Transformer no-load losses are constant and depend on the size of the transformer installed and the loss formula to which it was purchased. Decreasing the transformer rating will decrease the no-load losses. On the Hydro One system it is notable that on many feeders, the actual peak load on the feeder is only 20 to 40 % of connected kVA. This implies that the connected kVA is unnecessarily high and a reduction in transformer sizes would not overload the smaller transformers. Consideration would have to be given to the cost of inventory for stocking smaller transformer sizes.

The 2007 loss analysis indicates that the optimal specification and sizing of distribution transformers could yield an estimated present value of savings over twenty years of $119 M.

Kinectrics has not been able to include all of the costs in the estimate since they are dependent on the internal business processes at Hydro One and on the market for distribution transformers. It is recommended that Hydro One conduct an internal study of the cost of changing to more efficient transformers and compare the costs with the benefits presented in this report.

10.5 SUMMARY OF BENEFITS

Lowering distribution system delivery losses will reduce overall system demand and provide additional network capacity for growth. Since system delivery losses are currently passed on to all customers, improvements in this area will benefit all customers.

The expected benefits of the proposed distribution loss reduction program are summarized in the table below. The benefits of the capital expenditures over two years are present valued over twenty years.

Table 15 Economic Benefits

Program	Maximum Reduction in Annual Energy Loss GW-hr	Avoided Energy and Demand Costs* $M	Cost of Program $M	Profitability Index
PF Correction Capacitors - install cap banks on 278 feeders	9.8	8.7	5.1	1.7
Phase balancing - balance 314 circuits -2 years of a 6 year program	7.6	5.2	1.3	4.0

* Note: Present valued over a twenty year period

1. CONCLUSIONS AND RECOMMENDATIONS

1.1 OVERALL LOSS ESTIMATE

A high level computation using the latest system component inventories and loading data has shown that the best estimate of the annual energy technical loss in Hydro One distribution systems is 5.05% of energy sales, with an expected range of 3.9 to 6.1%.

The loss breakdown by power system component is shown in the following table.

Component	**Estimated Loss as a Percent of Total Energy Sold**
Subtransmission Lines	2.33
Power Transformers No Load	0.21
Power Transformers Load	0.12
Distribution Lines	1.18
Distribution Transformers No Load	0.78
Distribution Transformers Load	0.19
Secondary Lines	0.24
Total	5.05

1.2 DISTRIBUTION LOSS FACTORS

The Distribution Loss Factors (DLFs) calculated based on these technical losses are shown in the following table and compared to the previous DLF values used by Hydro One.

Customer Type	**DLF in Present Rates**	**Total Estimated DLF**
Embedded LDC and Subtransmission Customers	3.4%	4.4%
Primary Customers	6.1%	6.8%

Secondary Customers	9.1%	9.6%

The DLFs in the above table include the technical and non-technical losses on the distribution system and an allowance of 0.6% for loss in the transmission system.

1.3 TECHNICAL LOSS REDUCTION PROGRAM

The expected benefits of the proposed distribution loss reduction program are summarized in the table below. These estimates are based on the characteristics of the Hydro One distribution system and the avoided costs for generation, transmission, distribution and environmental impacts. The present value of the benefits has been calculated over twenty years. The overall benefit to cost ratio of the program is 5:1.

Program Savings

Program	Maximum Reduction in Annual Energy Loss GW-hr	Avoided Energy Demand and Environmental Costs PV $M
PF Correction Capacitors - install cap banks on 660 feeders requiring 300kVAr or more	53	52.9
Phase balancing - balance 750 circuits	15	11.4

Program Costs

($'000s)				
Distribution Network Loss Reduction	**2004/2005**	**2006**	**2007**	**Total**
PF Correction Capacitors		2,600	7,700	10,300

Reconductoring		100	na	100
Transformer Size and Efficiency		150	na	150
Total				12,750

2. INTRODUCTION

As part of the support for the rate application to the OEB Hydro One has requested a study of the technical line losses on its electric power distribution system. The project included an overall assessment of technical energy losses, an allocation of loss to different types of customers resulting in distribution loss factors (DLF) for each type, and development of a program to reduce energy.

Energy losses on power systems can be divided into two broad categories, technical losses and non-technical losses. The majority of this report deals with technical losses, however a brief discussion of non-technical losses is provided in section 2.2.

2.1 DEFINITION OF TERMS

Distribution Loss Factor (DLF)
A factor used to increase the measured energy from a customer's meter to account for losses in the delivery of the energy. Strictly speaking it should be a value with no units such as 1.08 but it is often expressed as a percentage using just the decimal part, for example 1.08 is expressed as 8%. It includes technical losses, an adjustment for theft and other non-technical losses and the supply facilities factor.

Supply Facilities Factor
A value added to the DLF to account for loss in the transmission system. This has been previously estimated to be 0.6% by Hydro One.

Technical Losses
Power or energy used in the components of the system that delivers electricity to the customer's meter. This includes conductor losses that depend on resistance and current and transformer losses that include a conductor loss and a core loss. The core loss does not vary with loading.

Power losses are expressed in kW or as a % of the loss at peak load.
Energy losses are expressed in kW-h per year or as a % of the total energy sold in a year.

Non-technical Losses
Includes all unaccounted for energy other than technical losses. This can occur through theft, meter inaccuracies, billing errors etc.

Loss Allocation
When technical losses are not averaged over all customers on the system they are divided into parts and each part assigned (allocated) to a different customer or group of customers. The loss allocation can be either power or energy losses, but usually it is energy losses. It can be expressed in kW-h or as a % of energy sold to that customer or group of customers in a year. The loss allocation is often used as a basis for a DLF. The DLF for a specific customer group can be calculated by adjusting for the amount of energy sold to that group and adding a factor for non-technical losses and the supply facilities factor.

Loss Factor
A factor used to convert the power loss at peak load to the average power loss. It depends on the details of the load profile, i.e. how the load changes with time. It is often estimated based on an equation involving the load factor as follows:

$$\text{Loss Factor} = p \times \text{load factor} + (1-p) \times \text{load factor}^2$$

The constant "p" in this equation depends on the load profile. It is typically 0.3 for subtransmission systems, 0.2 for distribution lines, and 0.15 for distribution transformers and secondary circuits.

Load Factor
A factor used to convert peak power to average power. It is the ratio of the average power to the peak power.

2.2 NON-TECHNICAL LOSSESS

Non-technical losses occur as a result of the difference between the amount of electricity distributed to customers and the amount that is actually paid for. These losses occur because of the following:

- Theft, fraud, meter tampering/bypassing
- Faulty meters - resulting in the amount of electricity used being under-recorded.
- Incorrect records, billing errors

Published figures for the level of non-technical losses in North America are very difficult to obtain. In California "unaccounted for energy" is defined as the difference between the energy purchased and the energy sold in a utility service territory after accounting for imports, exports and technical line losses. This includes the first three categories of non-technical loss listed above. Estimates from different utilities range from 3.9 to 5% of energy sales. (Ref 3).

Published figures for theft alone in the United Kingdom estimate levels at 0.2 to 1% of energy sold (Ref 1) and the upper limit of this range is used in Australia by regulatory commissions as a reasonable estimate in the calculation of distribution loss factors (Ref 2).

Any distribution loss factor calculated from technical loss allocation must be increased to cover all forms of non-technical loss. In the past Hydro One has used a figure of 10% of the technical losses to estimate non-technical losses. With technical losses at approximately 6% of energy sold this represents only 0.6% of energy sales as an estimate for non-technical losses. This is well below (<15%) of the published figures for utilities in North America and is less than that used in Australia or most of the United Kingdom. A more reasonable estimate for theft and other non-technical losses would by 1.2% of energy sales. This figure has been adopted in this report.

3. OVERALL TECHNICAL LOSS ESTIMATE

3.1 METHOD

There are two basic methods that can be used to calculate technical energy losses, a method based on subtraction of metered energy purchased and metered energy sold to customers and a method based on modeling losses in individual components of the system.

The method based on subtraction of energy sold from energy purchased is the traditional method outlined by the OEB. This method is not appropriate for Hydro One because of the extensive metering system that would be required and does not now exist. The existing meters do not total energy over the same time periods because they are manually read at fairly long intervals. More expensive metering would be required. Energy meters are also not installed at all intermediate levels of the system where they would be required to allocate losses to different types of customers.

The method of loss estimation based on modeling losses in individual components of the system has been used in this report in order to be able to allocate different amounts of loss to different types of customer within Hydro One. The following method was applied to each system component (subtransmission lines, power transformers, distribution lines, distribution transformers, secondary lines):

1. Identify different types of the component that would have different losses (e.g. different transformer ratings, line voltage levels, secondary line lengths etc.)
2. Assume a load profile for each component type (hours per year at each load level)
3. Calculate from the load profiles, values for load and loss factors for each component
4. Estimate the number of each type of component in the Hydro One system
5. Calculate the total loss at peak load and the annual energy loss.

The energy loss computation requires information on several basic factors: the inherent loss of the component, the profile of time varying load on the component, and the population of such components on the Hydro One system. The following sections describe the details of the loss computation for each separate type of component.

3.1.1 Subtransmission Lines

The number of subtransmission circuits at each voltage level and the total circuit length was available from spreadsheet “PSDB_Feeders_2005_07_14.xls” obtained in July 2005. There are 300 circuits at 44 kV, 221 circuits at 27.6 kV and 42 circuits at 13.8 kV. Circuits that are metered at the transformer station and/or owned by other utilities were not included. The 44 kV circuits were divided evenly into two different types, 44 kV in a developed rural area (surveyed lines and concession roads) and 44 kV in a sparse load rural area. The total length of subtransmission line was 15,800 km, obtained from Dx asset inventory numbers. A linear feeder topology was used for all types with four sub-stations per circuit in the developed rural areas and with two stations per circuit in all other types. An average value of conductor resistance was used based on the proportion of conductor sizes used in Hydro One. The circuit topology and the conductor sizes were based on an examination of Hydro One circuit maps.

The Hydro One load data spreadsheet (DNAMLoadingNov11.xls) provided the frequency distribution of total peak load on all sub-transmission circuits (78.7% of rating on average). The average peak loading was used in the calculation, adjusted to give the 2004 energy sold, obtained from "Dx Losses Customers Info.xls", but the resulting loss was multiplied by an adjustment factor to account for the actual distribution of peak loading obtained from the load data spreadsheet. The factor was calculated as the weighted average of the ratio of the per unit loadings squared.

Load loss at load levels other than the peak load was calculated by multiplying the load loss at peak load by the ratio of the square of the currents.

3.1.2 Power Transformers

The most recent load data for Hydro One substations was available in a data base "TLL Database_Apr_18_release.mdb", obtained in April 2005, as the sum of the load on all circuits of a substation. The total number of substation transformers was obtained from a text file, "Dx transformers .doc" provided by Hydro One in July 2005.

Typical load and no-load loss data for power transformers was available from a detailed study of 170 power transformers in Hydro One Networks. The differences in percentage loss between different voltage levels and MVA size was negligible so all transformers were assumed to be the average size.

The number of customers with power transformers was obtained from the "TLL Database_Apr_18_release.mdb", obtained in April 2005. Some of these customers are metered on the high voltage side of their transformers and the transformer loss should therefore not be included in the Hydro One loss estimate. The exact number of these customers is not known but examination of many circuits diagrams discovered that most LDC customers are metered on the high side and most other customers are not. Therefore all non-LDC customer transformers were included and no LDC customer transformers.

The energy sold through substation and customer power transformers was available from a spreadsheet "Dx Losses Customers Info.xls" provided in July 2005. The data was from 2004. This is the most recent data available. The total number of transformers, the total energy sold and the resulting peak load on the transformers was compared with data from previous calculations to ensure that it was reasonable.

The average peak loading was used in the calculation of transformer losses but the resulting load loss was multiplied by an adjustment factor to account for the actual distribution of peak loading obtained from the database. The factor was calculated as the weighted average of the ratio of the per unit loadings squared. The total loading was adjusted to give the correct annual energy sales through each type of power transformer.

Daily load profiles were obtained from data (based on load studies in the 1980s) for the different customer classes (residential, seasonal, farm, general <5 MW). This is the most recent load profile data available. The aggregate load profiles for the different types of customer are not expected to have changed significantly since this data was obtained. These daily load profiles were combined using the appropriate number of each type of customer for Hydro One into a total daily load profile. The Hydro One monthly load profile was combined with the total daily load profile to give a total number of hours at each load level in steps of 10% per unit. These hours were used to convert peak values into annual energy for both loss and energy delivered.

Load loss at load levels other than the rated load was calculated by multiplying the load loss at rated load by the ratio of the square of the currents.

3.1.3 Distribution Lines

Five different types of distribution line were modeled, based on voltage level (4.16, 8.3, 12.5, 25, and 27.6 kV). The number of each type was obtained from the spreadsheet "PSDB_Feeders_2005_07_14.xls" obtained in July 2005 and the frequency distribution of total load on each circuit was obtained from the data base "TLL Database_Apr_18_ release.mdb". A topology of a three phase main trunk with single phase laterals was used, with three main trunk sections and 25 lateral sections. The conductor sizes and lengths of each section were estimated based on examination of Hydro One maps. Loads were assumed to be evenly distributed. The total length of distribution line was 103,600 km, obtained from the Dx asset inventory numbers

The average peak loading for each circuit type was used in the calculation, adjusted to give the correct energy sold in 2004, but the resulting load loss was multiplied by an adjustment factor to account for the actual distribution of peak loading. The factor was calculated as the weighted average of the ratio of the per unit loadings squared. The same factor was used for all types.

The loss was also adjusted by factors to account for the distribution of imbalance between phases on the circuits (obtained from the April database) and for the assumed power factor of 0.92. The power factor assumption was based on a small sample of circuits for which measured values were obtained for other detailed projects in recent years.

Load loss at load levels other than the peak load was calculated by multiplying the load loss at peak load by the ratio of the square of the currents.

3.1.4 Distribution Transformers

Sixty different types of transformer were modeled, including twelve different kVA sizes in five high voltage ratings. The no load and load losses for each type of transformer was obtained from a Kinectrics data compilation which is based on manufacturer's data.

The total number of distribution transformers was 470,543, available from the Dx asset inventory numbers. The number of transformers at each voltage level was calculated using the proportion of circuit km at each voltage level (from the April database) and the distribution of transformer sizes was obtained from previous studies of Hydro One circuits in the Kingston area.

The average peak load on each transformer was assumed to be the same for all types since there was no data to support differences. The average peak load was calculated to give the total energy sold to retail customers in 2004. The average peak loading for each type was used in the calculation but the resulting load loss was multiplied by an adjustment factor to account for the actual distribution of peak loading. The factor calculated for distribution lines was used for distribution transformers because the frequency distribution specific to transformers was not available.

Load loss at load levels other than the rated load was calculated by multiplying the load loss at rated load by the ratio of the square of the currents.

3.1.5 Secondary Lines

Five types of secondary line were modeled: residential year round (urban and rural), residential seasonal, farm and general. Three phase farm and large customer general classes were assumed to be metered close to the transformers without the use of Hydro One secondary circuits.

All were assumed to be 120/240 Volt secondary except general which was assumed to be 600/347 Volts.

Most secondary lines were assumed to be directly from the transformer with no secondary bus as described in the Hydro One Line design standard and were assumed to use 3/0 Al triplex conductor. Urban customers were assumed to have eight customers per transformer and a secondary bus parallel to the road and then a perpendicular service drop.

The lengths of line were assumed to be 15m, 50m, 75m, 25m, and 10m respectively for the different types of customer. The maximum in the line design standard is 75m. Farms are usually shorter than residences because a primary line is run back from the road. General customers have shorter secondary lines because the meter is usually installed close to the transformer before the secondary is split to provide multiple main load locations.

The proportion of customers in each type was obtained from the “Dx Losses Customers Info.xls” spreadsheet.

3.2 RESULTS

The overall technical loss results are shown below in Table 1. The overall loss estimate is 5.05% of energy sold. This is the sum of the annual losses (1,976 GWh) divided by the total energy sold by Hydro One in a year (39,165 GWh). This total energy does not include the energy sold by Hydro One to non-embedded LDCs and non-embedded direct customers. These customers are supplied through dedicated subtransmission lines that are metered at the transformer station. All the losses in those lines are accounted for by the customer since they occur downstream of the revenue meter.

The loss percentage may appear to be high compared to urban utilities and low compared to most rural utilities. Hydro One's loss percentage is dependent on the composite rural/urban nature of their system and the fact that Hydro One serves many customers directly from their subtransmission system. The losses in Hydro One are higher than those in urban utilities because of the large rural area served by Hydro One. Rural areas have longer power lines with fewer customers per kilometer of line which increases the line losses. Distribution transformer losses also tend to be higher in rural utilities because of the minimum practical size of distribution transformer and the lack of load diversity when it only supplies a single customer.

The losses in Hydro One appear lower than most rural utilities because Hydro One provides 48% of its energy sales to customers at the subtransmission level, without use of distribution lines, distribution transformers and secondary conductors. This is a much larger percentage than most rural utilities because Hydro One serves local distribution companies. This means that 48% of the energy does not flow through the components of the system that produce half of the losses.

Another consequence of the high proportion of energy sold at the subtransmission level is that a larger proportion of Hydro One's losses occur at this level (46%) than would be typical of most utilities. This makes the portion of loss attributed to other components look smaller. For example, the 5% of the loss occurring on secondary lines is more typically 10% for other utilities.

The energy delivered through the sub-transmission lines (35,000 GWh) is less than the total sold (39,165 GWh) because some of the energy is sold through high voltage substations supplied directly from the 115 kV transmission system.

Table 1 Summary of Loss Estimation Results

	Peak Power (delivered by component) (MW)	Annual Energy (delivered by component) (GW-h)	Power Loss at Peak (MW)	Power Loss at Peak (% of total)	Annual Energy Loss (GW-hr)	Annual Energy Loss (% of total)	Annual Energy Loss as % of total energy sold
Subtransmission Line	8,600	35,000	200	34	913	46	2.33
Power Transformer No Load	3,270	20,500	9	2	82	4	0.21
Power Transformer Load	3,270	20,500	11	2	48	2	0.12
Distribution Line	4,530	18,750	233	40	461	23	1.18
Distribution Transformer No Load	4,290	16,900	35	6	304	15	0.78
Distribution Transformer Load	4,290	16,900	37	6	74	4	0.19
Secondary Line	4,290	16,800	62	11	93	5	0.24
Totals			587	100	1,976	100	5.05

The total annual energy delivered by the subtransmission lines is less than the total purchased from the transmission grid (39,165 GWh) because some of the energy purchased flows through high voltage substations supplied directly from 115 kV. Similarly the total energy delivered by distribution lines is less than the energy delivered by distribution transformers and secondary lines plus the primary customers because some of those distribution transformers are directly connected to 27.6 kV subtransmission lines in south west Ontario.

4. CALCULATION OF DISTRIBUTION LOSS FACTORS

The total loss percentage is calculated with reference to the total energy sales. However, when a DLF is applied, it is only applied to the portion of the total sales actually delivered to a particular customer group. In order to fully recover the costs for losses allocated to the group the DLF must be larger than the loss expressed as a percentage of total energy sales.

To calculate the DLF for the subtransmission customers (embedded LDC's, embedded directs and Transmission class customers) the first step is to calculate the fraction of the total energy sold that is sold to this group (19,089 / 39,165) which is 0.48 of the total. This fraction of the loss on the subtransmission lines and power transformers must be allocated to these customers (0.48 x (913+82+48)) which is 500 GWh. The DLF from technical losses alone is then 2.6% (500 / 19,089). Adding 1.2% for non-technical losses such as theft gives a final DLF of 3.8%. This can be compared with the previous DLF for this group which was 2.8%. Most of the difference is that the previous 2.8% DLF only included 0.28% for non-technical losses. When the supply facilities factor of 0.6% is added to account for loss in the transmission system the total DLF is 4.4%.

To calculate the DLF for primary voltage customers a similar procedure is used. They purchase 8.3% of the energy sold through subtransmission and 16.2% of the energy sold through distribution lines. Their allocation of loss is therefore 161 GWh (0.083 x (913+82+48) + 0.162 x 461). And the DLF due to technical losses is 5.0% (161 / 3249). Adding 1.2% for non-technical loss such as theft gives a DLF of 6.2%. When the supply facilities factor of 0.6% is added to account for loss in the transmission system the total DLF is 6.8%.

Secondary customers purchase 43% of the energy sold through subtransmission, 84% of the energy sold through distribution lines and 100% of the energy sold through distribution transformers and secondary lines. Their allocation of losses is therefore 1307 GWh (0.43 x (913+82+48) + 0.84x461 + 304 +74 + 93). The part of the DLF created by technical losses is 7.8% (1307 / 16,833). Adding 1.2% for non-technical losses such as theft gives a DLF of 9.0%. When the supply facilities factor of 0.6% is added to account for loss in the transmission system the total DLF is 9.6%.

The following table compares the previous DLF's used by Hydro One, with the new DLFs calculated in this study.

Table 2 Comparison of DLFs

Customer Type	DLF in Present Rates	Technical Losses part of DLF	Total Estimated DLF
Embedded LDC and Subtransmission Customers	3.4%	2.6%	4.4 %
Primary Customers	6.1%	5.0%	6.8%
Secondary Customers	9.1%	7.8%	9.6%

The DLFs in Table 2 include the 0.6% supply facilities loss factor.

5. SENSITIVITY STUDY

The assumed values for various parameters in the model that produced the global system loss estimate have been varied over their reasonable range to determine the probable error in the total estimate.

Table 3 Sensitivity Study Results

Parameter	**Value used**	**Maximum**	**Minimum**	**Range in Total Loss (as a % of estimated loss)**
Conductor size in main sections	556 AL and 336 AL	556 AL	336 AL	±12%
Factor adjusting for peak loading differences from average [note1]	1.8	+10%	-10%	±8%
Load level	normal	+10%	-10%	±6%
Load profile (load factor)	0.5	0.7	0.35	±4.5%
km of distribution line	103,000 km	+10%	-10%	±4%
Distribution line current imbalance	24% average	+10%	-10%	±4%
km of subtransmission line	15,800 km	+10%	-10%	±2.5%
Transformer no load loss	power 0.14% dist. 0.27%	+10%	-10%	±2%
Number of distribution transformers	470,000	+10%	-10%	±1.5%
Split of circuits between developed and rural 44 kV	50/50	70 / 30	50 / 50	±1.3%
Split of line lengths between developed and rural 44 kV	50/50	35 / 65	50 / 50	±1.2%
Transformer load loss	power 0.4% dist 1.4%	+10%	-10%	±1%
Number of power transformers	1425	+10%	-10%	±1%
Topology of subtransmission lines	both	Linear	branched	±0.7%
Length of secondary line	42,500 km	+10%	-10%	±0.7%
Resistance of secondary line	0.35ohms/km	+10%	-10%	±0.6%
Number of secondary circuits	925,000	+10%	-10%	±0.6%

Note 1 The factor adjusting for peak loading differences from the average converts the loss calculated from the average loading on the circuits or transformers into the actual loss created by the distribution of loading.

The cumulative effect of all the parameter sensitivities, some positive and some negative is expected to be ±22% of the estimated loss in GW-h or ±1.11% of the energy sold. This is a practical estimate of the probable range, not a “worst case”.

6. TECHNICAL LOSS MANAGEMENT PROGRAMS

Technical losses on distribution systems are primarily due to I^2R losses in conductors and magnetic losses in transformers. Losses are inherent to the distribution of electricity and cannot be eliminated but may be minimized. In order to properly manage the inevitable losses it is necessary to understand the relative impact of different sources of losses. The largest source of losses is not always the easiest to reduce. Some sources can be reduced more cost effectively than others.

Canadian Electricity Association Technologies research has developed loss estimates for "typical" urban and rural distribution systems as shown in Table 4 below. Hydro One has primarily rural distribution with some pockets of urban development. Independent assessments of Hydro One's distribution system losses indicate that technical losses are in the order of 4.4% of the energy delivered to the distribution system. This represents annual energy losses of approximately 1,700 GW-hr. Losses occur on 3-wire subtransmission lines, 4-wire distribution lines, station transformers, line transformers and secondaries to customers. Transformer losses include no-load losses that are independent of transformer loading and load losses that vary with loading. The breakdown of these losses from the various causes is shown in Table 4.

Table 4 Typical Loss Values

	Estimated Loss as a Percent of Energy Sold		
Component	**CEATI Typical Urban**	**CEATI Typical Rural**	**Hydro One***
Subtransmission Lines	0.1	0.7	2.33
Power Transformers	0.1	0.7	0.33
Distribution Lines	0.9	2.5	1.18
Distribution Transformers No Load	1.2	1.7	0.78
Distribution Transformers Load	0.8	0.8	0.19
Secondary Lines	0.5	0.9	0.24
Total	**3.6**	**7.3**	**5.05**

* Note: This table does not include the non-technical losses or the supply facilities factor that is included in Hydro One's total Distribution Loss Factors.

Management of system losses is an on-going consideration in the planning, design, operation, purchase, upgrading and replacement of Networks' distribution facilities and equipment. Nonetheless, Networks believes that there is an opportunity to achieve incremental economic reductions in distribution system delivery losses through targeted investment programs. Modest reductions in losses can yield considerable benefit in terms of avoided cost of energy and demand.

Studies of Hydro One distribution losses have indicated that there are several methods that can be practically and economically applied to reduce distribution losses. These include:

1. Power factor correction using shunt capacitors
2. Balancing of load on phases
3. Reconductoring lines which presently have under-sized conductors
4. Installing properly sized high-efficiency transformers

Each method is limited in the amount of energy that can be saved as well as a penetration limit on the number of Hydro One sites that would be amenable to the particular loss reduction method. Furthermore each method has an associated cost of implementation. Table 5 shows the results of demand and energy savings that were achievable in applying loss reduction methods to particular Hydro One feeders. The Profitability Index is provided as an indicator of how the reduction in the cost of losses relates to the investment required to achieve these savings. The Profitability Index is calculated as the net present value of the savings in loss costs over twenty years divided by the cost of the loss reduction method.

Table 5 Effects of Loss Minimization Techniques Applied to Example Feeders

Loss Reduction Technique	Reduction of Peak Losses (% Peak Feeder Losses)	Reduction of Loss Costs (% Feeder Loss Costs)	Profitability Index
Capacitor application	3.1%	3.2%	4.2
Phase Balancing	2%	1.6%	5.4
Reconductoring	30%	29%	1.4
Re-sizing Distribution Transformers	2.3%	4.1%	0.1

6.1 DESCRIPTION OF THE PROGRAM

The Distribution Network Loss Reduction Program will involve identifying and implementing projects where incremental investments will result in an overall economic benefit to customers by reducing system delivery losses.

The three major areas offering the best economic opportunities are described below and information on the project costs and financial benefits is provided:

- ***Power Factor Correction using Shunt Capacitors***

  Feeder power factors in the Hydro One distribution network are typically in the range of 0.85 to 0.95, depending on time of year, mix of customers, and customer usage patterns. Power factor correction can be achieved through application of shunt capacitor banks. Capacitors reduce feeder losses by providing reactive power compensation near the load, thereby reducing the current flow in the line. The challenge in capacitor application involves the determination of the location, size, number and type of capacitors to be placed in the system. Fixed and/or switched capacitors can be used in the system. Fixed shunt capacitors provide constant reactive power compensation and are suitable for loads having approximately constant reactive power requirements. Switched shunt capacitors are used in cases of load variability since they allow more flexibility in controlling the losses and voltage drop. Hydro One purchases rack mounted capacitors with pre-installed oil switches. Targeting feeders with the known poorest power factors will generate the highest contributions to loss reduction DSM.

A preliminary analysis has indicated a potential for saving and forms the basis of the capacitor installation plan. It indicates that shunt capacitor banks could be applied to 660 Hydro One feeders (70 feeders with 600 kVAR banks, 150 with 450kVAR units, and 440 feeders with 300KVAR banks). When fully implemented these capacitors would result in annual energy savings of approximately 53 GW-hr, about a 3.0% reduction in distribution system energy losses. This translates to a 20-year Present Value of savings in the order of $53M. The capital and labor cost for these installation in a two year program, plus analysis to determine optimal locations would be $10.3M. These costs and benefits are summarized in Tables 6 and 7 below.

Additional loss reduction could be achieved with the installation of switched capacitor banks which would match the connected kVAR to the variations in the load. Since this loss reduction method would require control schemes to monitor voltage levels, time of day and / or status of switching equipment, the costs would increase substantially, and will require further investigation in future.

- ***Feeder Phase Balancing/System Configuration***

The distribution network consists of approximately 400 “sub-transmission feeders” and 2700 “distribution” feeders. A considerable part of the Hydro One distribution system consists of single-phase residential loads, making the power flow in three-phase main feeders difficult to balance. The total I^2R loss in the three phases of an unbalanced system is higher than that of a balanced system, and therefore, a concerted effort to balance phases, can result in loss reduction. Phase imbalance is often expressed as the maximum phase current minus the average of the phase currents divided by the average of the phase currents. At the present time phase imbalances at the distribution stations on the worst third of the Hydro One feeders are in a range of 30% to 100 % indicating considerable room for improvement.

The phase balancing program will target the worst 750 of Hydro Ones’ distribution feeders in a 2-year period. It is estimated that at full implementation, balancing of these feeders will result in a 15GW-hr annual energy saving. Since unbalance will recur with the passage of time, the benefits from this phase balance were estimated assuming a decline in energy savings over a 20 year period. With this assumption, the 20 year present value of avoided costs is about $11M. The cost to implement the phase balancing over a two year period would be $2.2M.

- ***Re-conductoring***

The sizing of distribution conductors and cables is normally determined by considering the thermal capability of the conductors and cables, and by the amount of voltage drop from source to the receiving-end. Hydro One’s long rural feeders are generally voltage-drop limited as opposed to ampacity limited. Another consideration, however, is cost of losses related to the conductor size selected. The larger the conductor size, the lower are the losses. Larger conductors require more capital expenditures and a balance must be found when sizing the conductors. The conductor size is typically optimized, through the planning process, when a feeder is initially installed. However, as the system evolves and conditions change from original plans occurrences of sub-optimally sized conductors will materialize. Reconductoring of sections of a feeder that are heavily loaded can provide loss improvements.

Though not often highly profitable, reconductoring can be very effective in reducing losses on circuits that are particularly overloaded. As a portion of the distribution loss reduction program a study will be conducted to identify the Hydro One feeders that are prime candidates for reconductoring with profitability greater than one.

- ***Transformer Sizing and Efficiency***

The series and shunt resistance and reactance of distribution transformers result in significant losses on distribution systems. The consumption of reactive power by transformer reactance introduces higher reactive current flow in the primary circuits, which contributes to the system losses. Distribution system losses can be reduced by properly sizing the distribution transformers.

Transformer no-load losses are constant and depend on the size of the transformer installed and the loss formula to which it was purchased. Decreasing the transformer rating will decrease the no-load losses. On the Hydro One system it is notable that on many feeders, the actual peak load on the feeder is only 20 to 40 % of connected kVA. This implies that the connected kVA is unnecessarily high and a reduction in transformer sizes would not overload the smaller transformers. Consideration would have to be given to the cost of inventory for stocking smaller transformer sizes.

The low profitability index in Table 5 indicates that the cost of replacing existing transformers is typically beyond the benefits achieved. This illustrates that distribution transformers must be sized appropriately on initial installation in order to achieve minimal transformer losses.

Therefore, a portion of the distribution losses program will include a review of transformer sizing practices including the cost-of-losses formula, loss-of-life, load growth and inventory considerations. The intent is to minimize future losses by ensuring correct sizing and the purchase of transformers with the highest efficiency that can be justified by a total life-time cost consideration.

Benefits

Lowering distribution system delivery losses will reduce overall system demand and provide additional network capacity for growth. Since system delivery losses are currently passed onto all customers, improvements in this area will benefit all customers.

The expected benefits of the proposed distribution loss reduction program are summarized in the table below. These estimates are based on the characteristics of the Hydro One distribution system and are present valued over a twenty year period.

Table 6 Economic Benefits

Program	Maximum Reduction in Annual Energy Loss GW-hr	Avoided Energy Demand and Environmental Costs PV $M*
PF Correction Capacitors - install cap banks on 660 feeders requiring 300kVAr or more	53	52.9
Phase balancing - balance 750 circuits	15	11.4

* Note: Present valued over a twenty year period

Table 7 Program Budget

($'000s)				
Distribution Network Loss Reduction	**2004/2005**	**2006**	**2007**	**Total**
PF Correction Capacitors		2,600	7,700	10,300
Phase balancing		700	1,500	2,200
Reconductoring		100	na	100
Transformer Size and Efficiency		150	na	150
Total				12,750

APPENDIX A LOSS MANAGEMENT PROGRAM BACKGROUND, ASSUMPTIONS AND COMPUTATIONS

A1. Expected Technical Losses at Hydro One

Hydro One is a distribution utility with a mixed service area consisting of both rural and small urban areas. A recent study conducted by utilities in North East North America concluded that the technical losses of typical urban utilities range from 2% to 5% of energy sold and for typical rural utilities technical losses range from 4% to 10% of energy sold (Ref 4). It also concluded that the achievable level of energy efficiency is not the same for all utilities but varies depending on the details of the service territory and the past design practices. Present estimates of the technical losses at Hydro One have been in the range of 3.9% to 6.1% of energy sold (section 3). These estimates are for technical losses and do not include non-technical losses, such as theft.

A2. Available Loss Reduction Technologies and Approaches

The techniques that are most applicable to a specific utility system depend on which types of losses are the most significant on that specific system. There are no techniques that will be best in all circumstances. The amount of loss reduction that should optimally be implemented depends on the societal expectations, economic constraints, and competing values such as improved asset utilization. Improving asset utilization reduces overall capital costs but it increases the loading on equipment which also tends to increase losses.

There are two main sources of losses, conductors and transformers. Transformer losses can be reduced by design or loading changes. Design changes can be achieved by using lower loss steel in the transformer core, or by using windings with lower resistance, either by using copper instead of aluminum or by using larger wires or both. Since transformer losses depend on the design they can only be reduced by replacing a transformer with high losses with one with lower losses. Since transformers are expensive this is only feasible if done slowly as transformers are replaced for other reasons, such as age or under capacity.

The following methods can be used to lower conductor losses:

1. Using copper instead of aluminum
2. Using larger conductors
3. Using more transformer stations (shorter low voltage lines)
4. Using three phase lines instead of single phase
5. Installing capacitor banks
6. Balancing the load between conductors on the same line
7. Reducing peak loads by active or passive load control
8. Installing distributed generation

Some of these are methods that utilize capital costs and are basically unable to be retrofit on existing systems (3), some utilize capital costs but can be retrofit (1,2,4,5,7,8) and some utilize operations costs (6).

Choice of which method to implement first depends on both the technical efficiency (how much energy can be saved) and the economic efficiency (will savings be larger than costs). Previous studies have shown that the most cost effective methods are capacitor installation and phase balancing.

A3. Application of Loss Reduction to Hydro One

A3.1 Identification of Most Suitable Techniques

The most suitable techniques are efficient in both technical and economic terms.

The **installation of capacitors** reduces losses by correcting the power factor of the loads and thus reducing the current required to supply the same power and energy. The current flow in distribution feeders can be decomposed into active and reactive components. Applying a shunt capacitor, at the load end of the feeder, injects the capacitive current that results in reduction of the net reactive current. This result in a reduction of the overall line current and the effective apparent power at the load seen from the feeder. Therefore, as the current of the feeder is decreased, the conductor losses will be reduced. Moreover, the voltage at the load end is boosted which may allow better service to the customers. The amount of loss reduction achievable depends on the initial power factor. Ideally the best evaluation technique would be to measure the power factor on all circuits and calculate the current reduction that can be achieved on each circuit. However, at Hydro One the power factor is not measured on all circuits. A previous detailed study on eight Hydro One circuits found power factor varies from 1 to 0.92 with an average of 0.94.

Another suitable technique for loss reduction in Hydro One is **balancing the load** between conductors on the same circuit. Since many of the loads are on single phase lines it is never possible to get a complete balance. However, the latest data shows that the average imbalance on Hydro One distribution circuits is 26%. This means that the highest or lowest conductor current is 26% different than the average current. The balance of current between the phases is not a static quantity. It varies from one year to the next as loads grow, are added or removed from the system. Phase balancing is therefore a maintenance activity that needs to be done on a regular basis. The cost implementing this loss reduction technique is therefore a maintenance cost rather than a capital cost. An analysis of this loss reduction method is included in this report so that this method can be compared to the installation of capacitors and a suitable balance can be struck between implementing the two techniques.

A3.2 Estimation of Potential Energy and Peak Power Savings

The total potential for energy savings due to **capacitor banks** has been estimated from typical circuits. If an average power factor of 0.94 (ref cress) is assumed to be typical of the existing circuits then the most recent load data indicates that capacitor banks of at least 150 kVAr could be installed on 1560 of the 2700 circuits, assuming a minimum load of half the peak. With the assumed 0.94 power factor, this is estimated to reduce distribution line losses by 85 GW-h per year.

The kW savings in different loading periods has been estimated as follows based on modeling of typical circuits at each voltage level. The minimum single capacitor bank has been assumed to be 150 kVAr

	Winter			**Summer**			**Shoulder**	
	On peak	**Mid Peak**	**Off Peak**	**On Peak**	**Mid Peak**	**Off Peak**	**Mid Peak**	**Off Peak**
Hours	**602**	**688**	**1614**	**522**	**783**	**1623**	**1305**	**1623**
150kVAr	4.93	2.89	1.44	4.42	2.63	1.36	3.14	1.27
300kvAr	10.41	6.10	3.05	9.33	5.56	2.87	6.64	2.69
450kVAr	26.54	15.56	7.78	23.80	14.19	7.32	16.93	6.86
600kVAr	63.28	37.10	18.55	56.74	33.82	17.46	40.37	16.37

The potential energy and peak power savings from **phase balancing** has also been estimated based on analysis of typical circuits at each voltage level. It was assumed that after balancing the circuit would still be 10% unbalanced since this is an achievable minimum.

# Circuits Balanced	**Energy Savings per circuit MW-h**	**Peak Power Savings per circuit KW**
25	104	48
47	89	38
67	81	36
99	69	30
148	57	24
251	42	18
351	34	15
451	30	13
551	26	11
651	23	10
751	21	9

The decreasing energy savings per circuit is caused by the circuits with the largest imbalance being selected first. The first 25 circuits have 100% imbalance. By the last few rows of the table the 100 circuits between each row are moving from 30% unbalance to 10% unbalance.

Peak kW Saved in Different Time Periods

	Winter			Summer			Shoulder	
# Circuits Balanced	**On peak**	**Mid Peak**	**Off Peak**	**On Peak**	**Mid Peak**	**Off Peak**	**Mid Peak**	**Off Peak**
25	26.9	16.3	8.2	25.0	14.9	7.7	17.8	7.2
47	21.3	12.9	6.5	19.8	11.8	6.1	14.1	5.7
67	20.2	12.2	6.1	18.7	11.2	5.8	13.3	5.4
99	16.8	10.2	5.1	15.6	9.3	4.8	11.1	4.5
148	13.4	8.2	4.1	12.5	7.4	3.8	8.9	3.6
251	10.1	6.1	3.1	9.4	5.6	2.9	6.7	2.7
351	8.4	5.1	2.6	7.8	4.7	2.4	5.6	2.3
451	7.3	4.4	2.2	6.8	4.0	2.1	4.8	2.0
551	6.2	3.7	1.9	5.7	3.4	1.8	4.1	1.7
651	5.6	3.4	1.7	5.2	3.1	1.6	3.7	1.5
751	5.0	3.1	1.5	4.7	2.8	1.4	3.3	1.4

A3.3 Extent of Application of Loss Reduction Methods and Expected Achievable Savings

To estimate the savings that could be easily achieved by installation of **capacitor banks** it can be assumed that heavily loaded circuits will have a power factor of a maximum of 0.96. This is a conservative figure based on the known power factors. Assuming a minimum installation of 150 kVAr and a minimum load of half of the peak load, any circuit with a peak load of more than 1000 kW would have enough reactive power to install a capacitor bank. Circuits with more than 2200 kW load could have 300kVAR of capacitors installed, circuits with more than 3000 kW could have 450 kVAr of capacitors, and circuits with more than 4500 kW peak load could have 600kVAr of capacitors installed. The most recent circuit load data indicates there are 70 circuits that could have 600kVArs, 150 that could have 450 kVArs, 440 with 300kVArs and 900 that could have 150kVAr banks. This is a total of 1560 circuits with at least 150kVars. With the 0.96 pf assumption, the estimated energy savings in distribution line losses are 71 GW-h per year. Limiting the number of circuits to those which require the largest banks will increase the profitability index. If capacitors are applied to the 600 worst circuits, then 70 circuits with 600kVAr, 150 circuits with 450 kVAr, and 380 circuits with 300 kVAr could be installed. The estimated savings would be 50 GW-h per year. More capacitors could be installed if the power factor and minimum load of heavily loaded circuits was measured.

