1.2% estimate for non-technical losses is the same figure used in the previously filed report in 2005. It is applied to all customer classes evenly because all customer classes contribute to non-technical losses. For customers supplied at high voltage this can be in the form of inadvertent blowing of a potential transformer fuse or in the form of meter tampering. At lower voltages meter tampering and meter by-pass both occur.

6 RECALCULATION OF CAPACITOR AND PHASE BALANCING SAVINGS

In 2005 Kinectrics estimated the potential savings from the installation of capacitor banks and from balancing phase currents on Hydro One distribution circuits. This estimate was made using the best information available at the time. Since that time Hydro One has obtained more detailed load profile information and performed detailed modeling on 482 circuits. This detailed modeling has provided more information that can be used to refine the estimate of the total potential energy savings. The most significant new information for capacitor savings studies is that 28% of the circuits already have optimally sized capacitor banks installed.

In addition to the new customer class load profiles provided by Hydro One, Kinectrics has analyzed load profile data for a sample of Hydro One distribution circuits. This analysis combined with the new customer class load profiles has provided new information that suggests that the load profile used by Kinectrics for distribution lines in the previous study, may not have been representative of all Hydro One circuits.

The results of the detailed individual circuit modelling did not confirm the estimated savings described in the Kinectrics report from 2005. A comparison is shown in the following table.

Table 7 Comparison of Potential Savings Estimates

Saving type	Detailed Hydro One Models	Kinectrics 2005 Report Estimate
Load Balancing Annual Energy Savings (GWh)	5.9	15
Capacitor Annual Energy Savings (GWh)	9.6	53

It has been determined that several factors lead to the differences in the preliminary estimates of energy savings and the estimates in the detailed modeling including:

- 28% of circuits already having capacitors installed
- Assumed load profiles (affects the size of the capacitor banks recommended, and energy saved per kW peak loss saved)
- Assumed phase balance
- Number of circuits balanced

The largest difference in the capacitor savings estimate is the size of the recommended capacitor banks. A major source of this difference is that the Kinectrics estimate included all the heavily loaded circuits. When the 2005 Kinectrics estimate was made, there was no solid indication of how many circuits, or which ones, had capacitors installed; and it was thought that many of the previously existing capacitor banks had been removed, leaving very few in service.

A review has been made of the results of the detailed modeling on 100 circuits that were also part of the Kinectrics preliminary estimate. Comments of the technical staff doing the detailed modeling indicate that at least 28% of these circuits already had capacitor banks installed and could not handle more. Another 42% showed minimal potential savings for a variety of reasons, including severe VAr imbalance, very short lines, or very branched topology.

The detailed modeling has provided this new information that was not available at the time of the Kinectrics estimate. It is still not known how representative the 28% and 42% figures are of all the circuits at Hydro One. It is possible that if the 28% represents the 28% most heavily loaded circuits, which would not be surprising since these circuits would benefit the most from capacitors for both voltage support and loss reduction. If this is correct then the Kinectrics estimate should be lowered by removing some or all of the heavily loaded circuits.

Another source of the difference in the estimates is in different assumptions about load profile. The Kinectrics estimate assumed that capacitor banks would be sized to balance the Var flow at a load of 50% of peak. This is assuming a relatively flat load profile. The detailed modeling was done using a 30% of peak criteria. The effect of the different assumption is that the detailed modeling will size a capacitor bank at 60% (30/50) of the value in the Kinectrics estimate. This means that where Kinectrics would use a 300 kVar capacitor the detailed modeling procedure would only use 150 kVar. Very little load profile data is available to test these assumptions. Examples of both lower limits (50% and 30%) are in the available data.

The detailed modeling of savings from phase balancing has revealed that there is very little correlation between the initial unbalance and the amount of saving possible. A similar lack of correlation exists with load current, and even the two combined. This is caused by the large number of confounding factors that are unknown except in a detailed study of a specific circuit. These confounding factors include line branching and load distribution. Since the previous Kinectrics estimates were based on assumptions that the savings would be dependent on unbalance and current, a new methodology of estimating savings from phase balancing was required and will be developed in section 6.2.

6.1 RECALCULATION OF ENERGY SAVINGS FROM CAPACITOR INSTALLATION

The changes in the modeling assumptions for estimating the annual energy savings from the installation of capacitor banks are summarized in Table 8. The assumed load profile used in the new estimate is for heavily loaded distribution lines.

Table 8 Changes to Assumptions for Kinectrics' 2005 Estimate in Kinectrics' 2007 Estimate

	Study Filed in 2005	2007 Study Revised Estimate
Circuits with existing Capacitors	0%	28%
Load Profile – Load Factor	0.49	0.56
Load Profile – Loss Factor	0.23	0.33
Phase Balance	Uncorrected	Corrected
Minimum load (% of peak)	50%	30%

Using this new information the estimate of potential savings from capacitor bank installation has been revised.

The new overall analysis predicts 0 circuits for 600 kVar (assuming the 11 circuits that would take this large a capacitor already have them installed) 12 circuits for 450 kVar saving 1.3 GWh, 40 circuits with 300 kVar saving 2.5 GWh and 226 circuits with 150 kVar saving 6.7 GWh.