To estimate the savings that could actually be achieved by **load balancing** the diminishing returns evident in the table above have been taken into account. A reasonable level would be determined by the economic analysis. The savings from balancing last only a few years and gradually decrease in each year as the balance becomes poor again. A 20 year linear decrease is a reasonable assumption. In this case a 2 year program to balance the worst 750 circuits is proposed. This would save 15 GW-h per year at initial full implementation.

A3.4 Economic Analysis

The savings from the loss mitigation techniques were computed using the Avoided Cost methodology in the Navigant "Avoided Cost Analysis for the Evaluation of CDM Measures" report dated June 14, 2005.

Savings were computed both including and excluding environmental impacts using Table 23 and 21 of the Navigant Report respectively. Savings were further expressed as Present value over twenty years by applying a discount factor of 9.3% and an escalation factor of 2.5% to the tabulated values.

Distribution demand was evaluated at $6.5/kW however this value is expected to be high since it was computed by the Navigant localized method. Savings were computed neglecting the Distribution Demand factor and are provided in the Table below.

Savings for the mitigation techniques were computed over a 20 year period.

Capacitors were assumed to be installed 25% in 2006 and 75% in 2007. In the year of installation only half the energy savings of the banks installed in that year were received. In 2008 all the savings from all units was considered and these savings continued on to 2026.

Installed capacitor costs were considered to be as follows:

150kVAR	$14,500
300kVAR	$15,300
450kVAR	$16,000
600kVAR	$16,800
900kVAR	$19,500

250 circuits were considered to be **balanced** in 2006 and 500 additional in 2007. The per circuit cost of balancing was considered to be $3000 including one day's time for a bucket truck, crew and a technologist. Only half of the savings was considered in the year of installation. A factor was applied to reduce the energy savings in subsequent years to account for the gradual loss of the impact of balancing.

Avoided Energy and Demand Costs including Environmental Costs

Program	Reduction in Annual Energy Loss GW-hr	Avoided Energy Costs PV $M	Avoided Energy and Generation Demand Costs PV $M	Avoided Energy, Generation and Transmission Demand Costs PV $M	Avoided Energy, Generation , Transmission and Distribution Demand Costs PV $M
PF Correction Capacitors - install cap banks on 660 feeders requiring 300kVAR or more	53	45.7	51.4	52.0	52.9
Phase balancing - balance 750 circuits	15	9.9	11.1	11.3	11.4

Note: Present value calculated over a twenty year period

Avoided Energy and Demand Costs without Environmental Costs

Program	Reduction in Annual Energy Loss GW-hr	Avoided Energy Costs PV $M	Avoided Energy and Generation Demand Costs PV $M	Avoided Energy, Generation and Transmission Demand Costs PV $M	Avoided Energy, Generation , Transmission and Distribution Demand Costs PV $M
PF Correction Capacitors - install cap banks on 660 feeders requiring 300kVAR or more	53	40.2	45.8	46.5	47.3
Phase balancing - balance 750 circuits	15	8.6	9.9	10.0	10.2

Note: Present value calculated over a twenty year period

STAKEHOLDER CONSULTATION REPORT

1.0 OVERVIEW

In mid 2007, Hydro One designed a process for consultation and two-way dialogue with stakeholders to assist in its preparation of the 2008 Distribution Rate Application. This Exhibit reports on the stakeholder consultation process and provides a summary of the discussions held during three interactive sessions. Based on previous experience with such applications, the involvement of stakeholders was recognized as critical to developing a submission that reflected the broad interests and concerns of Hydro One distribution customers and stakeholder constituencies. Stakeholder consultation is also integral to satisfying the Ontario Energy Board (OEB) directive to be mindful of, and guided by, concerns raised by intervenors when preparing rate applications.

To assist in developing, implementing and facilitating this process, Hydro One retained Haussmann Consulting Inc. (HCI). This firm was selected through a competitive Request For Proposals process held in spring 2007. The stakeholder consultation process was subsequently implemented, with sessions being held in July, September and October 2007.

The purpose of the consultation process was to inform stakeholders and customers about Hydro One's application, the key issues and challenges facing its distribution business, and to learn about stakeholder issues. This was achieved through a series of interactive forums that allowed Hydro One and stakeholders to discuss and explore questions and potential areas of agreement and concern around key application-related issues. The goal was to improve the quality and completeness of the pre-filed evidence and to minimize the issues to be addressed at the OEB hearing.

Based on the potentially large number of interested stakeholders and their diverse range of resources and interest levels, two consultation approaches were chosen to meet the needs of various audiences. The consultation program consisted of: (1) stakeholder discussion sessions and (2) Web/Email Information. In addition, informal dialogue (e.g., email, telephone conversations) continued throughout the process between Hydro One staff and the stakeholders.

An initial list of stakeholders was developed based on previous participation in Hydro One rate proceedings. In total, twenty stakeholder organizations were represented at one or more of the discussion sessions. These included several local distribution companies; energy industry associations and unions; consumer and environmental advocacy groups; First Nations and one municipality. Groups advised about the Web site included Hydro One's large distribution customers and local distribution companies (LDCs).

Input received during the consultation sessions was documented, analyzed and addressed, where possible, at the discussion session, in notes of meeting, and through commitments to consider addressing or providing specific information in the application. Stakeholder input had a direct influence on the content of Hydro One's application with respect to the application approach, types of information provided and the level of detail.

Overall, Hydro One believes the stakeholder consultation process was effective in achieving many of its stated objectives. This belief is supported by the evaluation comments submitted by stakeholders who participated in the process. Their evaluations indicated that the process met their expectations and was well documented. A complete summary of the stakeholder evaluation comment sheets is found in Attachment 2 of Appendix G.

2.0 CONSULTATION PRINCIPLES AND OBJECTIVES

The following principles and objectives were developed at the outset of the process to guide the consultation design and implementation. These were reviewed with the Hydro One Customer Advisory Board (CAB), which provides advice and counsel to Hydro One management on how best to provide service to customers while meeting shareholder and regulatory requirements. The CAB consists of Hydro One distribution and transmission customers and energy industry groups. The principles and objectives were also reviewed with stakeholders at the outset of the first consultation session, and were posted on the Hydro One Web site.

2.1 Principles

- Hydro One engaged in the stakeholder consultation process in good faith with a view to facilitating and streamlining the upcoming OEB proceeding associated with this application.
- Hydro One received and considered all submissions and comments made by stakeholders, but retained control over the process of developing its application.
- All consultations were carried out on a without-prejudice basis.
- The facilitator documented and reported the discussions and any agreements reached with stakeholders.
- Agreements reached were to be submitted to the OEB as part of Hydro One's evidence.

2.2 Objectives

- Build on the stakeholder understanding of Hydro One distribution's business created through the stakeholder consultation processes for the recent Distribution and Transmission rate applications.

- Ensure stakeholder concerns and views are identified, understood and considered in the preparation of Hydro One's rate application.
- Provide insight, advice, and feedback to Hydro One on any concerns, values, information and preferences regarding all aspects of Hydro One distribution's operations.
- Act as a forum for the exchange of information and views.
- Assist Hydro One to anticipate and respond to stakeholder and customer views and preferences.
- Resolve as many issues as possible prior to the Hydro One submission to the OEB.
- Minimize the distribution business issues to be heard by the OEB.
- Reduce the time and cost associated with the OEB hearings.

3.0 CONSULTATION PROCESS

Building on these principles and objectives, a consultation plan was developed that included stakeholder sessions, and a communications strategy. The communications strategy included the use of e-mail and the company's web site to provide information to Hydro One stakeholders and to invite input at key points throughout the process.

Hydro One worked with Haussmann Consulting Inc. to design a process that would provide maximum opportunity to educate stakeholders about Hydro One's business and receive feedback on key areas of the application. For stakeholders, the plan allowed flexibility so that they could obtain information on the topics of most interest to them, and participate in a full discussion of issues of concern. The proposed approach was discussed with the Hydro One CAB on June 25, 2007. Overall, the CAB was supportive of the proposed approach.

3.1 Participants

Key stakeholder groups including intervenors from previous Hydro One rate proceedings, LDCs and large distribution customers were invited to participate in the first two stakeholder sessions via an invitation letter (Appendix A) and a follow-up e-mail. For the third session, an email invitation was sent to stakeholders. Approximately, forty groups were invited to participate in the stakeholdering sessions. Hydro One believes that those invited were representative of the interests of the majority of its distribution stakeholders.

First Nations political and treaty organizations were invited to participate in the consultation process. Hydro One did not propose a separate consultation process specifically designed for the First Nations, because the nature of the proceeding, which focused on Revenue Requirement, Cost Allocation and Rate Design, did not warrant such an approach. As this is a distribution rate proceeding, there are no land issues or treaty rights that would be affected by Hydro One's proposal for adjustment to its distribution rates.

Those who were not able to attend were invited to monitor the process through the company's web site and to provide input at key points throughout the process.

Stakeholder participation was guided by a Terms of Reference (see Appendix B). Funding guidelines were also developed to assist eligible intervenors (see Appendix C). The funding guidelines were based upon the Ontario Energy Board's Practice Direction on Cost Awards (October 2005) document.

3.2 Stakeholder Consultation Sessions

Three consultation sessions were held in July, September and October 2007. These sessions were timed to coincide with key milestones in the development of the distribution application. The first session focused on the Hydro One revenue requirement. Sessions 2 and 3 addressed cost allocation and rate design.

Session #1 was held on July 18, 2007 at the Metropolitan Hotel in Toronto. Thirteen people attended representing twelve stakeholder organizations (see Appendix D for list of participants). The session consisted of presentations describing Hydro One's business strategy, an overview of the revenue requirement application, Hydro One performance relative to comparable utilities, the most recent three-year trend, the 2006 actual OM&A and capital expenditures, and future needs and expectations, all of which support the rationale for the revenue requirement in the Hydro One application. Each presentation was followed by a discussion period, which provided stakeholders an opportunity to ask questions, comment on the presentations and proposed approach to the revenue requirement calculation, and to identify issues and information that were most important to them.

Session #2 was held on September 5, 2007 at the Metropolitan Hotel in Toronto. Twelve people attended representing eleven stakeholder organizations (see Appendix F for list of participants). Hydro One presented a summary of its August revenue requirement filing including its total revenue requirement and the average total bill impact, an overview of the OEB cost allocation methodology adapted to suit Hydro One distribution system characteristics, and a review of its current customer classes with some proposed principles for reducing the existing 281 classes to a more manageable number. This presentation was followed by an exercise in which stakeholders indicated how the existing classes might best fit into ten new customer classes. The remainder of the session was devoted to a presentation on the steps involved in rate harmonization and a workshop discussing principles and practices of rate harmonization.

Session #3 was held on October 15, 2007 at the Metropolitan Hotel in Toronto. Fourteen people attended representing twelve stakeholder organizations (see Appendix G for list of participants). Hydro One presented its proposals with respect to new customer rate classes and mapping from existing rate classes, the cost allocation results, rate harmonization and customer bill impacts.

3.3 Web/E-Mail Information

Recognizing the vast geographic area served by Hydro One and the large number of potentially interested stakeholders spread over this area, Hydro One launched a 2008 Distribution Rate Application Web site. The intent was to provide interested stakeholders the opportunity to monitor the consultation process and to provide input at key points throughout the consultation.

The 2008 Distribution Rate Application Web site (http://www.hydroonenetworks.com/en/regulatory/) was launched on July 13, 2007. The Web page was updated regularly and contained background information, documents and presentations made available at the stakeholder discussion sessions and the meeting notes.

An invitation to participate in the Web consultation activities was sent to large distribution customers, LDCs, as well as intervenors not able to participate in the discussion sessions.

4.0 SUMMARY OF DISCUSSIONS

Hydro One developed an agenda for the first stakeholder consultation session based on areas of interest expressed at previous distribution rate consultation sessions, and topics on which Hydro One was seeking direct input from stakeholders to enhance the application. The topics discussed at the July session are outlined below. Detailed Notes of Session #1 are attached as Appendix D.

Topics presented and discussed at the first stakeholder session included:

- **Hydro One Business Strategy:** Laura Formusa, President and Chief Executive Officer (Acting), Hydro One Inc., presented the company's overall business strategy and engaged in a discussion with stakeholders about Hydro One values and priorities.

- **Rate Application Overview:** Joe Toneguzzo, Director, Major Applications, presented an overview of the two-step process Hydro One is following in preparing its Distribution Rate Application.

- **Benchmarking, Reliability and Service Quality:** Carm Altomare, Manager, Performance Analysis, described benchmarking studies currently underway; major performance measurement drivers; and customer service indicators and performance. Barb Allen, Manager, Customer Care assisted by responding to some stakeholder questions about Hydro One customer satisfaction survey methods.

- **Distribution Incentive Regulation Proposal:** Andy Poray (Director, Regulatory Policy) and John Todd (Elenchus Research Associates) described and solicited participation in a Hydro One Distribution Incentive Regulation Working Group (IRWG) to help design an incentive regulation specifically to meet Hydro One distribution needs.

- **Major Investment Programs and Key Drivers (OM&A and Capital):**
  - Rick Stevens, Director, Smart Meter Project described the Smart Meter Program and the implementation plan to 2010; and
  - George Juhn, Manager of Distribution Development and Lines Sustainment, presented an overview of the remaining investment programs required by Hydro One and included in the revenue requirement.

- **Shared Services:** Ian Innis, Director, Corporate Planning and Regulatory Finance (Acting), provided an overview of OM&A and Capital expenditures associated with the Shared Services and Other category of Hydro One's business.

- **Revenue Requirement:** Ian Innis also presented an overview of the 2008 Distribution Revenue Requirement. Specific financial data were not available at the time, but financial parameters and assumptions in the 2008 filing, compared to the 2006 approved values were presented, and factors identified that would contribute to an increase or provide an offset to the Distribution rate change.

Stakeholder input at the first session assisted Hydro One to anticipate areas of interest that would be addressed during stakeholder Session #2. These included:

- Cost allocation methodology; and
- Rate harmonization methodology and impacts.

In addition, stakeholders showed interest in participating in a Hydro One Incentive Regulation Working Group (IRWG), which would assist in the development of an incentive regulation mechanism suitable for Hydro One and possibly other distributors. Prior to the first meeting of the IRWG, the Ontario Energy Board launched a similar consultation initiative. Therefore, the Hydro One IRWG was disbanded so that participants could devote their time and energy to participate in the OEB process.

At the second stakeholder session, discussion focused on the cost allocation methodology, the principles relevant to reducing the number of Hydro One customer classes to a manageable number, and principles and practices of rate harmonization. Using a template provided, stakeholders mapped how they proposed customer classes should be transitioned from the existing classes to a smaller number of new classes. For the rate harmonization discussion, stakeholders were asked to answer six questions regarding the OEB guidelines for rate harmonization, bill impacts, timelines, loss factors, mitigation, equity considerations, and rate structure considerations (see Appendix E for Rate Harmonization Design Process Questions).

Stakeholder feedback received at Session #2 suggested that the parameters and principles for delineating customer classes should include (see Session #2 Notes, page 10):

- Energy consumption levels
- Value of assets used
- Types of assets used
- Type of service provided at user gate
- Similarity with other LDC classes / fairness
- Ease of understanding
- Management simplicity.

When transitioning existing customer classes to new rate classes, most stakeholders (see Session #2 Notes, page 14):

- Favoured the elimination of the Seasonal class;
- Proposed applying a density delineation to the General Service customer class;
- Supported renaming Urban Residential, Residential High Density and Residential Normal Density to better describe the categories, e.g., Residential High, Medium and Low;
- Proposed moving the existing classes General Service (energy billed) and General Service (demand billed) into the new classes, General Service (primary) and General Service (secondary);
- Urged Hydro One to consider the impacts associated with creating new customer classes and propose appropriate mitigation where required; and,
- Agreed that new customer classes should be phased-in with minimal disruption to customers.

There were also a number of divergent views expressed regarding the Farm Classes. Some saw a need to retain the Farm classes; others supported migrating them to the General Service and/or Residential Normal Density classes. In addition, the need to maintain Rural Rate Assistance was debated by some stakeholders and there was some discussion of changing the 50 kW threshold for the General Service class.

The specific stakeholder comments, and questions raised through this process and Hydro One responses are reflected in the Detailed Notes of Session #2 attached as Appendix F.

The third stakeholder session was focused on presenting Hydro One's proposals with respect to new customer rate classes and mapping from existing rate classes, the cost allocation results, rate harmonization and customer bill impacts.

Much of the dialogue following the presentations related to clarification of the information presented. With respect to customer classes and cost allocation methodology, comments from stakeholders covered the following:

- Clarification of the process related to defining density classes and moving customers from lower to higher density classes (see Session #3 Notes, pages 5, 6 and 21);
- The revenue-to-cost ratio target of 1.2 for Urban General Service energy-billed (UGe) class and the target ratio of 1.08 for the General Service energy-billed (GSe) class were viewed as too high. (see Session #3 Notes pages 8, 14 and 22);
- The Sub-transmission (ST) class revenue-to-cost target ratio of 1.8 was still seen as too high (see Session #3 Notes pages 10 and 22); and,
- Hydro One was urged to consider setting rural rates at a level consistent with the original Rural Rate Assistance legislation that once specified rural rates should not exceed 115% of the provincial average for residential rates (see Session #3 Notes page 10).

The presentation on rate harmonization and customer bill impacts prompted the greatest amount of discussion. The presentation slides illustrated impacts at average consumption levels with maximum and minimum total bill impacts. Customers with higher and lower usage patterns could face different bill impacts, and stakeholders wanted to understand the range of impacts within each class for various consumption levels and the elements contributing to rate impacts (see Session #3 Notes pages 15, 16, 19, 21 and 22). There was concern expressed that more consideration should be given to customers who may be faced with high bill increases because they fall outside the average consumption range (see Session #3 Notes pages 11-13).

Effectively communicating these changes to customers who will see a significant increase in the distribution component of their electricity bill was discussed at length. It was noted that the rationale should include references to the need to achieve equity with other customers, historic underpayment for services relative to cost, OEB directive to apply the cost allocation methodology and phasing-in of increases to mitigate bill impacts. However, one stakeholder noted that, while the rate increases may be equitable within the Hydro One customer base, some customers would find their rates rising well above those for comparable users in nearby areas served by other LDCs.

The various methods, which could be used to notify customers were also discussed. Hydro One indicated there was an urgency to provide this information early, in order to allow affected customers an opportunity to participate at the OEB process should they wish. Notification options and pros/cons were discussed at length (see Session #3 Notes pages 11-13).

The specific stakeholder comments and questions raised through this process, and Hydro One responses, are reflected in the Detailed Notes of Session #3 attached as Appendix G.

5.0 CONCLUSION

Hydro One initiated the stakeholder consultation process to meet the objectives described in Section 2.2. Based on the discussions that took place, the consultation process met these objectives. Hydro One believes that the enhanced understanding by stakeholders of Hydro One operations and business practices resulting from the dialogue at these sessions should significantly reduce the effort required by Hydro One to explain its distribution business during the OEB proceeding. Hydro One also obtained a good understanding of stakeholder issues and concerns through the consultation process.

Stakeholder input assisted Hydro One to better understand and address stakeholder concerns in the following areas:

- The prioritization of investments;
- Rationale for demand capital and sustaining requirements;
- Customer satisfaction and reliability benchmarking, including identification of comparator utilities;
- Performance versus increases in expenditures, including effect of 2006 storm activity on Hydro One reliability measures;
- Investment justification documentation for capital projects equal to or greater than $1 million, including summaries of project needs and results; and
- Identification of new standards, codes or compliance requirements that affect Hydro One's distribution operations.

With respect to rate harmonization and impact management, Hydro One concluded from its dialogue with stakeholders that:

- The 10% total bill impact is a key guideline to follow, but consideration could be given to adding a maximum dollar impact if the 10% rule hindered achievement of harmonization within a reasonable period. It was noted that a rate increase between $3 and $5 per month is used by other utilities as a guideline to ensure low-income customers are not unduly affected.
- Rates should be harmonized as quickly as possible being mindful of customer impacts and ensuring bill impact guidelines are met.
- The number of customer classes should be simplified taking into consideration the principles discussed, including consistency with the class structure of other LDCs but expanded to accommodate Hydro One's unique customer characteristics.
- All customer classes should have a common fixed + variable rate structure.

- A weighted average probably should be used to determine a new class loss factor when combining different classes and loss factors into a new class.
- There is a need to present bill impacts at various levels of consumption for each customer class and to explain what drives the impacts.

Stakeholder input helped Hydro One to refine and shape the elements of its distribution rate application and helped to ensure that customer and stakeholder concerns were understood and addressed.

Sample Stakeholder Invitation Letter

Re: Hydro One Networks 2008 Distribution Rate Application

Hydro One Networks has begun to prepare its 2008 Distribution Rate Application for submission to the Ontario Energy Board (OEB) for implementing approved rates in mid-2008. The application will be developed and filed in two stages. The portion seeking approval for the revenue requirement will be submitted on August 15, 2007 and the cost allocation and rate design portion will be filed in October 2007.

In July, Hydro One will be initiating a stakeholder consultation program to assist us in the development of the application. Important aspects of the application include determining the work program spending that underlies the 2008 revenue requirement, as well as Hydro One's proposal to simplify its rate structure and harmonize the rates for customers of acquired utilities. The purpose of this letter is to invite you to participate in this process.

The goal for the consultation program is to create a forum for key stakeholders and Hydro One to discuss issues related to the Distribution Rate Application, and to identify areas of agreement and concern to assist in shaping the pre-filed evidence. Many stakeholders will have participated in the 2006 distribution rate consultation process. Hydro One intends to build on the experience gained during those sessions and subsequent OEB proceedings. The main objectives for this consultation program are to:

- inform key stakeholders about the approach and methodology used to determine revenue requirement, cost allocation and rate design;
- provide a preview of the application, including the numbers;
- provide stakeholders a range of opportunities to identify concerns on all aspects of the application;
- ensure stakeholder concerns and views are identified, understood and considered in the preparation of the application.

A report summarizing the key areas of discussion, agreement and concern raised through the consultation process will be included in the application.

Stakeholder Representation:

Hydro One will hold a series of discussion sessions with key stakeholders, including but not limited to groups who have participated in previous Hydro One Networks distribution rate proceedings. Stakeholders invited to participate will represent a diverse range of interests including consumer advocacy and environmental groups, energy industry associations; Aboriginal organizations, local distribution companies and large distribution customers.

Consultation Sessions:

The stakeholder process will consist of a minimum of three formal stakeholder sessions between July and October 2007 in the Toronto area. The preliminary topics for the three consultation sessions are as follows:

1. Hydro One business strategy and the revenue requirement (RR) components;
2. Principles of cost allocation (CA) and rate design (RD); and
3. CA/RD application and impacts.

The first stakeholder session is scheduled for July 18, 2007 at the Metropolitan Hotel, 108 Chestnut Street, Toronto, 8:30 a.m. to 4:30 p.m. (a continental breakfast will be available at 8:00 am). During this one-day session we will present and discuss:

- Hydro One business strategy;
- application development process;
- major investment programs and key drivers;
- benchmarking;
- overall 2008 revenue requirement;
- stakeholder issues and concerns.

This is the only planned meeting at which stakeholders can provide input to the revenue requirement portion of the application before it is submitted on August 15. Subsequent sessions are planned for mid-September and October, and Hydro One will consider holding additional sessions if warranted. Stakeholders will be able to follow the consultation process by visiting the Hydro One web site (www.HydroOneNetworks.com) and provide their comments by email or direct mail. All presentation materials will be posted on our web site. Comments received through these avenues will be considered fully and integrated into the stakeholder meetings, as well as in the final reporting.

Background Information:

This letter is accompanied by a Participant Terms of Reference and Funding Guidelines. The final agenda and presentation materials will be forwarded to participants in advance of the session. Please note that, if you were qualified to receive funding for the 2006 Distribution Rate Application or the 2007/2008 Transmission Rate Application stakeholder consultation processes, you are not required to apply again. It will be sufficient to indicate that you will be participating and submitting funding requests at the time you register to participate in this process.

If you have any additional questions about this process please contact Ms. Enza Cancilla, Manager, Public Affairs at 416-345-5892 or by email: Enza.Cancilla@HydroOne.com. ***Please confirm your attendance at Session #1 by contacting Jessica Pontone by email at*** Jessica.Pontone@HydroOne.com ***or at 416-345-5938 by July 13, 2007.***

Sincerely,

Susan Frank
Vice President and Chief Regulatory Officer

Enc.

Stakeholder Consultation
2008 Distribution Rate Application

Participant Terms of Reference

Background
Hydro One Networks Inc. (Hydro One) is a company committed to business excellence. Building positive and lasting relationships with stakeholders is key to our success. To continue to build these relationships, Hydro One is undertaking a stakeholder consultation process to assist in the preparation of its 2008 Distribution Rate Application to the Ontario Energy Board (OEB). This process will involve a number of consultation sessions and a project website. The purpose of the consultation sessions is to provide a forum for dialogue between Hydro One and key stakeholders and customers to discuss, clarify and prioritize key topics related to the application. These consultation sessions, along with any submissions received through the website, will be considered in the development of the content of Hydro One's submission to the OEB.

Stakeholder Consultation Principles
- Hydro One is entering into the stakeholder consultation process in good faith with a view to facilitating and streamlining future OEB proceedings related to the application;
- Hydro One will receive and consider all submissions made by stakeholders, but will retain control over the process of developing its application;
- All consultations are carried out on a without-prejudice basis;
- A neutral facilitator will document and report the discussions and any agreements reached with all or some stakeholders;
- Agreements reached will be submitted to the OEB as part of its evidence.
- This process will build upon stakeholder consultation sessions held in 2005 and 2006 for Hydro One's most recent Distribution and Transmission Rate applications.

Goal
The goal for the stakeholder sessions is to create a forum for key stakeholders and Hydro One to discuss issues related to Hydro One's 2008 Distribution Rate Application and to identify areas of agreement and concern to shape the pre-filed evidence. To further this mandate, participants are asked to:
- Represent the various views of their customers/constituencies;
- Assist Hydro One to understand their goals and issues through participation in a process of open dialogue and submissions.

Objectives

- Inform and update key stakeholders about our distribution business, and the approaches and methodology used to determine revenue requirement, cost allocation and rate design;
- Give stakeholders a range of opportunities to provide input and feedback on all aspects of the application;
- Ensure stakeholder concerns and views are identified, understood and considered in the preparation of the application;
- Act as a forum for the exchange of information and views;
- Assist Hydro One to anticipate and respond to stakeholder and customer views and preferences; and
- Clarify and scope as many issues as possible prior to the Hydro One submission to the OEB.

Membership

Participants have been invited from key stakeholder groups, namely: intervenors from previous Hydro One rate proceedings, energy and environmental associations, Local Distribution Companies, major customers and Aboriginal political organizations.

Hydro One believes that those invited are representative of the interests of the majority of its stakeholders. Stakeholder discussion sessions may be limited in size to ensure adequate time to fully explore issues.

Alternate Members

It is Hydro One’s intention that the same stakeholder representatives be actively involved throughout the process. This continuity will aid in the effectiveness of the process. In the event a participant is unable to attend one or more meetings, one designated alternate may be assigned to take their place. In the event that a participant and their alternate are both unable to attend a meeting, input may be submitted to Hydro One in writing.

Roles and Responsibilities

Hydro One

- Provide adequate background information to enable participation;
- Provide overview/presentations of key discussion topics;
- Act as a resource for main discussion and breakout sessions;
- Inform stakeholder how consultation has influenced Hydro One application.

Stakeholder Representatives

- Review Hydro One material presented;
- Identify key issues;
- Provide and present input, advice and feedback on issues relating to Hydro One's transmission rate application;

Stakeholder Discussion Session Details

- Meetings are to be convened at the request of Hydro One;
- At least three 1 or 2-day sessions (July, September and October) are envisioned;
- All meetings will be held in the Greater Toronto Area;
- The input received during the Hydro One consultation will be used solely for the purpose of developing the 2008 Hydro One Distribution Rate Application.

Working Group Meetings/Subcommittees

If, during the course of the consultation sessions, it is apparent that additional time to explore an issue(s) would be of benefit, subcommittees may be convened to discuss a specific issue/topic for a predetermined period of time. If required, facilitation and reporting resources will be provided for subcommittee meetings.

Consultation Process Support

Haussmann Consulting Inc. (HCI) has been retained to provide third party facilitation and reporting of consultation sessions. Assistance in identifying issues where discussion will be of benefit, exploring stakeholder views, and identifying any common ground are key parts of the facilitation role.

HCI will prepare meeting notes that document discussions and stakeholder submissions received during this process, as well as any areas of agreement that are reached between Hydro One and stakeholders. Where stakeholders take firm positions on an issue, this will be recorded if the stakeholder is willing to be identified in the notes. If an organization wishes to go on the record with a detailed position, this should be confirmed in writing to Hydro One. These formal responses, along with stated positions will be reflected in the final consultation report that will form part of the Hydro One submission to the OEB.

Participant Funding

Funding may be provided for participants who qualify for funding under the *Funding Guidelines* attached. No other participant funding will be offered. Those who have qualified for funding during previous consultation processes (2005 Distribution and

2007/2008 Transmission Rate Applications) do not need to re-qualify if their circumstances remain the same. In these cases, a short statement of intent to participate and a request for funding should be forwarded to the contact below.

Duration of the Consultation Period

The purpose of this consultation is to provide an opportunity for Hydro One-stakeholder dialogue during the time in which Hydro One is preparing its 2008 Distribution Rate Application. The Application will be developed and filed two stages: Revenue Requirement in August 2007 and Cost Allocation / Rate Design in October 2007.

Additional Consultation Opportunities

Parties who are not available to attend or cannot be accommodated in the stakeholder consultation sessions are encouraged to follow the process and submit comments through the Hydro One Web site (www.hydroonenetworks.com).

Accountability:

- Responsibility for the stakeholder consultation program rests with Susan Frank, Vice President and Chief Regulatory Officer, Hydro One Networks Inc.
- Participants are to be governed according to the policies/procedures of their respective organizations. In the event that agreements are reached during the consultation process, they must be consistent with relevant policies of the respective organizations and must be supported by written documentation from the organization.

Hydro One Contact

Should you have any questions about this document or the consultation program, please contact:

Ms. Enza Cancilla
Manager, Public Affairs
Tel: 416-345-5892
Fax: 416-345-6984

Stakeholder Consultation

2008 Distribution Rate Application

Funding Guidelines

In order to facilitate dialogue with its stakeholders, Hydro One Networks Inc. (Hydro One) will provide funding to assist qualifying stakeholders to participate in its 2008 Distribution Rate Application stakeholder consultation process. The funding criteria that will be used are based upon those found in the Ontario Energy Board's (OEB) most recent Practice Direction on Cost Awards (October 2005).

Eligibility

- Hydro One will determine which stakeholders are eligible for funding. This will normally be limited to intervenors who have participated in past Hydro One distribution or transmission rate proceedings.
- Transmitters, wholesalers, generators, distributors, electricity retailers and marketers of natural gas and gas storage companies (either individually or in a group), parties with a direct commercial or business interest, the Ontario Power Authority and the Independent Electricity System Operator are not eligible for funding.
- Municipal or provincial government staff or representatives are not eligible for funding.
- Funding will be provided only to stakeholders participating in the discussion sessions.
- The burden of establishing eligibility for funding is on the party applying for support. Interested parties must provide Hydro One with a statement justifying their eligibility.
- Stakeholders who have previously qualified to receive funding for the 2006 Distribution Rate Application or the 2007/2008 Transmission Rate Application stakeholder consultation processes, are not required to apply again. It will be sufficient to indicate in writing to Hydro One that your organization will be participating and submitting claim forms.

Funding Principles

- Only one representative from each stakeholder organization will be funded. Alternates must be designated in advance and Hydro One notified.
- Groups with common interests are encouraged to combine their participation, or show cause as to why separate funding is justified.
- Funding will be provided for meeting preparation, attendance, travel to and from meetings, reasonable out-of-pocket expenses, and follow-up, as necessary, based upon the rates outlined in the OEB's Cost Award Tariff, with an agreed upon cap for preparation time not to exceed an amount equal to the meeting time. See OEB Cost Award Tariff at: http://www.oeb.gov.on.ca/documents/practice_directions_costawards_appa.pdf)
- Preparation time will not be reimbursed unless the stakeholder attends the discussion session for which preparation time was spent.

Funding Process

- Reimbursement for costs claimed will require the use of a Hydro One-approved form (see Attachment 2: Hydro One Disbursement Claim Sheet and the Preparation/Attendance sheet.)
- Requests should be submitted not later than 30 days following the completion of each meeting/workshop.
- Parties should submit their request for financial support to:

  Glen MacDonald, Senior Advisor – Regulatory Review
  Regulatory Affairs
  Hydro One Networks Inc.
  8th Floor, South Tower
  483 Bay Street
  Toronto, ON M5G 2P5

1. Agenda and Participant List

HAUSSMANN CONSULTING

1. BACKGROUND

Hydro One Networks Inc. has begun to prepare its 2008 Distribution Rate Application for submission to the Ontario Energy Board (OEB) for rates effective mid- 2008. There will be one application that consists of two parts: a revenue requirement component which will be submitted on August 15, 2007, followed by a cost allocation and rate design component, which will be submitted in October 2007.

In July 2007, Hydro One initiated a stakeholder consultation program to assist in the development of this application. The main objectives of the consultation program are to develop a shared understanding and prioritization of the key issues affecting the application, with an aim to resolving or reducing the scope of as many issues as possible prior to the OEB process. All consultation activities are carried out on a without prejudice basis.

Hydro One invited key stakeholders who have participated in previous Hydro One Networks rate proceedings to participate in a series of discussion sessions. Additional information about the consultation process is posted on the Hydro One distribution rate application Web site at: http://www.hydroonenetworks.com/en/regulatory/2008_distribution_rate_application.
This document reports on the first of these discussion sessions, which took place on July 18, 2007.

1.1 Welcome and Introductions

Chris Haussmann of Haussmann Consulting Inc. (HCI) welcomed participants, thanked them for their attendance and introduced himself as facilitator for the workshop. In attendance were representatives from the City of Timmins, Energy Probe, Essex Power, Federation of Ontario Cottagers' Associations, Grimsby Power, Innisfil Hydro Distribution Systems, Ontario Power Generation, Power Workers Union, Pollution Probe, Society of Energy Professionals, the Union of Ontario Indians and the Vulnerable Energy Consumers Coalition. Also present were Hydro One staff, and their consultants, Elenchus Research Associates and the HCI facilitation team.

The full list of participants, together with the agenda, is provided in Attachment #1.

1.2 Process Overview

Chris reviewed the proposed agenda, which was structured to enable Hydro One to provide participants with information and an opportunity to discuss various aspects of Hydro One's business that relate to the Distribution Revenue Requirement. Stakeholder Session 1 was comprised of a series of presentations, which delivered this information in an interactive manner. The entire session was conducted in plenary. There were two changes to the agenda:

- Barb Allen (Manager, Customer Care) responded immediately after lunch to questions that stakeholders posed in the morning relating to the manner in which customer satisfaction is measured; and

- Rick Stevens (Director, Smart Meter Project) made his presentation on the Smart Meter Program before George Juhn (Manager, Distribution Development and Lines Sustainment) made his presentation on Major Investment Programs.

The objectives for Stakeholder Session 1 were to:

- Inform key stakeholders on the approach and methodology Hydro One is using to determine the revenue requirement;
- Preview the application;
- Afford stakeholders with a range of opportunities to identify any concerns relating to the key issues driving revenue requirement; and,
- Ensure stakeholder concerns and views are identified, understood and considered in the preparation of the application.

Chris then introduced Susan Frank (Vice President & Chief Regulatory Officer), who welcomed participants and thanked them for taking the time to attend the session. Susan encouraged participants to raise their concerns and questions. Hydro One sees the session as a dialogue and views stakeholder input as an opportunity to improve the application. She indicated that Hydro One staff also will be available for further discussion "offline".

2. PRESENTATIONS AND DISCUSSION

The following sections provide brief descriptions of the presentations made by Hydro One staff. Questions of clarification and discussion following each presentation are summarized in bullet form. Points in *italics* represent responses or comments from Hydro One or its consultants. All session 1 presentation slides are available on the Hydro One distribution rate application Web site at: http://www.hydroonenetworks.com/en/regulatory/2008_distribution_rate_application.

2.1 Hydro One Business Strategy

Laura Formusa (Acting President & Chief Executive Officer) reiterated that stakeholder consultation is an important part of the rate application process. Hydro One is committed to supporting open and transparent discussion on the issues. Laura provided an overview of the current direction of Hydro One and its key accomplishments:

- Hydro One's mission is to be the best transmission and distribution company in North America measured in terms of safety, customer service and reliability, while focusing on the development and retention of its employees and creating shareholder value. Hydro One is committed to achieving customer satisfaction ratings of 90% across all segments and first quartile status with respect to reliability relative to comparable utilities. Restoring employee pride and respecting the public's trust is also a top priority.
- Hydro One is proud to have received the Edison Electric Institute Emergency Recovery Award for the restoration of service to customers after three major storm events in the summer of 2006. Such events underscore the need for rigorous and proactive vegetation management.
- Hydro One's initiatives associated with conservation and smart meters are important because they support provincial energy and environmental goals, help Hydro One customers meet these goals,

and provide Hydro One with a new opportunity to speak to customers. Hydro One's Conservation and Demand Management (CDM) program has resulted in energy savings of 100 million kWh since 2005 and demand for electricity during peak periods has been reduced by almost 11 MW. Hydro one is on track to install 1.3 million smart meters by 2010. The CDM and smart meter programs have resulted in Hydro One being ranked 26th of 50 corporations (and third among Canadian utilities) by Corporate Knights magazine based on environmental, social and governance indicators.

- Hydro One supports the Province of Ontario's Renewable Energy Standard Offer Program (RESOP) through the Ontario Power Authority's (OPA's) initiative for small projects (under 10MW) using renewable sources, such as solar, wind, biomass and water power. Hydro One has received over 700 requests for assessments. Hydro One has been unable to respond to all requests in a timely manner due to limited availability of the required expertise to conduct these assessments. Hydro One is improving its ability to respond to applications more quickly through training of additional staff and accessing external consulting service providers.
- Hydro One is listening to customers in all forums, and wants to sustain or increase the level of service, while changing some services to meet government policy objectives and environmental obligations.
- Hydro One understands that it must be a good steward of the assets with which it has been entrusted and the natural environment within which it operates; it must maintain the public trust; and, its customers must feel that they are getting value for money.

The following questions were asked/points were clarified in ensuing discussion:

- Is it Hydro One's objective to be the number one Ontario LDC in terms of CDM over the next three years?

  We probably are number one, and if not, are in the lead in terms of our program achievements to date. It is not absolute targets but the way we operate the business which will lead us to be number one. All our LDC colleagues are striving towards that goal and this competition will benefit all Ontarians.

- In terms of targets over the next three years, is it Hydro One's goal to achieve an absolute reduction in your LDC customers' peak day demands? Do you have a target to achieve an absolute reduction in their electricity consumption?

  We are not targeting a definitive number. Despite population growth, overall load growth is flat in the province. That means that average consumption per customer has been decreasing as a result of our CDM programs. Targets are nice, but CDM should become a way of life and a way of doing business.