Using the PV of the savings calculated in the previous Kinectrics report (not including environmental costs) and the estimated cost of capacitor banks, the cost information shown in the final three column of Table 9 have been calculated. A $1 million cost for detailed circuit modeling to size individual capacitor banks on specific circuits has been divided proportionally among the bank sizes.

Table 9 2007 Revised Estimate of Potential Energy Savings from Capacitor Bank Installation

Capacitor Bank Size (kVar)	Number of Circuits	Energy Saved (GWh)	$ Saved (k$)	$ Cost (k$)	Profitability Index
150	226	5.9	5,263	4,080	1.3
300	40	2.5	2,230	762	2.9
450	12	1.4	1,250	239	5.2
600	0	0	0	0	
Total	278	9.8	8,743	5,081	1.7

The uncertainty in the estimate of energy savings is quite high. The loss factor uncertainty can vary the estimated savings by 30% either higher or lower. Other sources of uncertainty are insignificant in comparison.

6.2 RECALCULATION OF ENERGY SAVINGS FROM PHASE BALANCING

The new method for estimating the total potential savings from load balancing has been based upon the results of the detailed studies done to date. The detailed studies have analyzed 482 circuits and found savings from load balancing in 256 circuits with an average savings of 8.2 kW at peak load. Circuit loading data bases show that there are at least 250 circuits in the Hydro One system with more than 37% unbalance and more than 50 amps of load current. These are likely candidates for load balancing. Only 58 of these circuits have been modelled in the detailed study. These 58 circuits averaged a savings of 9.6 kW at peak.

If the new peakier load profile, used in the capacitor savings estimate, is also applied to this peak saving then the annual savings per circuit are estimated to be 24.2 MWh per circuit balanced. Using the PV of the savings calculated in the previous Kinectrics report (not including environmental costs) this would result in a total savings of $16,450 per circuit balanced. Compared to an estimated cost of $3,000 to balance the circuit and $955 to do the detailed modeling, this work would have a profitability index of 4.0.

The total number of circuits on which the losses can be improved by balancing the phase currents is not known and cannot be accurately predicted because it would require detailed modelling of all circuits. In the completed detailed modelling of 482 circuits, the total savings has been calculated to be 5.9 GWh. The latest circuit loading data base has 750 circuit with significant phase unbalance and significant load current (>20% unbalance and >50 Amps). Planned circuit modelling over the next 6 years will identify which circuits will benefit most from load balancing.

If the results on the circuits modelled to date are extrapolated linearly then the total estimated savings would be at least an additional 4.9 GWh of savings in addition to the 5.9 GWh on the circuits already modelled, for a total estimated energy saving of 10.8 GWh per year. The additional 4.9 GWH is assuming only the 192 circuits with the worst balances (>37%) but not yet modelled in detail will result in significant energy savings. This is a conservative estimate since many of the circuits with a significant imbalance but less than 37%, will be modelled and found to have potential savings as has been the case in the circuits already modelled in detail.

7 ESTIMATION OF SAVINGS FROM IMPROVED EFFICIENCY DISTRIBUTION TRANSFORMERS

Distribution transformers are a significant source of energy loss. This loss can be minimized by the design of the transformer and by carefully planning the loading of the transformer.

The design of the transformer includes many parameters that can be adjusted to reduce losses including: core size and material which affect the constant no-load loss and conductor size and material that affect the load loss, which varies. The losses inherent in the transformer design can be adjusted by the "cost of losses formula" that is used in the tendering document in the transformer purchasing process. The formula adds to the purchase price the expected present value of both no-load and load losses over the life of the transformer, so that different bids by manufacturers can be compared on a total cost of ownership basis. This process produces a transformer design that minimizes the life time cost, but does not minimize losses.

Kinectrics has recently recommended that Hydro One change the cost of losses formula so that it reflects the OEB approved avoided cost of losses for evaluation of conservation and demand side management programs. Separate values for rural and urban transformers are shown in Table 11 because the rural transformers serve fewer customers and therefore tend to be lightly loaded and their overall efficiency is thus more dependent on no-load losses. The actual cost of losses formula is :

$$TOC = CAPCOST + CNLL \times NLL + CLL \times LL$$

Where:

TOC	is the total cost of ownership ($)
CAPCOST	is the capital cost of the transformer ($)
CNLL	is the cost of no load losses ($/W)
NLL	is the no-load loss of the transformer (W)
CLL	is the cost of load losses ($/W)
LL	is the load loss of the transformer at rated load (W)

Table 10 Transformer Purchasing Cost of Losses Formula

Application	Loss Type	1997 ($/W)	New ($/W)
Rural	No-load	5.2	15.06
Rural	Load	0.9	2.75
Urban	No-load	7.4	15.06
Urban	Load	3.9	8.6

The energy savings from the change to the "new" formula depend on the actual loading of the individual transformers, and the effects of reducing each type of loss on the capital cost of each manufacturer's transformer design.

As an example, in a 50 kVA single phase pad mount, an amorphous steel core could reduce the no load losses by about 30% or 31.5W but at a cost of about $200 (ref DOE study). This is 6.3$/W which would lower the total ownership cost under the new cost of losses formula but raise it under the 1997 formula. The new formula will therefore allow for the use of amorphous cores, reducing no load losses by 30%.