- Over the next three years, what is your CDM budget? How much of it will be financed through rates and how much do you hope to get from the OPA?

  The OPA is taking the lead in terms of the programs they manage and finance. Hydro One takes guidance from the OPA with respect to developing budgets for CDM programs, and is taking the *lead in terms of what we think our customers want and need. It is important for the OPA to listen to the LDCs, who know their customers best, when designing their programs. We have to be as innovative as possible. Each of us has something to bring to the table over the next three years. We are not simply relying on the OPA to tell us what programs to roll out and deliver.*

- Is Hydro One independently funding CDM initiatives through their own rates and, if so, from what part of the rates will that be derived? How do you justify double charging customers by receiving funds on CDM initiatives from rates and from the OPA? What are you planning on doing with the Lost Revenue Adjustment Mechanism (LRAM)? Are you just looking at re-basing and foregoing any lost revenue?

  We are working through the OPA only. We are not proposing that separate CDM projects go into the rate base for this application. Our programs will be delivered through the funds that the OPA is managing. We do take into account in our load forecasts the conservation targets set by the OPA. That will continue.

  We are not applying for an LRAM because we do take into account the conservation that we anticipate our customers will achieve in our load forecast.

- Hydro One has done a great job with CDM. Why is Hydro One not participating in the 10/10 program?

  Hydro One is participating in the 10/10 program.

- Can you speak to your philosophy on consolidation of rates and harmonization related to the utilities you acquired in 1999-2000?

  The major storms that Hydro One had to cope with last year, and the associated forestry and restoration costs incurred, took place in the heavily treed areas of Northeastern Ontario. In southern Ontario we have 3-5% tree coverage so there is not a lot of that cost burden across the customer base. In southern Ontario we are worried about jobs, reliability and affordable rates for primary homes and businesses, not supplying power to million dollar cottages in "recreational" areas. Hydro One still carries a line rate that is 20% higher than the average for all the other LDCs in Ontario. How are you looking at managing increasing forestry/vegetation costs across the customer base?

  Both the harmonization question and the second question (which is about whether there should be regional rates based on the user pay principle rather than uniform rates across the province) are rate design issues. These issues will be addressed in the September and October stakeholder sessions. We believe these are critical issues and we want to get your views before we go to our Board and the OEB. The OEB is doing a great deal of work in the area of cost allocation and rate design. Hydro One must work within the governance structure the OEB provides to develop regional rates.

- We talk about achieving greater efficiencies through consolidation and regionalization, but everybody keeps going to the OEB for more money. We have a rate base in which customers in one area are subsidizing customers in another; for example, the rate base in southern Ontario likely includes a 30% OM&A on forestry in northern Ontario. There are still many efficiencies to be achieved through further consolidation and regionalization, but this is inhibited by the current rate making process which creates artificial rate bases across different sectors of the province with different service requirements. Rates for some service areas should not subsidize rates in other service areas.

This is a rate design issue that will be addressed in the September stakeholder session. Hydro One agrees that there are further efficiencies to be obtained across the entire distribution sector. We are all trying to do that.

We hear your viewpoint, but do not necessarily share it. The regional issues of north versus south, east versus west or farmers versus cottagers have been debated for decades. We have a diverse province, and serve a diverse customer base and communities that all make a contribution to the province.

- Rural rates have a much bigger impact on rates and the cost of power for ordinary customers across the province than storm restoration. Where should load-serving entities (LSE) go from Hydro One's point of view?

  This has not been a key focus in the company. As the debate grows, we will certainly be involved. Our general view is that this is not the right time for LSEs. The market has not evolved to the extent that customers would benefit from an LSE approach. Andy Poray is the expert on this within Hydro One and would be glad to talk to you.

2.2 Application Overview

Joe Toneguzzo (Director, Major Applications) provided an overview of the application and its time-line. Hydro One will identify where there are increasing work and cost pressures and where other factors are contributing to cost reductions. Joe described the key cost drivers for the revenue requirement and rates filing. He also described Hydro One's approach to the planned rates filing submissions. The filing will be structured and include information consistent with the 2005 Distribution submission.

The 2008 Distribution rate application to the OEB will be filed in two parts. The revenue requirement will be filed on August 15, 2007. Hydro One has not yet completed the internal approvals process for its business plan and a meeting with the Hydro One Board is scheduled for August 10. This is a key step in finalizing the application and meeting the August 15 OEB filing deadline for the Revenue Requirement submission. Given this challenging time-line, specific Revenue Requirement figures will not be available for this meeting or before the filing date. The rates portion of the application will be filed in the latter part of October 2007. Rate design and cost allocation will be discussed during Stakeholder Session 2 in September before going to Hydro One's Board of Directors on October 3, 2007. There will be a final stakeholder session in mid October to discuss customer impacts of the rate design. Our intention is to move towards harmonization and consolidation of the 270 rates Hydro One currently has, and to ensure that rates more accurately reflect the costs of providing distribution service to specific customer groups. The target Distribution rate reset date is mid-2008.

The following questions were asked/points were clarified in ensuing discussion:

- Given your two-part filing, when do you anticipate that the OEB will be starting the clock on their guidelines/processes: between the two filings or after the second filing?

  Hydro One hopes that the clock will start on August 15, 2007. However, Hydro One and the OEB have not finalized those details yet. We do not think that we can meet the May reset date and think a June or July 2008 reset date is more likely. The issue is complicated by the fact that the OEB also has to deal with many other LDCs who may be submitting 1-part or 2-part filings.

- Did you receive OEB approval for the list of the consolidated LDCs that you purchased and that you will be re-basing to the harmonized rates?

  No, there was no criterion established by the OEB for deciding which utilities would be re-based in 2008.

- Regarding harmonization, the OEB has traditionally indicated that there should not be a rate increase greater than 10% to a specific customer group or level. Will it be difficult for Hydro One to limit the rate increase to no more than 10% when harmonizing the rates?

  Yes, for some groups it will be a challenge. Hydro One will have to stage the increase over time. With harmonization of rates, the overall revenue requirement remains the same. Rates in one area will increase while they decrease in another area. The issue is, "Who is paying what rates?" Hydro One is not asking for more revenue due to harmonization. Hydro One recognizes that there are customers and communities who are paying too much today and their rates must be brought down. Other customers and communities are not paying enough. Susan Frank asked the stakeholders how long the harmonization of rates should take. She also asked stakeholders to suggest (by the September Stakeholder Session) alternate approaches or rules that could be considered other than the10% rule.

- If rates are increasing even after Hydro One has acquired 87 utilities in order to achieve increased efficiencies, what efficiencies have really been achieved?

  The increased efficiencies are at a higher level. We would have to determine what the total cost was of running those utilities plus Hydro One versus the cost of running Hydro One now that these utilities have been integrated into our system. Early estimates from industry working groups suggested an overall benefit in the order of $200M could be achieved depending on scenarios assumed.

- When it acquired other LDCs with lower rate bases, Hydro One effectively blended those rate bases into its own, which has the effect of lowering the overall blended rate base. The OEB and the provincial government must consider the over-riding principles of harmonization and ask whether this is what they want.

We must look at overall efficiencies and we agree that the cost profiles will change. Through cost allocation and rate design, we can address these changes by making rates more cost reflective. This question can be better addressed during Stakeholder Session 2 in September.

- Will Hydro One identify only the total corporate revenue requirement in the August filing; or, will there be a breakdown of the revenue requirement by categories such as shared facilities, shared distribution lines, and the associated revenue required to serve individual customer segments? For example, right now we are paying $0.63/KW for shared low voltage (LV) lines. Is that going to be separated out in your revenue requirement or will you only show the corporate total?

  Only the total revenue requirement will be filed on August 15. However, once the revenue requirement is established, we can describe the allocation of costs to the various rate classes.

- If customer satisfaction does not meet objectives (e.g., in the call centre), will you increase staff to achieve the objectives?

  Hydro One would not necessarily increase staff. We would look at changing a business process or introducing new technology, such as an Interactive Voice Response system, or looking for other low cost options that may not result in an immediate increase in staff or cost. Depending on the options, there may be an increased cost to improve customer satisfaction ratings.

- With respect to distributed generation, most of these connections are or will be in Hydro One's service territory. The OEB is struggling with the issue of standby rates for distributed generation. You probably know more about the cost characteristics than the OEB since you have the lion's share of distributed generation.

  Last week, the OEB published a series of discussion papers on distributed generation and impacts to rates. Hydro One recognizes that standby rates certainly are a key issue.

2.3 Benchmarking, Reliability and Service Quality

Carm Altomare (Manager, Performance Analysis) described the two benchmarking studies that the OEB has directed Hydro One to conduct. Benchmarking is primarily a vehicle to identify best practices in order to enable process improvement. Distribution benchmarking studies are being conducted currently by P.A. Consulting and results are not yet available. Carm also discussed Hydro One's two major performance measurement drivers: OEB performance standards; and, customer expectations and performance goals identified in the Hydro One Five Year Plan. There are six customer service metrics and three customer reliability metrics. Since the last Hydro One Distribution filing, there have been no changes to the OEB's service quality indicators for customer service and reliability.

Carm provided an overview of the customer service indicators, illustrating the OEB minimum targets and Hydro One's performance over the past three years (2004 – 2006). In most cases Hydro One meets or exceeds OEB targets.

Hydro One's performance for System Average Interruption Frequency Index (SAIFI) and System Average Interruption Duration Index (SAIDI) are consistently stable year-over-year when excluding *force majeure* events. *Force majeure* events have a significant effect on service quality and emergency response. Carm also provided detailed overviews of system reliability and related trends, including new distance-based metrics and comparisons to similar utilities.

Hydro One's Five-Year Plan is to improve customer satisfaction to 90% or better in all segments, to meet or exceed the OEB's Service Quality targets (where this helps achieve the 90% customer satisfaction level), and to achieve top quartile reliability in Distribution when compared against similar utilities.

The following questions were asked/points were clarified in ensuing discussion:

- At what point do you start planning for and "building in" *force majeure* events?

  Hydro one has always planned for an average number of force majeur *events. As Laura Formusa indicated, Hydro One was honoured with an Edison Electric Institute award for its storm restoration work in 2006. Hydro One has a great deal of experience planning for and responding to these types of events. We monitor weather patterns and place staff on call if a force majeure event is anticipated. Our service staff also communicate and cooperate with staff from other utilities when major storms are imminent. Most of these storm events are the result of strong winds and extreme weather that come from the southwest and cross Ontario between Georgian Bay and the Ottawa Valley. This weather pattern has recently tended to move a little further south, so impacts may be different in the future. Our revenue requirement does include some costs to respond to storms.*

- Do you exchange information or have a comparison with Florida in terms of storm restoration?

  The P.A. Consulting benchmarking study will include information on reliability in Florida. Hydro One liaises with Florida to explore what they do, and sometimes our lines people do assist them to restore their system. Hydro One is trailing Florida's reliability performance but there are some regional differences that also need to be considered (e.g., tree density in Ontario is greater than in Florida).

- What were the comparator utilities that were included in the benchmarking studies?

  This is part of the P.A. consulting study. The comparable utilities they are looking at are those that have a similar business model and the same geographic issues we have, so that we are comparing similar companies. The P.A. consulting study will include a list of the utilities.

- It looks like some of the OEB customer service targets are below customer expectations. Are there particular areas where this happens?

  Yes, for example, customers want Hydro One to respond faster with respect to telephone accessibility than OEB targets. With effort in this area, overall customer satisfaction numbers are expected to improve. We can negotiate appointments during force majeure *events but customers understand that it will take time to restore power. Technical questions to the call centre now get redirected to technical operators. For example, land developers now have a direct number they can call to ask technical questions. This improves satisfaction and efficiency.*

- When comparing SAIFI and SAIDI measures, are Hydro One numbers included in the composite of utilities that you compare against and therefore affecting the trends?

  No, there are no composites used in these SAIFI and SAIDI comparisons. These trends relate to quartile performance of all industry participants.

- Do you consider Canadian utilities outside of Ontario as "comparable utilities" in the benchmarking studies?

  Yes, utilities operating in British Columbia, Québec, New Brunswick, Nova Scotia, and parts of Alberta, Saskatchewan and Manitoba with service areas that have trees are considered to be comparable. Furthermore, we are trying to break down all provincial utilities into regional data. By doing this, we can compare different regions within Canada, to regions within Ontario.

- How long have you been tracking urban LDC reliability performance data (slides 17, 18)? Can we access these data?

  Hydro One has been tracking urban LDC performance for several years. We started to do so when we began working on the OEB's second generation Service Quality Regulation initiative. Hydro One does not create the data itself. It comes from the data the LDCs file with the OEB. Hydro One then gets the data from the OEB website where it is publicly available.

  It was also noted that there is no uniform definition of urban and that the definition Hydro One uses is "an area where there are at least 3,000 customers and a density of at least 60 customers/km." Hydro One believes that it should respond to urban customers more quickly than rural customers and that this may become a regulatory requirement in the future. About 50% of the reliability problems experienced in urban pockets are "loss of supply" problems stemming from the system (e.g., a rural feeder line outside the urban area, a station or a transmission problem). If loss of supply situations were removed from the data, Hydro One's reliability performance would be higher. Loss of supply data is not consistently reported in LDC data, although this is an OEB requirement. The OEB is considering requiring LDCs to report reliability both with and without loss of supply data.

- When you exclude *force majeure* in the Hydro One data, do you also exclude *force majeure* for the comparators?

Yes, but the problem is that no two utilities use exactly the same definition for force majeure. *The Canadian Standards Association uses the term "prominent event" which is similar to our definition of* force majeure. *In any event, variations in definitions do not change the numbers significantly.*

- Given the changing climate, and the trend to move towards more of a user-pay model, have you considered changing your conditions of service by requiring the use of underground lines in high vegetation areas? This might increase capital costs but reduce ongoing maintenance costs. For retrofits the cost may be quite high, but for new installations the cost might not be as high as one would think.

  Underground lines have been installed in some locations, but this is a very expensive and a technically difficult option. There are other options. For example, in areas prone to lightening strikes, we can put surge arrestors on the primary line or erect sky wire to improve reliability.

  The Federation of Ontario Cottagers' Associations noted that constructing underground lines on the Canadian Shield would be very expensive.

  Hydro One has a policy that describes standards and requirements for the underground lines. It has not been looked at for a while.

2.4 Hydro One Distribution Incentive Regulation Proposal for 2009/2010

Andy Poray (Director, Regulatory Policy) and John Todd (President, Elenchus Research Associates) discussed the proposal to establish a stakeholder Incentive Regulation Working Group (IRWG) to enable a collaborative approach on incentive regulation that is appropriate for Hydro One. Hydro One and stakeholders need to think through and identify the issues early, before the OEB comes out with its policy paper on third generation incentive regulation. It is expected soon and the program will move quickly towards implementation. Participating in the IRWG would allow stakeholders to take the lead in policy development, identify options for incentive regulation in the electricity Distribution sector and proactively contribute to the OEB's thinking and direction.

Hydro One is not seeking consensus; rather, it is looking for input via the IRWG from stakeholders regarding issues, and options. Issues to be addressed include: principles of incentive regulation, design alternatives, and evaluation criteria. John Todd requested that:

- Stakeholders who want to participate in the IRWG identify themselves; and,
- Stakeholders who were not present today but who may be interested in participating in the IRWG be identified.

The proposed process includes: a process meeting in late July, where interested stakeholders meet and agree on the terms of reference and other items; three or four options development meetings in August and September; and, preparation of a working group report to be included in the October filing. Hydro One will provide the usual participant funding for this consultation process.[1]

The following questions were asked/points were clarified in ensuing discussion:

- Will Hydro One file its own Distribution Incentive Regulation proposal (as opposed to the IRWG report) as part of its 2008 OEB application or will this come as a separate application to the OEB at a later time?

  Given the time constraints, we will likely submit both the IRWG report (which will contain options) and our recommendations as part of the October filing. Our hope is that the methodology would be agreed to, so that we could apply that methodology for 2009 without having another separate hearing. We are open to ideas about a more efficient path.

- The time constraint is due to how late the OEB got started on thinking about 3rd-generation incentive regulation mechanisms (3GIRM). The OEB seems to think that 3GIRM may not necessarily meet all Hydro One requirements. It would be advantageous to have as much commonality as possible between what the OEB is doing and Hydro One's approach.

  Hydro One is concerned that it may not hear from the OEB until late in the process. We should be proactive and provide input to them via the IRWG before the OEB begins to develop fixed ideas.

- Could you review the price cap index that Dr. Mark Lowry is thinking about?

  He is taking a classic price cap approach using comparators to come up with productivity factors. Price adjustments are made for cost driver inflation and offset by productivity. The approach does take into account that electric utilities face largely fixed costs not necessarily related to volume throughput fluctuations (e.g., resulting from weather conditions) or even long term trends. It is dependent on a United States database of comparators, which may not be appropriate for Ontario or Hydro One.

  The model is not clear on how long the period of adjustment will be – is it a three-year or five-year performance-based regulation (PBR)? Will we start off with a cost of service in the first year with adjustments in every year based on that first year's cost of service, or will there be a requirement to file information on projected expenditures for each year of the period (i.e., the English and Australian models)? So we are not clear as to what the model will be and which model would be preferable to Hydro One, given what we envision happening down the road.

- What do you mean in slide 3 by "process to be included in the August 15 filing"?

[1] A number of stakeholder groups expressed interest in participating in the IRWG and an initial meeting was held. However, Hydro One cancelled this initiative on August 3, 2007 after the OEB announced a consultation process to develop the 3rd Generation Incentive Regulation for all LDCs that is very similar to the IRWG process proposed by Hydro One.

We will simply inform the OEB in the August 15 filing that this IRWG process is in place and that they can expect a report in late October when the cost allocation and rate design portion of the Application is filed.

At this point in the discussion, the presenters asked stakeholders whether, given that the OEB is committed to incentive regulation, this IRWG process is worth engaging in or whether it would be better to await the outcome of the OEB's 3GIRM process? They urged stakeholders to provide proactive input to the OEB so that the industry is not simply reacting to OEB discussion papers.

- It was noted that when the first Distribution Rates Handbook was produced, it was called the PBR Handbook. There was more consideration put into developing the PBR side of the rates, which turned out to be a disaster. It never went anywhere. In the second generation PBR, the Consumers Association brought in a United States expert who stated that PBR schemes all eventually turn into cost of service regulations. This initiative will be challenging and its success will likely be minimal.

  Yes, but the OEB has indicated its intent to develop an incentive regulation for electric distribution companies.

- The IRWG process seems like a worthwhile exercise because it is always better to shape your future, if possible. What level of familiarity or expertise is Hydro One looking for to serve on the IRWG?

  It was explained that stakeholders do not need a great deal of expertise to join the IRWG. If needed, Hydro One can provide background material. The key criterion is whether stakeholders think this is a good process and have the interest to be engaged. It would also be helpful to have some diversity on the IRWG in order to get as many points of view as possible.

  This initiative has the potential to be a demonstration case for stakeholders taking a proactive approach. It may change the way the industry does things in the regulatory environment. Stakeholders were asked to express their interest or identify others who may be interested to John Todd or Andy Poray.

2.5 Customer Satisfaction Survey

Barb Allen (Manager, Customer Care) addressed questions initially raised by stakeholders during the morning session relating to customer satisfaction. She was responsible for implementing the customer satisfaction survey, which asked customers how satisfied they were with Hydro One service. The survey was conducted in 2003 and then repeated in 2006. Customers had the opportunity to complete the survey over the telephone or online.

The following questions were asked/points were clarified in ensuing discussion:

- What comparator utilities were used in the customer satisfaction survey?

Researchers contacted people in every province of Canada with the same survey that was used with Hydro One customers. Respondents were asked to rank overall satisfaction with their utility. Hydro One discovered there was a best practice satisfaction level of 89%. This helped us set our goal of 90% customer satisfaction for 2010.

- How are responses weighted in the customer satisfaction survey?

  In customer satisfaction surveys, traditional survey research techniques are used to weight the survey sample to reflect the makeup of the Hydro One customer base (e.g., residential, small business, seasonal, agricultural). But there is no weighting of the final survey result; they are simply a consolidation of responses to the top two boxes in the questionnaire (satisfied or very satisfied).

- Has the OEB provided specific guidelines or methodology concerning customer satisfaction surveys? Are the formats for the customer satisfaction survey available?

  The OEB has provided no specific guidelines. However, Hydro One follows standard research practices and methodologies (e.g., sample size, statistical analysis, etc.).

2.6 Smart Meter Program

Rick Stevens (Director, Smart Meter Project) provided information on the Smart Meter Program. He described how the initiative is designed to work and the implementation plan to 2010; 1.3 million smart meters will be installed by the end of 2010. The meters are called “smart” because they collect time-of-use data and can transmit these data via an Advanced Metering Communication Device and a local area network (LAN) to an Advanced Metering Regional Collector, and then to the Meter Data Management/Repository Company (MDMR). As a result, manual meter reading will be eliminated. Rick provided a regulatory update and program implementation status report on Hydro One’s smart meter program. He also described the 2008 deliverables. He described some of the numerous challenges that are unique to Hydro One’s implementation program (e.g., the need to use enhanced technologies in rural areas because of the distances and limited availability of communications infrastructure, and the resulting higher cost).

Rick also described various elements of the program: Capital expenditures, OM&A expenditures, and anticipated savings. Expenditures to May 2008 will be handled through three proposed variance accounts that would be settled as part of the 2008 application. Capital and operating costs are to be included in the 2008 revenue requirement.

The following questions were asked/points were clarified in ensuing discussion:

- Do you have any concerns about whether your meter data management system will meet your needs from an operational perspective, as opposed to the billing and customer information aspects (slide 2)?

The focus is on time-of-use billing but there will be potential operational benefits to having all that data. It will be archived and contracts will be developed with the Independent Electricity System Operator (IESO) and the MDMR provider. Another option is that the data stored in the Advanced Metering Communications Device can be streamed off for Hydro One use, if a business case shows merit.

- When will the first time-of-use bills go out?

  This will happen in the second and third quarters of 2008. By then we will have 500,000 to 600,000 customers on- line. Rather than doing them all at once, we may have to stage the billing implementation to make sure that all the bills are accurate.

- The MDMR will involve costs and it appears that the OEB currently has no plans to regulate the MDMR. How will Hydro One deal with these costs in its submission (slide 3)?

  We expect there will be more direction on this from the OEB, and quite possibly another variance account to track costs that cannot be forecasted.

- Perhaps Hydro One should proactively suggest this to the OEB (slide 3).

  That is a good idea. Hydro One could ask the OEB for an MDMR variance account. The proposed incremental functionality variance account (last slide) may cover this item.

- What are the anticipated total smart meter Capital costs and annual OM&A costs to 2010?

  We have not evaluated that yet. There are regulatory standards on minimum meter functionality for the residential and small commercial sectors (i.e., less than 50 KW). Standards for the greater than 50 KW segments, in which we have a much smaller number of customers, have not yet been developed.

  We are currently implementing smart meters in urban and semi urban areas where we have a good understanding of costs. When we get to more rural and remote areas, there may be technology limitations and issues around the economics. Implementing in these areas will be a sizable program. Rural territory requires use of enhanced equipment and multiple technologies that would increase costs. Deployment costs increase with expansion into lower density areas. We are running a rural pilot north of Peterborough this summer to get a better handle on costs.

- What does the outage detection capability plug into?

  There are two super capacitors in the collector (slide 5) that allow four to six minutes to clear the network. The collector communicates with the meter and has backup battery power. The modems also have backup battery power. So as long as the cellular tower does not go down, information about an outage occurrence will be transmitted.

  No data is lost in the event of an outage. The data are stored in both the meter and in the collector.

2.7 Major Investment Programs and Key Drivers (OM&A and Capital)

George Juhn (Manager, Distribution Development & Lines Sustainment) described the investment programs required by Hydro One. These programs are determined by business drivers (e.g., meeting company objectives, public and employee safety, meeting regulatory requirements, etc.), as well as the need to improve performance, as described by metrics for reliability (e.g., SAIDI, SAIFI) and customer satisfaction. George outlined the key customer base segments of the Distribution business and the principal assets used to service these segments. He described the asset categories, actual 2006 expenditures, and associated programs for OM&A program and Capital program elements. Information on expenditures was also provided for OM&A sustaining programs, and Capital sustaining and development programs.

Additional funds are required to address various challenges associated with OM&A and Capital programs:

OM&A Programs

- Demand Sustaining OM&A – projected increases in trouble calls resulting from storm damage, expect more cable locate and disconnect/reconnect requests based on recent experience (there is a greater public awareness of "call before you dig"), and increased economic activity;
- Vegetation management – increased vegetation management is required to improve reliability and reduce storm-related damage costs (55% of unreliability is associated with trees); and,
- Development – more generation connections, more stringent safety standards and additional Long Term Load Transfer assessments.

Capital Programs

- Asset replacement – cost escalation for equipment and material such as wood poles, transformers, and conductors;
- Trouble call & storm damage – 2006 storm damage is considered a worst-year scenario for expenditure planning purposes;
- New connections and system reinforcement; and,
- Generation connections.

The following questions were asked/points were clarified in ensuing discussion:

- How did the OM&A Sustaining 2006 actual spending ($253M) track against the OEB-approved spending, and what caused the differential (slides 4 and 5)?

  The OEB-approved spending was about $230M. The differential was caused primarily by the unusually high level of trouble calls and storm restoration we experienced in 2006. This information will be provided in the filing.

- Assuming that 2006 was an aberration and that in future years trouble calls will track closer to the historical average, is the 2006 $253M actual spending number too high to base your forecast on?

There is no doubt that the 2006 storm damage was unusually high, and this has been appropriately factored into the calculation of our forecast for future years.

- Are you segregating the cost of low voltage (LV) facilities into OM&A and Capital costs in order to come up with the revenue requirement? In other words, are you tracking LV charges separately in order to come up with a rate or are LV costs simply consolidated with all the other costs? At the end of the day, how do I know that $0.63/KW for LV assets is the rate I should be paying based on your projected Capital and OM&A costs for LVs?

  It would be a very onerous task to track costs at this level of detail. We run an integrated operation with one total revenue requirement. In accordance with the Board's requirements, we use cost allocation to tie costs to the various rate groups.[2] *The September stakeholder session will focus on cost allocation. The rates were originally set using cost allocation and they will be set the same way again.*

- Did increased trouble calls and storm damage in 2006 impact net income?

  Yes, and the impact was significant, as indicated in our Annual Report.

- Were some programs (e.g., asset replacement) negatively impacted because you had to transfer staff/resources from other activities to respond to trouble calls and storm damage in 2006?

---

[2] Hydro One uses the Cost Allocation Methodology issued by the Board on September 29, 2006 to separate Capital and OM&A Sub-transmission, Primary and Secondary costs (Section 6.3.1), and to allocate those costs to the various rate classes (Section 6.3.2). The methodology states:

6.3.1 Direction – Identifying Bulk, Primary and Secondary Costs
Once the bulk, primary and secondary assets have been identified based on the above tests and guidance, it is necessary to break out the associated costs. As the accounting granularity is presently not available to do such a breakout, the distributor must provide an estimate of the percentage of costs of the assets in each of the bulk, primary and secondary buckets. This percentage will be applied to the total cost in the asset account. For contributed capital see below.
The Filing Summary must explain how the distributor broke out its costs between bulk, primary and secondary assets. The following approach is to be used:

> The distributor should determine the unit cost of installing bulk, primary and secondary assets and then apply the kilometres of line for the bulk, primary and secondary assets to these unit costs. The result from each type of asset should be divided by the total for all assets and this percentage should be used to determine costs by asset type.

6.3.2 Direction - Breakout of Bulk, Primary and Secondary Sub-accounts
The bulk, primary and secondary sub-accounts should be broken out to the corresponding rate classifications that use those assets. In particular:

- Secondary costs will only be allocated to those rate classifications that use secondary assets.
- Primary costs will only be allocated to those rate classifications that use primary assets.
- Bulk costs will be allocated to those rate classifications that use bulk assets. For many distributors, bulk costs will be allocated to all classifications since the bulk assets deliver power to the primary and secondary assets.

HAUSSMANN CONSULTING

There is some flexibility. Additional resources were recruited through the Hiring Hall and via overtime. However, some programs were negatively affected. Some LDCs also offered assistance but at a cost.

- With respect to your benchmarking, Hydro One appears to do it one way while other utilities applied for a Z-factor to compensate for storm damage. In your rate application, are you trying to recover the costs for potential storms, rather than requesting a Z-factor?

  Other LDCs requested a Z-factor because of the force majeure *events. Hydro One also had* force majeure *events but does not believe they triggered a Z-factor. So for 2007, Hydro One asked for no additional money for storms even though other LDCs did so. We will not try to recover the incremental costs we spent in 2006 on damage resulting from higher than usual storm activity. We have a normal budget allocated for dealing with storms. We will continue to budget for storms in the future; however, the large amount of storm activity in 2006 does not mean a lot more resources will be allocated for storms in the next filing. We use a four-year history to project future budgets for storm damage, and discount abnormal years such as 2006. It is not our objective to inflate the budget, as can be seen in our last rate filing.*

- With respect to asset replacement, how much of your capital is planned versus unplanned (i.e. "assumed reactive" related to storms) in a normal year?

  Replacement of assets is funded primarily by Sustaining Capital, but some assets are also replaced under Development. Development Capital funds additions and changes to the system and, during the course of this work, some assets may be replaced. The breakdown for 2006 was as follows:

Capital Program		***2006 Demand***	***2006 Planned***
***Sustaining**:*	*Trouble Calls, Storm Damage, Joint Use and Relocations*	*68%*	*32%*
***Development**:*	*New Customer Connections and Upgrades*	*71%*	*29%*

- With respect to new customer connections, do your numbers include capital contributions from developers or are they net (slide 8)?

  The numbers are net.

- The storms of 2006 are going to contribute to reliability in 2007 and 2008 because many of the dangerous trees have fallen, been cut, or been removed. This will be a future benefit. Why is more forestry and vegetation management required?

  We cannot assume that the 2006 storms have taken out all of the danger trees. About 1,500 km of lines have been rebuilt. This is a small amount when compared to the 119,000 circuit km in the Hydro One Distribution system. Also, some trees may have been weakened by the storms but not fallen, and we don't know which ones they are. Therefore, we cannot assume a future benefit as a result of the 2006 expenditures.

- The Federation of Ontario Cottagers' Associations believes that vegetation management should be a priority. We would also like to see improved communication with townships, local community organizations and individual customers and notification before work begins, especially if herbicides are going to be used. The public is more likely to accept the judicious use of herbicides if they understand there are no serious environmental consequences.

  Agreed and noted. There is always room for improvement, especially better information and education regarding herbicide use.

- Hydro One has spent a lot of money since 2004 to improve reliability and you will be asking for more in this filing. We need to see some evidence in the filing that this money was well spent, given that reliability since 2004 has, in fact, not increased.

  Agreed and noted. Reliability is significantly influenced by weather. The increased storm activity in 2006 skewed our reliability results. Major system changes would be required to make significant reliability improvements if such storms were to become routine events. Excluding force majeure *events, Hydro One's reliability has remained consistent. If we had not received the rate adjustment in 2005, we would be in a worse position now.*

- Where does the capital come from to offset load transfers (slide 14)?

  This capital comes from the new customer connections budget. However, the amounts involved are not large.

- There seems to be a discrepancy between the 8,000 poles referred to in slide 18 and the 6,000-7,000 poles in slide 17. What is the timeframe to replace 8,000 poles and in which years will this take place? Is pole replacement accounted for under Capital or in OM&A?

  Some poles will be replaced this year and some next year. There is always a 2,000 to 3,000-pole carryover from the previous year because we coordinate pole replacement with line refurbishment when this is most cost effective. Some poles may be replaced on a "one for one" basis (i.e. the 6,000-7,000 poles in slide 17), while others may be replaced when a line is being refurbished i.e. the 2,000 to 3,000-pole carryover which is not included in the slide 17 figure. Pole replacement therefore takes place under several work programs. Pole replacement is captured in our Capital budget.[3]

- How will the new rules concerning ground voltage in the agricultural community impact Hydro One? You will be more affected than any other utility and this will be a very technically complex area involving significant amounts of analysis time.

  This is very new. The government has directed the OEB to examine this issue. To date no new standards have been announced so it is difficult to gauge the impact on us or be precise about how we should modify existing programs. Hydro One is working closely with the Ontario Federation of

[3] George Juhn provided further detail to this stakeholder after the session was adjourned.

Agriculture on this, and we both expect to work with the OEB and Electrical Safety Authority (ESA) on this issue.

- We have seen quartile benchmarking on reliability. Can you benchmark reliability spending in the same way, so that we could compare money spent against results achieved with respect to reliability?

  Some high level cost studies have been done but inconsistencies (e.g., in cost accounting and reliability definitions) make it difficult to draw conclusions about the relationship between spending and reliability across the industry.

2.8 Shared Services and Other (OM&A and Capital)

Ian Innis (Acting Director, Corporate Planning and Regulatory Finance) provided an overview of OM&A and Capital expenditures associated with the Shared Services and Other category of Hydro One's business. These are common costs that relate to the asset management function and shared services (Common Corporate and Information Management) that support both Transmission and Distribution. There are economies of scale and efficiencies associated with the sharing of expertise and resources by both Transmission and Distribution. Three key factors will drive the Shared Services OM&A and Capital requirements. These include the cascading effect of increased work programs as outlined earlier by George Juhn, new policy-based processes (such as Bill 198 and Regulatory Compliance) and the end-of-life of common infrastructure. Ian provided a cost breakdown using actual 2006 expenditures. Increases needed in the Common and Other Capital category are due to end-of-life common infrastructure replacement, in particular the Cornerstone project which is required to address the replacement of core business systems.

The following questions were asked/points were clarified in ensuing discussion:

- Make clear in your filing exactly which and how the increased standards, codes and compliance requirements referred to in slides 2, 4 and 5 affect Distribution.

  Agreed. Hydro One will identify standards that affect Distribution.

- The IESO has just sent out a regulatory compliance notification to all transmission and distribution companies in the province. The majority of these requirements impact Transmission, but the IESO also identifies the compliance standards it believes Distribution companies are accountable for and asks for feedback.

2.9 Rate Change Overview

Ian Innis (Acting Director, Corporate Planning and Regulatory Finance) provided a summary of the 2008 Distribution Revenue Requirement. Hydro One is not conducting new "special" studies for the filing; rather the methodologies from studies previously accepted by the OEB are being applied with current data. While specific financial data are not yet available, the structure and information to be provided will be consistent with the previous Distribution filing. Ian discussed the financial parameters and assumptions in the 2008 filing, and compared their values to the 2006 approved values. Finally, he identified the factors that will contribute to an increase or provide an offset to the Distribution rate change.

The following questions were asked/points were clarified in ensuing discussion:

- With respect to the common corporate costs methodology (slide 2), will you be updating the cost drivers that actually do the allocation?

  Some drivers will be updated where relevant and appropriate, but for the most part they will be the same.

- Was it the OEB or the government that told you to get rid of the preferred equity (slide 3)?

  Our actual capital structure still contains a preferred equity component. However, for the purpose of determining our revenue requirement, we apply the deemed regulatory capital structure that is approved by the OEB, which no longer includes return on preferred equity.

2.10 Final Comments

A final discussion period followed the conclusion of the presentations. The following questions were asked:

- With respect to the capital program and work prioritization, please provide a justification in the Distribution filing for the programs that you are proposing to undertake. In the Transmission submission, there were a few large projects, which were undertaken because the IESO or the OPA said they were needed. On the distribution side, if a project is demand-driven (e.g., a subdivision or other new connects) the need is understandable. But there will likely be many more potential projects that you will have to prioritize. Explain why you chose one portfolio of projects over another.

  The pre-filed evidence will provide individual Investment Justification documentation for capital projects equal to or greater than $1M, which include summaries of project needs and results.

- How do you decide whether a generation connection point goes into the distribution or transmission system?

  There are many variables but size is the key determinant. Typically, if above 20 MW it will be connected directly to the Transmission system.

- It would be helpful for us to know if Hydro One did the work, which was approved as part of the last Distribution filing.

  Hydro One will provide actual 2006 expenditures within its pre-filed evidence thereby enabling comparisons to the OEB approved 2006 revenue requirement.

3. NEXT STEPS

The following next steps were agreed to at the conclusion of the session.

- The report on this stakeholder consultation session will be posted on Hydro One's 2008 Distribution rate application website. There is a web consultation that parallels the stakeholder sessions. Stakeholders can go to the website to download the notes and the presentations, and to submit feedback.
- Hydro One requested any additional comments be forwarded by email to Enza Cancilla (Manager, Public Affairs) at enza.cancilla@HydroOne.com. Stakeholders may also forward comments to other Hydro One staff present at the stakeholder sessions, or provide comments via the website.
- There will be two more stakeholder sessions:
  - Stakeholder Session 2 will be a one or two-day session planned for early September 2007. At the session, the principles of Cost Allocation and Rate Design will be discussed, but the specific rates will not be available. However, stakeholders will have the Revenue Requirement numbers submitted to the OEB on August 15, 2007; and,
  - Stakeholder Session 3 will be the final 1-day session planned for mid-October 2007. The meeting topics will include the numbers on Cost Allocation and Rate Design.

Susan Frank thanked all participants for attending the session and providing their input. Hydro One has received many good comments that will help it submit a better filing. She invited all participants to attend Stakeholder Session 2 in September and reminded them that Hydro One would like their help with incentive regulation through participation in the stakeholder Incentive Regulation Working Group over the next few months.

Chris Haussmann then adjourned Stakeholder Session 1.

Stakeholder Consultation

2008 Distribution Rate Application

Stakeholder Session #1
Metropolitan Hotel
Mandarin Ballroom, Lower Level
108 Chestnut Street, Toronto
July 18, 2007

Registration and Continental Breakfast start at 8:00 a.m.

AGENDA

8:30 a.m.	Introductions and Process Overview	Chris Haussmann, Facilitator, Haussmann Consulting Inc.
8:45	Welcome	Susan Frank, Vice President & Chief Regulatory Officer
9:00	Hydro One Business Strategy / Q&A	Laura Formusa, President & CEO (Acting)
9:45	Application Overview	Joe Toneguzzo, Director, Distribution Rate Filing
10:15	**BREAK**	
10:30	Benchmarking, Reliability and Service Quality	Carm Altomare, Manager, Performance Analysis
11:30	Hydro One Distribution Incentive Regulation Proposal for 2009/2010	Andy Poray, Director, Regulatory Policy AND John Todd, President, Elenchus Research Associates
12:00 p.m.	**LUNCH**	
1:00 p.m.	Major Investment Programs and Key Drivers (OM&A and Capital)	George Juhn, Manager, Distribution Development & Lines Sustainment AND Rick Stevens, Director, Smart Meter Project
2:30 p.m.	Shared Services 2008 Revenue Requirement Summary	Ian Innis, Director, Corporate Planning & Regulatory Finance
3:00	Discussion	All
3:30	Next Steps and Wrap-up	Chris Haussmann
3:45	Thank you & Adjourn	Susan Frank

SUMMARY OF BOARD DIRECTIVES AND UNDERTAKINGS FROM PREVIOUS PROCEEDINGS

This exhibit identifies Board directives to Hydro One Distribution from its previous rates proceedings. Table 1 lists the directives and indicates the Exhibit number in this application in which the evidence responds to the Board directives, or provides the response itself.