Considering load losses, the resistance of copper wire is 36% less than similar size aluminum wire so its losses are 36% less, however it costs more. This is partially mitigated by copper windings needing a smaller, less expensive core because core opening is smaller for the same ampacity of winding. As an example (Ref DOE study) consider a 50 kVA padmount with aluminum windings which has a core cost of $275 and winding cost of $116 and compare with a transformer with copper windings at $246 core cost and $216 winding cost. The reduction of 36% in losses (239W) comes with a price increase of $71 or 0.3$/W. In this example case both versions of the cost of losses formula will result in the use of copper windings. The larger CLL value will encourage the use of larger conductors in the winding to reduce load losses, until this is balanced by the increase in capital cost of the copper used and the larger core required by the larger windings, and the increased no load loss of the larger core.

A reasonable expectation may be that the load losses will be reduced in proportion to the amount of capital money (increase in capital cost) that the manufacturer can spend on them. The new loss cost formula would give the manufacturer twice as much capital cost to spend on reducing load losses of urban transformers and three times as much for rural, compared to the old formulas. Weighting these by the proportion of urban and rural customers at Hydro One, this could result in a reduction in load losses by a factor of 0.51.

The overall effect of the recommended cost of losses formula is therefore expected to be a reduction of 30% in the no load losses and a reduction of 50% in the load losses. Using the total system no load and load loss values from Table 6 this would be a savings of 91 GW-h and 31 GW-h per year, when all transformers on the system have been replaced.

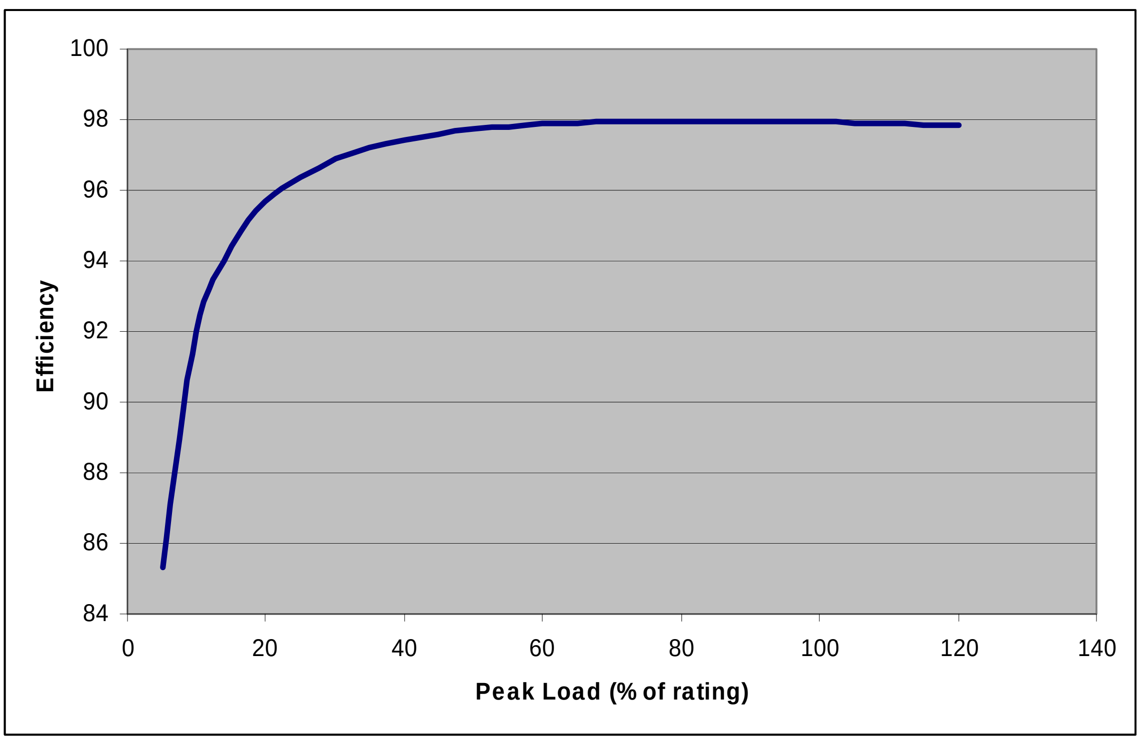
No matter what cost of losses formula is used in transformer purchasing specifications, the actual losses that occur will depend on how the transformer is loaded. Most transformers are designed for maximum efficiency at a constant 50% load. A previous study (Ref 2) found that on average Hydro One distribution transformers where loaded between 20 and 40% at peak load. The reasons for this are complex. Although the cost of losses would be reduced by using smaller transformers, the cost of inventory for stocking more sizes of transformers would be higher and partially off set the cost reduction in losses. The cost of transformer change outs when load grows unexpectedly, such as the construction of another house nearby, would also increase.

Independent of these non-technical considerations, it is necessary to accurately predict what the peak load will be on a transformer for any new load. This is done by considering the type of loads expected and the diversity of the loads. Load diversity is the reduction in the actual peak power drawn by the load below the sum of the peak power of the individual loads. There are two processes at Hydro One at the present time for sizing transformers based on type of load and load diversity. The 1992 Overhead Line Design Standard uses a procedure based on a table of “unit values” which are selected for each load on the transformer and then the transformer is sized on a separate table of total unit values and transformer kVA size. The diversity is taken into account in the construction of the second table, where the kVA/unit value varies from 10 to 1.9. Although no background information is given in the standard, one unit value appears to be equivalent to about 3 kW of load.

The Underground Line Design Standard has a different procedure for sizing pad mount transformers based on a diversity curve. Modifications to this procedure have recently been made by Kinectrics to bring the 1973 curves up to date. If the recommendations are adopted the recommended kVA for a single house will be reduced and larger load diversity will be assumed. Both of these will result in smaller recommended transformer sizes and increased loading, but the difference is typically 20% which will not increase the average peak load to 50% of rating.

A typical relationship between peak load and efficiency is shown in Figure 1. Notice that the realistic load profiles used in the calculation of Figure 1 (Load factor 0.49, loss factor = 0.23) make the maximum efficiency occur at a peak load of 80% of rating. The same transformer at a steady load will give a maximum efficiency at 50% of rating. Loading this transformer (25 kVA pole mount, single phase, 8.32/4.8 kV, NLL=0.26%, LL=1.71%) at 30% results in an efficiency of 96.9%, which means 3.1% of the energy carried is lost. Increasing this by 20% to 36% loading would only increase the efficiency to 97.2%. The expected savings in annual losses due to using the new diversity charts is estimated to be 9.7% of the present load loss. Using the present load loss from Table 5 this would be a savings of 7 GW-h.

Figure 1 Distribution Transformer Efficiency as a Function of Loading



Note: Efficiency has been defined as the energy output expressed as a percentage of the input energy .

The small overall savings in losses created by purchasing more efficient transformers and loading them appropriately is therefore estimated to be 91+37+7 = 135 GW-h per year. This is 36% of the 367 GW-h lost now in distribution transformers. It is a substantial saving but it can only be achieved by replacing all distribution transformers. Since this is a major investment, in the order of $900 million, it can only be done as the transformers reach their end of life over the next 40 years. The estimated savings over 20 years if all were replaced in the first year are only $119 million for a profitability of 0.13. If the transformers are replaced as they wear out then there are no additional costs to saving 3.4 GW-h more each year. This would be 67 GW-h after 20 years and a present value of the savings would be $28 million.

This cost analysis has been made on the basis of an estimate of the direct cost of the transformer. This direct cost cannot be accurately predicted because the cost of a transformer is based on a competitive tendering process. The price of efficient transformers depends on the cost of labour and materials at the time on the order and also on the number of other utilities specifying a similar transformer. There is a large price penalty for buying transformers that are not standard products and mass produced for many other buyers.

In addition to the direct costs of the transformer there are other costs associated with changing to more efficient transformers, particularly amorphous core transformers which have lower no-load losses. The amorphous steel cores saturate at lower levels of magnetic flux, and therefore the cores must be larger. This makes the overall transformer significantly larger and heavier. When a transformer is replaced an assessment must be made of the condition of the wood pole on which it is mounted. If the pole strength is not adequate then a new pole must be installed, considerably increasing the cost of the transformer replacement. This situation would happen more frequently if heavier transformers are used.

Other sources of costs in switching to more efficient transformers include, writing new specifications and purchasing documents, new work procedures to handle the heavier transformers, increased stocking, warehousing and transportation charges.

Kinectrics has not been able to include all of the costs in the estimate since they are dependent on the internal business processes at Hydro One and on the market for distribution transformers. It is recommended that Hydro One conduct an internal study of the cost of changing to more efficient transformers and compare the costs with the benefits presented in this report.

8 ESTIMATION OF SAVINGS FROM CONDUCTOR REPLACEMENT FOR LOSS REDUCTION

Distribution line losses can be reduced by replacing small conductors with larger ones. This is particularly cost effective if a larger conductor is chosen when the line is built, because then there are fewer extra costs other than the cost of conductor. However, often larger conductors require stronger poles and more guying which increase the costs. The following analysis calculates when changing out conductor on an existing line can be cost effective.

The conductor costs, obtained from a manufacturer's website (Southwire) in October 2006 are shown in the following table.

Table 11 Conductor Data

Conductor	Cost ($/conductor- km)	Resistance (ohms/km)	Ampacity (Amps)
#2 ACSR	840	0.8501	200
1/0 ACSR	1,260	0.5351	275
3/0 ACSR	1,990	0.3363	365
336 MCM ASC	3,660	0.1683	565
556 MCM ASC	5,660	0.1017	775

The resistance values are from Hydro One Line Design Standard 1992. The ampacities are summer values from the same source. Winter ampacities are approximately 22% higher.

The installed cost of stringing new conductors has been estimated by Hydro One, based on recent projects, at between $200,000 and $250,000 per km of three phase line. The costs are high because the line being reconductored is usually the first km of the circuit, close to the substation, where the poles carry more than one circuit and require replacement to have adequate mechanical strength to handle the larger conductors.

The cost of poles and hardware on a new three phase distribution line has been estimated at 35$/m (Ref 4) or $38/m adjusted to 2007 dollars. The extra cost of using larger poles, smaller pole spacing and heavier guying has been estimated as 18 $/m for medium conductor sizes (556, 750) and 30$/m for the largest (1033) in new construction. For retrofit situations where stronger poles and guys are required the full 38+18(or 30)=$56(68)/m cost would apply. The conductors themselves would cost another $19/m (5.66 x 3 + 1.9) or $26/m for the largest size. The total estimated cost for new construction would then be $75/m (56+19) or $94/m (68+26). This is an additional $19m for changing the new design to a larger conductor. When compared with the $225/m for reconductoring an existing line, it is clear that although using larger conductors in new construction might often be cost effective, retrofitting to larger construction can be expected to be cost effective in very few cases.