Table 1
Directives from Proceeding RP-2005-0020/EB-2005-0378 (2006 Distribution Rates)

Item #	Issue	Summary of Directive	Reference Exhibit
(i)	CDM	The Board expects Hydro One to provide a more sound analysis of CDM program details and reduction objectives in future applications. (2.3.9) **Response Note - Hydro One will take guidance on planned reductions and funding from OPA based programs.**	Exhibit A, Tab 14, Schedule 3, Section 2.6
		The Board expects Hydro One to present future CDM load reduction forecasts with a bottom-up analysis estimating the expected results of their CDM activities and those of others that affect their loads. The Board expects Hydro One's next CDM load reduction forecast, of this order of magnitude, to include a proposal for an LRAM. (2.3.13) **Response Note - Hydro One has concerns with the practical difficulties and related accuracy of determining the actual amount of CDM savings achieved by its customers in a given year, through the implementation of CDM initiatives from various sources such as the Ontario Power Authority, Provincial Government and Federal Government. Hydro One believes it is prudent to wait for the OPA to develop Measurement and Verification programs for determining actual CDM achievements and as such is not proposing or requesting an LRAM at this time.**	Exhibit A, Tab 14, Schedule 3, Section 4.0

Item #	Issue	Summary of Directive	Reference Exhibit
(ii)	Compensation	The Board has noted in this proceeding that since the de-merger on Ontario Hydro, Hydro One has taken a number of steps to control its overall compensation costs …. These are positive steps and the Board expects the company to continue and enhance such efforts in the future and report to the Board at the next main rates case. The Board is particularly concerned about the apparently high labour rates. In this respect, the Board expects Hydro One to identify what steps the company has taken or will take to reduce labour rates. (3.4.3)	Exhibit C1, Tab 3, Schedule 2
		The Board will not make an adjustment to the proposed OM&A costs based on compensation levels at this time but expects the utility to demonstrate in the future that lower compensation costs per employee have been achieved or demonstrate concrete initiatives whereby compensation costs will be brought more in line with other utilities. (3.4.5)	Exhibit C1, Tab 3, Schedule 2
		The Board expects Hydro One to file appropriate evidence in the next main rates case to establish that none of the incentive compensation should be charged to the shareholder. (3.4.6)	Exhibit C1, Tab 3, Schedule 2
(iii)	Benchmarking	While the Board is not prepared to order a comprehensive benchmarking study, the Board sees value in a high level benchmarking study for initial review at the next rate proceeding. The Board directs Hydro One to engage an independent party to develop a list of comparable North American companies with similar business models (transmission and/or distribution) and to report on high level comparative performance and cost information for Hydro One and these companies. In future rate cases, this information may assist with determination of areas for a more comprehensive benchmarking review. The Board does not anticipate that the high level benchmarking study will be overly costly. Hydro One will want to consult with intervenors regarding the scope of the study. The independent study should be submitted as part of Hydro One's next main application for distribution rates. (3.5.6)	Exhibit A, Tab 15, Schedule 2 Exhibit A, Tab 16, Schedule 1
		In addition, the Board directs Hydro One to engage an independent party to develop a comparison of labour rates and overtime policies amongst Hydro One, other comparative Ontario electricity distributors and other Canadian utilities as identified in the high level benchmarking study. This independent study should also be submitted as part of Hydro One's next main applications for distribution and transmission rates. (3.5.7)	Exhibit A, Tab 15, Schedule 2

(iv)	Spending on Line Losses	The Board does accept the submissions of intervenors regarding the expected benefits of the $4.75 million expenditure and directs Hydro One to include in its next main rates case filing a budget and a work plan to implement all the cost-effective line-loss reduction suggestions contained within the Kinetrics study. If Hydro One concludes that any of the recommendations in the Kinetrics study should not be implemented, it must clearly demonstrate the reasons for that position, and an accompanying budget and work plan for its preferred implementation plan. (4.3.10)	Exhibit A, Tab 15, Schedule 3
(v)	AFUDC	The Board therefore directs Hydro One to recalculate the AFUDC using a rate of 6.2%, which is the Company's blended long-term debt rate. (4.4.4) ***The AFUDC rate to be used by LDCs is currently prescribed under the Board-approved interest rate methodology (EB-2006-0117)***	Exhibit D1, Tab 4, Schedule 1
(vi)	Deferral Accounts – Pension Costs, MEU Rate Mitigation	The Board directs Hydro One to recalculate the interest using 3.88% instead of 7.71%. (6.2.3) The Board directs Hydro One to recalculate the interest using 5.75% instead of 7.71%. (6.2.7) ***Deferral Account interest rates now prescribed under the Board-approved interest rate methodology (EB-2006-0117)***	Exhibit F1, Tab 1, Schedule 1
(vii)	Line Loss Factors	The Board is of the view that either a less expensive metering program, or a second effort to evaluate line losses using current load data and local experience, may provide loss factor estimates that are more acceptable and credible to stakeholders. (7.3.10)	Exhibit A, Tab 15, Schedule 3
		The Board expects Hydro One to continue its efforts to refine line loss factors as they affect the bills of individual LV customers. (7.3.12)	Exhibit G1, Tab 10, Schedule 1, Section 1.1

Board Directives from Proceeding EB-2005-0528 (Rates for Distributed Generation)

Item #	Issue	Summary of Directive	Reference Exhibit
(i)	Rates for Distributed Generation	The Board therefore directs the Company as part of its upcoming cost allocation review filing to properly identify the costs for serving the proposed new rate classification (s), Following this, the Board will expect the Company to come forward with an updated rate design proposal for distributed generators that also considers the benefits that these customers provide.	Exhibit G2, Tab 1, Schedule 1 Section 4.0

Board Directives from Proceeding EB-2006-0501 (2007 and 2008 Electricity Transmission Revenue Requirements)

Item #	Issue	Summary of Directive	Reference Exhibit
(i)	Benchmarking	The PA study filed in this Application suffered from various deficiencies and shortcomings, as noted by the authors of the study, the Applicant and the intervenors. The Board expects the new study to be comprehensive and reliable, with none of the limitations of the PA study. If Hydro One cannot correct all of these deficiencies in time for the Company's 2008 Distribution rate filing, the Board expects them to be corrected in the 2009 transmission filing. (Page 33 of Decision with Reasons)	Exhibit A, Tab 15, Schedule 2 Attachments A and B.
(ii)	Reduction in CDM Forecast	The Board finds that Hydro One should reduce the expected impact of CDM on total Ontario peak demand by 350 MW. (Page 92 of Decision with Reasons)	Exhibit A, Tab 14, Schedule 3, Section 2.6

Directive in Letter from the Board dated October 29, 2007 Re: Ontario Uniform Transmission Rate Order, EB-2007-0759

Item #	Issue	Summary of Directive	Reference Exhibit
(i)	Retail Transmission Rates and Associated Variance Accounts	The Board directs each distributor to propose an adjustment to their retail transmission rates and disposition of the associated variance account balances in its 2008 Cost of Service or Incentive Rate Mechanism application, as applicable. The Board notes that resetting these rates should take into consideration the reduction in the wholesale transmission rates and the pattern of variance in the accounts.	Exhibit G1, Tab 6, Schedule 1 and Exhibit F1, Tab 1, Schedule 1.

Board Directives from Proceeding EB-2007-0063 (Combined Smart Meter Proceeding)

Item #	Issue	Summary of Directive	Reference Exhibit
(i)	Recovery of Smart Meter Costs Incurred to Date	The Board will allow each utility to recover its costs as set out Appendix "A" by including those costs in rate base for the 2006 and 2007 rate years and calculating a revenue requirement on that investment in the manner set out in Appendix "E". Before calculating a rate increase from this revenue requirement, however, the utility must first deduct the amount of money previously collected in rate adders pursuant to the Orders of March 21, 2006. (Page 18 of Decision with Reasons)	Exhibit F1, Tab 1, Schedule 1, Section 2.3
(ii)	Recovery of Project Management Costs Incurred to Date	The Board will allow half of Hydro One's project management costs incurred to date with an invitation to Hydro One to apply for the remaining amount with further and better evidence to justify the prudence of this cost at the time of its 2008 rate application.	Exhibit F1, Tab 1, Schedule 1, Section 2.5

PROCEDURAL ORDERS, CORRESPONDENCE, NOTICES

To be filed behind this tab as and when Procedural Orders, correspondence, Notices are filed.

LIST OF WITNESSES

PANEL ONE (tentative hearing dates - July 7, 8 & 10, 2008) **Application Overview,** **OM&A and Capital: Shared Services,** **Customer Care Programs, Rate Base, Revenue Requirement**
Witnesses: Ian Innis**,** Mark Fukuzawa, Sandy Struthers, Greg Van Dusen
Issues 3.3 Is the proposed level of 2008 Shared Services and Other O&M spending appropriate? 3.4 Are the methodologies used to allocate Shared Services and Other O&M costs to the distribution business for 2008 appropriate? 4.1 Are the amounts proposed for Rate Base appropriate? 4.6 Is the proposed level of 2008 Shared Services and Other Capital expenditures appropriate? 4.7 Are the methodologies used to allocate Shared Services and Other Capital expenditures to the distribution business consistent with the methodology approved by the Board in previous Hydro One rate applications?
Pre-filed Evidence A-1-1 Application A-2-1 Summary of Application A-2-2 Financial Summary C1-2-5 Customer Care OM&A C1-2-6 Shared Services and Other OM&A C1-5-1 Common Corporate Costs C1-5-3 Common Asset Allocation D1-1-1 Rate Base D1-1-4 Materials and Supply Inventory D1-3-5 Shared Service and Other Capital D2-1-1 Statement of Utility Rate Base D2-3-1 Continuity of Property , Plant and Equipment D2-3-3 Continuity of Construction Work In Progress E1-1-1 Revenue Requirement
Interrogatory Responses H-1-1, H-1-2, H-1-3, H-1-4, H-1-5, H-1-6, H-1-9, H-1-10, H-1-11, H-1-12, H-1-13, H-1-16, H-1-19, H-1-29, H-1-30, H-1-31, H-1-32, H-1-33, H-1-37, H-1-39, H-1-41, H-1-42, H-1-56, H-1-65, H-1-66, H-1-67, H-1-68, H-1-78, H-1-81, H-1-82, H-1-83, H-1-84, H-1-85, H-1-86, H-1-87, H-1-89, H-1-90, H-1-91, H-7-12, H-7-13, H-7-14, H-7-25, H-7-26, H-10-13, H-10-14, H-10-15, H-11-16, H-11-19, H-11-20, H-11-21, H-11-29, H-12-17, H-12-18, H-12-19, H-12-23, H-13-14, H-13-15, H-13-16, H-13-17, H-13-18, H-13-20, H-13-21, H-13-22, H-13-23, H-13-24, H-13-25, H-13-26, H-13-27

PANEL THREE (tentative hearing dates - July 17, 18 & 21, 2008)
Cost Efficiency, Compensation, Staff Resourcing, Cornerstone

Witnesses: Greg Van Dusen, David Curtis, Judy McKellar

Issues
1.1 Has Hydro One responded appropriately to all relevant Board directions from previous proceedings with respect to CDM and compensation?[1]
3.6 Are the 2008 Human Resources related costs (wages, salaries, benefits, incentive payments, labour productivity and pension costs) including employee levels, appropriate?

Note 1: With respect to Issue 1.1, Panel 3 is responsible for Board directives pertaining to compensation.

Pre-filed Evidence
A-15-2 Distribution Benchmarking Study (Attachment A – Comparison of Labour Rates and Overtime Policy Study)
A-17-1 Summary of OEB Directives and Undertakings from Previous Proceedings (limited to items in Table 1 pertaining to compensation)
C1-3-1 Corporate Staffing
C1-3-2 Compensation, Wages, Benefits
C1-4-1 Costing of Work
C1-4-2 Cost Efficiency
C2-3-1 Comparison of Wages and Salaries
D1-3-5 Shared Service and Other Capital (Sect. 2.4.1 - Cornerstone)
D2-2-3 Justification for Programs/Projects in excess of $1M (IT1 - Cornerstone)

Interrogatory Responses
H-1-37, H-1-38, H-1-69, H-1-70, H-1-71, H-1-72, H-1-73, H-1-74, H-1-75, H-1-76, H-1-77, H-1-78, H-1-79, H-1-88, H-7-3, H-7-27, H-10-18, H-10-23, H-10-24, H-11-28, H-12-20, H-12-21, H-12-22, H-12-31, H-13-1, H-13-26, H-13-31, H-13-33, H-13-34, H-13-35, H-13-32, H-13-36

PANEL FOUR (tentative hearing dates - July 22, 24, 25, 28 & 29, 2008) **Cost Allocation, Rate Design, Load Forecast and CDM, Regulatory Assets**
Witnesses: Mike Roger, Stanley But, Ian Innis
Issues 1.1 Has Hydro One responded appropriately to all relevant Board directions from previous proceedings with respect to CDM and compensation?[2] 1.5 Have the impact of Conservation and Demand Management initiatives been suitably reflected in the load forecast? Is Hydro One's load forecast compatible with OPA's load forecast? Is an LRAM appropriate at this time? 3.10 Is the level of Hydro One initiated and or delivered CDM activity and budget appropriate and should it be funded by OPA or in rates? 5.3 Is the proposed accounting treatment of non utility revenue and expenditures associated with OPA funded CDM appropriate? 6.1 Is the proposal for the amounts, disposition and continuance of Hydro One's existing Deferral and Variance Accounts (Regulatory Assets) appropriate? 6.2 Is the proposal to establish new Deferral and Variance Accounts appropriate? 7.1 Are Hydro One's proposed new Customer Rate Classes appropriate? 7.2 Is Hydro One's cost allocation appropriate? 7.3 Are Hydro One's proposed rates appropriate? 7.4 Are the proposed revenue to cost ratios appropriate? 7.5 Are the fixed-variable splits for each class appropriate? 7.6 Is Hydro One's proposal to have both fixed and variable service charges for sub-transmission customers, appropriate? 7.7 Is the proposal for harmonization of rates appropriate? 7.8 Are the customer bill impacts resulting from the proposed rate impact mitigation plan reasonable? 7.10 Is the proposal for regulatory asset rate rider #3 appropriate? 8.3 Are the amounts for Smart Meter related variance accounts appropriate? 8.5 Is Hydro One's regulatory treatment of Smart Meter costs appropriate? *Note 2: With respect to Issue 1.1, Panel 4 is responsible for Board directives pertaining to CDM.*
Pre-filed Evidence A-13-1 Summary of Initiatives Based on Legislative Changes A-14-3 Distribution Business Load Forecast and Methodology (limited to incorporation of CDM in the load forecast, load forecast methodology has been settled) A-16-1 Stakeholder Consultation Report A-17-1 Summary of OEB Directives and Undertakings from Previous Proceedings (limited to items in Table 1 pertaining to CDM) F1-1-1 Regulatory Assets F1-2-1 Planned Deposition of Regulatory Assets F1-3-1 Variance Account Requested

PANEL FOUR (tentative hearing dates - July 22, 24, 25, 28 & 29, 2008) **Cost Allocation, Rate Design, Load Forecast and CDM, Regulatory Assets**
Witnesses: Mike Roger, Stanley But, Ian Innis

CURRICULUM VITAE OF STANLEY BUT

EDUCATION:

York University, Toronto, Ontario (1981-1983)
Completed course requirements for Master of Arts in Economics

York University, Toronto, Ontario (1980)
Master of Business Administration

York University, Toronto, Ontario (1979)
Honours Bachelor of Arts in Economics

INDUSTRY EXPERIENCE:

1999 – Present:	Hydro One Networks Inc. / Ontario Hydro Services Company
1986 – 1999:	Ontario Hydro
1980 – 1986:	Ontario Government

2002-Present	Manager, Economics & Load Forecasting
1999-2002	Senior Advisor, Load Forecasts
1993-1999	Team Lead/Senior Energy Economist, Corporate Finance
1989-1993	Senior Economist, Economics & Forecasts Division
1986- 1989	Economist, Economics & Forecasts Division
1985- 1986	Senior Economist, Ontario Manpower Commission, Ontario Ministry of Skills Development
1984- 1985	Senior Economist, Ontario Task Force on Employment and New Technology, Ontario Ministry of Labour
1980-1984	Research Economist, Ontario Manpower Commission, Ontario Ministry of Labour

APPEARANCE(S) BEFORE THE ONTARIO ENERGY BOARD:

EB-2005-0378:	Hydro One Networks Inc. Distribution 2006 Rate Application
EB-2006-0501:	Hydro One Networks Inc. 2007-2008 Electricity Transmission Revenue Requirement Application

CURRICULUM VITAE OF
CLIFFORD JOHN (Jack) COULIS

EDUCATION:

Secondary Diploma

BUSINESS EXPERIENCE:

2001 – Present:	Hydro One Networks Inc.
1999 – 2001:	Ontario Hydro Services Company
1974 – 1999:	Ontario Hydro

2005 – Present:	Director, Forestry Services
2000 – 2005:	Director, Hydro One Remote Communities
1999 – 2000:	Manager, Customer Service - Northern Territory
1997 – 1999:	Manager, Operations – Kenora & Fort Frances Operations Centers
1996 – 1997:	Manager, Operations – Kenora Operations Center
1994 – 1996:	Supervisor, Customer Operations – Kenora Operations Center
1990 – 1994:	Area Distribution Technician – Kenora Operations Center
1978 – 1990:	Powerline Maintainer, Journeyperson
1974 – 1978:	Powerline Maintainer, Apprentice

**CURRICULUM VITAE OF
DAVID B. CURTIS**

EDUCATION:

McMaster University, Hamilton, Ontario (1978)
Masters of Business Administration (Co-operative) - Operations Research and Finance

State University of New York, Stony Brook, New York (1974)
Masters (Nuclear Physics)

McMaster University, Hamilton, Ontario (1972)
Bachelor of Science (Physics)

BUSINESS EXPERIENCE:

2001 – Present:	Hydro One Networks Inc.
1999 – 2001:	Ontario Hydro Services Company
1978 – 1999:	Ontario Hydro

2005 – Present:	Director, Business Transformation
2001 – 2005:	Director, Transmission Regulation
1998 – 2001:	Manager, Transmission Regulation
1997 – 1998:	Manager, Strategic Planning and Programming
1996 – 1997:	Section Head, Strategy & Regulatory Affairs
1994 – 1996:	Section Head, Grid System Strategies and Plans

COST OF CAPITAL

1.0 INTRODUCTION

The purpose of this evidence is to summarize the method and cost of financing Hydro One Distribution's capital requirements for the 2008 test year.

2.0 CAPITAL STRUCTURE

Hydro One Distribution's deemed capital structure for rate making purposes is 60% debt and 40% common equity. This capital structure was determined by the Ontario Energy Board as being appropriate for all distributors in its December 20, 2006 Cost of Capital report.[1] Consistent with the Board's report, there is no adjustment for a preferred share component in rates as determined by the Board. The 60% debt component is comprised of 4% deemed short term debt and 56% long term debt.

3.0 RETURN ON COMMON EQUITY

Hydro One Distribution is requesting an equity return for the 2008 test year of 8.64% per the Board's formulaic approach in Appendix B of the Cost of Capital report. The return of 8.64% is based on the Long Canada Bond Forecast for 2008 using the May 2007 Consensus Forecast. In accordance with the Cost of Capital report, upon the final decision in this case, Hydro One assumes that the ROE will be adjusted using the January, 2008 Consensus Forecast.

---

[1] *Report of the Board on Cost of Capital and 2nd Generation Incentive Regulation for Ontario's Electricity Distributors*, Ontario Energy Board (December 20th, 2006) [EB-2006-0088/EB-2006-0089]

4.0 DEEMED SHORT TERM DEBT

The Board has determined that the deemed amount of short-term debt that should be factored into rate setting be fixed at 4% of rate base, and that the deemed short-term debt rate be based on the forecast 3-month bankers' acceptance rate plus a fixed spread of 25 basis points. For 2008 the deemed short term rate is 4.74%, using the May 2007 Consensus Forecast. In accordance with the Cost of Capital report, upon the final decision in this case, Hydro One assumes that the deemed short term debt rate will be adjusted using the January, 2008 Consensus Forecast.

5.0 THIRD PARTY LONG TERM DEBT

The Distribution business' third party long term debt is $2,326 million for 2008. The effective cost of third party long term debt is calculated as the weighted average cost of embedded third party debt, new third party debt and forecast third party debt planned to be issued in 2007 and 2008. The weighted average cost of third party long term debt rate for 2008 is 5.71%. Details of Hydro One Distribution's long term debt portfolio for the 2008 test year are identified at Exhibit B2, Tab 1, Schedule 2, Page 5. A detailed discussion of the Hydro One Distribution's debt and forecast interest rate support is provided at Exhibit B1, Tab 2, Schedule 1. Historical long term debt cost information is filed at Exhibit B2, Tab 1, Schedule 2, pages 1 – 3, for the 2004 – 2006 period.

6.0 DEEMED LONG TERM DEBT

Deemed long term debt consists of the amount of any variable rate debt or affiliate debt callable on demand, as well as any remaining amount required to balance the total financing with the rate base. Consistent with the Board's Cost of Capital report, the deemed long term debt rate is to be applied to any variable rate debt and for any affiliate debt callable upon demand. The deemed long-term debt rate for 2008 is 5.69% based on the approach in Appendix A of the Cost of Capital report, using the May 2007 Consensus Forecast. In accordance with the Cost of Capital report, upon the final decision in this case, Hydro One assumes that the deemed long term debt rate will be adjusted using the January, 2008 Consensus Forecast.

7.0 COST OF CAPITAL SUMMARY

The overall capital incorporated in Hydro One Distribution's 2008 revenue is $4,382 million which results in an after tax required return on rate base of 6.84%.

2008 Cost of Capital

Particulars	$ Millions	%	Cost Rate (%)	Return ($M)
Third Party long-term debt	2,326	53.1	5.71	133
Deemed long-term debt	128	2.9	5.69	7
Deemed short-term debt	175	4.0	4.74	8
Common equity	1,753	40.0	8.64	151
Total	4,382	100.0	6.84	300

Historical, bridge and test year debt and equity summary schedules have been provided at Exhibit B2, Tab 1, Schedule 1.

COST OF THIRD PARTY LONG TERM DEBT

1.0 HYDRO ONE DISTRIBUTION LONG TERM DEBT

The debt portfolio for Hydro One Distribution, as set out in Exhibit B2, Tab 1, Schedule 2, is based on debt issued by Hydro One Networks Inc. to Hydro One Inc., of which the Distribution business is mapped a portion. Hydro One Networks Inc. has issued debt to Hydro One Inc., reflecting debt issued by Hydro One Inc. to third party public debt investors.

Third party public debt investors hold all of the long term debt issued by Hydro One Inc. Hydro One Inc.'s debt financing strategy takes into consideration the objectives of cost effectiveness, distributing debt maturities evenly over time, and ensuring the term of the debt portfolio is compatible with the long life of the Company's assets.

Hydro One Inc. has a Medium Term Note program that provides ready access to issue debt with a term greater than one year into the Canadian debt capital markets. The short form base shelf prospectus for the current $2.5 billion Medium Term Note program is provided in Exhibit A, Tab 11, Schedule 2. The standard maturity terms of 5, 10 and 30-years are preferred by investors and represent the main financing Hydro One utilizes to execute its financing strategy and raise the required funds.

2.0 CREDIT RATINGS

Hydro One Inc. issues medium term notes in the Canadian public debt markets, hence credit ratings are a requirement. The credit ratings of Hydro One Inc.'s debt obligations by Dominion Bond Rating Service, Moody's Investors Service and Standard & Poor's Rating Services are as follows:

Rating Agency	**Short-term Debt**	**Long-term Debt**
Standard & Poor's Rating Services (S&P)	A-1	A
Dominion Bond Rating Service (DBRS)	R-1(middle)	A(high)
Moody's Investors Service (Moody's)	Prime-1	Aa3

The most recent rating agency reports are provided in Exhibit A, Tab 11, Schedule 1.

3.0 COST OF THIRD PARTY LONG TERM DEBT

The Distribution business' third party long term debt is $2,326 million for 2008. The effective cost of third party long term debt is calculated as the weighted average cost of embedded third party debt, new third party debt and forecast third party debt planned to be issued in 2007 and 2008. This cost includes the amortization of issuance costs. The weighted average cost of third party long term debt rate for 2008 is 5.71%. Details of Hydro One Distribution's third party long term debt portfolio for the 2007 bridge year and 2008 test year are identified at Exhibit B2, Tab 1, Schedule 2, Pages 4 and 5.

The amount of each Hydro One Networks Inc. debt issue that is mapped to the Distribution business is based on its most recent forecast of borrowing requirements. Borrowing requirements are mainly driven by debt retirement, capital expenditures net of internally generated funds, and the maintenance of its capital structure. For example, in March 2007 Hydro One Inc. issued $400 million of 30 year notes with a coupon rate of 4.89%, of which $160 million was mapped to Hydro One Distribution as shown on line 21 of Exhibit B2, Tab 1, Schedule 2, Page 5. The interest rates of debt issues mapped to the Distribution business as shown in Exhibit B2, Tab 1, Schedule 2 are equal to the actual interest rates on debt issued by Hydro One Networks to Hydro One Inc., and by Hydro One Inc. to third party public debt investors.

3.1 Embedded Third Party Debt

The Board has determined in its Cost of Capital Report that for embedded debt, the rate approved in prior Board decisions shall be maintained for the life of each active instrument, unless a new rate is negotiated, in which case it will be treated as new debt. Hydro One Distribution's embedded third party long term debt, which was issued during the period from 2000 to 2005, is shown on lines 1 to 16 of Exhibit B2, Tab 1, Schedule 2, Page 5. The rates on these embedded debt issues were approved by the Board as part of RP-2005-0020.

3.2 New Third Party Debt

The Board has determined in its Cost of Capital Report that the rate for new debt that is held by a third party will be the prudently negotiated contract rate. This would include recognition of premiums and discounts. The following discusses new third party debt issued during 2006 and 2007, which are shown on lines 17 to 21 of Exhibit B2, Tab 1, Schedule 2, Page 5.

In March of 2006, Hydro One issued $300 million of 10-year notes with a 4.64% coupon rate of which $90 million was mapped to Hydro One Distribution as shown on line 17 of Exhibit B2, Tab 1, Schedule 2, Page 5.

In April of 2006, Hydro One Inc. issued $250 million of 30-year notes, of which $62.5 million was mapped to Hydro One Distribution as shown on line 18 of Exhibit B2, Tab 1, Schedule 2, Page 5. The offering was a re-opening of the 5.36% coupon bond originally issued in May 2005 bringing the total outstanding in that series to $600 million.

In August of 2006, Hydro One Inc. issued $150 million of 10-year notes with a 4.64% coupon rate, of which $90 million was mapped to Hydro One Distribution as shown on line 19 of Exhibit B2, Tab 1, Schedule 2, Page 5.

In October of 2006, Hydro One Inc. issued $75 million of 40-year notes with a 5.00% coupon rate, of which $45 million was mapped to Hydro One Distribution as shown on line 20 of Exhibit B2, Tab 1, Schedule 2, Page 5.

In March of 2007, Hydro One Inc. issued $400 million of 30-year notes with a 4.89% coupon rate, of which $160 million was mapped to Hydro One Distribution as shown on line 21 of Exhibit B2, Tab 1, Schedule 2, Page 5.

3.3 Forecast Third Party Debt

The issuance of 5, 10 and 30 year debt will be the main financing to meet Hydro One Distribution's forecast borrowing requirement of $205 million remaining for 2007 and $434 million for 2008. For planning purposes it is assumed that debt issuance will be evenly distributed over the standard 5, 10 and 30 year terms which are preferred by investors.

The following table lists the fixed rate medium term notes Hydro One Distribution plans to issue in 2007, as shown in lines 22 and 23 of Exhibit B2, Tab 1, Schedule 2, Page 5. The remainder of the third party debt to be issued during 2007 is assumed to be issued as 5 and 10 year debt, as a 30 year issue was completed during March 2007.

2007		
Principal Amount ($Millions)	**Term (Years)**	**Coupon**
102.5	5.5	4.47%
102.5	10	4.71%

The following table lists the fixed rate medium term notes Hydro One Distribution plans to issue in 2008, as shown on lines 24 to 26 of Exhibit B2, Tab 1, Schedule 2, Page 5.

2008		
Principal Amount ($Millions)	**Term (Years)**	**Coupon**
144.7	5.5	4.77%
144.7	10	5.01%
144.7	30	5.37%

3.4 Interest Rates for 2007 and 2008 Forecast Debt Issues

Distribution business borrowing will be financed at market rates applicable to Hydro One Inc. The following table summarizes the derivation of the forecast Hydro One Inc. yield for each of the planned issuance terms for 2007 and 2008.

	2007		**2008**		
	5-year	**10-year**	**5-year**	**10-year**	**30-year**
Government of Canada	4.13%	4.20%	4.43%	4.50%	4.55%
Hydro One Spread	0.34%	0.51%	0.34%	0.51%	0.82%
Forecast Hydro One Yield	4.47%	4.71%	4.77%	5.01%	5.37%

Each rate is comprised of the forecast Canada bond yield plus the Hydro One Inc. credit spread applicable to that term. The 10-year Government of Canada bond yield forecast for 2007 and 2008 is based on the May 2007 Consensus Forecasts. The 5 and 30-year Government of Canada bond yield forecasts are derived by adding the April 2007 average spreads (5-year to 10-year for the 5 year forecast and 30-year to 10-year for the 30-year forecast) to the 10-year Government of Canada bond yield forecast. This derivation is consistent with the Board's methodology in establishing the forecast of the

30-year Government of Canada yield, in the formula based return on common equity approach for regulated utilities. Consistent with this methodology, Hydro One's credit spreads over the Government of Canada bonds are based on the average of indicative new issue spreads for April 2007 obtained from our MTN dealer group for each planned issuance term.

3.5 Treasury OM&A Costs

Treasury OM&A costs are incurred to:

- execute borrowing plans and issue commercial paper and long-term debt;
- ensure compliance with securities regulations, bank and debt covenants;
- manage the company's daily liquidity position, control cash and manage the company's bank accounts;
- settle all transactions and manage the relationship with creditors; and
- communicate with debt investors, banks and credit rating agencies.

These costs are $1.1 million for 2008 as shown on line 28 of Exhibit B2, Tab 1, Schedule 2, Page 5.

3.6 Other Financing-Related Fees

Column (e) of Exhibit B2, Tab1, Schedule 2 (ie. Premium, discount and expenses) represents the costs of issuing debt. These costs are specific to each debt issue and include commissions, legal fees, debt discounts / premiums on issues or re-openings of issues relative to par, and hedge gains / losses.

Other financing related fees, $0.4 million in 2008, identified on line 29 of Exhibit B2, Tab 1, Schedule 2, Page 5, include the Distribution allocation of Hydro One Inc.'s annual credit rating agency, letter of credit, banking, custodial and trustee fees.

COST OF SERVICE SUMMARY

1.0 INTRODUCTION

This evidence presents an overview of Hydro One Distribution's Cost of Service evidence. The Cost of Service submissions include the following components:

- Operation, Maintenance and Administration ("OM&A") expenses
- Resourcing
- Costing of Work
- Corporate Cost Allocation
- Depreciation and Amortization Expense
- Payments in Lieu of Corporate Income Taxes
- Taxes Other Than Income Taxes

Each of these components is separately addressed within the company's evidence. Exhibit reference numbers are provided below.

Hydro One Distribution's forecast cost of service has been developed consistent with corporate objectives. The Company's planning process is described in detail at Exhibit A, Tab 14, Schedule 1.

1.1 Operation, Maintenance and Administration Expenses (OM&A)

Total OM&A expenses for the 2008 test year are $477.7 million.

Hydro One Distribution plans and organizes its OM&A expenses on the basis of the various work programs and functions performed by the company. Exhibits in support of

OM&A costs have been prepared by program area, and appear within the submitted evidence as follows:

Program Areas	2008 Total Cost ($ million)	Reference
Summary of OM&A Expenses	$477.7	Exhibit C1, Tab 2, Sch 1
Sustaining	$280.0	Exhibit C1, Tab 2, Sch 2
Development	$9.1	Exhibit C1, Tab 2, Sch 3
Operations	$13.4	Exhibit C1, Tab 2, Sch 4
Customer Care	$103.8	Exhibit C1, Tab 2, Sch 5
Shared Services, and other Costs	$66.9	Exhibit C1, Tab 2, Sch 6
Taxes other than Income Taxes	$4.5	Exhibit C1, Tab 2, Sch 7

In order to satisfy the requirements of the *2006 Electricity Distribution Rate Handbook* and the *Filing Requirements for Transmission and Distribution Applications* (November 14, 2006), Exhibit C2, Tab 2, Schedule 2 identifies OM&A costs by grouped USofA accounts.

1.2 Resourcing

Labour costs are charged to OM&A and Capital work programs. The evidence contained at Exhibit C1, Tab 3 presents total staff levels and costs incurred by the company as follows:

- Corporate Staff Levels — Exhibit C1, Tab 3, Schedule 1
- Compensation, Wages, Benefits, Bonus — Exhibit C1, Tab 3, Schedule 2
- Pension Costs (Appendix A) — Exhibit C1, Tab 3, Schedule 2

1.3 Costing of Work

OM&A and Capital work programs are comprised primarily of costs relating to labour, materials and equipment. Exhibit C1, Tab 4, Schedule 1 provides exhibits that explain how costs flow to work programs and also discusses cost efficiencies that have been achieved.

Throughout its operations, Hydro One Distribution has been successful in containing costs and undertaking productivity initiatives, as described in Exhibit C1, Tab 4, Schedule 2.

1.4 Corporate Cost Allocation

Hydro One Networks Inc. provides common services to Distribution and Transmission and other subsidiaries on a centralized basis. The costs of these services and assets are assigned to business units on the basis of cost causation. These costs and assets are directly assigned where it is possible to do so. All other costs are allocated based on cost drivers, direct benefits or other appropriate methods. Exhibit C1, Tab 5 describes these allocation methods, as well as the derivation of the overhead capitalization rate, which determines the assignment of overhead costs to capital expenditures.

In RP-2005-0020/EB-2005-0378, Hydro One Distribution commissioned R.J. Rudden Associates to establish a cost allocation approach for Common Costs, which would be in accordance with accepted industry standards. The Common Corporate Cost Allocation Study determined the appropriate allocation of these shared costs between the business units. The study and its methodologies were accepted by the OEB in its Decision with Reasons dated April 12, 2006. The company's evidence on shared services uses this methodology and is shown in Exhibit C1, Tab 5, Schedule 1.

Exhibit C1, Tab 5, Schedule 2 provides evidence regarding the derivation of Overhead Capitalization Rates.

Exhibit C1, Tab 5, Schedule 3 provides evidence regarding shared assets and their allocation to business units.

1.5 Depreciation and Amortization Expense

In RP-2005-0020/EB-2005-0378, the Company filed the Foster Associates Inc. depreciation study which methodologies and associated costs flows were accepted by the OEB in its subsequent Decision with Reasons. The results of this study form the basis of the depreciation submission in this application. The company is proposing to recover $238.9 million in depreciation and amortization expense. Hydro One Distribution's evidence on depreciation expense is filed at Exhibit C1, Tab 6, Schedule 1.

1.6 Payments in Lieu of Corporate Income Taxes

As a result of *the Electricity Act, 1998*, Hydro One Distribution has been required to pay proxy taxes since 1999. Evidence outlining the calculation of Payments in Lieu of Income Taxes of $38.8 million appears at Exhibit C2, Tab 6, Schedule 1.

SUMMARY OF OM&A EXPENDITURES

1.0 SUMMARY OF OM&A EXPENDITURES

The requested OM&A expenditures result from a rigorous business planning and work prioritization process that reflects risk-based decision making to ensure that the most appropriate, cost effective solutions are put in place. This process is described in detail at Exhibit A, Tab 14, Schedules 1 through 5.

The proposed OM&A programs represent Hydro One Distribution's integrated set of asset maintenance and customer activity needs to meet public and employee safety objectives, to comply with the Distribution System Code, environmental requirements and Government direction, maintain distribution business service quality and reliability at targeted performance levels, and ensure public confidence as stewards of provincial assets.

The development of asset maintenance programs is based on equipment specifications coupled with comprehensive asset condition information and good utility practice, as discussed in Exhibit D1, Tab 2, Schedule 1.

Work planning and implementation of programs is based on Hydro One Distribution's long-term planning cycle and prioritization approach described in "Work Planning and System Operations" within section 4 of Exhibit A, Tab 3, Schedule 1

Hydro One Distribution's OM&A budget is grouped into different investment categories: Sustaining, Development, Operations, Customer Care, Shared Services and Other OM&A and Taxes Other than Income Taxes. Table 1 provides a summary of Hydro One Distribution's OM&A expenditures for the historical, bridge and test years.

Table 1
Summary of Distribution OM&A Budget ($ Million)

Description	Historic (Actual)			Bridge	Test
	2004	2005	2006	2007	2008
Sustaining	207.9	222.0	255.6	278.8	280.0
Development	5.5	4.8	4.2	8.0	9.1
Operations	16.3	11.2	14.9	12.6	13.4
Customer Care	103.0	96.3	103.7	97.1	103.8
Shared Services and Other OM&A	9.3	23.3	21.2	91.9	66.9
Taxes Other Than Income Tax	4.0	4.6	4.5	4.2	4.5
TOTAL	346.0	362.1	404.1	492.6	477.7

Total OM&A expenditures have increased by 38% or $132 million over the 2004 to 2008 period. Contributing to the increase over this period is escalation of about 24% in OM&A costs, as noted on page 2 of Exhibit A, Tab 14, Schedule 2, as well as an additional $37 million in pension related costs.

In particular, expenditures have grown by $74 million from 2006 to 2008 driven primarily by increases in Sustainment expenditures to ensure the safe and reliable operation of the distribution system, including increased vegetation management costs, increased maintenance costs associated with aging assets, and an increase in costs associated with smart meters. Also contributing to the total increase in OM&A expenditures is an increasing shared services workload associated with supporting increased core work programs as well as required compliance and regulatory activities; higher than planned overheads capitalized credit in 2006, which, consistent with the Rudden overhead capitalization rate methodology, is subsequently trued up as outlined in Exhibit C1, Tab 5, Schedule 2; and, recognition of pension costs (which were deferred during the 2004 to April 2006 period).

Detailed descriptions of the work activities in each area of Distribution OM&A expense and the reasons for the changes in costs over the 2004 – 2008 period are discussed in the schedules that make up Exhibit C1, Tab 2.

2.0 SUSTAINING

The Sustaining OM&A budget represents investments required to maintain existing distribution lines and stations facilities so that they will continue to function as originally designed to support a typically rural based system. The proposed investments are intended to ensure that the overall reliability of the system is improved, that customer commitments are achieved, and that all legislative, regulatory, environmental and safety requirements are met. Details of the expenditures under this program are provided at Exhibit C1, Tab 2, Schedule 2.

3.0 DEVELOPMENT

The Development OM&A program, through system data collection, system studies and generation connection studies, enables the analyses needed for economical operation, development and expansion of the distribution system to meet existing and anticipated load and generation demands, while maintaining delivery system reliability. This program also ensures appropriate standards are maintained as required to meet construction, legal and regulatory requirements, as well as funding Research & Development that will enhance the long- and short-term effectiveness of the distribution system. Details of the expenditures under this program are described in detail at Exhibit C1, Tab 2, Schedule 3.

4.0 OPERATIONS

The Operations OM&A program represents the annual expenditures required for the Central Distribution Operations function, operated out of Hydro One's Ontario Grid Control Centre. The Distribution Operations function is concerned with the real time operations of the Hydro One Distribution system, including the dispatch of field crews to distribution system problems received by the Customer Call Centre. Details of the expenditures under this program are filed at Exhibit C1, Tab 2, Schedule 4.

5.0 CUSTOMER CARE

The Customer Care OM&A work program represents the set of work activities that are required to provide services to customers connected to the Hydro One Distribution system, and to meet the service levels stipulated in the Electricity Distribution Rate Handbook. The work program includes service to customers receiving electricity under Standard Supply Service and to customers under retailer contracts. Details of the expenditures under this program are filed at Exhibit C1, Tab 2, Schedule 5.

6.0 SHARED SERVICES AND OTHER OM&A

The Shared Services and other OM&A program includes the provision of Common Corporate Functions and Services and Asset Management programs to support the Distribution business, as well as the maintenance of existing infrastructure, including business systems, facilities, and information technology. The Common Corporate functions and services include the provision of financial, human resource, legal, information technology and strategic planning services. Asset Management programs include developing Distribution asset strategies, policies and standards; identifying, planning and prioritizing specific OM&A and Capital work on the distribution network;

facility services; and monitoring the execution of the annual work program. Other OM&A programs include the credits for overheads capitalized and the cost of goods sold in support of external revenues. Details of the expenditures under this program are filed at Exhibit C1, Tab 2, Schedule 6.

7.0 TAXES OTHER THAN INCOME TAXES

This program consists of property and proxy taxes, and indemnity payments to the Province. Details of the expenditures under this program are filed at Exhibit C1, Tab 2, Schedule 7.

SUSTAINING OM&A

1.0 INTRODUCTION

Distribution Sustaining OM&A represents expenditures required to maintain existing distribution lines and stations facilities so that they will continue to function as originally designed. Hydro One Distribution manages its Sustaining OM&A program by dividing the program into four categories: stations, lines, vegetation management, and meters.

The expenditures covered under the Sustaining OM&A program are intended to ensure that the reliability of the system is improved where it is cost effective to do so, customer commitments are achieved, and that all legislative, regulatory, environmental and safety requirements are met. Hydro One Distribution sustaining OM&A programs and proposed spending levels for 2008 are described below.

2.0 DISCUSSION

Distribution assets and their components are subject to deterioration and failure over time. Appropriate maintenance practices ensure that the life of assets is optimized and will help protect against major equipment failures and associated reliability problems. Maintenance programs are designed with recognition that asset integrity is influenced by factors such as condition, design, environment, deterioration with age, and equipment utilization. As assets deteriorate, equipment performance usually suffers resulting in increased environmental risks and an increase in potential safety hazards to both the public and employees, and a decrease in system reliability. Ultimately, assets will deteriorate to the point that they are no longer able to perform their function(s) effectively or where current year or longer term costs of maintaining the asset exceed the costs of replacement. At this point, it becomes more cost-effective to replace an asset rather than to continue to repair or maintain. Replacement of capital assets is discussed in Exhibit D1, Tab 3, Schedule 2.

Sustaining OM&A programs fund both planned and unplanned work. The planned programs represent the work required to preserve the functionality of the distribution system by maintaining or replacing defective components and managing rights-of-way to ensure vegetation growth does not adversely affect system reliability. The determination of which specific facilities need to be maintained is in part based on the comprehensive Asset Condition Assessment (ACA) process described in Exhibit D1, Tab 2, Schedule 1. The condition of assets is one consideration in determining the need to schedule maintenance. Other factors include historical performance, asset criticality, asset demographics, availability of spare equipment and material, local customer impacts and the business drivers as detailed in the work program prioritization process discussed at Exhibit A, Tab 14, Schedule 5. The prioritization process allows all distribution programs to be ranked and compared to one another so that investments can be directed to where they provide the maximum business value.

Sustaining OM&A includes demand work, also referred to as unplanned work. Demand work involves responding to customer outages and restoring power on a twenty-four hour basis, responding to safety issues, managing billing meters to ensure they are replaced upon failure, responding to customer requests to remove hazardous trees, responding to requests to locate underground power cables, and replacing or repairing failed equipment. The variable nature of this work requires Hydro One Distribution to forecast costs based on historical averages of cost and volume of work, with adjustments made to reflect anticipated changes in expenditure patterns and work requirements.

Demand work requires an immediate or timely response to customer, safety and system needs, and is initiated by interruptions to service, line and station inspection findings, and customer and property owner requests. Hydro One Distribution maintains infrastructure, equipment and resources to respond to these issues within the appropriate time frame as they arise. Some demand work does not pose the same degree of urgency, and in these instances, the work is scheduled over time based on knowledge of the condition of the assets and coordinated in a cost effective manner with other work.

The spending for 2008, along with the spending levels for the bridge and historic years are provided in Table 1 below.

Table 1
Sustaining OM&A
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Stations	18.4	19.9	26.0	25.0	24.9
Lines	92.4	105.3	126.5	123.1	118.1
Meters	8.2	10.3	14.0	15.7	17.6
Vegetation Management	88.9	86.4	89.1	115.0	119.4
Total	**207.9**	**222.0**	**255.6**	**278.8**	**280.0**

The change in overall spending for 2008 relative to historic expenditures is attributed to the following reasons:

- Increased vegetation management line clearing and brush control to manage and improve reliability.
- Increased maintenance on distribution station transformers to restore the condition of these aging assets.
- Maintenance and other OM&A spending for Smart Meters.
- Continuing efforts on lines data collection and increased emphasis in defect corrections to manage reliability and safety

These increases are discussed in more detail below.

2.1 Stations

Hydro One Distribution owns and operates 1,006 distribution and regulating stations province-wide. Stations are used for the delivery of power, voltage transformation, and switching. Station facilities typically contain the following components: power transformers, instrument devices, fuses, reclosers, disconnect switches, bus, insulators, support structures, power cables, cable terminators, surge arresters, station service supplies, grounding systems, fences, mobile substation facilities and buildings.

Stations sustaining OM&A covers investments required to maintain existing assets located within distributing stations, regulating stations, as well as Hydro One Distribution's 28 mobile substations. The work is divided among three programs as noted in Table 2 below. Funding for 2008 along with the spending levels for the bridge and historic years are provided in Table 2 below.

Table 2
Stations Sustaining OM&A
($ Millions)

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Stations Demand and Corrective Maintenance (d)	6.2	6.7	7.0	6.9	6.1
Planned Station Maintenance	6.6	8.9	12.1	13.1	12.9
Land Assessment and Remediation	5.6	4.3	6.9	5.1	5.9
Total	**18.4**	**19.9**	**26.0**	**25.0**	**24.9**

(d) – indicates this is a demand program

2.1.1 Stations Demand and Corrective Maintenance

This program covers emergency work required to respond to component failures at distributing and regulating stations, correct situations where there is a likelihood of failure that could cause a power interruption or present a safety hazard, and to complete unplanned corrective work discovered during planned maintenance activities that cannot be deferred until the next planned maintenance. When station components fail, the consequence is typically a service interruption to customers. Station interruptions can impact a large number of customers, typically from 1,000 to 10,000 customers per interruption. Emergency and corrective maintenance work must be carried out in a timely manner in order to minimize the risks to customer reliability and safety.

In most cases, smaller components such as reclosers, insulators, connectors, switches, etc. will be repaired, temporarily bypassed, or replaced on site. The failure of a large component, such as a transformer, may require moving the equipment off site and repairing it at a central location. If a prolonged service interruption is anticipated, service is typically restored through the temporary use of a mobile substation.

The 2008 spending requirement for this program is $6.1 million and is within 10% of historic expenditures except for 2006. During 2006 copper theft and a number of site security and safety problems were identified that required corrective action.

2.1.2 Planned Station Maintenance

The planned station maintenance work program includes station inspections, power equipment maintenance, asset condition assessments, grounds and site maintenance, and maintenance of mobile substations. A planned maintenance program is required to reduce the risk of equipment failure, which can impact reliability of service to the large number of customers typically supplied from a station. Planned maintenance also ensures equipment reaches its maximum economic life potential and limits the amount of unplanned maintenance in future years.

Appendix C of the Distribution System Code requires all LDCs to inspect their stations on a regular basis to identify obvious structural problems, hazards and signs of vandalism. Hydro One Distribution's stations are inspected two times per year in rural areas and monthly in urban areas as stipulated in the Distribution System Code. The 2008 spending for this activity is $2.0 million. Inspections identify obvious problems and safety hazards prior to initiating the planned maintenance work. The planned maintenance of stations is required to preserve operational integrity and to correct equipment defects before they cause outages and reduce the reliability of service to customers, or impact employee safety.

A preventive maintenance optimization (PMO) approach has been adopted, where appropriate, for the planned maintenance of station assets. PMO is a structured program that best utilizes a company's resources to efficiently and effectively execute its maintenance requirements. Using a PMO process, detailed analysis of failure modes, causal impacts, and asset criticality are all considered in evaluating preventative measures. The end result of PMO will be a listing of routine maintenance tasks that are the most technically correct and cost-effective to address the causes of critical modes of failure, as opposed to the more traditional standardized time based maintenance approach.

The 6,000 station reclosers are maintained on a 6 year interval, and airbreak switches, circuit switchers, high voltage fuses, and transformer underload tap changers are maintained on a similar interval. These activities, in addition to mid-life maintenance overhaul on major equipment, management of station PCBs, transformer diagnostics and technical services account for a 2008 spending of $8.6 million.

Station grounds and site maintenance includes weed control, snow removal, fence repair, access road maintenance, site drainage and foundation repairs, and accounts for a 2008 spending of $1.6 million.

Hydro One Distribution’s 28 mobile substations play a key role in providing reliable service to customers. They provide emergency backup, should a distributing station fail, and facilitate planned maintenance programs at distributing stations, as well as providing load relief during heavy load periods in the summer or winter. As such, planned maintenance of mobile substations is required to ensure these critical units are available and in good working condition when required. The cost to maintain the mobile substations during 2008 is estimated to be $0.7 million.

The total 2008 spending requirement for Planned Station Maintenance is $12.9 million to maintain 1,006 station sites and associated equipment including infrastructure. The 2008 spending is about the same as the bridge year spending and a 7% increase over 2006 expenditures. The increase in spending is attributed to a need for added transformer maintenance and mid-life overhauls as identified through inspections and diagnostic activities.

Maintenance plans initiated during 2005 are showing benefits. Increased use of transformer diagnostics (dissolved gas analysis), and the removal of suspect transformers from service in a proactive manner based on the results of the diagnostic tests, have enabled a reduction of forced outages (i.e. failures). A reduction in failures has benefits to customer reliability and avoids environmental contamination from spilled or burning insulating oil. It is important that the coordinated maintenance strategy (i.e., ACA, proactive removal of suspect transformers and mid-life overhauls) adopted for this aging class of key assets be maintained in order to increase the life of these assets and to keep failures in check over the longer term.

2.1.3 Land Assessment and Remediation

Hydro One Distribution owns 1,006 distribution and regulating station properties across Ontario. Soil contamination has occurred over time within some of the properties as a result of the following: application of certain long lasting chemicals, such as wood preservatives and arsenic-based herbicides; storage and use of mineral insulating oil, fuel, PCBs, and miscellaneous other materials. The historical use and storage of these materials and chemicals met all applicable environment regulations and guidelines at the time that they were first used. Approximately 45% of these properties have some level of on-site soil contamination, exceeding applicable Ministry of Environment land-use criterion. Because contaminated properties have the potential to cause adverse effects on people and the environment, Hydro One Distribution has undertaken to assess their properties and carry out remedial work where environmental risks are significant. The ACA process described in Exhibit D1, Tab 2, Schedule 1 provides additional details concerning Land Assessment and Remediation.

The Land Assessment and Remediation program's primary focus is to reduce the human and ecological risk of off-property impacts, through the implementation of remedial measures to treat, remove or otherwise manage the contamination found off-site and/or the implementation of on-site management controls to mitigate future off-property impacts.

The 2008 spending requirement for this program is $5.9 million. This level of funding is required to complete assessments and required remedial work on 8 priority sites. This volume of work aligns with a managed remediation schedule that would address all high to medium risk sites within the next 5 years. Historic costs have varied year over year due to the complexity and volume of work needed to address the particular sites during any given year.

2.2 Lines

Distribution lines total 119,900 circuit km province-wide and are used to deliver power to Hydro One Distribution customers. Lines are constructed on road allowances where possible, or on rights-of-way for which Hydro One Distribution has legal rights to occupy. Line components include poles, conductor, transformers, switches, fuses, surge arresters, voltage regulators, capacitors, insulators, guy anchors and reclosers.

Funding under lines sustaining OM&A provides for investments required to maintain the integrity of the distribution lines system. The work is divided among four categories, Trouble Call/Cable Locates/Reconnect and Disconnects, Line Maintenance, Waste Management and Other Services. Funding for 2008, along with the spending levels for the bridge and historic years, are provided in Table 3 below.

Table 3
Lines Sustaining OM&A
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Trouble Call Response, Cable Locates and Disconnects/Reconnects (d)	67.2	73.8	89.2	78.6	76.9
Line Maintenance	15.2	19.3	26.7	30.2	28.8
Waste Management	2.7	2.8	3.2	3.1	3.0
Other Services	7.3	9.4	7.4	12.7	9.4
Total	**92.4**	**105.3**	**126.5**	**124.6**	**118.1**

(d) – indicates this is a demand program

2.2.1 Trouble Calls, Underground Cable Locates, Disconnects/Reconnects

These demand programs provide funding for responding to customer service interruptions and power quality concerns and for customer-driven service response activity. The externally driven nature of this work requires Hydro One Distribution to forecast costs based on historical averages with adjustments made to reflect anticipated changes in expenditure patterns or work requirements. The funding is divided into three programs as shown in Table 4.

Table 4
Trouble Calls, Locates, Disconnects/Reconnects
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Trouble Calls (d)	51.5	56.8	70.9	57.6	58.9
Underground Cable Locates(d)	9.1	10.2	10.7	12.4	10.5
Disconnects/Reconnects (d)	6.6	6.8	7.6	8.6	7.5
Total	**67.2**	**73.8**	**89.2**	**78.6**	**76.9**

(d) – indicates this is a demand program

Trouble Calls

The Trouble Call program is required to address unplanned power interruptions to customers, customer power quality related complaints, and the emergency repair of equipment and component defects found on the distribution system.

Unplanned power interruptions on the distribution system are largely due to line component failures and/or contact with right-of-way vegetation (trees). Line component failures can be caused by severe weather conditions (e.g. snow/ice, wind, lightning), right-of-way vegetation falling into lines and system component deterioration. Tree related interruptions are largely due to trees falling onto lines or branches contacting the lines, and in many cases are due to adverse weather conditions.

Service quality complaints from customers can include concern with momentary outages (flickering lights), radio and television interference and high neutral voltage (also known as 'tingle voltage' in the farming community).

The Trouble Call program also addresses assets that are in immediate need of repair or replacement, or encroachment of vegetation that has the potential to cause an outage within a short period of time. If not attended to, these types of defects may ultimately result in a power interruption to customers or create a safety hazard to the public or employees.

The majority of trouble calls result in an interruption to customers and/or power quality degradation. Service interruptions can impact from one customer to thousands of customers depending on the severity of the incident and system configuration. Service restoration requires that the defective component be repaired, temporarily bypassed, or replaced by crews dispatched to the site at any time, day or night. Defective equipment, if categorized as a capital component would be replaced under Sustaining Capital as discussed in Exhibit D1, Tab 3, Schedule 2.

This program is reactive in nature and will vary due to external factors such as weather severity (e.g. storms), variability in equipment deterioration, random equipment failures, and the volume of customer power quality complaints. Historically, there are approximately 50,000 trouble calls responded to annually, of which roughly one-third are incidents that do not cause a service interruption, but pose a high risk to the reliability of supply or safety, and need to be addressed in an expedient manner.

Hydro One Distribution must address trouble calls in order to comply with legal and regulatory requirements to correct known hazardous problems and to maintain safe and reliable electric service in accordance with good utility practice. Performance on this program will impact the system reliability service quality indicators specified by the OEB in the Electricity Distribution Rate Handbook, Sections 15.2.1 and 15.2.3.

The 2008 spending requirement for this program is $58.9 million based on a forecast volume of 49,100 Trouble Calls and an allowance for storm related costs that are not capitalized, i.e., vegetation management and overtime accumulated during storm events. The 2008 allowance for OM&A storm related costs is $6 million. The proposed spending takes into account observed historic volumes and historic expenditures for storm response. Trouble Call volumes have remained relatively steady but increasing expenditures associated with storm activity since 2004 have placed greater demands on program expenditures.

Spending for 2008 is projected to be 17% lower than 2006 actual costs. During 2006 there were an unusually high number of damaging storms resulting in much higher storm related costs than normal. It is expected that spending of this magnitude will be not required during 2008.

Underground Cable Locates

This program provides a service of locating and marking Hydro One Distribution underground plant for customers and contractors who require this information prior to excavating. This service is provided in accordance with the Electrical Safety Authority's (ESA) "Guidelines for Excavating in the Vicinity of Distribution Lines". The program costs are not recovered through end-user charges in order to encourage property owners and contractors to make use of this service and avoid hazardous situations that can cause serious injury. This approach is consistent with the practice followed by other regulated utilities, including telephone service and natural gas utilities.

Program funding is driven by external demand and varies based on the amount of public and economic development activity in any given year. Hydro One Distribution has seen an approximate 12% increase in volume since 2004 from 73,001 to 81,975 locates during 2006, due mainly to an increased number of locates generated by increased public awareness of the "call before you dig" message.

Performance on this program is tracked by the "Underground Cable Locates" service quality indicator specified by the OEB in the Electricity Distribution Rate Handbook, Section 15.1.2. Refer to Exhibit A, Tab 15, Schedule 1 for additional details.

The 2008 spending requirement for this program is $10.5 million and is based on a projected volume of 75,800 cable locate requests The volume forecast is derived using a 4 year average with adjustments made to incorporate recent trending in volumes. The projected spending maintains recent historic expenditures.

Service Disconnects and Reconnects

This program funds the provision of service to customers, or their contractors, who require isolation from the distribution system to facilitate working safely around the customer-owned portion of a distribution line (e.g., clearing trees and vegetation or working on customer-owned equipment). When customers complete their work, the service is reconnected and returned to normal conditions. There is no cost to the customer for providing this service once per calendar year during normal working hours in order to encourage customers to maintain their facilities and to work safely.

Performance on this program contributes to the "Appointments" service quality indicator specified by the OEB in the Electricity Distribution Rate Handbook, Section 15.1.4.

The 2008 spending requirement for this program is $7.5 million to complete a forecast 10,600 disconnect/reconnect requests. The volume forecast is derived using a 4 year average with adjustments made to incorporate recent trending in volumes

2.2.2 Line Maintenance

The line maintenance program includes funding to gather information needed to effectively manage the line assets and to carry out ongoing equipment maintenance to maximize the life of these assets and to ensure performance and operability of equipment. As well, defective equipment or components at end of life are replaced or repaired under the corrective programs within line maintenance.

Line maintenance is divided into 3 program categories: Line Patrols/Wood Pole Assessment and Asset Data Collection; Preventative and Corrective Maintenance; and Sentinel Lights. Funding for 2008, along with spending levels for the bridge and historic years, are provided in Table 5 below.

Table 5
Line Maintenance
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Line Patrols, Wood Pole Assessment & Asset Data Collection	8.1	8.1	13.1	15.4	13.4
Preventative & Corrective Maintenance	7.2	9.7	12.3	13.6	13.7
Sentinel Lights (d)	*	1.5	1.4	1.3	1.6
Total	**15.2**	**19.3**	**26.7**	**30.2**	**28.8**

(d) – indicates this is a demand program
* During 2004 sentinel lights were treated as a non-utility expense and as such were not included in the revenue requirement. The cost during 2004 was $2.0 million.

2.2.2.1 Line Patrols, Wood Pole Assessment and Data Collection

Appendix C of the Distribution System Code requires that all local distribution companies patrol their distribution lines to identify structural problems, damaged equipment and components that may cause a power interruption, as well as any hazards such as leaning poles, damaged equipment enclosures, and vandalism. Hydro One Distribution is required to patrol one-sixth of all rural distribution feeders and one-third of urban feeders each year to identify defects for corrective action. Those defects requiring immediate attention are corrected under the trouble call programs as discussed in section 2.2.1 of this Schedule and Exhibit D1, Tab 2, Schedule 2 for capital expenditures. The less serious defects are addressed on a planned basis in the appropriate time frame. The approach adopted by Hydro One Distribution for line patrols meets the requirements of the Distribution System Code, and combines patrol activities with asset condition assessment required to effectively plan future corrective work, and data collection on assets needed to improve the future management of these assets. Using an integrated approach that combines line patrols, asset condition assessment and data collection to acquire information during one site visit is the most cost effective means of acquiring the information needed to effectively manage the distribution lines system.

As part of the patrols, each pole is assessed visually and sounded to identify voids in a pole that may jeopardize its structural integrity. During the assessment, a pole may be identified to be at end-of-life, in need of follow-up testing if there is uncertainty concerning end-of-life, or given an acceptable rating. Follow-up testing, if needed, will involve a measurement of the remaining sound wood and the degree of wood decay, internal and external. The pole assessment and test results are used to plan future pole replacements as well as supporting the need for line refurbishment and line upgrades.

About 18,000 km of rural and urban patrols are completed annually, with about 300,000 poles assessed out of a total of 1,650,000. The findings are recorded in a database where the nature of a deficiency and suggested follow-up actions are highlighted.

When a pole is assessed, the geographic coordinates of the pole are captured, equipment and line components on the pole identified, condition assessed and all information is recorded in electronic format and entered into Hydro One Distribution’s Asset Condition Assessment Database. The line data capture was started in 2005 and will be complete by 2010, at which time all lines will have been patrolled and poles assessed. This scope of work was recognized during the 2006 Rates proceeding as an implementation of good utility practice.

This program helps ensure that reliability and safety problems are identified and corrected, provides information needed to plan replacement of defective poles and equipment, and ensures valuable asset information is obtained that will improve the management of the line assets in the future.

The 2008 spending requirement for this program is $13.4 million. These expenditures are required to complete line inspections as required by the OEB, remain on schedule to complete the data collection by 2010, and assess poles during inspections.

The 2008 spending is similar to 2006 expenditures.

Reduced funding for this work will prevent Hydro One Distribution from realizing the benefits that can be achieved by having more detailed information on its asset base.

The lines data collection is in the early stages, however the Company is starting to see the benefits from a planning and work execution perspective. The line data collected to date has provided benefits in a number of areas, including; allowing more accurate identification of the number of wood poles requiring replacement; providing a centralized repository of line defects that enables more efficient scheduling and bundling of work for field crews; and reducing the time for job planning and site visits, and easier identification of the work location through the availability of geographic coordinates.

2.2.2.2 Preventative and Corrective Maintenance

Hydro One Distribution's lines preventative maintenance program includes equipment maintenance that is carried out primarily on a time based schedule and adjusted based on the Preventative Maintenance Optimization (PMO) approach.

The equipment maintained includes line reclosers, line regulators, three-phase airbreak switches, underground and submarine cable and insulator washing to remove salt accumulation at locations where there has been a history of problems. There are approximately 17,000 reclosers, 3,000 line regulators, 1,500 three phase switches. The

2008 plan is to maintain 1,850 reclosers, 150 line regulators, 150 three-phase switches, 500 pad mounted transformers at underground cable locations and wash insulators on about 8,000 structures. The projected 2008 spending requirement for these activities is $3.8 million.

Distribution line defects such as broken guy wires, damaged insulators, and defective lightning arresters are identified and logged during line patrols as described in Section 2.2.2.1 under this Schedule. The defects identified are categorized based on the requirements of the Distribution System Code and corrected in an appropriate time frame.

As well as the normal deterioration that is addressed through the end of life component replacement programs and ongoing defect corrections, Hydro One Distribution has identified several system wide problems that need to be addressed in the near term. One such system wide problem is a type of polymeric insulator known as EPAC that has a history of failing prematurely due to a design flaw that allows moisture ingress under the polymeric cover that protects the fiberglass rod. This situation has resulted in insulator failures well before the expected end of life and has required the implementation of work restrictions to address safety risks. These insulators as well as other defective line components are identified during the patrols and scheduled for corrective action. The 2008 spending requirement for defect corrections is $9.9 million and includes the replacement of 6,500 EPAC insulators 3,850 other insulators and about 9,000 other defects that need to be addressed to ensure the reliability and safety of the distribution system.

The 2008 spending requirement for the preventative and corrective maintenance programs is $13.7 million which maintains the spending for the bridge year. The increase in expenditures over historic amounts is attributed to the need for addressing an increase in defects identified during line patrols and a greater emphasis on equipment maintenance with a goal of improving reliability.

Reduced funding in the preventative maintenance program will reduce the performance of line protective and isolating equipment needed to minimize customer impacts during power interruptions. Reductions in the corrective program will increase the failure rate of equipment and line components, resulting in more frequent and longer duration outages to customers and increased safety risks. Reductions will lead to a deteriorating trend in reliability over time.

2.2.2.3 Sentinel Lights

The sentinel light program provides outdoors dusk-to-dawn lighting for rural customers and has been in existence in Ontario for over 20 years. Hydro One Distribution has a contractual obligation to honour commitments made by the former Ontario Hydro for present installations, but no longer accepts requests for new sentinel light installations.

The current inventory of sentinel lights totals about 41,100 and drives an annual maintenance program between 4,000 and 5,000 maintenance responses.

The 2008 spending requirement for this program is $1.6 million. The forecast is based on historic volumes with adjustments made to incorporate recent trending in volumes and cost. The projected spending maintains historic averages.

Hydro One Distribution is required to honour agreements currently in place, as such, there is no alternative other than to respond to the maintenance requests.

2.2.3 Waste Management and PCB Lines Transformer Oil

This program ensures that wastes generated during the course of maintaining distribution assets are managed in an environmentally responsible manner and in compliance with Federal, Provincial and Municipal regulations. Oils are used in a number of equipment types and may enter the environment should equipment fail. In such instances, Hydro One Distribution must respond to minimize impacts to the environment.

The 2008 funding, along with spending levels for the bridge and historic years, are provided in Table 6 below.

Table 6
Waste Management
($ Millions)

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Waste Management	2.7	2.8	3.2	3.1	3.0

2.2.3.1 Waste Management

Once transformers and other distribution equipment are removed from service, there is a requirement to manage the solid and liquid waste materials, which includes reporting of PCB inventories to regulatory authorities, disposal and destruction of these inventories, disposal of non-contaminated oils, and management and disposal of other wastes. Waste and PCB management will be an ongoing activity as Hydro One Distribution has 475,000 distribution line transformers and a number of other equipment types that will generate wastes as they are removed from service. These wastes will need to be managed in an environmentally approved manner

.

The 2008 spending requirement for this program is $3.0 million, which maintains the amount being projected for the bridge year and is slightly less than the 2006 expenditures.

Reduced funding in this program would impact Hydro One Distribution's environmental stewardship commitment for responsible waste management and hamper the ability to comply with waste management regulations.

2.2.3.2 PCB Lines Transformer Oil

Distribution pole-mount and pad-mounted transformers manufactured prior to 1980 contain insulating oil that may contain polychlorinated biphenyl (PCB) compounds. Regulations at this time place strict due diligence requirements on situations where PCB's have potential to enter the environment or have entered the environment as a result of transformer failure or oil leakage, but there are no regulations mandating the elimination of PCB contaminated oil. Environment Canada is proposing to change regulations to eliminate PCB contaminated oil above 50 ppm by 2014 in pad-mount transformers and by 2025 in pole-mount transformers. Hydro One Distribution has elected to wait until regulations are enacted before a plan is implemented to test and inspect transformers, and as such the 2008 program does not include any funding for proactive PCB testing and inspections of line transformers. Should Environment Canada regulations be enacted as currently proposed, it is estimated that Hydro One Distribution will be required to test about 200,000 transformers prior to 2025 at an annual cost of about $8 million. It is emphasized that this application does not contain any allowance to fund transformer oil sampling and testing should Environment Canada proceed with the regulations as proposed.

The proposed Environment Canada regulations, if enacted, will not only increase OM&A spending, but will also require the replacement of transformers with PCB levels above the 50 ppm threshold. Based on previous testing results for PCB content, about 10% of those transformers tested (pre 1982) will require replacement at an average capital cost of about $4 million per year. These costs are not included in any 2008 capital programs.

2.2.4 Other Services

Lines sustaining OM&A also covers a number of other miscellaneous services listed in Table 7.

Table 7
Sustaining OM&A – Other Services
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Customer Inquiries (d)	2.8	3.8	3.2	3.8	3.5
Investigations & Data Collection (d)	1.6	2.4	1.0	1.2	1.0
Miscellaneous Services	2.9	3.2	3.2	6.2	4.9
Total	**7.3**	**9.4**	**7.4**	**11.2**	**9.4**

(d) – indicates this is a demand program

Customer Inquiries provides for the work required to respond to inquiries concerning customer services, bills, location of Hydro One Distribution assets on customer properties, planned and unplanned outages, power quality complaints, clarifications on policies, etc. Approximately 9,000 customer inquiries are processed annually.

Investigations and Data Collection captures the work required to respond to requests for detailed information on distributing station and line assets. This program addresses information requirements related to the condition of the assets, public and employee safety hazards, unacceptable system performance, audit of joint use facilities and data required to support response to customer reliability concerns.

Miscellaneous Services covers a number of activities including: payments to other LDCs for pole rental where Hydro One Distribution wires are supported by other LDC's poles; LDC switching requests; funds to collect and report data for a number of service quality indicators to the Ontario Energy Board on an annual basis; miscellaneous engineering and environmental support; Corporate Environmental Health and Safety activities. Environmental Health and Safety includes activities required to meet legal obligations, ensure a level of due diligence that is appropriate for Hydro One Distribution and assist in meeting safety targets. Included in Environmental Health and Safety are costs for technical and safety training, work method support, incident management, compliance reviews, work place inspections, and public safety awareness.

Work on these programs requiring an appointment at a customer's residence or requiring a written response to a customer inquiry contributes to Hydro One Distribution's performance on the "Appointments" and "Written Response to Inquiries" service quality indicators specified by the OEB in the Electricity Distribution Rate Handbook, Sections 15.1.4 and 15.1.5, respectively.

The 2008 spending requirement for this program is $9.4 million, and is based on historic customer demand and forecasted workload. The 2008 spending is 17% greater than the historic average. The increase over average historic expenditures is primarily attributed to an increasing focus on Health and Safety consistent with the company's strategic goals.

2.3 Metering

Hydro One Distribution currently owns and maintains revenue meters of three main types as follows:

- Retail Meters
  - About 1.2 million meters measuring energy consumption for residential and other customers whose average monthly demand is 50 kW or less.
  - About 7,300 electronic demand meters for smaller business customers with an average monthly electricity demand of greater than 50 kW.
  - About 1,300 interval meters for existing business customers whose demand exceeds 1,000 kW, recently connected customers whose demand exceeds 200 kW and customers below the threshold who have requested interval meters.
- Smart Meters – Advanced metering devices and components of a metering system with functionality to bill customers on the basis of Time of Use (TOU) pricing. These will replace the existing 1.2 million energy meters by 2010.
- Wholesale revenue meters used to settle the purchase of energy where the point of supply is directly connected to the IESO-controlled grid. A number of these meters are transitioning from Transmission to Distribution as noted below.

OM&A expenditures are required to ensure that all metering installations are maintained properly, replaced when needed and verified in accordance with requirements of the Electricity and Gas Inspection Act (E&GIA), Measurement Canada and the market rules. In 2007 and 2008, metering sustaining OM&A expenditures are significantly affected by the full deployment of the Smart Meter Program.

The funding for distribution revenue metering for 2008, and spending levels for the bridge and historic years, is provided in Table 8 below.

Table 8
Metering OM&A
($ Millions)

Description	Historic			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Customer Retail Meters	8.0	7.2	8.1	8.5	6.0
Smart Meters	-	2.4	4.9	6.2	9.7
Wholesale Revenue Meters	0.2	0.7	1.0	1.0	1.9
Total	**8.2**	**10.3**	**14.0**	**15.7**	**17.6**

2.3.1 Customer Retail Revenue Meters

Of Hydro One's existing 1.2 million retail meters, about 500 must be removed and replaced each year due to random failures, damage or obsolescence. In addition, under the E&GIA and regulations, all revenue meters must be routinely inspected, maintained and their accuracy verified by an accredited meter verifier. A statistically derived sample group of about 2,000 meters is tested annually, according to a sampling program monitored and regulated by Measurement Canada. Normally the samples pass, but a failure of a sample group entails replacement of all meters in that group which could require the replacement of 10,000 meters.

Meters that do not qualify to be sampled, such as commercial or industrial meters, require all seal meters to be verified. These verification averages between 8,000 to 12,000 meters per year.

To avoid inefficiencies which would result from the testing and verification of installed meters, followed by their near term replacement by smart meters, Hydro One Distribution received a dispensation in 2006 from Measurement Canada which allows meters coming due for verification from 2008 through 2010 to remain in place without verification. This dispensation applies only to meters that have been demonstrated to retain a high level of accuracy, comprising about 75% of the sample group population. The remainder will continue to be tested and re-verified annually as planned.

For its demand and interval-metered customers, Hydro One Distribution is currently examining smart meter options with appropriate communication platforms and once these are determined, will develop and implement smart metering plans. The current meters, however, will continue to need expenditures focused on routine maintenance, re-sealing, verification, trouble calls and other sustaining activities.

The 2008 spending for this program is $6.0 million, $2.5 million less than for 2007. This funding level is based on an assessment of historic costs and projected meter verifications, while accounting for estimated savings of $2.8 million from reduced meter testing and replacement due to the Measurement Canada dispensation. The 2008 spending is 22% less when compared to average historic expenditures. The reduction is again attributed to the Measurement Canada dispensation.

2.3.2 Smart Meters

This section of the evidence describes the OM&A expenditures related to Hydro One Distribution's Smart Meter Program. Capital requirements are described at Exhibit D1, Tab 3, Schedule 2 and at Exhibit D2, Tab2, Schedule 3, S19. Distribution Regulatory Asset account information associated with the Smart Meter Program is filed at Exhibit F1, Tab 1, Schedule 1

In 2007, in line with legislative and regulatory requirements, Hydro One Distribution began full implementation of its Smart Metering Program, including smart meter deployment, communication network "build-out," and customer information system

(CIS) and associated process re-engineering, to enable it to support TOU and Regulated Price Plan (RPP) implementation.

These installations require on-going sustaining investments, with expenditures of $9.7 million in 2008. This spending requirement reflects the continuing deployment of smart meters through Hydro One Distribution's service territory, toward its target of about 1.2 million meter installations by 2010. The related sustaining activities and costs encompass both minimum and incremental functionality work:

- Activities associated with the government's regulations concerning minimum functionality, which account for $6.2 and $5.8 million in 2007 and 2008 respectively, include the following work:

    - maintaining and operating hardware, software and software licenses associated with the advanced metering control computer (AMCC);
    - telecommunication charges associated with operating the local area networks (LANs) and wide area network (WAN); and,
    - maintaining and operating smart meters and the network devices that have been placed into service.

- Incremental functionality activities associated with effective use of the smart meters to provide time-differentiated billing to customers and provide Hydro One the ability to leverage its Advanced Metering Infrastructure (AMI) system for other business benefits, which account for $0.0 and $3.9 million in 2007 and 2008 respectively, include the following work:

    - managing, developing and implementing business process re-design (e.g. manual to automated meter reading for on-cycle and off-cycle reads), change management (including staff training) and customer communication related work;

- responding to a higher number of customer inquiries as a result of pre- and post-installation of smart meters on customer premises; and,
- Maintaining the changes required to the CIS system (new processes, workflow and tariffs) and the systems and interfaces necessary to integrate to the AMCC and the IESO's meter data management and meter data repository (MDM/R).

The 2008 expenditure level of $9.7 million is about $3.5 million higher than for 2007, reflecting higher costs for on-going IT-related and meter maintenance. Spending on smart meter program contributes to lower costs in other program areas. In addition to the estimated savings of $2.8 million in customer retail meter maintenance costs resulting from reduced meter testing and replacement due to the Measurement Canada dispensation, as discussed in Section 2.3.1 of this exhibit, there are also estimated savings of $1.4 million in 2008 as a result of reduction in the number of manual meter reads related to the smart meter program, as discussed in Section 2.1.2 of Exhibit C1, Tab 2, Schedule 5.

A fuller description of the Smart Meter Program is provided in Exhibit D1, Tab 3, Schedule 2 and in the IJD in Exhibit D2, Tab 2, Schedule 3.

2.3.3 Wholesale Revenue Meters

Since 2003, in accordance with market rules, accountability for legacy wholesale revenue meters (WRMs) owned by Hydro One Transmission, but used to settle Hydro One Distribution purchases from the IESO-administered market, have been transitioning to

Hydro One Distribution. By the end of 2008, Hydro One Distribution will have assumed accountability for a projected 375 WRMs.

As Hydro One Distribution is an IESO-registered meter service provider it will provide all servicing for its WRMs, i.e. preventative maintenance, meter re-sealing and verification, response to problems, corrective services and IESO registration. Funding for this program includes these services and is required to ensure accurate wholesale billing by the IESO, and to comply with the market rules and Measurement Canada regulations.

The 2008 spending for this program is $1.9 million and is based on known costs and volumes. The 2008 spending is greater than the bridge year and greater than historic expenditures as the number of meters to maintain has gradually increased due to the transition of the WRMs from Hydro One Transmission to distribution as required by the market rules.

2.4 Vegetation Management

The Vegetation Management program manages clearances to energized equipment to maintain an acceptable and sustainable level of reliability; manage safety hazards that trees in proximity to energized lines pose, manage plant species on the right of way floor to permit worker access for maintenance and restoration of power, and minimize environmental, ecological and social impacts.

There are approximately 101,000 km of lines on rights-of-way, with most requiring tree trimming or removal, and brush (undergrowth) control. Tree growing conditions vary throughout Ontario, which contains three forestry zones. The predominate region is the temperate hardwood forests which includes areas of the south, east and as far north as Wawa & New Liskeard. The other two regions include the deciduous forests of southwestern Ontario and the boreal forests of parts of northern Ontario. Tree species indigenous to the southern part of the province, and better growing conditions usually results in more frequent maintenance cycles in the south than in the north.

Vegetation management activities include line clearing comprising of tree removal and trimming, brush control, customer notification, vegetation asset condition assessment, and unplanned maintenance in response to reliability and customer issues as required. The annual program is compiled using the following inputs: vegetation condition data, tree clearances to energized facilities, and recent reliability data and customer issues.

Vegetation Management work is divided into 5 programs with proposed funding for 2008 along with spending levels for the bridge and historic years provided in Table 9 below.

Table 9
Vegetation Management
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Unplanned Maintenance (d)	6.2	5.3	6.1	6.9	6.0
Customer Notification	6.9	6.8	6.8	6.5	7.9
Asset Condition Assessment	0.5	0.2	0.5	0.5	0.5
Line Clearing	55.6	52.9	50.6	74.1	76.8
Brush Control	19.6	21.1	25.2	26.9	28.2
Total	**88.9**	**86.4**	**89.1**	**115.0**	**119.4**

(d) – indicates this is a demand program

The 2008 spending on the vegetation management program is $119.4 million, which is about 35% greater than average historic expenditures. The reason for the increase is primarily attributed to increase levels of accomplishment in line clearing (accomplishment increased by 35%) and brush control (accomplishment increased by 25%), for the reasons discussed below.

Vegetation management is the largest program managed by Hydro One Distribution and has the greatest impact on system reliability. As noted in Section 6 of Exhibit A, Tab 3, Schedule 1, tree-related contacts accounted for 57% of SAIDI and 28% of SAIFI between 2003 and 2006, and the negative impact of trees during storm events were especially acute. As such, vegetation management presents the greatest opportunity to improve reliability.

Hydro One Distribution proposes to increase spending in a prudent and gradual manner for maintaining vegetation on its rights-of-way, taking into account the availability of resources.

The need for increasing the accomplishments in line clearing was highlighted on page 31 of Exhibit C1, Tab 2, Schedule 2 of the 2006 Distribution Rates application under proceeding RP-2005-0020/EB-2005-0378, and is repeated below:

"Hydro One Distribution's goal is to continue to increase accomplishments for line clearing with an objective to reach an optimum cycle from a reliability perspective of eight years by 2008. Annual accomplishment would have to increase from the current 10,360 km to 12,500 km."

The proposed 2008 accomplishments for vegetation management is 12,500 km of rights-of-way line clearing and 12,500 km for brush control, which maintains Hydro One Distribution's strategy to gradually improve the condition of its rights-of-way, as articulated in 2006.

Accomplishments over the 2004-2006 period have averaged 9,300 km for line clearing and about 10,000 km for brush control. The accomplishments during this period were below plan because the 2005 program was impacted by a labour disruption and the 2006 program was affected by the redirection of resources to respond to the unusually high number of storms in that year. Accomplishments in 2007 were 12,211 km for line clearing, which is above historic values and partially offsets the shortfalls during the previous two years.

Details concerning each of the components that make up the vegetation management program are discussed in the sections below and additional information on vegetation management is also provided as part of the ACA discussion in Exhibit D1, Tab 2, Schedule 1.