In the energy loss calculations, the resistance of the conductor has been increased at higher loading levels because the resistance increases at higher temperatures. The adjustment factors are shown in the following table (Ref 5). The annual load profile for Hydro One was used to calculate the fraction of the year at each conductor temperature assuming the annual peak load was at the thermal capacity of the line (90 ºC). For conductors loaded at less than the thermal capacity at peak, the resistance was adjusted a lowered amount, in proportion to the fraction of the peak load squared. In the final analysis the temperature correction was only a few percent of total ownership cost if peak currents were less than 200 amps. It could be as high as 20% at 500 amps.

Table 12 Conductor Resistance Temperature Adjustment

Temperature (ºC)	Multiplying Factor	Fraction of Time
0	0.92	0
10	0.96	0
20	1	0
30	1.04	.008
40	1.08	.09
50	1.12	.28
60	1.16	.45
70	1.20	.15
80	1.24	.02
90	1.28	.002

The costs of losses over a twenty year planning period were added to the capital cost to obtain a total ownership cost. The cost of losses in each year was calculated using the energy and power costs provided by the OEB (Ref 6). The expected conductor life is greater than forty years. If a forty year planning period had been used the present value of the savings would be 25% higher. If a ten year planning period is used the values would be 34% lower.

New load profile data (8760 hrs) was obtained in 2006 and an overall load factor of 0.66 and loss factor of 0.45 was calculated from these data. Since the load profile data was from the entire load of Hydro One, these profiles are suitable to apply to subtransmission lines but not distribution lines. Distribution lines have less load diversity and therefore "peakier" load profiles. A load factor of 0.56 and loss factor of 0.33 have been estimated for heavily loaded distribution lines. These are the same values used in the calculation of energy savings from capacitor banks. Using the lower values reduces the total ownership costs by 20% at 500 amps and 10% at 200 amps.

In the figures of total ownership cost shown below, the load growth is assumed to be 1% per year and the financial discount rate is 9.3%. The total ownership cost is the capital cost plus the present value of the expected cost of the losses.

Figure 2   Total Ownership Cost at Low Current Levels

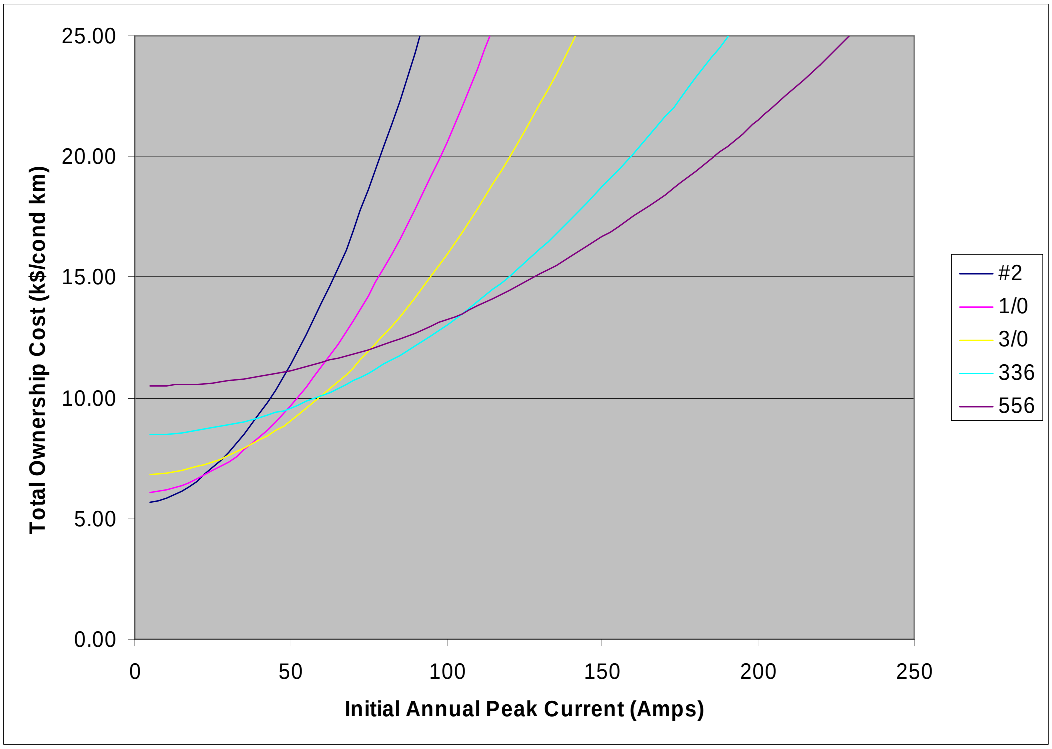


Figure 3   Total Ownership Cost at High Current Levels

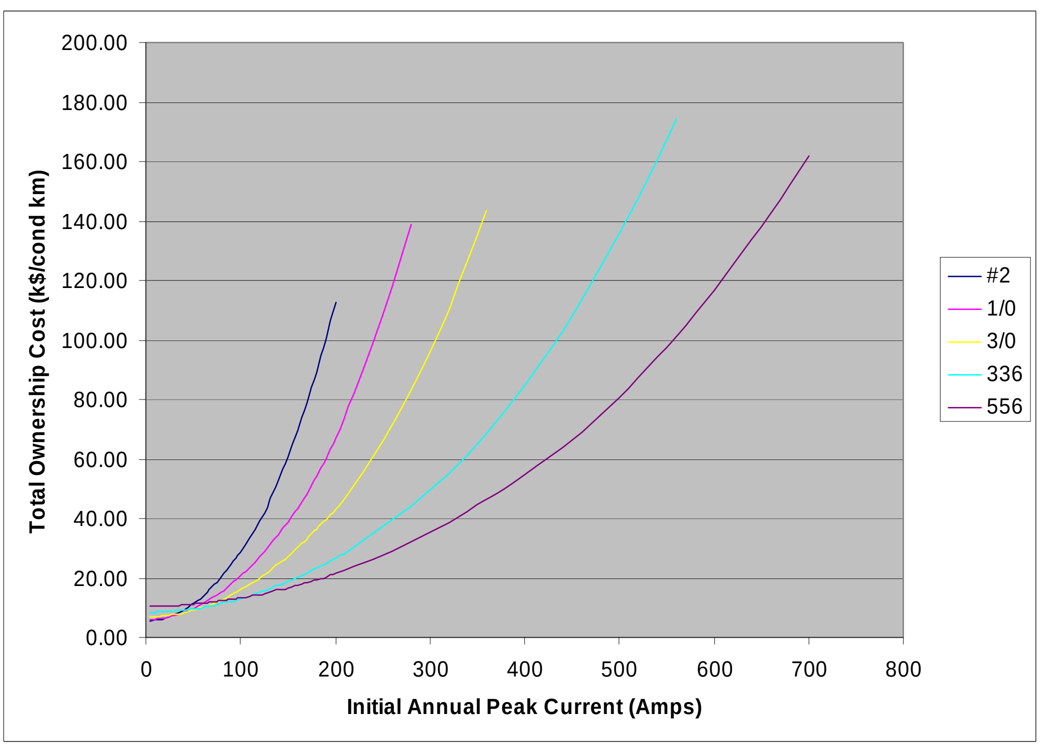

Figure 2 illustrates that the cost of losses dominates over the capital cost of the conductor at any significant load. For example the 336 conductor has an installed capital cost of $8.5/m (the vertical intercept) and even at a peak load of 34% of rating (190 amps) the total ownership cost is triple at $25/m. This means that even in urban areas where the voltage drop is not limiting, large conductors should be used to minimize the total ownership cost. At the present time the largest conductor routinely used at Hydro One, 556 MCM ASC, should be used whenever the expected peak current is greater than 100 amps. However, if larger poles and guys are required, increasing capital cost for the larger conductor by $10/conductor–m in new construction, then the lower load limit for 556 conductor increases from 100 amps to 230 amps.

In order for a retrofit change in conductor size to be cost effective, the reduction in the total ownership cost in Figure 2 or 3 (vertical distance between the curves) must be greater than the reconductoring cost. Using the reconductoring cost for Hydro One of $225/m of line gives a breakeven point of $75/conductor km.

A single step in conductor size was found to never be cost effective.