2.4.1 Unplanned Vegetation Management

All of the 101,000 km of rights of way is situated in the public domain and the management of vegetation on and adjacent to the rights of way is of interest to many of the 1.2 million Hydro One Distribution customers, property owners, municipalities, and government ministries. Each year these groups identify vegetation issues that need to be addressed during the current year in order to ensure customer reliability and public safety. Unplanned work initiated by the public includes the removal of hazard trees that may fall into a line and restoring clearances to energized equipment at locations that are not within the current years planned program.

A number of the reliability issues that develop each year need to be addressed during the current year in an off-cycle manner. A portion of the unplanned funding is allocated to address unforeseen system reliability problems cause by tree or underbrush growth.

The 2008 spending requirement for this program is $6 million which is similar to historic expenditures. This is a demand program that is needed to respond to customer and reliability issues during the current year, as well as responding to and managing safety risks to the public.

2.4.2 Customer Notification

Prior to commencement of line clearing and brush control, customer approval is acquired to gain access onto private property and to resolve issues concerning tree removal, trimming and control of brush, as well as obtain input from customers concerning any property restrictions and environment concerns. During this phase of the work, job planning and project layouts are completed, a detail scope of work is prepared and approvals are obtained from property owners, Municipalities, Ministry of Natural Resources, etc. These planning and project management activities are essential for Hydro One Distribution to complete its annual vegetation management work programs, (i.e., line clearing and brush control) with minimum disruptions, and to manage customer and property owner concerns in a responsible and proactive manner.

The 2008 spending requirement for this program is $7.9 million. The amount is approximately 15% above historic expenditures. The primary reason for the increase is higher volume of notification associated with increases in line clearing and brush control program for 2008.

Reductions in this program will see an increase in customer complaints, incomplete approvals to enter properties to carry out work, and expected disruptions to planed work as a result of property owner intervention. As well, with disruptions in the flow of planned work, one can expect unit costs to increase with the larger line clearing and brush control programs.

2.4.3 Asset Condition Assessment

Asset condition assessment is an integral aspect of the asset management approach and is generally completed about 2 years prior to the time projected for line clearing. Information obtained includes vegetation height, tree and brush densities and clearances to conductors, and this information is then used to prioritize and schedule work. For further details concerning the condition of vegetation on Hydro One Distribution's rights of way refer to Exhibit D1, Tab 2, Schedule 1.

The 2008 spending requirement for this program is $0.5 million, and is consistent with historic expenditures.

Reductions in this program will result in planning inefficiencies that will seriously reduce the effectiveness of the larger brush control and line clearing programs.

2.4.4 Line Clearing.

Line clearing includes: removal of damaged or diseased trees along the edge and on the rights-of-way that pose a threat of falling into a line; and tree trimming required to maintain clearances to energized facilities, thereby reducing the likelihood of power interruptions. On average there are slightly more than 50 trees per kilometer that need to be removed or trimmed on the distribution system, and during 2006 Hydro One Distribution removed and trimmed about 480,000 trees in total. This program maintains tree clearances and reduces risks of danger trees, and as such has a great potential to improve reliability.

For 2008, Hydro One Distribution is proposing an accomplishment of 12,500 km. This volume of work is needed to reduce the high negative impacts vegetation have on reliability of the distribution system under more normal conditions and during storm events. The impact that vegetation has on reliability can be seen in Table 10 below.

Table 10: Total SAIDI and Vegetation Contribution

Year	All Interruptions (hrs)			Force Majeure Events (hrs)		
	Total	Tree Contribution	Tree %	Total	Tree Contribution	Tree %
2003	15.1	8.9	59%	7.1	6.0	84%
2004	6.9	2.0	29%	0.4	0.2	39%
2005	14.5	7.9	54%	6.5	5.4	83%
2006	28.4	18.1	64%	21.3	16.2	76%
Total	**65.0**	**36.9**	**57%**	**35.3**	**27.8**	**78%**

The impacts of trees on Hydro One Distribution's system is significant. Considering all interruptions, trees on average account for about 57% of SAIDI and during *force majeure* events the impacts increase to an average of 78% with a high of 84%. The planned 35% increase in the volume of work will target the rights-of-way contributing most to unreliability on Hydro One Distribution's system, and should make appreciable improvements over time to the benefit of our customers. Hydro One believes its plan demonstrates good utility practice and addresses customer reliability. Hydro One Distribution monitors the performance of its distribution system on a continual basis and once the 12,500 km accomplishment is achieved, the need for further improvements will be re-assessed. This topic is further discussed as part of the ACA in Exhibit D1, Tab 2, Schedule 1.

The 2008 spending requirement for this program is $76.8 million. The increase over historic years is about 45%, primarily attributed to an increase in volume of about 35%.

Reduced funding in this program will allow the current tenuous situation to persist resulting in a highly variable reliability performance, as can be seen above, and an increase in safety hazards associated with vegetation in proximity to energized line facilities. Reductions in this program also increase the life cycle costs for vegetation management and thereby create future inefficiencies.

Evidence of the effectiveness of line clearing can be seen in the performance improvements achieved with feeders cleared during 2005. Table 11 below highlights the aggregate percentage improvements when comparing reliability in 2003 and 2004 (i.e. years prior to clearing) to that experienced in 2006 (year after clearing in 2005).

Table 11
2006 Reliability Improvements Attributed to Line Clearing in 2005

Measure	Improvement *
Average Customer Interruptions	33%
Average Customer Hours of Interruption	41%

* Excludes impact of force majeure events

As can be seen from the results in Table 11, customers connected to the lines cleared during 2005 received significant benefits, as their average outage durations were reduced by 41% and the number of customer interruptions were reduced by 33%. These results highlight the large improvements that can be achieved with more frequent line clearing.

2.4.5 Brush Control

Brush control involves the management of specific plant types on the right-of-way floor to minimize the presence of trees that can grow tall enough to contact the overhead lines. This program also provides a right-of-way that will facilitate access of equipment, inspection and maintenance activities, and emergency response.

Costs to control brush increases significantly once the height exceeds 3 meters and can more than double in cost if the brush is allowed to grow within the electrical limits of approach. Mechanical brush control methods and the requirement to use work procedures to ensure worker safety are the primary reason for the increase in cost. These methods are increasingly required as a result of community resistance to herbicide use. The level of accomplishment proposed for 2008 is the same as for line clearing and involves clearing brush on 12,500 km of rights-of-way.

The 2008 spending requirement for this program is $28.2 million which is about 28% greater than historic expenditures. This increase is primarily attributed to an increase in volume of about 25%.

Reduced funding in this program will increase unit cost for brush control and the overall life cycle cost. Reduced brush control also makes it more difficult to access the rights-of-way, which hampers emergency restoration and consequently increases outage durations.

DEVELOPMENT OM&A

1.0 INTRODUCTION

Development OM&A provides funds for the analysis needed to economically operate and develop the distribution system as necessary to meet existing and anticipated load and generation demands, while maintaining delivery system reliability. As well, Development OM&A ensures that standards are in place to meet distribution construction and planning needs, and legal and regulatory requirements.

2.0 DISCUSSION

Development OM&A provides funding for the collection of feeder voltage and current (loading) data and the analysis required to support system expansions, reinforcement and protection requirements. As well, generation connection studies are undertaken to evaluate the impact of connecting new or modified generation projects to the Hydro One distribution system as per the requirements of the Distribution System Code.

The Standards and Technology OM&A program covers the development of new, and the review of existing technical distribution standards. Some revisions to existing standards or the development of new standards, are made in response to compliance requirements set by authorities outside Hydro One Distribution, such as the Electrical Safety Authority (ESA). The Technology portion of the program encompasses Research and Development projects.

The funding for 2008, along with the spending levels for the bridge and historic years are provided in Table 1 below.

Table 1
Summary of Development OM&A
($ Million)

Description	Historic			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Data Collection, Engineering and Technical Studies	2.7	2.0	2.8	5.2	5.2
Standards and Technology	2.8	2.8	1.3	2.8	3.9
TOTAL	**5.5**	**4.8**	**4.2**	**8.0**	**9.1**

The increase in overall spending for 2008 relative to historic expenditures is attributed to a need to assess Long Term Load Transfers, added costs to prepare for the increase in generation connections and an increased business need for technical standards and specifications. Additional details are provided further on in this Schedule.

2.1 Data Collection, Engineering and Technical Studies

To ensure that up to date and accurate information is available on the operating characteristics of the distribution system, data is collected on an annual basis for use in assessing the adequacy of equipment and supply lines to meet system and customer needs. A portion of the OM&A Development program funds the collection of this data during high load conditions on a sampling basis, using electronic recording ammeters.

Investments in System Capability Reinforcement for lines and stations (Exhibit D1, Tab 3, Schedule 3) are based on system utilization, i.e., voltage and current, and reliability performance information. Distribution Development OM&A also funds studies to determine system capability and reinforcement needs, and thereby, investment levels required to ensure reliable operation of the electrical system. Other studies are needed to ensure compliance with the Distribution System Code and associated supply standards (e.g., voltages maintained within acceptable limits). The program also provides funding for high-end technical support needed to address customer specific issues in areas such as power quality investigations. This work is of a continuous and ongoing nature and is required to avoid deterioration of service.

The required number of studies is based on operational and customer issues, and system performance issues identified through ongoing analysis of the system, equipment and feeder operating characteristics.

An example of activity under this program would be the collection of feeder loading data with further analysis to identify a distribution feeder that has experienced steady load growth due to the addition of many small services over time. The feeder loading survey and analysis of data would identify the issue of a feeder nearing its rated capacity, so that alternative solutions can be studied with eventual implementation of a preferred plan.

The 2008 spending requirement for this program is $ 5.2 million, and represents a 100% increase from average historic expenditures. The increase is primarily attributed to three factors:

- Evaluation of Long Term Load Transfers (LTLTs) to comply with the Distribution System Code requirement that Local Distribution Companies eliminate all LTLTs by January, 2009.
- The need for increased electrical system modeling to prepare for the anticipated increase in generation connections. Locations selected for modeling are identified by interested parties as likely locations for wind and other small generation.
- Increased analysis of the distribution system to ensure protections function as intended and are synchronized, to ensure operating conditions remain within equipment ratings and to address phase imbalance thereby reducing line losses.

Reduced funding of this program would result in a lack of data available on which to base distribution system investment decisions, inability to properly analyze the needs of the system to meet existing customer and new connection requirements. More specifically, there would be an inability to meet expected time lines for processing and connecting new generators. Direct impacts of reduced funding include an increased risk of electrically overloading system assets and allowing the delivery system performance to deteriorate, leading to declining reliability for customers and service quality degradation, e.g., equipment damage, voltage degradation, increased frequency of outages, and increased outage duration.

2.2 Standards and Technology

Technical standards form a collection of comprehensive references used as templates and productivity tools to efficiently and effectively carry out operating, maintenance, and capital programs. Standards also incorporate company policies and requirements to ensure compliance with regulations such as the Electrical Safety Code. The collection includes over 350 planning, design and maintenance specifications, 500 material specifications and 800 drawings.

This program covers the development and maintenance of distribution standards, which are driven by public and worker safety, equipment obsolescence, evolving regulatory requirements, technological advancements and changes in work methods. Hydro One Distribution monitors and influences emerging industry standards and requirements for new standards mainly through its participation in Canadian Standards Association working groups.

The Technology program provides the funding to monitor, assess the benefits, and evaluate the feasibility, of emerging technologies, and enable the implementation of new tools and methods. Hydro One Distribution monitors emerging technologies mainly through its participation in industry interest groups that include CEA Technologies Inc. (CEATI) and Electric Power Research Institute (EPRI). Where possible, the Technology program expenditures are leveraged through those interest groups by jointly funding projects with other utilities that have similar interests or challenges.

The 2008 spending requirement for this program is $3.9 million, which is 39% greater than 2004, 2005 and 2007 expenditures. The increases are primarily attributed to the following:

- Added due diligence to document and approve standards and provide technical review to manage field modifications in order to comply with new ESA requirements.
- Added research and development to understand and address the complexities associated with generation connections and the development of new standards for generation connections.

The lower spending during 2006 was primarily attributed to delays in research and development work until formal agreements could be reached with the primary vendor. The delay has also deferred spending for 2007 research and development. As well, 2006 was a transition year for ESA compliance, as such plans were under development but not implemented and resources had not been fully assigned to the required tasks.

Reduced funding would result in the unavailability of sufficient standards to meet regulatory requirements, construction and planning needs and to effectively deal with technical issues associated with generation connections. Opportunities to utilize emerging technologies would be missed with increased longer term costs as a result.

OPERATIONS OM&A

1.0 INTRODUCTION

Operations OM&A investments are required to manage the day to day flow of electricity within Hydro One Distribution's system. The Operations function coordinates and dispatches crews to restore power as required, schedules and coordinates planned outages and provides customer notifications, and monitors and reports on the performance of the distribution electricity system.

2.0 DISCUSSION

Distribution System Operations activities are carried out centrally at the Ontario Grid Control Centre (OGCC) using modern technology and systems. OGCC is a shared facility which allows central operations of the distribution and transmission systems and is backed up by facilities located at a separate site.

The cost assigned to Hydro One Distribution for Distribution Operations at OGCC is based on the "Rudden" cost allocation study discussed in Exhibit C1, Tab 5, Schedule 1.

Operating control of the distribution and transmission systems was consolidated at the OGCC during 2003 and 2004 through the combination of Hydro One Distribution's Central Operations with Hydro One Transmission's real-time operation of the transmission system. This consolidation enabled several ongoing efficiency and effectiveness benefits:

- Reduced staffing costs through allocation of staff between transmission and distribution operations, taking advantage of the general non-coincidence of workload between these two functions.
- Improved effectiveness through real-time communication and coordination of priorities between transmission restoration and distribution restoration.
- Reduced staff development costs through sharing of training programs and facilities.
- Reduced support and systems costs through sharing of common infrastructure.

A suite of systems and tools is used to aid in the monitoring, planning, and maintenance of the distribution system. Hydro One Distribution has been proactive in assessing and implementing technologies to improve the operation of the distribution system and the consolidation to one centre further facilitates assessment and implementation of these systems.

The primary systems in place are as follows:

- The ***Distribution Operating Maps and Distribution Station Diagrams*** are the legacy tools that continue to be used by field crews and, to a lesser extent, by OGCC to provide the picture and detailed information showing the configuration of the distribution system, and to ensure the safe isolation of equipment.
- The ***Network Management System (NMS)*** is the supervisory control and data acquisition (SCADA) tool. It provides the real-time voltage and loading on the sub-transmission circuits at the transformer station as well as monitoring and control of the status of the breakers feeding those circuits.
- The ***Outage Response Management System (ORMS)*** is the distribution outage management tool that automatically analyses no-power calls received at the customer call centre and pinpoints the location of outages, identifies all affected customers and facilitates optimal dispatch of field crews.

- The ***Interactive Voice Response (IVR)*** system is the tool used to advise customers of the status of an outage affecting them. The IVR is set automatically by the ORMS after it has determined all affected customers for an outage location. This significantly reduces the call volumes that agents need to handle at the Customer Call Centre.
- The ***Provincial Mobile Radio System*** is the means by which both the OGCC and the field operations centres maintain continuous contact with field crews. It is designed to be reliable in the event of a widespread blackout and at all remote locations where field crews would be dispatched.
- The ***OGCC Integrated Voice System*** which allows Central Operations to effectively manage voice communications using multiple paths of communication, such as the public telephone network, public cell phone network, Hydro One's Distribution's provincial mobile radio system and mobile satellite telephone system.
- ***The OGCC Emergency Response Services Information System*** which provides verified up-to-date contact numbers for all emergency response services (e.g. police, fire, ambulance, ministry of environment, gas utilities, etc.) across the province keyed in a Geographical Information System to their service territories.

The OGCC is the operating authority for Hydro One Distribution's 44/27/13 kV systems (i.e., from the transformer supply station to the distribution supply station). During real-time operations, the OGCC monitors the distribution system at the transformer supply stations for correct voltage levels, power quality, equipment loading, and equipment alarms.

Distribution Operations is divided into two programs, Operations and Operating Support, with the funding for 2008 and the spending levels for the bridge and historic years provided in Table 1 below.

Table 1
Operations OM&A
($ Millions)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Operations	13.0	8.1	10.8	8.5	9.5
Operating Support	3.3	3.2	4.1	4.1	3.9
Total	**16.3**	**11.2**	**14.9**	**12.6**	**13.4**

2.1 Operations

The Operations program funds the real time distribution operating functions, training of staff, and ensuring that the various systems and tools are kept current and functioning as required.

Specific functions include managing planned and unplanned outages, coordinating emergency response and monitoring system performance. These activities are described in greater detail below.

2.1.1 Managing and implementing planned outages: all outages on the distribution system are managed at the OGCC. Planned outages are about 10% to 15% of all Hydro One Distribution customer outage durations. Applications for planned outages are coordinated to capture efficiencies and mitigate impacts on customers. This involves:

- Assessing all equipment involved in the outage to determine appropriate limits and control actions.
- Identifying and notifying customers of upcoming outages using means such as auto-dialer, phone, fax, newspapers, flyers, radio, and door to door visits.

- Addressing customer concerns regarding outages by moving, where possible, the outage times/date, transferring customers to other distribution sources, or providing a back up source.
- Applying the Utility Work Protection Code to all outages to ensure all safety barriers are established.

2.1.2 Responding to and managing unplanned outages: equipment failures, tree/vegetation contact, road accidents, severe weather, and lightning result in interruptions to the distribution system and cause unplanned outages. Unplanned outages account for about 85% of Hydro One Distribution total customer outage durations. The cost of wide-area rural telecommunication and monitoring and control equipment has prohibited the use of real-time monitoring and remote controls on Hydro One Distribution's system. Hydro One Distribution accordingly relies on "no-power" phone calls from customers to detect and locate distribution system outages. All restoration measures depend on field crews responding to the location of the outage. Once the location of the faulted equipment is determined, the OGCC dispatches repair crews. The OGCC tracks all crews that have been dispatched to effect repairs and is able to manage response times by following repair status. Affected customers are kept advised of the interruption status through the use of an interactive voice response (IVR) system, which informs callers that the problem is known and that crews have been dispatched, as well as providing an estimated time of power restoration if known.

2.1.3 Emergency response coordination: when the Hydro One Distribution system experiences widespread interruptions due to weather impacts, an emergency response system is implemented. The level of response varies according to the area(s) and number of customers affected and the expected duration of the problem. The OGCC will dispatch crews normally until a decision is made, based on volume of power-off calls, to move to "Field Operations Center Dispatch" mode. In this mode, customer power-off calls are spread out over the field operations centers to allow supervisors to dispatch crews at a more local level and manage their resources efficiently. If the emergency is significantly widespread, incident command centers (ICCs) and forward command posts (FCPs) are established to centralize a command structure to address resources, equipment needs, and restoration activities. The OGCC provides media notifications to keep Hydro One Distribution customers advised and it provides municipalities and agencies with outage progress updates.

Following the 1998 Ice Storm and in preparation for Y2K, Hydro One Distribution developed a formal Emergency Preparedness Program (EPP). The EPP consists of emergency response plans, procedures, designated facilities and a trained and tested emergency response organization. Maintaining an effective and efficient Emergency Preparedness Program is a market rule requirement.

2.1.4 <u>Acquire system performance information, internal reporting and performance monitoring:</u> Reliability information is needed to support sustainment and development decisions, respond to emerging problems, and report on system performance to the Ontario Energy Board, customers and other stakeholders. Data required to calculate the standard reliability indices such as SAIDI (System Average Interruption Duration Index), SAIFI (System Average Interruption Frequency Index), and CAIDI (Customer Average Interruption Duration Index) is acquired at the OGCC. Outage inquiries from customers are reviewed and the data extracted from the various systems to advise customers what has been done as well as establish additional plans.

2.1.5 <u>Summary:</u> The 2008 spending requirement for this program is $9.5 million which is within the range of historic expenditures. These costs have fluctuated somewhat over the years, due to several factors. 2004 was the last year for higher expenditures relating to the consolidation of transmission and distribution operations at the OGCC. Lower demand in 2005 resulted in spending which was slightly lower than usual. Operations work and related costs were higher in 2006, as it was a higher than normal year for storm activity thereby requiring added efforts to manage restorations.

Distribution operations is an essential activity for the safe and reliable supply of power. Any funding reductions in this program would negatively impact customer reliability, efficiency of power restoration, and the safe operation of the distribution system.

2.2 Operating Support

As highlighted under the Discussion portion of this Schedule, Operations relies on a number of systems and tools to manage and operate the distribution system, as well as a Back-up Operating Facility.

Operating Support funds ongoing costs that include system configuration updates for ORMS, updates to the distribution operating maps and station diagrams, emergency preparedness, and the allocated portion of the maintenance and upkeep of operating facilities at the OGCC and the back-up operating facility. The historical fluctuation in funding for this program is due to variations in volume of updates to the distribution operating maps and station diagrams.

The OGCC came into service in 2004 and the Back-up Operating Centre came into full service in 2005. Funding needed for the Distribution allocation of the cost to sustain these facilities became part of this program in 2004.

The 2008 spending requirement for this program is $3.9M, which is within the range of historic expenditures with variations attributed to changes in volume of work associated with map and diagrams updates.

Reduced funding for this program would result in deterioration in the performance of ORMS and control room facilities to unacceptable levels, reduction in the accuracy of operating maps (which increases the safety risk to workers), and non-compliance with emergency preparedness obligations.

CUSTOMER CARE OM&A

1.0 INTRODUCTION

Customer Care OM&A represents the set of work activities required to provide customer care services to customers connected to the Hydro One Distribution system, to address the Company goal to improve customer satisfaction, and to meet or perform better than the relevant service levels stipulated in the Electricity Distribution Rate Handbook, Chapter 15, Service Quality Regulation.

The Customer Care Work Program includes service programs and projects. The main service programs are: meter reading, billing, settlements, customer contact handling and collections. Project work includes regulatory compliance initiatives and service enhancements.

The Customer Care services programs are provided to the approximately 1.2 million customers who are connected to the Hydro One Distribution system. These customers are in a variety of rate classifications, and include residential, seasonal, farm and general service customers, as well as local distribution companies, direct customers and generators with connection points embedded in the Hydro One Distribution system. The services are provided to customers purchasing electricity through Standard Supply Service or under Retailer contracts.

1.1 Customer Care Resources

The Customer Care services of billing, settlements, contact handling, and collections are delivered through the outsourcing contract with Inergi LP. The Inergi contract became effective on March 1, 2002 and the contract is described in Exhibit C1, Tab 2, Schedule 6.

Although these services are delivered by Inergi, Hydro One retains within the Company accountability for customer policy, planning, work program budgeting and service performance management. The focus of this work is to translate corporate customer objectives into Inergi service delivery results, and to build a healthy buyer-vendor relationship that allows Hydro One Distribution to benefit from the specialized expertise of the outsourcing partner. Hydro One resources also manage customer research and surveying, Customer Service System project management, and management of escalated customer complaints.

The meter reading service program and delivery of field support services are required for customer billing, settlements and collections, and these activities remain within Hydro One.

2.0 WORK PROGRAM FUNDING

The proposed Customer Care Work Program funding for the test year, and the spending levels for the bridge and historic years, are provided in Table 1 below.

Table 1
Customer Care Costs by Category ($ Million)

Description	Historic			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Base Services	80.1	76.8	80.9	80.8	84.6
Bad Debt	11.8	9.7	17.3	13.5	13.0
Regulatory Compliance	7.1	6.6	4.1	0.7	3.6
Service Enhancements	4.0	3.1	1.4	2.1	2.6
TOTAL	103.0	96.3	103.7	97.1	103.8

The Base Services represent the largest cost component of the Customer Care Work Program, and include the provision of meter reading, billing, settlements, contact handling and collection services to Hydro One Distribution customers. Bad Debt is shown as a separate cost category.

Regulatory compliance work is required to implement government and regulator policies which impact Customer Care, such as the Bill 100 legislation or Regulated Price Plan, and distribution customer rate changes. Costs related to smart meters are not currently part of this work program. All smart meter OM&A costs are included in Exhibit C1, Tab 2, Schedule 2. Service Enhancements represent investment in service or productivity improvements to our customer service programs, such as initiatives to automate processes or introduce self-serve options.

The Total Customer Care Work Program increases by under $1 million over the period 2004 to 2008. The largest change is in the Base Services costs, due primarily to annual cost-of-living-adjustment (COLA) added to Inergi fees, and to a change in customer care management costs. This is offset by a reduction in spending on regulatory compliance projects.

The sub-sections that follow provide a description of each of the Customer Care cost categories.

2.1 Base Services

Table 2 below shows the breakdown of Base Service program costs for the historic and bridge years and the planned expenditures for the test year.

Table 2
Customer Care Base Services Cost Breakdown

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Customer Service Operations	37.8	35.5	39.0	39.3	40.5
Meter Reading	23.3	23.6	22.2	19.9	19.6
Other Field support costs	6.8	6.8	6.8	6.5	7.6
Other Service Support costs	9.3	8.4	8.8	8.7	9.8
Customer care management	2.9	2.5	4.1	6.3	7.2
TOTAL	80.1	76.8	80.9	80.8	84.6

2.1.1 Customer Service Operations

Customer Service Operations costs include delivery of billing, contact handling, collections and settlements services, and the customer services included in the contract with Inergi LP. The change in costs year-over-year represents the annual cost decline in base service fees contained within Hydro One Distribution's contract with Inergi, offset by growth in annual volumes, annual COLA amounts, and changes in scope of services delivered.

2.1.1.1 Billing

This service program covers delivery of the billing process, including validation and editing of meter reading data, bill calculation, exception handling, accuracy management, bill creation, insertion and issuance, and validation of receivables processing.

The majority of customers are issued monthly bills, but approximately 160,000 seasonal customers are issued quarterly bills and about 140,000 customers are billed bi-monthly.

Hydro One Distribution has implemented a number of initiatives to improve billing services for customers and manage billing costs. An electronic billing presentment and payment option was launched for Hydro One customers in 2007. Ongoing changes to the method of estimating consumption between actual meter reads have been implemented to better align consumption amounts to bills issued and to smooth out variances between bills. In addition, Hydro One has expanded the ability to receive customer self-reads. In 2008, Hydro One plans to promote Summary Billing to more customer segments, and promote self-service options on the Hydro One website.

2.1.1.2 Contact Handling

Hydro One's Distribution customers contact the Company in many ways: by telephone, letters, faxes, email, via self-service features on the Interactive Voice Response (IVR) technology and the Company's Internet website. This service program covers the management of customer calls and other types of contacts at Hydro One Distribution's contact centres in Markham and London.

Regular business hours for call handling are from 7:30 a.m. to 8:00 p.m., Eastern Time, Monday through Friday, with seven days a week, 24-hour a day emergency and power outage call handling service. The contact centres handle more than two million calls a year from Hydro One Distribution customers.

The Hydro One Distribution contact centres manage all areas of customer call activity: Bill and account enquiries; collections; outages and emergencies; and service requests. In 2006, bill and account enquiries made up 34 per cent of total calls, collections calls were 12 per cent, and outages and emergency 27 per cent of calls. The balance cover service requests, including new service, upgrade, cable locates or forestry requests, and general topics such as questions on market changes, energy efficiency, electricity safety, and damage claims.

Bill and account enquiry call types include requests for information or questions on high bills, bill format, rates and charges appearing on bill (including commodity pricing, Good and Services Tax and debt retirement charge), exemptions and refunds, usage, meter readings, meter queries, payment options, payment confirmation, late payment charges, change to customer account details, security deposits, rate changes, rate classifications, and account balances. Move-in and move-out calls are triggered by a change of property ownership or tenancy. Move-in calls require opening an account. Move-out calls require a final account billing which depends on a field service order for a final meter reading. Calls relating to collections activity include negotiating payment arrangements, confirming payments made, processing overdue account payments via credit card, and responding to customer calls during disconnection.

An outage call can relate to either a planned or unplanned power outage. Emergency calls are those from emergency service agencies and personnel (fire, police, etc.) and the general public regarding damage caused to field-based equipment, or notification of unsafe conditions. A Business Customer Centre, located in Markham, manages the special needs of the large demand, distribution customers, as well as the contact relationship with Retailers, services for net billing customers, and Theft of Power activities.

In addition to responding to customer calls, the contact centres respond to inquiries received via other contact methods, including: customer letters; lawyers letters for move-in and move-out requests; customer and contractor faxes and customer email. These contacts numbered over 200,000 in 2006. In addition, the contact centres issue pamphlets or other information, such as duplicate bills, welcome packages, or a summary of Hydro One Distribution's Terms and Conditions of Service.

Since 2006, significant improvements have been made in the outage management area. These changes have increased the accuracy and availability of information for customers during an outage. As an example, processes to improve the accuracy of estimated restoration times were implemented and this information is now delivered to contact centre representatives and made available in our automated telephone system in a much more timely fashion. Improvements have been made to services provided within the Business Customer Centre to large Distribution customers, to provide dedicated points of contact and support for complicated billing explanations. In 2008, Hydro One is planning to improve first call resolution for customers and also review and upgrade the Interactive Voice Response menus and self-serve options.

As indicated in Exhibit A, Tab 15, Schedule 1, Hydro One Distribution has performed better than the OEB established target in the telephone accessibility measure, and the Company plans to maintain this higher level in 2007 and 2008.

2.1.1.3 Collections

This program includes the execution of collection processes associated with electricity revenues, for both active and final-billed accounts. This work includes issuing collection letters and notices, establishing payment arrangements, issuing payment confirmation letters and scheduling and issuing disconnection orders. The program also provides required information for power of sale, foreclosures, bankruptcies, debt reviews and consumer proposals and receiverships. More than 82,000 payment arrangements on overdue accounts were fulfilled in 2006.

Hydro One Distribution has added processes to manage collections costs and improve ease of making payments of past due amounts. In 2004, a credit card payment option was introduced for customers in collection arrears. Outbound calling has been added to the steps taken when an account falls into the collections process. Hydro One continues its policy of using load limiters during the winter months in place of full disconnection. In 2007, a second third-party collections agency was added to improve account recovery on final billed accounts. Additional outbound calling will be implemented later in 2007, and an end-to-end process review is underway to streamline the collection processes and identify areas of continual improvements. Relevant improvement items will be considered for 2008 implementation.

The billing, contact handling and collection service programs discussed above were part of the PA Consulting study of Inergi fees for Customer Service Operations, completed in 2005 and filed with RP-2005-0020/EB-2005-0378. The study found that Inergi fees in Customer Service Line of Business were within 1.0% of the fair market value range. The Inergi agreement established benchmarking at years three, six and nine of the 10-year agreement. The year six benchmarking is planned for 2008.

2.1.1.4 Settlements

The program ensures the integrity of financial transactions between Hydro One, the Independent Electricity System Operator (IESO), and applicable customers. The program includes: reconciling purchases of energy from the IESO; applying retail transmission service tariffs; updating data in totalization tables; and, implementing commodity and other charges, including appropriate distribution rates, to embedded LDCs, direct and generator customers as well as interval-metered, end-use customers. It also includes calculating and administering payments for energy produced by retail embedded generators, and settlements for short- and long-term load transfers. The Settlements program provides the appropriate level of due diligence to ensure that billing and payment transactions are reconciled accurately for parties involved, and to ensure that affected customers receive timely, accurate bills.

2.1.2 Meter Reading

This service program includes manual reading of conventional meters and remote reading of interval meters. Manual meter reads involve a visit by field staff to the customer premise to obtain the reading; interval meters are read remotely by the system via a telecommunications connection.

The manual meter reading activities include scheduled meter reads used for regular cycle billing of Hydro One Distribution's approximately 1.2 million customers. Meters are scheduled to be read on a monthly, bi-monthly, quarterly or annual basis, depending on the service territory and rate classification of the customer.

This program also includes unscheduled meter reads, which are taken on customer request and are typically used for check reads or final billing on move-out or property transfer. Program costs also include ancillary charges required for support activities, such as maintaining meter reading tools, reviewing demand charges annually and updating 911 customer addresses.

Time-of-use billing will be rolled out in a stepped fashion, with a target of having all feasible customers on time-of-use billing by the end of 2010. In 2008, time-of-use billing will be activated for customers who have received their smart meter, and also have the required communications infrastructure in place. All other meters will continue to be manually read. Manual meter reading costs are expected to decline in 2008 due to the reduction in the number of manual reads related to the Smart Meter Project.

The meter reading program also includes the cost of interval meter reading. In late 2004, Hydro One Distribution made a policy change to expand the installation of interval meters for new connections by lowering the size threshold from 500 kilowatts (as required by the Distribution System Code), to 200 kilowatts. The change was made to be directionally consistent with the Government's anticipated policy on smart metering greater than 50 kW. In 2006, Hydro One Distribution had approximately 1,500 interval remote meters. These meters are read and the data processed several times per week.

2.1.3 Other Field support costs

This category covers the field work required to support the billing, collections and settlements service programs. It includes execution of service orders to disconnect or load limit electricity services due to non-payment, to reconnect electricity services when payment issues are resolved, and, in certain situations, to follow up to ensure the integrity of a reconnect, a disconnect, or a load limiter. Field work is also requested to investigate high bill complaints and other miscellaneous customer issues. Also included in this cost category is work required to develop, review and revise the totalization tables that are required for settlements services.

2.1.4 Other Service support costs

These services include: Postage and courier service to issue bills, telephone expenses including costs for 1-800 numbers, third party contracts held by Hydro One Distribution for centralized payment processing, and collection agency costs related to final bill collection activity.

2.1.5 Customer Care Management

This program includes customer policy, planning, work program budgeting, service performance management, contract management, customer research and surveying, project preparation and coordination of implementation, and management of escalated customer complaints.

The 2008 costs represent Hydro One Distribution's assessment of the needs of this function to serve its distribution customers. The distribution-related costs have changed from $4.1 million in 2006 to a forecast value of $7.2 million in 2008. The increase is due to a number of factors including: supporting the corporate objective of improved customer satisfaction; refining management practices associated with the Inergi contract to assist in raising service quality to customers; preparing for time of use billing related to the incorporation of Smart Meters.

2.2 Bad Debt

This cost category reflects bad debt expenses, net of recoveries. Bad debt expense peaked in year 2006 and is expected to improve by 2008 to a value of $13 million. There are two reasons for the higher cost of bad debt in 2006. First, rising energy costs and worsening economic conditions have increased the number of customers in arrears and the average value of outstanding accounts in the collections process. The second reason was a change in the provision rates used to calculate the bad debt allowance. An allowance is calculated each year, estimating bad debt from uncollected accounts receivable. The allowance provision rates were updated in 2006 to better reflect actual write offs, and resulted in a one-time adjustment of $3.6 million to amounts that should have been allotted to the allowance since 2003.

To address bad debt costs, additional front-end collections methods have been introduced, aimed at reducing outstanding receivables before the final billing of an account. As well, Hydro One Distribution has added a second collections agency to help increase amounts recovered in final billed receivables. Examples of these and other collection tactics are noted in the description of the collection services program, Section 2.1.1 Customer Service Operations.

2.3 Regulatory Compliance

The cost of projects to implement legislative, regulatory and rate changes are included in this category. Hydro One Distribution has implemented the Regulated Price Plan (RPP) including the seasonal threshold changes, and is required to update commodity amounts twice a year, under direction from Ontario Energy Board. Among the regulatory projects included in 2007 and 2008 planning are the annual RPP commodity threshold and price changes, implementation of release 4.0 of electronic business transactions for retailer activity, and plans for rate changes to better align costs with rates, and to harmonize the rates of acquired utilities with the rates of legacy customers.

2.4 Service Enhancements

Service enhancements represent investment in service or productivity improvements to our customer service programs. The 2008 planning includes: promotion of Summary Billing and web self-serve options; process efficiencies for bill exception handling; a review and update to Call Centre Interactive Voice Response menus and self-serve options; improvements to first call resolution; introduction of new collections initiatives to enhance receivables recovery.

SHARED SERVICES AND OTHER OM&A

1.0 INTRODUCTION

Hydro One Shared Services are comprised of Common Corporate Function and Services (CCF&S), Common Asset Management Services, Information Management Services, and Cost of Sales to external parties. Other OM&A includes the capitalized overhead credit, the environmental provision credit, indirect depreciation and miscellaneous shared services/costs.

CCF&S services include finance, human resources, legal, corporate communications, risk management, internal audit, regulatory, corporate management, and strategic planning activities. Common Asset Management services include, asset strategy, system investment, business transformation, business integration, real estate facilities and contracts and business relations activities. Information management activities include providing and managing computer systems (for example, hardware and software) and IT infrastructure.

Hydro One utilizes a centralized shared services model to deliver its common services. The common services are delivered to the Distribution and Transmission businesses within Hydro One Networks Inc., and to the legal entities Hydro One Inc., Hydro One Telecom, Hydro One Brampton, and Hydro One Remote Communities. The centralized shared services model has allowed Hydro One to efficiently deliver key common services across the whole company in a cost-effective manner.

Many organizations have adopted a shared service model as an effective method of delivering common services to multiple subsidiaries and / or multiple business units. Hydro One adopted this model when it was established in 1999. Hydro One does not have any specific studies or reports that support the efficiencies of a shared services model for Hydro One, however the additional cost to establish the common functions in each of its subsidiaries would be cost prohibitive. In addition, the shared service model allows for the delivery of specialty services (i.e. Tax, IT systems and processes) without the need for having multiple experts in many areas.

This shared services model is a recognized business concept which has many benefits including:

- Minimization of the work force through commonly available specialist expertise and resources;
- Ensuring consistent policy and governance framework processes;
- Rationalizing and providing consistent levels of service across the organizations (for example, consolidation of office space, centralization of human resources, pay and financial services, infrastructure support);
- Using common technology systems and platforms and providing better access to information (for example, implementation of common financial and work material management systems);
- Synergies from economies of scale (for example, accounts payable processing, common procurement process and management of supplier relationships);
- Increased flexibility to pursue outsourcing of services where appropriate.

Shared services cost levels are fully reviewed as part of the annual business planning process (Exhibit A, Tab 14, Schedule 1).

Table 1 summarizes the Distribution portion of the Shared Services and Other OM&A Costs over the Historic, Bridge and Test years.

Table 1
Allocated Distribution Shared Services and Other Costs ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Common Corporate Functions and Services	21.1	24.4	33.2	35.6	40.5
Asset Management *	26.0	20.7	40.9	38.1	46.3
Information Management Services	41.5	42.5	46.8	51.3	52.6
Cost of Sales	28.1	15.3	6.6	6.9	5.9
Other Shared Services	(107.5)	(79.5)	(106.3)	(40.1)	(78.3)
Total	**9.2**	**23.3**	**21.2**	**91.9**	**66.9**

* For the years 2004 and 2005, Asset Management costs were lower due to certain program costs, including facilities and work scheduling, being charged directly to work programs through standard labour rates.

The allocation methodology utilized in the 2004 - 2005 timeframe was developed internally for Hydro One and was customized to the business model being used by Hydro One at that time. The approach was based on the general principles of cost causality and benefits received. Cost drivers were utilized based on a high-level activity based costing approach.

For the 2006-2008 periods, Hydro One utilized the methodology developed by R.J.Rudden (as discussed in Exhibit C1, Tab 5, Schedule 1). The Rudden approach utilizes a further breakdown of activities and drivers.

The two approaches are similar in nature. They both use direct allocation where possible and the use of appropriate drivers where costs cannot be directly assigned. Hydro One's use of the Rudden approach has expanded the use of drivers, further refined the services / activities to be allocated and has updated data. The changes have lead to more precision and accuracy in the allocations.

Table 2 provides an overview of the various shared services cost categories for 2008 showing the total costs (where applicable) as well as the allocated Distribution costs.

Table 2
Shared Services and Other Costs ($ Millions)

Description	2008 Total	2008 Dx Allocation
Common Corporate Functions and Services	84.2	40.5
Asset Management *	118.9	46.3
Information Management Services	99.3	52.6
Cost of Sales	11.5	5.9
Other Shared Services	(165.3)	(78.3)
Total	**148.5**	**66.9**

As noted above, shared services costs are managed on an integrated or centralized basis, and then allocated to Transmission, Distribution and other businesses based on methodology developed through a cost allocation study.