Figure 4 Profitability of Conductor Change Out to Reduce Losses

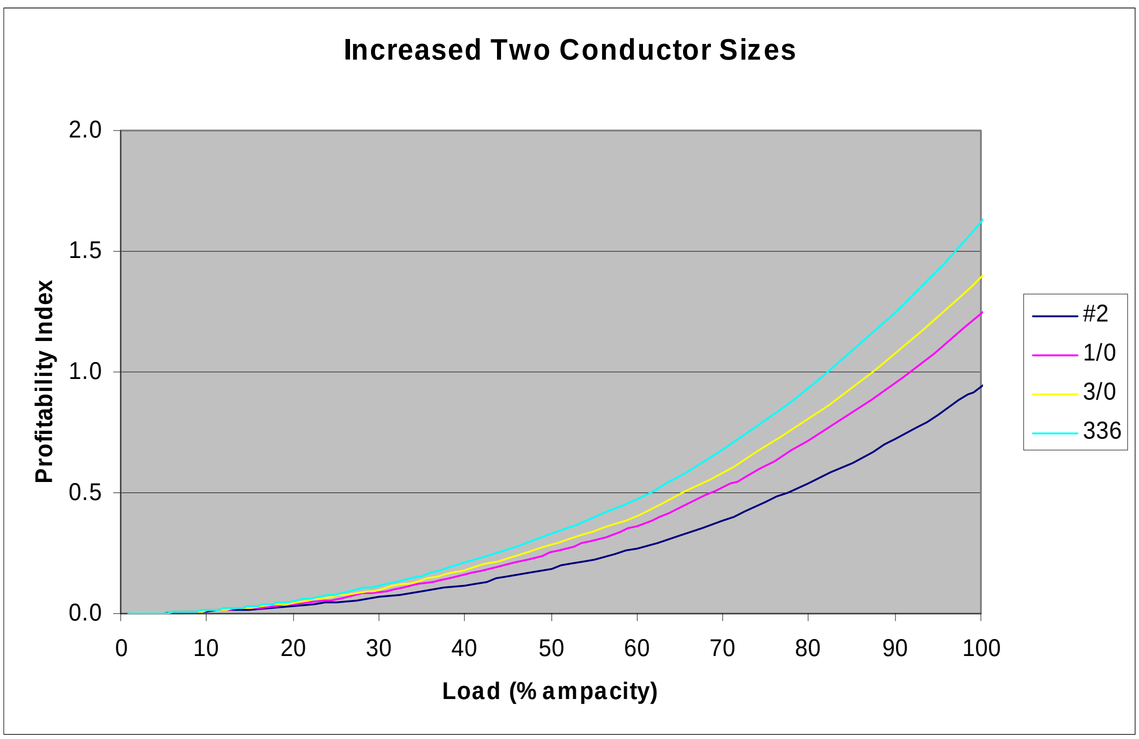

Figure 4 shows the profitability index (ratio of the present value of savings to the cost of reconductoring) of replacing a conductor with one two sizes larger in the standard Hydro One conductor set, as a function of the initial load on the smaller conductor. A reasonable decision criterion is to use a profitability of at least 1.5 to indicate that a line should be reconductored. This gives some room for error in the estimate and still ensures that the project is profitable. In Figure 4 the criterion is met only for 336 conductor when the peak load is more than 95% of the ampacity of the line. The curve was calculated with a twenty year study period. If a forty year period is preferred then a criteria of a profitability ratio greater than 1.2 is equivalent. This would give the same % loading as a profitability ratio of 1.5 calculated for a forty year period. If a ten year period is preferred then the criteria should be a profitability ratio of at least 2.2 and no conductor would ever be replaced as a cost effective way to reduce losses.   A single step in conductor size was never cost effective.

The values in the figures were calculated using the "peakier" load profile of distribution lines. If the smoother load profile of subtransmission lines is used then the % load at which a profitability of 1.5 achieved decreases by about 10% to a load of 85% of ampacity for the 336 conductor.

In order to estimate the potential loss savings for all of Hydro One, data on the % loading of 1245 rural distribution feeders in 2003 was examined. The results are shown in Table 13. It indicates that conductor change out would be cost effective on 3% of the circuits. The data could not determine how much of each circuit could be reconductored. The loading data only applies to the section closest to the substation.

Table 13   Loading on Hydro One Distribution Circuits

% Ampacity	# circuits	% of circuits
80 – 90%	57	4.5%
90 – 100%	43	3.5%
> 100%	39	3.1%

The detailed cost and benefits from reconductoring can only be calculated for specific circuits. Increasing conductor size by two steps can require the use of larger poles and crossarms. Increasing conductor size outside of the normal conductor set would result in many increased costs for Hydro One, including purchase of equipment that can string the heavier conductors and increased inventory costs for more conductor and connectors. In individual cases there are often alternative methods for reducing the losses, such as rebuilding a parallel single phase line as a three phase line, or reconfiguring adjacent circuits to lower the load.

It is recommended that Hydro One conduct a detailed study of its circuits loaded greater than 95% to determine the most cost effective means of lowering the losses.

9 COST MODELS FOR LOSS REDUCTION

There are a number of options for the appropriate cost model with which to identify loss reduction projects that should be implemented in the present business environment. It is different for different stakeholders.

It might be considered that cost of losses are all incurred by customers as they put the load on the system and they determine the timing of the loads which result in peaks and highest losses. The customer however, does not control the voltage at which they are served or the distance of line to their facility. Distributors also have a substantial influence through their network configuration, thresholds for capacity reinforcement and the loss levels of the network equipment they install. Losses could therefore be considered to be controlled by both the customer and the distribution company.

Peak losses have a direct impact on the demand and therefore on the distribution plant required, and thus have direct costs to the distribution company in terms of requiring additional capital equipment and costs associated with the loss-of-life of station transformers. Losses incur costs on the utility such as:

- requirement to increase the size of assets on the network to transport units which will be lost further into the network.
- Cost to maintain the system for incremental kW
- cost of facility to handle higher loads
- cost to maintain assets with higher capacity
- cost of allocating losses to customers

Given the above, it can be argued that although there is no energy cost of losses to utilities, there is a cost of demand losses. System components have to be planned, designed operated and maintained to handle the losses of downstream components. The cost to transfer an extra unit of power is borne by the utility without direct compensation from the customer. This cost is a component of the capital operation and maintenance budgets and must be included in the rate base

For the utility, the cost of energy losses is a pass through cost, and therefore does not affect them financially. This consideration implies that there are no benefits that accrue to the utility if it decreases the system losses. However, the utility is allowed to earn a return on its capital investment in the system. If that capital investment is made to reduce losses, then there is a financial return to the utility for decreasing losses. This consideration implies that the benefits to the utility are substantial and independent of actual loss savings achieved. The security of the return on investment causes the latter consideration to out weigh the former, resulting in a net benefit to the utility for implementing loss reduction programs. The cost effectiveness of the reduction in losses is not an issue for this stakeholder.