In its transitional rate order RP-1998-0001, the Board directed Networks to provide more substantial support for its corporate services costs and allocation methodology. As a result, for the 2006 Distribution Rates Application (RP-2005-0020 / EB-2005-0378), Hydro One Networks engaged an independent expert, R.J. Rudden Associates (Rudden) to establish a cost allocation approach for Common Costs, which would be in accordance, with accepted industry standards. Hydro One submitted this study as part of its 2006 Distribution Rates Application and the subsequent Transmission Rates Application (EB-2006-0501).

In the 2006 Distribution Rates decision, the Board accepted the recommendations contained in the Rudden study and accepted the costs flowing to Hydro One Distribution for purposes of setting rates. The decision also stated that the Board “considers it reasonable for the Company to employ the Rudden methodology in the pending transmission case". Accordingly, Hydro One Networks has utilized the Rudden methodology to update their study for the purpose of the 2008 Distribution Rates Application, consistent with the OEB accepted allocation approach.

The following sections of this exhibit provide information for the years 2004-2008 on the following areas:

- Common Corporate Functions and Services (including Inergi sustainment costs);
- Asset Management Services;
- Information Management Services;
- Cost of Sales;
- Other Shared Services /Costs.

In addition, Hydro One Networks Inc. (Networks) entered into an outsourcing agreement with Inergi LP (Inergi) in December 2001 that extends to February 29, 2012 (the "Master Services Agreement" or "MSA"). Inergi is a wholly owned subsidiary of Capgemini and is not an affiliate of Hydro One Networks Inc. During the review of Hydro One's Distribution rates for 2006 (RP-2005-0020/EB-2005-0378), the Company provided evidence on the MSA, which the Board and intervenors assessed. The Board noted the "considerable scrutiny" given by intervenors to the agreement and concluded in its Decision, issued April 12, 2006, "that the Inergi contract represents a reasonable strategy by Hydro One to reduce costs, improve efficiencies and improve focus on the utility's primary operations. The Board is satisfied that the cost consequences flowing from the Inergi agreement for the test year are reasonable and therefore approved for ratemaking purposes." The terms of this agreement cover elements which are common to both Distribution and Transmission Businesses and accordingly are approved for application to the Distribution Business. For completeness of this Application, the agreement is addressed in summary form in Attachment A to this Exhibit.

2.0 COMMON CORPORATE FUNCTIONS AND SERVICES

The Corporation has identified certain functions that provide common services to all business units. It was determined that these functions could be shared effectively by all business units, avoiding costly and unnecessary duplication

Table 3 presents for comparison purposes the total CCF&S costs over the Historic, Bridge and Test years as well as the 2008 Distribution amounts.

Table 3
Total 2004 - 2008 CCF&S Costs and
2008 Allocation to Distribution ($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Corporate Management	6.6	6.9	8.3	5.6	6.2	2.8
Finance	18.9	22.6	22.3	22.4	26.9	12.1
Human Resources	10.1	10.2	10.5	12.1	12.6	6.4
Corporate Communications	4.9	4.7	6.4	5.8	5.7	3.8
General Counsel and Secretariat	6.5	6.6	6.8	7.9	7.5	2.9
Regulatory Affairs	14.0	11.7	15.8	18.0	19.7	10.3
Corporate Security	1.2	5.4	1.8	1.7	2.5	1.2
Internal Audit	2.4	2.4	2.5	2.5	3.0	0.9
Total CCF&S Costs	**64.6**	**70.5**	**74.3**	**76.0**	**84.2**	**40.5**

The increase in CCF&S cost in 2005 is due to increased security costs associated with the Society labour disruption and new Bill 198 compliance work. The cost increase of approximately $3.8 million in 2006 as compared to 2005 is primarily due to Regulatory OEB costs, increased Corporate Communication Costs, and general cost escalation increases. The increase of approximately $1.7 million in 2007 over 2006 is mainly due to increased on-going regulatory obligations, the Theft of Power Program, and general escalation increases. The increase of approximately $8.2 million in 2008 over 2007 is primarily due to increased Regulatory compliance requirements, human resources support for increased staffing and new programs, and general escalation. Details of the cost changes for each of the CCF&S functions are described in the following sections.

2.1 Corporate Management

Table 4 provides a summary of Corporate Management costs:

Table 4
Corporate Management Function ($ Millions)

	Historic			Bridge	Test	
Description	2004	2005	2006	2007	2008	2008 DX
Corporate Management	6.6	6.9	8.3	5.6	6.2	2.8

Corporate Management represents those functions responsible to provide overall strategic direction to the corporation, including the Board of Directors, Treasurer's Office the Chief Executive Officer ("CEO"), Chief Financial Officer ("CFO"), the General Counsel and Secretary as well as the costs of certain supporting functions, Executive Office support and External Relations.

The President, CFO and General Counsel & Secretary are considered to be part of Hydro One Inc. and provide services to Hydro One Networks Inc.

The General Counsel and Secretary function in Hydro One consists of:

- Provision of advice and support to the Board of Directors and Corporate Officers.
- Provision of advice, training and reports on Code of Conduct and activities.
- Managing all donations, sponsorships and Community Citizenship programs.
- Managing and supporting all activities related to the Freedom of Information and Privacy Act and the Federal PIPEDA.
- Managing corporate archives.
- Carrying out the functions of Chief Ethics Officer.

The CFO functions in Hydro One Inc. consist of:

- Review and approval of financial and investment decisions.
- Provision of input to strategic and business plans.
- Oversight of Finance functions and provision of reporting information to Hydro One, subsidiaries, regulators, investors and the shareholder.
- Ensuring financial services are provided efficiently and reliably.
- Ensuring integrity of, and compliance with, internal controls over regulatory, financial, accounting activities.
- Monitoring of performance against operational, financial and regulatory targets.
- Ensuring sufficient revenue for operating, financial and regulatory needs.
- Supporting Hydro One's Board of Directors.
- Ensuring access to capital on reasonable terms.

The costs associated with the activities of the Treasurer's Office are charged to the company's costs of debt as discussed at Exhibit B1, Tab 2, Schedule 1.

The allocation of the costs associated with the activities of Corporate Management are governed by a Service Level Agreement between the Holding Company and the legal subsidiaries as outlined in Exhibit A, Tab 8, Schedule 3. This exhibit also describes the activities preformed by the Holding company and the amounts allocated to the various subsidiaries.

The cost changes over the 2004 to 2008 period are due to incorporation of improved IT systems and processes; an increased effort for the on-going Bill 198 requirement; and increased effort for streamlining regulation approvals to proceed with timely implementation of critical capital expansion programs. As a reporting issuer, Hydro One is required to comply with the Ontario Securities Commission (OSC) Multilateral

Instrument MI 52-109 and MI 52-111 concerning internal control and the related certifications, often referred to as Bill 198. As such, Hydro One management initiated the Financial Control Compliance Readiness Project and established a formal project governance structure in order to implement and comply with the underlying requirements on a continuing basis. The increase in 2006 is due to the CEO severance payout partially offset by lower audit fees and board costs. The decrease in 2008 includes a lower level of executive compensation, consistent with the Agency Review Panel (the "Arnett Panel") report (as discussed in Exhibit C1, Tab 3, Schedule 2).

Hydro One has not included any charitable donations in its 2007/2008 Distribution revenue requirement request, although Hydro One does make charitable donations to a number of organizations throughout the province. The primary beneficiaries of these donations are the annual United Way Campaign, energy awareness, local community causes, injury prevention programs, health care facilities, food banks, and employee volunteer grant programs.

2.2 Finance

Table 5 provides a summary of Finance costs:

Table 5
Finance Function ($Millions)

	Historic			Bridge	Test	
Description	2004	2005	2006	2007	2008	2008 DX
Finance	18.9	22.6	22.3	22.4	26.9	12.1

2.2.1 Overview

The Finance function consists of the Corporate Controllers, Corporate Tax, Treasury and Financial Strategy work programs.

Corporate Finance provides strategic advice and services related to the planning, processing, recording, reporting and monitoring of all financial transactions taking place within the organization. Clients include parties both internal and external to the organization, depending on the service provided. Services are provided through the following specialist functions:

- Corporate Controllers;
- Corporate Tax;
- Financial Strategy;
- Treasury.

The increase in costs in 2004 - 2008 are primarily attributed to the costs of complying with the requirements of Bill 198 on a continuing basis, as well as increased work requirements related to the Securities Commission and Provincial Audit issues.

2.2.2 Corporate Controllers

Corporate Controllers provide leadership and direction regarding all business planning, financial reporting, accounting and internal control policies; and procedures to ensure statutory and regulatory compliance and consistency with generally accepted accounting principles. The total cost of Corporate Controllers activities in 2008 is $18.1 million, of which $8.4 million is allocated to Distribution.

The function oversees the development of actual and forecast financial information and manages reporting processes to appropriate audiences or stakeholders. Clients receiving information and reports generated through Corporate Controllers may be internal to the organization, such as the executive team and board of directors, or may be external parties such as auditors, investors, regulatory and government agencies. Some examples of services provided include consolidated financial statements, annual and quarterly financial and regulatory reports and regular reports of internal OM&A and capital work program results.

Corporate Controllers are responsible for establishing and leading the annual business planning and budgeting processes, developing the instructions and assumptions used in the plan, finalizing the plan and budget documents, and leading the presentation of the plan to the Board of Directors and the Provincial Government.

The function develops and maintains financial models and provides analytical support for a variety of financial planning and reporting processes. In addition, this function is responsible for the financial management of revenues and associated costs of power.

Routine financial services, such as Accounts Payable, Accounts Receivable, Fixed Asset Accounting, General Accounting, Planning Budgeting and Reporting, Pension Support and a number of administrative procedures are outsourced to Inergi. These services are a major portion of the Corporate Controllers costs. The Inergi contract is discussed in more detail in Attachment A to this Exhibit.

Corporate Controllers are also responsible for managing and providing direction to the company with respect to matters of internal control, including Organization Authority Registers and financial policies and procedures providing leadership regarding compliance with Bill 198 and associated OSC-related rules.

2.2.3 Financial Strategy

Financial Strategy costs in 2008 are $3.1 million. Of this amount $1.5 million in 2008 is allocated to Distribution.

The function provides Financial Strategy services to the company through decision support as well as business case review and preparation, business valuation, transaction support, and other services as required. In addition, this function’s work includes the directing of the development and maintenance of all financial systems in the company.

The function is also responsible for the implementation and on-going management of the internal control compliance project within the company. Financial Strategy provides overall Inergi contract governance and support. Financial Strategy provides direction and analysis of the financial systems and of Enterprise Systems.

2.2.4 Corporate Tax

Corporate Tax manages the tax affairs of Hydro One Inc. and its subsidiaries. The costs associated with Corporate Tax activities in 2008 is $1.8 million. Of this amount $0.7 million is allocated to Distribution in 2008. Corporate Tax cost has been basically unchanged over the 2004 - 2008 periods.

Corporate Tax manages the tax obligations of each corporation within the Hydro One group including corporate income and capital taxes, the federal goods and services tax, the provincial retail sales tax, debt retirement charge, payroll and non-resident withholding tax and the employer health tax. Corporate Tax ensures that internal and external tax compliance requirements are met.

Tax compliance activities involve the preparation of income tax, goods and services tax ("GST"), Retail sales tax ("RST") and debt retirement charge ("DRC") returns for all corporate entities. Corporate Tax is also responsible for ensuring that the proper amount of tax is withheld from payments made to non-residents, particularly from payments for services performed in Canada by non-residents. The function calculates, manages and remits the corporate income and capital tax installments made by each entity in the group to ensure conservation of cash while eliminating any interest charges that would result from deficient installments. Other activities involve tax accounting and managing federal and provincial government tax audits.

Corporate Tax provides tax advice to the Human Resources department concerning employee taxable benefits; to Treasury concerning tax effective financing; to the Pension department concerning various plan issues; and to the operating lines of business to ensure tax effective acquisitions and dispositions. Tax planning strategies include a review of the tax classification of capital expenditures to ensure maximum allowable deductions are taken.

Corporate Tax also performs a monthly transactional analysis to ensure that the GST amounts charged to the Hydro One group and claimed as input tax credits are correct and that proper procedures are in place to ensure collection of GST, provincial RST, and DRC amounts.

2.2.5 Treasury

Treasury total costs are $6.1 million in 2008. Of this amount, $2.2 million for 2008 represents costs incurred to:

- execute borrowing plans and issue commercial paper and long-term debt;
- ensure compliance with securities regulations, bank and debt covenants;
- manage the company's daily liquidity position, control cash and manage the company's bank accounts;
- settle all transactions and manage the relationship with creditors; and
- communicate with debt investors, banks and credit rating agencies.

The Distribution portion charged to the company's cost of debt is $1.1 million in 2008, as shown in Exhibit B2, Tab 1, Schedule 2 Pages 5 Line 28.

Treasury is also responsible for the costs incurred in relation to assessment of risk, negotiation and purchase of insurance policies, claims management and settlement. These costs total $3.9 million for 2008, (of which $1.6 million is allocated to Distribution in 2008) and form the basis of the Treasury costs allocated as part of CCF&S. Included in the $3.9 million are the premiums paid for third party liability, fiduciary liability, and, directors and officers insurance. These costs do not include the premiums paid for insurance such as automobile, property, and other insurance. The premiums for these insurance policies are charged to work programs or included as an Asset Management cost as deemed appropriate.

Insurance and claims requirements are based on historical experience and are determined through consultation with management, as well as with insurance companies to ensure their understanding of the company's assets, operations, maintenance program and governance. This is followed by review and assessment of insurance policy options to ensure that appropriate statutory and discretionary coverage is in place at a cost-effective rate.

Hydro One also self-insures exposures that are either not covered by insurance policies or fall below the specified deductibles. Hydro One employs the services of a third party claims processing service provider to administer and settle claims against the company that are under $50,000. Claims against the company greater than $50,000 are managed by Treasury in consultation with internal and external legal counsel as appropriate.

All aspects of claims are managed through investigation, evaluation and negotiation, ensuring fair and cost effective settlement of claims for which the company is legally liable.

Table 6 shows the premium for Hydro One Inc.'s insurance policies for the 2004 to 2008 period and is a summary of the annual claims expense and associated administrative cost.

Table 6
Hydro One Inc. Insurance Program ($ Millions)

2.3 HUMAN RESOURCES

Table 7 provides a summary of Human Resources costs:

Table 7
Human Resources Function ($Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Human Resources	**10.1**	**10.2**	**10.5**	**12.1**	**12.6**	**6.4**

2.3.1 Overview

The Human Resources (HR) function exists to enable the success of Hydro One. As a staff function, HR adds value by providing advice, guidance and services to managers (and on their behalf, to employees) which support and optimize the acquisition and management of the workforce, and the treatment of pensioners. HR provides consulting, staffing & training, compensation and benefits and labour relations' services. The total cost for 2008 is $12.6 with $6.4 million allocated to Distribution.

Total costs for the function remained relatively stable 2004-2006. The cost increases in 2007 and 2008 are due to general escalation increases, increased employee-related transactions associated with increased staff, and new programs.

2.3.2 Human Resources Purpose

In the last decade there has been an increase in awareness that human performance is the critical differentiating factor between success and failure for organizations, and that progressive management – supported by effective HR policies and services – can significantly enhance employee engagement, which in turn drives and sustains performance gains.

HR's main purpose is to support the organization's business strategy, so it must react and flex to meet the needs of that strategy. HR, like every other part of Hydro One, has been required to look for ways of increasing its efficiency by driving costs and redundancies out of its processes.

These reductions have been achieved by several means; in some areas Hydro One has leveraged new technologies such as PeopleSoft Employee Self Service, Intranet self service reports and training, Internet recruitment and pension inquires. In some cases Hydro One has chosen to outsource work completely, such as the Mercer Pension Administration System and Inergi LLP for payroll services, as the best way to achieve the required efficiencies.

One of the greatest challenges facing Hydro One is in an area where HR will be expected to play a significant role – the dramatic demographic "churn" that will occur in the Hydro One workforce in the next 3-5 years and beyond. Approximately 25 percent of the workforce (>1000 employees) become eligible to retire in the next 1 1/2 years. Hydro One must not only replace these people, but also find an additional 600 people over the next 5 years to meet the needs of the planned work programs. HR is also involved in promoting the development of the skill base and expertise required by Hydro One from graduates of high schools, trades schools, colleges and universities. New staff means extra training which will be provided by HR staff dedicated to this function. Hydro One is currently looking at ways by which to mitigate some of the impact of this "wave" of staffing work; by outsourcing or further automating (IT) some of the more labour intensive components of the hiring processes.

2.3.3 HR Consulting

HR Consultants provide advice and guidance to managers, supervisors, and employees on myriad of issues related to HR policies and procedures, collective agreement administration, staffing and other large initiatives that impact staff. HR consultants are assigned to specific "Client Groups" within the organization, but much of their day-to-day work, that at one time would have been done face to face with managers and employees, is now done via fax, telephone and email. However, given the nature of some of the issues, and Hydro One's geography, those consultants who serve field client groups around the province still spend a lot of time 'on the road'.

Certain elements of the HR Consultants' work are out-sourced to ensure they are still accorded the level of attention they require; one such area is that of the investigation of harassment or Human Rights complaints from employees. The law and Hydro One policy both treat these complaints very seriously, and because of the exhaustive and time-consuming information collection process demanded in relation to these complaints, Hydro One typically outsource this work, and the resulting mediation processes, to appropriately trained external professionals.

Technology changes have been implemented, so that employees can obtain HR information without the need for the assistance of an HR Consultant. The AskHR website, for example, provides managers and employees who use it with information on policies and procedures. The HR Hot-Line email and telephone service deals with the many daily inquiries that come from managers and employees (and pensioners).
Alongside the Generalist consulting group, Hydro One HR contains a number of smaller 'specialist' support/service activities.

2.3.4 <u>Staffing and Training</u>

This function recommends and administers policy in areas related to hiring and development; in addition it manages all of Hydro One's management/leadership development activities and Hydro One's principal[1] cyclical hiring processes - the New Graduate, the Co-Op Student and the Summer Student Hiring programs, plus miscellaneous specialized one-off hiring initiatives, as required.

The annual hiring processes are complex and labour-intensive and increasingly Hydro One is competing with other high profile employers. Hydro One offers Co-Op work terms to approximately 65 students three times a year. This provides Hydro One, and

[1] Trades staff are hired through the Power Workers' Union Hiring Hall processes.

200 young people with an opportunity to work with each other and as a result, if Hydro One is later able to hire a Co-Op student as a new Graduate, both parties will know what they are getting. Historically, the ‘Grad Hiring Program’ resulted in line managers being able annually to attract and hire Engineering and Business graduates from Universities across Ontario and beyond.

As part of the HR resourcing strategy, Hydro One offers a range of management/leadership development training programs related to identified management competencies for managers and supervisors. The costs reflect an increase in management training. While HR is active in developing the training strategy and identifying and specifying programming needs, most of the program design and delivery is outsourced to external training vendors. HR has found this a cost-effective way of keeping leadership development activities flexible and high quality.

The Human Resources function has always had a role in organizational succession planning, but in Hydro One in the last two years, HR’s role in this area has widened considerably. The demographic changes referenced above have added urgency to the situation and, as a priority HR has focused effort on identifying a number of mid-level staff who, based on internal recommendation and expert external assessment, are considered to have high potential to excel in due course in the most senior positions in the Company. As part of what is termed an “Acceleration Pool’, the development of these people is assigned a high priority which translates into exposure to high-profile projects and work assignments and special external educational opportunities as appropriate.

In addition, the Human Resources department manages the internal vacancy system. All PWU, Society and Management vacancies are posted internally, and employee applications are processed through the vacancy management office in Human Resources.

2.3.5 Compensation & Benefits

Payroll operations for a company of the size and complexity of Hydro One are both critical and extensive. The labour intensive transactional elements of payroll administration were largely outsourced to Inergi with contract administration within Hydro One to ensure compliance and cost containment. This same group also manages the Annual Performance Pay process for Society - represented staff and the Short Term Incentive ("STI") Plan for Management Compensation Plan ("MCP") staff.

As with pay, benefits administration in Hydro One is a complex area, since the plans offered to employees vary according to their jurisdiction, their date of first employment and, in some cases, their personal choices. The transactional administration of the main Benefit Plans is outsourced (currently to Great West Life). Compensation and Benefits is accountable for designing and implementing changes or new additions to the various compensation and benefits programs provided to Hydro One staff.

Minor status changes and inquiries can be handled by Hydro One's Hotline service, but substantive pension-related issues and events before and after retirement are dealt with by Compensation and Benefits. They are also accountable for managing any changes that are made to the provisions of the Pension Plan as a result of changes in the Law or in Hydro One Corporate policy. For the 7,140 pensioners (as at Dec 31, 2006), the Compensation & Benefits unit is their principal link with Hydro One. The cost levels are not changing significantly and those that do change are recoverable from the pension plan. Inergi Base contract price declines are offset by COLA and OPEB cost escalations.

Compensation & Benefits provides regular strategic reporting of HR and Pay data for Senior Management in such areas as retirement demographics, headcount, overtime reports, data for OEB submissions etc.

2.3.6 Labour Relations

Labour Relations exists to provide advice, guidance and training to Managers regarding collective agreements and labour legislation. There are 23 collective agreements plus midterm agreements and letters of understanding that bind the company. In addition, the company must comply with legislation such as the Ontario Labour Relations Act, the Employment Standards Act, the Human Rights Code, etc, all of which require interpretation and advice to Managers.

Labour Relations negotiates with 21 different bargaining agents to renew 23 collective agreements. Fifteen of the renewal agreements are negotiated in conjunction with the Electrical Power System Contractors Association ("EPSCA"), while the remaining eight are negotiated directly with the applicable unions.

The Labour Relations unit manages the grievance and arbitration processes and in addition, prepares and presents company briefs at grievance and arbitration hearings. It also participates in Ontario Labour Relations Board (OLRB) hearings involving various unions. Most of the construction unions (Buildings Trades Unions [BTU]) utilize the Ontario Labour Relations Board ("OLRB") instead of a grievance/arbitration process. Labour Relations prepares and presents company briefs at the OLRB.

2.4 Corporate Communications

Table 8 provides a summary of Corporate Communications costs:

Table 8
Corporate Communications Function ($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Corporate Communications	**4.9**	**4.7**	**6.4**	**5.8**	**5.7**	**3.8**

2.4.1 Overview

Corporate Communications is responsible for managing all communications initiatives for the corporation, including communications strategy development; media and public relations, public affairs, community and government relations; customer communications; employee communications; and internet/intranet communications. Increased communication costs from 2004 to 2008 are associated with increased focus on proactive customer communications and consultation associated with transmission citing rate increases and billing activity as well as communications in support of government directed initiatives around safety and conservation and demand management activities, including smart meters.

The increase in costs in 2006 is due to increased work for initiatives such as the Smart Meter roll-out, and Hydro One and OPA's conservation programs as well as communication around storm restoration activities.

2.4.2 Corporate Communications Activities

2.4.2.1 Media Relations

Media relations is key to reducing overall operating costs by reducing reliance advertising and other paid forms of communications. Proactive media relations is seen as a important driver of customer satisfaction by providing timely communication and important third party endorsement of company activities.

- **Local investment**: Corporate Communications issues press releases concerning Distribution projects in order to promote the ongoing commitment of the company to investing in critical electricity infrastructure and improve reliability.

- **Conservation:** Working with the Conservation and Demand Management Group, Corporate Communications establishes marketing and media campaigns to promote customer enrollment/participation in a full range of conservation programs.
- **Electrical safety**: enables Hydro One to abide by various regulations and laws pertaining to public health and safety, mitigate risk and cost of potential liability by demonstrating due diligence, and protecting the Company's assets from damage (i.e. encouraging customers to "call before you dig.")
- **Power Outages and other significant events:** Local media and government officials can contact Hydro One's media relations desk 24/7 for immediate updates concerning expected duration of outages. Regular updates are provided to government officials allowing them to make informed decisions about emergency measures that may need to be taken in their communities and can help reduce calls to the Call Centre. This service also extends to other operational emergencies including, Health and Safety Events, contingencies on the distribution system, Load Shedding, Voltage Reductions

2.4.2.2 Stakeholder/Industry Relations

Many of the services provided by the Communications function involve educating and informing external parties such as customers and stakeholders regarding company and shareholder directed initiatives. Included among these activities would be stakeholder consultations (including consultation for First Nations) for rates changes and capital project related proceedings. These processes allow stakeholders the opportunity to understand the company's submissions and provide input, allowing them to influence the end results.

2.4.2.3 Community Outreach

Corporate Communications plays a key role in environmental assessment teams working to obtain approvals for Distribution lines and stations. As part of Hydro One's work program, Corporate Communications liaises with both elected and administrative staff in the affected municipality, coordinating briefings, participating in council presentations, and providing notification letters, and issues management, coordinating all activities associated with Public Information Centres, (PICs). Community outreach is another tactic used to disseminate the messages noted above. Activities include meetings and events with local government officials, service organizations and other community groups, participation in municipal conferences, local fairs and events.

Corporate Communications develops also liaises directly with customers and the community to keep them apprised of distribution related work taking place in their communities (maintenance, forestry and construction). An emphasis is placed on helping when controversial issues arise; this also includes managing community complaints either through telephone conversations, letters or community meetings.

Customer Communication: Customer communication activities involve informing customers of changes in their electricity and delivery rates using multiple communications channels. This includes explaining the impacts on their electricity bills and how to make wise use of electricity. Hydro One also communicates with customers on several other customer related issues/concerns including security deposit policies, and conditions of service, etc., as part of the Company's customer focus and as required by regulation.

2.4.2.4 Internal Communications

Internal communications efforts are equally important. The function provides managers/supervisors and employees with information related to corporate strategy, goals and specific operational initiatives to build awareness and buy-in. The employee communications function also facilitates the sharing of new ideas, approaches and suggestions among employees across the organization that can help to lower costs and improve productivity.

It should be noted that Corporate Communications costs do not include Customer Care Services or the Call Centre.

2.5 General Counsel and Secretary

Table 9 provides a summary of the costs of the General Counsel and Secretary function:

Table 9
General Counsel and Secretariat Function ($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
General Counsel and Secretariat	**6.5**	**6.6**	**6.8**	**7.9**	**7.5**	**2.9**

2.5.1 Overview

The office of the General Counsel and Secretary ("GC&S") provides legal advice and direction to Hydro One and its operating subsidiaries, as well as overall guidance in the areas of corporate structure, governance, business ethics and the business code of conduct. The GC&S function consists of two main functions: Law and the Corporate Secretariat.

The GC&S functions in Hydro One Networks Inc. consist of:

- Provision of legal services to all business units including the Company's major borrowing and financing initiatives, regulatory activities, transmission and distribution businesses (contracts, other commercial matters), employment, including pension and benefits, health, safety and environment and all Board-related activities. Arranging for the provision of legal services to the Corporation. The volume of these services is driven by capital and OM & A activities, as well as regulatory and legislative requirements.
- Overseeing the Regulatory, Law and Corporate Secretariat functions.
- Ensuring compliance with legal and regulatory requirements.

Hydro One does most of its legal work in-house, except when the in-house expertise is not available (for example, tax, labour) or when the workload exceeds the capacity of the internal legal group. The level of spending for external legal services has remained fairly constant. While the use of external legal resources has decreased, rates for those resources continue to climb. For most retainers, Hydro One undertakes an RFP process for retention of law firms.

Overall, GC&S expects its costs to remain relatively steady over the forecast period while continuing to manage increasing work loads. The nature of the Corporation's work programs, focused as they are on the core specialized business, can be more easily managed with internal resources, thereby minimizing the higher costs associated with external legal and other consulting resources. In 2008, there is an increase associated with increased work for rate applications, increased work programs and increased legislative and regulatory oversight.

2.5.2 Law

Law provides legal advice to all business units of the Corporation, acting as an internal "law firm" for the corporation. It advises on most aspects of law affecting the corporation, and relies on its experience and knowledge of the Company's business in providing economical and timely advice. The Law function maintains core knowledge of the law and the Company's business.

In particular, Law provides legal support to the Corporation's major borrowing and financing initiatives; regulatory activities, including approvals for major Distribution projects; approvals, land acquisitions, claims, Distribution businesses (contracts, other commercial matters); employment, including pension and benefits; and health, safety and environment. This support generally takes the form of reviewing legislation, giving general legal advice, drafting legal opinions, contracts and other legal documents, doing collections work, pursuing and defending litigation where claims have been made against the company.

2.5.3 Corporate Secretariat

The Corporate Secretariat provides support to the Office of the Chair, the Board of Directors and its Committees, including the administrative aspects of the Board and its meetings. It provides advice and analysis with regard to a variety of board-related matters, including corporate governance best practices and emerging trends and issues. It provides advice and direction with regard to the business Code of Conduct, ensuring appropriate actions to resolve known or suspected violations. This group also has responsibility for Community Citizenship initiatives and Freedom of Information and Privacy matters, advising the Corporation on compliance with privacy legislation, and administering requests for information under the Freedom of Information and Protection of Privacy Act.

The level of legal or corporate secretariat services required is not entirely dependent on the volume of work programs being undertaken by the Corporation but is also driven by the nature of the work programs and by changes in legislative and regulatory regimes.

2.6 Regulatory Affairs

Table 10 provides a summary of Regulatory Affairs Costs:

Table 10
Regulatory Affairs Function ($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Regulatory Affairs	5.3	5.8	7.0	7.9	8.9	4.7
OEB Costs	8.7	5.9	8.8	10.1	10.8	5.6
Total Cost	**14.0**	**11.7**	**15.8**	**18.0**	**19.7**	**10.3**

2.6.1 Overview

Regulatory Affairs consists of Regulatory Affairs and the Pricing and Load Forecast Management functions. The costs of this function include Hydro One’s share of the OEB costs. OEB costs are approximately $10.8 million of total 2008 costs. The cost increases over the period are primarily related to increased regulatory compliance and major OEB proceedings.

2.6.2 Regulatory Affairs Activities

Regulatory Affairs is responsible for managing the Company's relationships with the regulatory bodies with which it interacts, including the Ontario Energy Board, the IESO and the OPA. Through this function, it is responsible for developing strategy and coordinating the Company's submissions to these bodies and participation in regulatory initiatives in areas such as the development of cost allocation and rate design.

Regulatory Affairs is involved in the coordination, preparation and processing of applications, as well as providing support to witnesses and business support staff. Such proceeding-specific services are provided for a wide range of applications, including distribution and transmission rates, transmission leaves–to-construct, merger/ acquisition/ divestiture applications and area and system supply planning.

In addition to proceeding-specific work, Regulatory Affairs is responsible for a variety of ongoing reporting and other activities. The function prepares quarterly and annual reports required under OEB Reporting and Record-keeping requirements; Regulatory Compliance manages the increased emphasis of the IESO and OEB on compliance matters and the OPA’s standard offer programs which have challenged Distribution connection assessment capability.

Pricing and Load Forecast management is responsible for Cost Allocation and Rate Design for the regulated businesses of Hydro One. The function develops rate structures and rate proposals for the regulated transmission and distribution tariffs applicable to the company and provides support in submitting and defending rate proposals. Load Forecasts are developed to enable system planning and financial planning which underlie the company's financial forecasts. In addition, provision of metering information for revenue reconciliation purposes is also provided. The increase in Regulatory Affairs costs in 2007 and 2008 is related to increased work associated with regulatory compliance and major OEB proceedings, Section 92 applications, and load forecasting for rate design activities.

2.6.3 Ontario Energy Board Costs

Under the *Ontario Energy Board Act, 1988*, the Ontario Energy Board is required to recover all of its annual operating costs. Almost all of its costs are recovered from gas and electricity distributors and electricity transmitters. A small fraction of OEB costs are recovered through licensing fees and penalties. OEB costs that are subject to recovery include its staff costs, office space costs, administration costs and overheads. These costs are allocated to one of three categories – electricity distribution, electricity transmission and gas distribution. Hydro One Networks' then receives an allocation of each for electricity distribution and electricity transmission related OEB costs.
In 2005 the Board implemented a new cost allocation methodology which resulted in a significant year over year reduction in overall OEB costs for Hydro One Networks.

In a letter dated December 20, 2004 the Board announced an amendment to the Accounting Procedures Handbook and the Uniform System of Accounts to establish a deferral account to record Ontario Energy Board Costs Assessments. The intent of this account is to record Ontario Energy Board cost assessments for the Board's fiscal year 2004 and subsequent fiscal year(s) determined in accordance with the Board requirements.

The OEB costs shown in Table 10 for 2005 and 2006 are net of amounts deferred. The increased OEB costs from 2006 to 2007 reflect a shift of recoverable Board costs into the electricity sector as well as higher overall OEB costs. The decrease in 2008 reflects lower OEB invoice assessments based on updated information received from the OEB.

2.7 Corporate Security

Table 11 provides a summary of Corporate Security costs:

Table 11
Corporate Security Function ($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Corporate Security	**1.2**	**5.4**	**1.8**	**1.7**	**2.5**	**1.2**

2.7.1 Overview

The Corporate Security Services (CSS) function exists to enable the success of Hydro One primarily in the protection of assets (assets include people, property and information) and assisting in the reliable delivery of electricity. CSS adds value by providing advice, guidance, investigative and intelligence gathering expertise and services to managers (and on their behalf, to employees) which support and optimize the reliable delivery of electricity and the protection of Hydro One assets.

The total costs in 2008 are $2.5 million of which $1.2 million is allocated to Distribution. In the last decade there has been a dramatic increase in the focus on the protection of critical infrastructure and the industries that comprise these key social, safety and security functions due to the recognition of the criticality for electricity delivery assets and global terrorist activities (9/11). Cost increases in 2008 are primarily related to implementation of the new Theft of Electricity security program, and assuming the investigative and security monitoring role related to Information Technology.

2.7.2 Corporate Security Activities

Effective asset protection and recovery can be the primary differentiating factor between success and failure for critical infrastructure organizations such as Hydro One. This is achieved by effective corporate security policies, directives, guidelines and services, which can significantly enhance employee and business productivity. Hydro One places emphasis on providing safe reliable power supply in the Province of Ontario, and in large part is influenced by events such as terrorism, domestic extremism, sabotage, theft of copper conductors and other metals, and pandemic threats. The events of September 11th, the August 2003 Blackout, and the Caledonia substation sabotage and the subsequent blockade against the continuation of Hydro One work have underlined the importance and critical role CSS plays within Hydro One.

The CSS work program concentrates on providing physical security advice and co-ordination, IT investigation and system use monitoring, as well as assuming the security response role within the emergency preparedness program.

CSS also provides other security services such as criminal investigations and security advocacy roles to influence the electricity industry and intelligence agencies regarding the protection of the power supply in the Province of Ontario. Security services that directly impact Hydro One employees range from undertaking investigations regarding employee or contractor wrongdoing, security threats intelligence gathering and assessment, security clearances, employee safety and protection initiatives, workplace violence prevention, as well as corporate ID card processing.

The leveraging of new technologies and information gathering systems to retain security incidents and threats has promoted a more mobile and visible CSS function and has increased CSS's ability to identify security and threat trends. CSS has introduced an external email address for the general public to solicit tips for information and increased critical infrastructure protection information sharing strategies regarding the protection of Hydro One assets.

Efforts are made to identify potential security risks that could interrupt the reliable transmission and delivery of electricity. These risks include preventing asset threats, pandemic infections that can deplete available staff, criminal acts such as thefts, mischief or sabotage and hacking attempts into critical IT systems. CSS personnel have developed key relationships with various agencies that gather and disseminate information that can be used to reduce or eliminate these threats. CSS staff are able to gather and use this information to assess the risk impact to Hydro One operations. Greater emphasis can therefore be given to those actual risks that threaten Hydro One's business operations.

Emergency preparedness support activities include acting as the primary source of threat and corporate intelligence assessment for the OGCC, the Emergency Preparedness Program and maintenance of the Corporate Security Response Plan. Industry advocacy roles include participation in the Canadian Electrical Association's ("CEA") "Critical Infrastructure Protection Working Group", Provincial and Federal intelligence liaison committees and security industry standards development.

Continued vigilance is required to ensure protection against terrorist threats. Although there are no industry standards in place to guard against such threats, CSS follows general industry accepted approaches at gathering and analyzing information and trends. Current efforts in this area involve continued membership in CEA Critical Infrastructure Protection Working Group and the CISO (Criminal Intelligence Service of Ontario). The company plans to increase access to intelligence information through the Federal Government and expand information-sharing protocols with Natural Resources Canada ("NRCan"), Canadian Security Intelligence Service ("CSIS"), Electrical Sector Information Analysis Canada ("ESISAC"), CEA, and Public Safety Canada ("PSC").
Security costs increased substantially in 2005 due to security services associated with the Society Labor disruption.

The 2008 cost increases are due to the implementation of several security initiatives that the industry has developed for infrastructure and information protection as well as a new Theft of Electricity pilot program and the IT investigative function. The goal of this pilot program is to detect electricity theft through proactive investigation; therefore reducing the overall costs associated with electricity theft.

2.8 Internal Audit and Risk Management

Table 12 provides a summary of Internal Audit and Risk Management costs:

Table 12
Internal Audit Function ($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Internal Audit	**2.4**	**2.4**	**2.5**	**2.5**	**3.0**	**0.9**

2.8.1 Overview

Internal Audit reports to the CEO and the Audit and Finance Committee of the Board of Directors. It is an independent, objective, assurance and consulting activity designed to add value to and improve Hydro One's operations. The mandate for Internal Audit is to provide independent assurance to the CEO and Board that internal controls are adequate in areas of high-risk and to follow-up and report on management actions to address findings from past audits. It helps the Company accomplish its objectives by bringing a systematic and disciplined approach to evaluating and improving the effectiveness of risk management, internal control and governance processes. The total cost for this function in 2008 is $3.0 million of which $0.9 million is allocated to Distribution. Costs over the 2004 - 2008 periods have changed because of normal salary increases, upgrading of staff in areas of electricity operations and information technology auditing in an escalating period of hiring auditors due to Bill 198 and improved emphasis on governance.

2.8.2 Internal Audit and Risk Management Activities

The Corporate Business Risk Management function supports the CEO by:

- developing business risk management policies, frameworks and processes;
- introducing and promoting new techniques for assisting management to identify and evaluate risks within their operations;
- preparing corporate risk assessments; and,
- maintaining a framework of key business risks.

The annual internal audit work program is determined based on an assessment of risks and a prioritization process involving input from audit staff, senior management, the CFO, the CEO, the external auditors and the Audit and Finance Committee of the Board of Directors. Internal Audit and Risk Management's contribution to achieving corporate strategic goals includes: providing assurance that management systems and internal controls will continue to operate effectively; identification of and recommendation for areas where controls can break down or need improvement to meet corporate objectives; and, finding opportunities to improve the efficiency and effectiveness of operations. The types of audit conducted vary from year to year but generally consist of internal control reviews of processes such as Information Technology, Finance, Safety & Environment, and Operational audits.

Generally, audits focus on assessing the adequacy of the various corporate systems of internal control to ensure: the reliability and integrity of information; compliance with laws, regulations and corporate policies and procedures; safeguarding of assets; economical and efficient use of resources; and, effectiveness of management systems in achieving stated objectives. In addition, audits focus on assessing the adequacy of management systems to ensure efficiency, effectiveness and economy.

Audit recommendations are well received and often acted upon during the course of the audit. External auditors rely on the work of the internal audit function when conducting their examination of the financial statements.

3.0 ASSET MANAGEMENT

3.1 Overview

The Distribution and Transmission businesses are operated using the Asset Management model, which the company adopted in 1998 and is described in Exhibit A, Tab 3, Schedule 1. The model separates the planning, decision-making and approvals associated with customer and asset needs from the engineering design, estimating and asset service functions required to expand and maintain the assets. This separation of functions is a common industry practice in today's utilities and reflects the different skills required for these functions. By applying this model and centralizing the decision-making, Hydro One Networks Inc. can ensure that management decisions involving customer and asset requirements are made on a consistent basis across the service territory.

The costs associated with the operation of the Asset Management function are outlined below while the various activities that are performed as part of this function are discussed in the following sections.