For society as a whole, the reduction of losses increases the cost efficiency of the society, decreases resource depletion, decreases pollution and decreases the investment in generation facilities with its attendant financial risk. If the cost of losses is less than the cost of program implantation then the cost of electricity is reduced creating a better business climate and reducing the cost of living. However, there may be net societal benefits even if the cost of program implementation is above the cost of energy saved.

For the individual customers who purchase electricity the major effect is on the price of electric energy. If the cost of losses is less than the cost of program implantation then the cost of electricity is reduced. A cost model for this stakeholder would probably not include environmental costs.

For each stakeholder, the costs that should be included in the cost model are different. The table summarizes the various costs and which stakeholder requires them to be in the cost model.

The relative value of the various costs as recommended by the OEB Total Resource Cost Guide (Ref 6) using the avoided cost method are shown in the following table.

Table 14 Cost for Inclusion in Cost Model

Cost	$/kWh	Distribution Utility	Society	Customer
Energy Cost	0.066		✔	✔
Generation Capacity Cost	0.018		✔	✔
Transmission Capacity Cost	0.0014	✔	✔	✔
Transmission Loss Cost	0.002	✔	✔	✔
Distribution Capacity Cost	0.0018	✔	✔	✔
Distribution Loss Cost	0.006	✔	✔	✔
Environmental Costs	0.019		✔	

In Table 15 capacity costs were converted from $/kW to $/kW-h, for the purposes of comparison, by multiplying by the ratio of energy sold to peak power for the Hydro One distribution system (0.000245). When this is done it is clear that the energy cost is about 57% of the total avoided cost, or 69% if the environmental cost is not included.

In this report all of the costs have been included except the environmental cost. The environmental costs represent about 16% of the total.

10 REVISED TECHNICAL LOSS MANAGEMENT PROGRAMS

10.1 POWER FACTOR CORRECTION USING SHUNT CAPACITORS

The most recent loss analysis has indicated a potential for saving and forms the basis of the capacitor installation plan. The 2007 estimate indicates that shunt capacitor banks could be applied to 278 Hydro One feeders (12 with 450 kVAR units, 40 feeders with 300 KVAR banks and 226 feeders with 150 kVAR banks). When fully implemented these capacitors would result in annual energy savings of approximately 9.8 GW-hr, about a 0.5% reduction in distribution system energy losses. This translates to a 20-year Present Value of savings in the order of $8.7M. The capital and labor cost for these installations in a two year program, including the cost of analysis to determine optimal locations would be $4.1M for a profitability index of 2.1.

Additional loss reduction could be achieved with the installation of switched capacitor banks which would match the connected kVAR to the variations in the load. Since this loss reduction method would require control schemes to monitor voltage levels, time of day and / or status of switching equipment, the costs would increase substantially, and will require further investigation in future.

10.2 FEEDER PHASE BALANCING

The distribution network consists of approximately 400 “sub-transmission feeders” and 2700 “distribution” feeders. A considerable part of the Hydro One distribution system consists of single-phase residential loads, making the power flow in three-phase main feeders difficult to balance. The total I^2R loss in the three phases of an unbalanced system is higher than that of a balanced system, and therefore, a concerted effort to balance phases, can result in loss reduction. Phase imbalance is often expressed as the maximum phase current minus the average of the phase currents divided by the average of the phase currents. At the present time phase imbalances at the distribution stations on the worst third of the Hydro One feeders are in a range of 30% to 100 % indicating considerable room for improvement.

The recommended phase balancing program will target the 250 already identified circuits and the worst 192 of Hydro Ones’ distribution feeders yet to be identified over a 6-year period. It is estimated that at full implementation, balancing of these feeders will result in a 10.8 GW-hr annual energy saving. Since unbalance will recur with the passage of time, the benefits from this phase balance were estimated assuming a decline in energy savings over a 20 year period.

Considering only the first two years of this program, 250 circuits have already been identified and 64 more can be anticipated within two years, for a total of 314. This will result in an energy saving of 7.6 Gwh per year. The 20 year present value of avoided costs is about $5.2M. The cost to implement the phase balancing over a two year period would be $0.94M, for a profitability of 5.5.

10.3 CONDUCTOR CHANGE OUT

The sizing of distribution conductors and cables is normally determined by considering the thermal capability of the conductors and cables, and by the amount of voltage drop from source to the receiving-end. Hydro One's long rural feeders are generally voltage-drop limited as opposed to ampacity limited. Another consideration, however, is cost of losses related to the conductor size selected. The larger the conductor size, the lower are the losses. Larger conductors require more capital expenditures and a balance must be found when sizing the conductors. The conductor size is typically optimized, through the planning process, when a feeder is initially installed. However, as the system evolves and conditions change from original plans, occurrences of sub-optimally sized conductors will materialize. Conductor change out on sections of a feeder that are heavily loaded can provide loss improvements. There are also other techniques for lowering the losses by lowering the load.

It is recommended that Hydro One conduct a detailed study of its circuits loaded greater than 95% to determine the most cost effective means of lowering the losses.

10.4 TRANSFORMER SIZING AND EFFICIENCY

The series and shunt resistance and reactance of distribution transformers result in significant losses on distribution systems. The consumption of reactive power by transformer reactance introduces higher reactive current flow in the primary circuits, which contributes to the system losses. Distribution system losses can be reduced by properly sizing the distribution transformers.