Table 13
Asset Management Function ($ Millions)

Function/Service	Historic			Bridge	Test	
	2004	2005	2006	2007	2008	2008 Dx
Strategy & Business Development	6.4	6.3	6.4	5.9	9.6	5.1
System Investment	17.2	14.0	22.0	22.7	32.2	7.7
Business Transformation	1.8	2.3	2.7	3.4	3.2	1.7
Business Integration	13.1	12.1	16.5	15.5	20.3	8.7
Facilities and Real Estate	38.7	35.4	38.7	37.5	44.0	21.6
Contracts & Business Relations	3.2	2.6	4.9	5.1	4.9	0.7
Work Program Optimization	2.5	2.5	3.6	3.8	4.7	0.7
Total Costs	82.9	75.2	94.8	93.8	118.9	46.3

Asset Management remains focused on ensuring, and being able to demonstrate, that the necessary distribution and transmission assets are planned, acquired, constructed and maintained to deliver the required function and level of performance expected by customers in a sustainable manner. The Asset Management function balances the needs of customers, the regulator, employees, and the shareholder by delivering on the following accountabilities:

- Development of an investment plan that ensures maintenance of critical distribution and transmission infrastructure, in order to meet the needs of customers in the short and long term and to ensure regulatory compliance.
- Ensure the effective delivery of the programs and projects within the plan, by working with other business units to optimize the bundling and sequencing of the work;

- Implementation of effective processes and support for the bundling, release, monitoring and redirection of investment projects, and assurance that expected results are being delivered;
- Ensuring that Hydro One Networks Inc. meets the transmission development challenge presented by the Province's supply situation, including identifying and undertaking system augmentation, load connections, generation connections, and interconnections with neighbouring systems;
- Development, integration, and implementation of Corporate strategies and support or lead, appropriate key initiatives such as Conservation & Demand Management, smart networks, business development opportunities, and productivity improvement initiatives;
- Influencing the business and regulatory environment to ensure customer needs and business objectives (safety, regulatory compliance, environmental performance, etc.) are met in an effective and efficient manner;
- Coordinating and managing an integrated approach to emergency preparedness and business continuity, including liaison with other industry organizations and various levels of government; and
- Managing property rights and maintain facilities.

Effective delivery of these accountabilities is key to the Company to meet public and employee safety objective, to comply with the Distribution System Code, environmental requirements and Government direction, maintain distribution business service quality and reliability at targeted performance levels, and ensure public confidence as stewards of provincial assets. In particular, Asset Management plays a key role in the development of asset strategies and investment plans to move the distribution and transmission businesses to first quartile reliability on a like-for-like basis; in undertaking initiatives to increase customer satisfaction to 90%; and through transformation initiatives to improve the efficiency of Hydro One's business environment.

As shown in Table 13, the 2008 cost of doing this work is $118.9 million with $46.3 million allocated to Distribution. Please refer to Exhibit C1, Tab 5, Schedule 1 for further details on the percentages used to allocate costs into Distribution and Transmission components.

Over the period 2004 through 2008, total costs increased in Asset Management by 43% mainly due to:

- The large increase in the corporate OM&A and Capital work programs resulting in the need for more planning engineers and finance support staff.
- Increased regulatory support including OEB rate hearing, Environmental Assessment Board (EAB) and OEB leave-to-construct (Section 92) support,
- Support for the compliance activities including Bill 198 programs
- Succession planning / demographics planning (i.e. dealing with staff attrition)

3.2 Strategy and Business Development

Table 14 provides a summary of Strategy and Business Development costs***:***

Table 14
Strategy and Business Development Function ($ Millions)

	Historic			**Bridge**	**Test**	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total Costs	**6.4**	**6.3**	**6.4**	**5.9**	**9.6**	**5.1**

3.2.1 Overview

The Strategy and Business Development function provides leadership to ensure the Asset Management function fulfills its role in managing the distribution and transmission businesses, meeting all legislative, regulatory and corporate requirements. The 2008 total cost for this activity is $9.6 million, with $5.1 million being allocated to Distribution.

The increases in costs in 2008 over 2006 are due to increased requirements related to Distribution Business Development for Distribution Rationalization ($1.5 million), increased insurance costs due to escalation ($1.2 million) and additional staffing requirement ($0.6 million). Distribution Rationalization was launched together by Ministries of Finance and Energy to promote further rationalization of the electric distribution sector in Ontario.

3.2.2 Strategy and Business Development Activities

Strategy & Business Development will continue to lead and support the development and integration of strategies that respond to corporate direction, and to changes in the industry environment and/or government policy; as well as opportunities to optimize leveraging of Hydro One's assets and improving efficiencies within the utility sector such as utility rationalization.

The Strategy and Business Development function provides the following key work activities:

- continuing to lead and support the development and integration of strategies that respond to corporate direction, and to changes in the industry environment or

- government policy (for example, Distribution Rationalization, and the Conservation and Demand Management initiative);
- supporting opportunities to optimize leveraging of Hydro One Networks Inc.'s assets (for example, secondary land use);
- develop strategies and implementation plans for business improvement initiatives (for example, smart networks);
- developing business initiatives that support corporate goals related to the transmission and distribution functions;
- assisting with improving efficiencies within the utility sector (for example, utility rationalization).

Included in the cost of this function is the funding for Property and Boiler and Machinery insurance (approximately $3.5 million for both 2007 and 2008).

3.3 System Investment

Table 15 provides a summary of System Investment costs:

Table 15
System Investment Function ($ Millions)

	Historic			Bridge	Test	
	2004	2005	2006	2007	2008	2008 Dx
Total Costs	17.2	14.0	22.0	22.7	32.2	7.7

3.3.1 Overview

System Investment focuses on developing an effective distribution and transmission integrated system investment plan that delivers on the planned business objectives. As shown in Table 15, the 2008 cost for this activity is $32.2 million with $7.7 million being allocated to Distribution. The increase in cost since 2004 is due to the need to address staff demographics and to accomplish additional work activities related to the growth of the Distribution and Transmission work programs (62% increases) managed by System Investment. Specifically,

- the management of an aging asset base requiring higher levels of maintenance refurbishment and replacement;
- the unprecedented number of new proposed generation connections;
- the impact of the Government's policy decisions (e.g. Smart meters) and OPA programs (e.g. Standard offer program);
- the need to plan, consult and obtain approval for new facilities to accommodate load growth, address reliability issues or improve operational flexibility;
- the emergence of new industry standards and codes; and
- the need to address customers' concerns regarding service quality including reliability and power quality (e.g. Tingle voltage).

3.3.2 System Investment Activities

System Investments activities include:

- setting overall policy, strategy and standards for managing the regulated asset base;
- providing the framework to develop, scope and establish priorities for work programs to manage the risk to Hydro One's business values;
- evaluating and recommending an integrated OM&A and Capital investment plan, through an integrated assessment and prioritization process;
- developing programs and plans to manage the performance of existing assets;
- developing plans to connect new loads and generators to address network constraints;

- preparing and obtaining approval for system investment business cases;
- developing, in consultation with customers, OPA and IESO, economic, cost efficient and practical investments that are consistent with customers needs or government policy
- supporting regulatory filings and applications;
- conducting technical evaluations (including system performance studies and asset condition analysis), developing and scoping alternatives, conducting economic studies to establish preferred plan, supporting industry transformation and compliance through representation in industry organizations to influence reliability or equipment requirements; and
- identifying and testing new technologies, such as the Geographic Information System ("GIS") to provide a digitized spatial representation of the physical assets to improve Hydro One Inc.'s knowledge of its assets and use this knowledge to improve investment decision making.

There will continue to be an increased focus on connecting new generation and providing increased transmission and distribution capacity to allow new supply to be delivered to load centers. Initiatives to improve the performance of the distribution and transmission systems are ongoing. Station and line assets and rights of ways have been assessed performance outliers and end-of-life equipment have been identified and corrective actions have been prioritized within the investment plan. Actions required to ensure assets are planned, designed and operated in compliant with industry standards, are also included in the investment plan.

.

3.4 Business Transformation

Table 16 provides a summary of Business Transformation costs:

Table 16
Business Transformation Function ($ Millions)

	Historic			Bridge	Test	
	2004	2005	2006	2007	2008	2008 Dx
Total Costs	**1.8**	**2.3**	**2.7**	**3.4**	**3.2**	**1.7**

3.4.1 Overview

The Corporate Projects / Business Transformation function identifies emerging issues, develops appropriate responses, fulfills the needs set by corporate strategic direction, and implements selected time-limited initiatives that are critical to the future of Hydro One Networks Inc. Opportunities for improvement and especially projects that require a focused, integrated approach across Hydro One Networks Inc. are a focus of the function.

Investments are required to effect more efficient, industry standard business practices, oversee replacement of the end-of-life Enterprise business systems to meet business needs and maintaining and ongoing sustainment function, develop governance of shared business data, provide project delivery services for major corporate initiatives and mitigate risks in certain critical areas of Corporate infrastructure and business functions.

The total 2008 cost for this function is $3.2 million with $1.7 million being allocated to Distribution. The increase in cost since 2004 is due to increased work activities and scope in areas such as, project management for cross functional initiatives, enhancing data and systems, and providing a sustainment organization over this period.

3.4.2 Business Transformation Activities

Corporate Projects / Business Transformation Activities include:

- participating in the preliminary definition and scoping of cross-functional priority projects, or directly managing and mobilizing resources for large projects;
- managing cross-corporate initiatives to ensure an integrated approach to data, systems, and processes within Hydro One. The current priority is planning the replacement of a corporate core system, the first phase of which is the replacement of the existing purchasing module, inventory module, work management module, labour time entry module, and Accounts Payable module (refer to Section 4.0 of this exhibit and to Exhibit D1, Tab 3, Schedule 5, Section 2.4 for more information);
- managing the Data Management Program providing a single coordinating agency for optimizing Hydro One's data systems and processes; and
- providing appropriate physical security and monitoring, response security services, police awareness and adequate backup facilities for critical infrastructure; and managing Hydro One's integrated approach to Emergency Preparedness and Business Continuity, including liaison with other industry organizations and various levels of government.
- providing a sustainment organization for the corporate strategic direction in assisting the development of corporate strategy, ensuring ongoing sustainment of critical corporate initiatives once developed, and supporting for maintaining ongoing strategic relationships and other strategic projects.

3.5 Business Integration

Table 17 provides a summary of Business Integration costs:

Table 17
Business Integration Function ($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total Costs	**13.1**	**12.1**	**16.5**	**15.5**	**20.3**	**8.7**

3.5.1 Overview

The Business Integration function provides effective support across the organization through its role in planning, budgeting, releasing, monitoring, reporting, and control of the Capital and OM&A work programs and related processes. As shown in Table 17, the 2008 cost for this activity is $20.3 million, with $8.7 million allocated to Distribution. The increase in cost since 2004 is mainly due to support for an increased work program and labour escalation increases.

3.5.2 Business Integration Activities

Business Integration Activities include:

- Development of specific business plan requirements, support for the development of plans, and consolidation of the plan;
- Development of work program standard costing rates;
- Management of integration processes for releasing and monitoring program results through common systems;

- Reporting and analysis of work program costs and results, and managing necessary program redirection;
- Reporting and analysis of system and component reliability;
- Development and maintenance of field business processes;
- Management of field processes for data capture, reporting and internal controls; and
- Management of Inergi contract governance including official contract notice, joint operating committees, internal governance.

3.6 Facilities and Real Estate

Table 18 provides a summary of Facilities and Real Estate function costs:

Table 18
Facilities and Real Estate Function ($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total Costs	**38.7**	**35.4**	**38.7**	**37.5**	**44.0**	**21.6**

3.6.1 Overview

The total cost for the Facilities and Real Estate function in 2008 is $44.0 million with $21.6 million allocated to Distribution.

3.6.2 Real Estate Services ("RES")

Real Estate Services manages Hydro One's land rights portfolio across the Province. This involves ensuring that rights across over 200,000 acres of owned transmission corridor, easement and "statutory right" properties are maintained and new rights are acquired as necessary to ensure the safe and reliable operation of the transmission systems. In addition, Real Estate oversees the management of Hydro One's rights associated with distribution and transmission lands, stations and other property. Key work activities include:

- managing acquisition of real estate and new real estate rights (this includes Company Transmission Development Project Initiatives across the Province);
- managing the Provincial secondary land use program on behalf of the shareholder / Province, for example leasing transmission corridor lands to external parties;
- managing easement, other rights agreements on public/private sector, railway and other lands;
- managing First Nations settlements and First Nations;
- managing about 500,000 unregistered, low-voltage, real estate rights agreements;
- providing specialized real estate service activities, including managing property tax payments to municipalities, appealing property tax assessments, and providing employee relocation services.
- maintenance of Geographic Information System (GIS) – property record database.

More specific support is provided on a selected project basis. This includes provision of land ownership information, damage claim settlement, road access and other rights acquisitions.

Specialized real estate services are provided as necessary. This includes assessment appeals, payment of property taxes on distribution lands/buildings, as well as Employee Relocation Services as appropriate.

3.6.3 Facilities

Facility costs contribute $33.0 million, or approximately 75% of the total Real Estate costs. The Facilities function manages all of the building and site facilities across the

Corporation. This includes leasing costs and contract management for Head Office. In addition, it also includes costs for administrative & service centers, transmission site facilities and infrastructure and other work locations (for example, London Call Centre and the Ontario Grid Control Centre).

The Facilities Program focuses on providing employee workspace at sites across the province including Head Office, administrative and service centers, including the OGCC and other work locations, such as the London Call Centre, and Network Services field centre facilities.

Providing adequate workspace, storage and garage facilities for employees and trades is critical to the effective undertaking of organizational work programs. Equally important is ensuring that new or existing employee workspaces are consistently maintained to a standard that meets current work requirements and complies with all corporate, legislative and other related health, safety and environmental standards.

This Program includes:

- Administration of 42 contract lease agreements for workspace rented from other parties, including contractual obligations undertaken regarding payment of rent, operating expenses and taxes;
- Coordination of activities related to the ongoing management, operation, maintenance and inspection of 92 administrative/service Centers;
- Provision of support services for Head Office space, such as provision of office supplies and equipment, coordination of office moves, records management and tenant services.
- Providing accommodation strategies and acquiring new employee / trades workspace in line with operational requirements is also undertaken.

The Facilities work program is extensively driven by fixed cost contractual obligations as well as by the current regulatory environment (including Health & Safety and Corporate Standards) and corporate staff levels.

Fixed cost contractual obligations arise primarily through relationships with external landlords. For example, rent, operating and tax costs are specified in formal lease agreements and opportunities to significantly amend these set costs typically do not materialize until the agreement expires. Other fixed costs are represented by negotiated contracts with internal and external service providers for base level facility maintenance (for example, Administrative/Service Centre building maintenance, janitorial and snow removal, minor repairs, building component inspections) and similar activities. These contracts focus on maintaining facilities in a condition that meets current employee work requirements and corporate/legislative requirements.

The 2008 funding level primarily reflects the new Company accommodation and space requirements. In addition, fixed facility cost components (for example, utilities, property taxes, operational costs) are expected to continue to rise. This is due to the anticipated escalation of electricity and natural gas prices in Ontario.

3.7 Contracts & Business Relations

Table 19 provides a summary of Contract & Business Relations function costs:

Table 19
Contracts & Business Relations Function
($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total Costs	**3.2**	**2.6**	**4.9**	**5.1**	**4.9**	**0.7**

3.7.1 Overview

Improving customers' view of Hydro One Inc. is one of the company's strategic objectives, this strategy targets achieving a 90% customer satisfaction rating by the end of 2010. Within Hydro One Inc., it is the role of each employee to ensure that they work towards improving customer satisfaction in all of their dealings. The Contracts and Business Relations function focuses its efforts on large distribution and transmission customers.

3.7.2 Contract & Business Relations Activities

Contracts & Business Relations activities include:

- Maintaining and enhancing customer service and customer loyalty while working within regulatory boundaries in a manner that optimizes shareholder value;
- Enhancing relationships with large distribution and transmission customers; Implementation of the "Large Customer" strategy has resulted in an increase in effort to better manage customer expectations, reflect their concerns in Hydro One Inc.'s plans, and demonstrate accountability on the part of Hydro One Inc. Although there has been great improvement in these activities, there is a need to spend more time and include more customers in order to achieve planned customer satisfaction initiatives;

- Facilitating of new connection agreements;
- The wholesale meter exit program and the SCADA data provision program.

3.8 Work Program Optimization

Table 20 provides a summary of Work Program Optimization costs:

Table 20
Work Program Optimization Function ($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total Costs	**2.5**	**2.5**	**3.6**	**3.8**	**4.7**	**0.7**

3.8.1 Overview

Work Program Optimization focuses on planning, integrating and bundling awarded transmission and distribution work across Hydro One Networks. As shown in Table 20, the 2008 cost for this activity is $4.7 million with $0.7 million allocated to Distribution. The year over year changes since 2006 are due to increased work activities that are a direct consequence of an increasing distribution work program plus the addition of long term work modeling as well as resource management to improve overall work execution effectiveness.

3.8.2 Work Program Optimization Activities

Activities of the function can be split into four major categories:

- Work Planning, Bundling & Integration - Work closely with functions across the organization to bundle and schedule work utilizing a corporate planning and scheduling system, to minimize outages, costs and resources used.
- Scheduling Operations - Provide administration of the corporate planning and scheduling system including the management of any required upgrades, training and operating requirements and the development of planning standards and templates for the efficient scheduling of work.
- Regulatory Compliance Monitoring – Manage the regulatory compliance program which includes the communication and coordination of requirements to ensure corporate compliance targets are met. Create a data set that demonstrates regulatory compliance has been achieved; and coordinate activities taken by other business units in completing the work.
- Knowledge Management - Manage a knowledge management system for key Engineering & Construction Services documents. The system includes standard document templates and a structured workflow for document creation. Provide a storage and management system to enable searching and retrieval of historic documents.

4.0 INFORMATION TECHNOLOGY

4.1 Overview

Information Technology (IT) refers to computer systems (hardware, software and applications) that support business processes through which employees perform work activities. IT infrastructure includes the voice and data telecommunication networks and computer equipment that connect employees to customers, IT systems and facilities for the distribution and transmission of electricity.

The mission of Information Technology is:

- To act in the role of custodian of the technology assets and infrastructure.
- To ensure a robust, resilient, secure and flexible information, technology and business telecom infrastructure
- To develop information and technology strategies and plans consistent with the lines of business needs to enable them to meet their operational objectives
- To be client-focused by delivering knowledgeable, expert advice and service to the lines of business
- To oversee, manage and deliver IT projects.

Broad industry-wide principles govern the strategies employed at Hydro One in the formulation of foundation principles, such as:

- Implementing a governance structure that involves the lines of business to meet the Company’s objectives by prioritizing required tools and funding
- IT tools supporting the business should be generic and “off the shelf”, and outsourced services should be readily available through leading providers

- Applications and hardware should be managed in accordance with their lifecycle parameters
- Disaster recovery should allow for the resumption of essential business processes in a reasonable time frame
- The IT custodian is accountable for maintaining a secure and robust technology infrastructure.

Table 21
Information Technology Summary of OM&A Expenditures
($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Sustainment	**62.6**	**57.6**	**60.2**	**63.9**	**59.6**	**34.2**
Development	**7.5**	**7.0**	**12.5**	**10.9**	**14.4**	**5.8**
Business Telecom	**17.2**	**15.7**	**18.6**	**17.2**	**17.1**	**8.7**
IT Management & Project Control	**5.4**	**5.6**	**5.0**	**6.7**	**8.2**	**3.9**
TOTAL	**92.7**	**85.8**	**96.2**	**98.7**	**99.3**	**52.6**

Sustainment costs in 2006, which were paid to Inergi pursuant to the Outsourcing Contract, include an additional $1.2M attributable to COLA. In 2007, sustainment costs increased to $63.9 million as a result of the purchase of additional Inergi support services for field side and helpdesk support, storage services, and IT vendor management. Support costs included in sustainment increased with the delivery of new applications such as the Work Execution Project (WEP) and the “lock in” of support for the Arc FM application.

Development OM&A includes the impact of capital projects, which increases going forward as a reflection of the Cornerstone project. Business Telecom costs fluctuate when major initiatives to enhance Hydro One’s telecom network are required, such as extensive work and materials to refresh and realign Local Area Networks throughout the company, part of a three year program from 2006 through 2008.

IT work programs include both OM&A and capital items and includes the maintenance and sustainment of existing and newly commissioned applications and technologies; the development and implementation of new technology processes; the provision of Business Telecom services; and the overall management and control of information technology capital projects. IT capital investments are made in accordance with approved business strategies and are described in Exhibit D1, Tab 3, Schedule 5.

IT Sustainment and Business Telecom services represent approximately 77% of total IT OM&A expenditures in the Test year and are work programs provided by third parties. This work is obtained through competitive contracts or at costs representing fair market prices.
Work management and project control costs relate to, IT administration, project oversight and reporting, program and spend coordination, and QA/QC processes. These functions comprise approximately 8% of the annual expenditure. The development, enhancement and upgrading of IT applications approximates 15% of the IT OM&A expenditure. The provision of these small non-Capital applications and/or added incremental functionality enables Hydro One to more efficiently perform work and to enhance the business value of existing applications.

Since January, 2005, Hydro One has evolved its IT governance structure to address IT control requirements contemplated by Bill 198, the financial control structure to which the company adheres.

IT governance has evolved from a project centric model to a more structured corporate enterprise wide model which looks proactively at IT strategy, project expenditures and service delivery as integral to allowing the lines of business to meet their objectives.

The IT governance model involves the senior business managers who provide guidance, direction and support to the decision-making for corporate technology decisions. These executives act as an IT Steering Committee to which the CIO reports at regular intervals. The CIO also reports to the CFO and CEO and the Executive Committee on IT matters. The Steering Committee's mandate is to review and prioritize the IT investments on a corporate enterprise basis.

The integrated governance structure generates a close working relationship among IT and the lines of business, and the outsource provider Inergi, to ensure that information technology provides the IT solutions required by business operations.

IT infrastructure is composed of three major categories which are described in Table 22.

Table 22
Overview of IT and Business Telecom Infrastructure

Item	**Description**
IT Hardware Infrastructure	Hardware infrastructure includes processors, data storage, data backup and disaster recovery systems located at data centers and which are required to run business applications. As of January 2007, it included IBM mainframe computers (used by Customer Information System), 55 Unix servers (used by major business applications) and 357 Windows servers (used by small business applications, web servers, Email, and file/print services), 66 terabytes of data storage, and employee workstations. There are approximately 6700 desktop, laptops and other portable devices used by Hydro One staff to carry out their work assignments.
IT Software Infrastructure	Software infrastructure includes applications, utilities, and tools required to operate and maintain Hydro One work functions. There are approximately 700 software applications used by various groups throughout Hydro One. Of these there are a small number of critical and broadly used applications as noted below in Table 25 of this section. Infrastructure software includes items such as: desktop office programs; data base applications; operating systems; geographic information systems ("GIS"); programming language compilers; database design tools; web design tools; data extraction and analysis tools; report writing tools; and application integration tools. Enterprise software are applications those that enable the linking of several applications and/or several work efforts to a single business process.
Business Telecom Infrastructure	Voice and data telecommunication infrastructure links staff and business applications at major Hydro One sites (Trinity, Richview TS, Markham and London Call Centres, Mississauga Data Centre), at over 120 field office locations and at additional work sites located throughout Ontario. Hydro One's 1.2 million customers can connect with the company's two Call Centres by telephone, facsimile, letter and email as can access customer information and notices electronically on the Web-site. Business Telecom infrastructure includes voice and data lines leased from common carriers, leased equipment, as well as company owned data circuits and internal wiring for local and wide area data networks ("LAN" and "WAN"). There are over 5300 desktop handsets for telephone and voice mail service, over 790 routers and switches for the data network, and approximately 22 network security devices (for example, firewalls, intrusion detection, anti-virus appliances, and proxy servers).

4.2 IT Sustainment OM&A

Table 23 shows the expenditures for IT sustainment of the Information Technology infrastructure.

Table 23
OM&A Sustainment of Information Technology
($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Base IT Sustainment Services	48.4	41.3	45.9	43.5	42.8	24.5
OMS Incremental Sustainment	7.9	7.1	6.8	6.5	6.6	3.8
Other Incremental Sustainment	6.3	9.2	7.5	13.9	10.2	5.8
Total	62.6	57.6	60.2	63.9	59.6	34.2

IT OM&A Sustainment represents expenditures for work programs required to operate IT services for Hydro One and is provided through the outsourced service contract with Inergi. Sustainment charges for enterprise information technology systems and applications includes work performed on the data centre server systems, on desktop office applications, on customer service applications and contact centre systems, financial and material management systems, work management applications, administration and communications systems, engineering and planning applications as well as on field operations systems. Sustainment work includes help desk support; implementing system patches; applying fixes for application troubles; decommissioning or installing software applications or equipment; maintaining and operating Hydro One equipment located at offices and the data centre. Sustainment OM&A costs also include amounts paid to third parties for software licenses and equipment operating leases.

IT sustainment work is broken down into the three categories discussed below. These categories are Base IT Services, Open Market Systems ("OMS") Incremental

Sustainment (which comprises those applications introduced in response to Government open market policy initiatives) and Other Incremental Sustainment representing new services or technology support obtained after March 2002.

4.2.1 Base IT Sustainment Services

The term "Base" IT Sustainment Services refers to those IT services, including the sustainment services discussed above, that were part of the original scope of work outsourced in March, 2002.

Base IT services are provided by Inergi LLP (Inergi) pursuant to a 10-year competitively bid outsourcing agreement entered into in 2002. The cost to Hydro One for base IT services from Inergi will decline over the term of the agreement. Service levels are contractually maintained throughout the contract period.

The amount of the base IT cost is predicated on the assumption that the level of service for the number of applications supported at the time of the contract would continue while costs associated with those services charged to Hydro One would decline over the life of the agreement. Inergi is responsible for managing its business operations to obtain the guaranteed savings being provided to Hydro One without affecting the contracted service levels.

Base IT Sustainment services are required each year to support corporate computer applications including Microsoft Windows, Microsoft Office, PassPort, PeopleSoft and Customer-1, the corporate LAN and the corporate data centre systems that existed in March, 2002. Base IT services are discussed under the five categories below.

Hardware Maintenance/Software License Fees

Hydro One maintains a careful watch over application software licenses and versions, and hardware equipment and warranty programs to ensure interoperability among various applications and hardware and to honour licensing agreements. Inergi and IT staff work with application and hardware vendors to undertake maintenance work or upgrades as required.

Application software license costs are fees paid to third party vendors. Application usage is reviewed on an ongoing basis jointly by Inergi and Hydro One personnel.

At the inception of the outsourcing agreement $13.4 million of application costs were transferred to Inergi to administer on a pass through basis. Over time many of these contracts have migrated back to Hydro One, and are now administered by Hydro One. In 2008 the remaining administered contract cost reflected in the base fee is $5.3 million. Contract costs which are now being managed by Hydro One, and administered by Inergi, are reflected in Other Incremental Sustainment costs.

Application Support

Application support includes the work to maintain and to address matters associated with the approximately 730 Hydro One business applications used by the various business units across the Province. Within these applications there are strategic or business critical software applications used in major functional areas, such as those shown in Table 24. These critical programs affect many work processes and are enterprise wide serving many employees across multiple work and business groups.

Based on support levels established by IT and the respective business operations, applications are managed in a problem management framework. Application problems and user inquiries are logged, prioritized, and managed through to resolution.

Table 24
Strategic Information Technology Systems

IT Systems	Description
Desktop Applications	These include Microsoft Office XP/2003 (for example, Word, Excel, Access, and PowerPoint) email, Internet browser, and various others such as anti-virus and directory functions.
PassPort™	This is an integrated enterprise asset management (EAM) application suite that provides Asset and Work Management, Purchasing and Supply Chain functions as well as Inventory Management functions. This application is currently being replaced with an SAP solution as part of the Cornerstone Program as described in Exhibit D1, Tab 3, Schedule 5.
PeopleSoft™	This Financial and HR application suite provides General Ledger, Accounts Receivable, Fixed Assets, Project Accounting, Payroll, and Pension functions. These applications are planned to be replaced or upgraded as part of the Cornerstone Program. Work has commenced to replace these systems as part of the Cornerstone project
Customer Information System	The CIS is an application suite providing billing and services support through sub-systems of Customer Service System (CSS) and Open Market Systems that interface with each other. The CIS application is also scheduled for replacement under the Cornerstone Program.
Contact Centre Technology	This suite of applications enables contact centre operators to respond to customers (service requests, billing inquiries, information), and provide operator scheduling and service quality-monitoring functions.
Open Market Systems (“OMS”)	These are a set of applications that provide for meter data collection, sending/receiving of electronic business transactions with market participants, bill calculations, and settlement functions with the Independent Electricity System Operator.
Field Design Tool (ArcFM)	This is a geographic application that is used to design and modify customer connections to the electrical distribution system.

Outage Response Management System (ORMS)	ORMS is used for the reporting of distribution outages and managing the service restoration, which includes outage repair scheduling and dispatching of field crews
Work Execution Project (WEP)	WEP consists of 3 applications (Pragmacad, P3e,e-time) which are used to plan, schedule, dispatch and report on work completion. The applications are used for work planning, crew scheduling and for both planned and unplanned field work. The applications are "out of the box" and are cross linked to ArcFM, Passport and to Customer One through the use of the enterprise bus or enterprise middleware.
Asset Data Mart	This application provides the storage of information on distribution asset condition and maintenance history, and is used in planning asset/work management. It extracts and aggregates data from a variety of applications, including Passport and PeopleSoft.
Work Planning and Reporting System (WPRS)	The WPRS is an application that provides work planning, crew scheduling, dispatching and time recording functions to the LOB users such as Customer Operations, Grid Operations and E&CS and as such interfaces with PassPort, PeopleSoft and other critical systems

Data Centre Services

Data centre services include operating, maintaining, and repairing hardware (servers, mainframe, and data storage devices) plus associated applications located at the data centre facilities. This hardware is used to run key business applications, noted above, such as Passport, PeopleSoft, Market Ready OMS and the Customer Information Systems that are critical to operating the business.

Data Centre service levels have been established to ensure the reliable operation of business applications and are based on system criticality. The system hardware is located at data centres, which have the required system redundancies including 24/7 monitoring. In addition to the primary site, there is a back up data centre facility for development and testing and which would be used in the event of a disaster recovery scenario to recover critical business systems.

Distributed Server Sustainment

Distributed server sustainment includes the support services that maintain and operate the application and file servers that are located at various Hydro One facilities across the province. The servers are used to run business applications and administration systems such as file sharing, e-mail exchange, web hosting and security monitoring systems. This work is required to maintain the reliability of the servers and the business applications used to operate the business.

Help-Desk & Desktop Support

Help-Desk & Desktop Support includes daily and emergency IT maintenance services delivered to employees across the Province.

The support function is provided through two key service areas: the Help Desk which provides centralized call handling through a 1-800 number, problem resolution and escalation or referral for all IT and telecom service areas; and Desktop Workstation Support which provides physical desk side support to fix hardware and software problems for laptops, desktops and rugged tablet computers. Desktop Workstation Support includes the support for IT peripherals such as printers, plotters, scanners and other equipment. Help Desk support includes work comprising a number of functions including handling trouble calls, providing application support and resetting or enabling application or system passwords.

Desktop and Help Desk support is available to all users across the province and assistance can be provided by telephone, remotely through the data network, or if necessary through the use of field technicians. On a monthly basis, approximately 5,000 help desk calls are logged, dealt with and cleared. Effective response to these calls ensures the efficient operation of infrastructure that enables staff to perform their work unimpeded.

4.2.2 OMS (Open Market Systems) Incremental Sustainment

This category is incremental to the base sustainment identified and sourced to Inergi in 2002. Specifically, the work addresses OMS and consists of the support functions performed to sustain the OMS hardware and software applications. The OMS is comprised of a suite of software applications that have been bundled together to provide the required functionality. The support for the OMS was "locked in" and is supported by Inergi at an annual cost of $6.6 million in 2008. The OMS suite is used to enable wholesale and retail settlement processes. The processes provide interaction with the IESO and other market participants and are required for the business to operate under the Province's open market policies, driven in part by the *Electricity Act, 1998* and related legislative policies.

4.2.3 Other Incremental Sustainment

Other Incremental Sustainment includes additional sustainment services provided in order to support and manage hardware and business applications, commissioned since March, 2002 and includes license and software costs. The work and the associated costs which are shown are incremental.

New applications are being continually commissioned or added to meet new business requirements. Since 2002, therefore, the incremental sustainment cost has increased as additional hardware and applications have been added annually through capital projects and also through development projects.

As noted above, included in the Incremental Sustainment charges are costs related to additional application software licences, hardware maintenance costs for new equipment, as well as contracts which when they expired were transferred back to Hydro One for direct payment.

While the overall trend of “incremental sustainment” is upward as more applications are being added, savings from decommissioned applications are netted against these new costs.

A list of planned incremental capital projects, which in turn will create incremental sustainment needs when these projects are commissioned, is found in Exhibit D1, Tab 3, Schedule 5.

Cost increases in 2007 reflected the introduction into production of the WEP applications, a “lock in” of the support costs for Arc FM, consolidation of servers (partially offset by a reduction in server volume based costs) and the increases in database volume requirements. In addition, help desk and support costs services were increased to meet demands for improved support for field business processes and to adjust for increasing ongoing support volumes.

4.3 IT Development OM&A

Table 25 lists the expenditures driven by non-Capital small IT projects and the OM&A portions of capital projects.

Table 25

OM&A Development Expenditures

($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Small Projects	**5.2**	**5.6**	**9.1**	**5.6**	**6.5**	**2.4**
Data Management Program	**0.0**	**0.0**	**0.0**	**0.1**	**0.0**	**0.0**
Impact of Capital Projects	**2.3**	**1.4**	**3.4**	**5.1**	**7.9**	**3.4**
Total	**7.5**	**7.0**	**12.5**	**10.9**	**14.4**	**5.8**

4.3.1 Small Projects

Small Projects include those individual projects that are valued at less than $2 million each and according to the Hydro One accounting rules are not capitalized. Small Projects include enhancements made to existing applications or new software for minor process automation improvements, software (version) upgrades or task defined software replacements.

Hardware costs for smaller items such as desktop computers, tablets, and printers are not included in this category and are considered minor fixed assets and are capitalized.
The number of small projects and the associated small project costs varies each year depending on the work projects requested by the lines of business to meet their needs and programs. Small projects costs and programs are reviewed with the IT steering committee on a regular basis.

Small project costs for 2007 include upgrades to the learning management system, the real estate GIS system, and the purchase of a customer call virtual hold functional application which operates in conjunction with the call center IVR. In 2008, there are a number of smaller enhancement projects which include upgrades to the ArcFM GIS application, Hazardous Waste application and some additional work flow improvements for the customer system.

Small projects typically fall into two categories:

1. Software version upgrades which are undertaken to ensure reliability and to maintain warranty status by securing continued vendor support for applications that may otherwise be outdated, unsupported or may present an undue risk of failure given their age. Therefore, these investments are critical to maintain existing functionality.
2. Enhancements or improvements which are made to existing applications, or to enhance business processes to add improved functionality or usability.

4.3.2 Data Management Program

The Data Management Program provides the single coordinating agency accountable for optimizing Hydro One's data systems and processes. Data issues are addressed by Data Management in consultation with stakeholders in the lines of business and Business Information Technology. Program expenses are forecast to take place in 2007, with data efforts being focused in the Cornerstone Project in 2008. .

4.3.3 Impact of Capital Projects

The item “Impact of Capital Projects” includes business process re-engineering costs such as training and change management work efforts that are required to implement and train the line of business personnel when new or revised IT applications are introduced. These costs are associated with the IT capital projects discussed under Exhibit D1, Tab 3, Schedule 5, and typically reflect an OM&A cost equal to 10% of the Capital project.

Increases in annual costs in 2006, 2007 and 2008 relate to projected work primarily associated with the implementation of the Cornerstone project.

In accordance with Hydro One's accounting practices, the cost associated with this implementation work (training and business process change) is not capitalized. The implementation work ensures each new business application or upgrade is properly introduced and has the necessary user understanding and support.

4.4 Business Telecom

The work involved in ensuring adequate Business Telecom services also includes the Field Services work involved in the Local Area Network (LAN) upgrades. The charges assigned to Voice Services reflect voice components from combined Data/Voice telecom bills rendered by Bell Canada and by other 3rd party providers.

Data Services reflects the LAN equipment materials as well as carrier charges (Bell, Allstream etc) for increased network bandwidth capacity, required to support business field applications, and network changes to add or delete locations.

Business Telecom provides the data and voice telecommunications services, network operations management and field service repairs which are required for the company to operate from its province wide locations. The business telecommunications data network is comprised of a mixture of company owned and leased facilities and equipment.

The costs shown in Table 26 reflect the lower supplier costs now available from common carriers while still responding to the generally increasing demands of all forms of communications. Growth in data network points served and circuit capacity bandwidth have generally been offset by pricing concessions obtained by Hydro One Telecom from common carriers on behalf of Hydro One.

Cost increases in 2006 reflect additional charges for bills in dispute between Hydro One and a large carrier. These invoices were resolved and resulted in a one time increase in costs for data and voice services.

Table 26
Business Telecom OM&A Expenditures
($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Operations and Carrier Management	**2.9**	**3.0**	**3.2**	**4.2**	**4.4**	**2.2**
Field Services	**3.9**	**3.3**	**4.1**	**3.8**	**4.9**	**2.5**
Voice Services	**5.3**	**3.7**	**5.4**	**4.1**	**3.4**	**1.7**
Data Network	**5.1**	**5.6**	**6.0**	**5.1**	**4.4**	**2.3**
TOTAL	**17.2**	**15.7**	**18.6**	**17.2**	**17.1**	**8.7**

A 2005 independent industry review concluded that the service level agreement for the Hydro One Telecom operation centre, and for the services provided by it, reflects market conditions and that Hydro One Telecom has provided an advantage to Hydro One in respect of telecom administration and the resultant costs.

In 2006, an updated review was undertaken. The report considered the revised services which will be performed in the contract and the increase in costs charged by Hydro One Telecom. The report concluded the proposed contracted costs for 2007 and 2008 are indicative of fair market value. The 2006 review considered the negotiated service level agreement between Hydro One and Hydro One Telecom for services to be provided in 2007 through 2008.

4.4.1 Operations and Carrier Management

Operations and Carrier Management costs relate to telecommunications management services provided by Hydro One Telecom. Increases in 2007 and 2008 relate to additional security monitoring and infrastructure management services, an increase in the growth of the business telecom network, and reflects the new contract for Telecom services.

Work performed by Hydro One Telecom includes operating and monitoring the business telecom and data networks; management of security firewalls, managing data and voice system problems, obtaining and managing fibre services from third party vendors, and directing other telecom service providers and vendors to change, maintain, and restore the networks as required. On an ongoing basis, this function includes managing contracts as well as analyzing and processing bill payments to third party common carriers and other telecom service providers.

Telecom service firms who provide fibre and network access include common carriers such as Bell Canada, Telus and MTS/Allstream. These companies lease telecom data and voice circuits to Hydro One at competitive market rates. The management of these services requires the contracted services of Hydro One Telecom to proactively liaise with the many common carriers in Ontario and other service suppliers.

Operations and Carrier Management also provides oversight of the Bell Field Services contract as described below.

4.4.2 Field Services

Field Services includes the maintenance and repair of voice and data telecom equipment. Field Services also includes the handling of connection changes for moves, additions, changes, and deletions (MACDs). In 2004 this work was outsourced to Bell Canada after a competitive process.

The Bell Canada maintenance agreement evolved from a time and materials arrangement into a three-year contract that can be extended for another two years to August of 2009. After a review of the options available to it the Company intends to extend this agreement until August 2009.
The MACD agreement was based on a competitive bid process that was undertaken earlier in 2004. The agreement came into operation in September 2004 with the first full year of operations under the agreement being 2005. This agreement calls for Bell Canada technicians to be dispatched to resolve any telecommunications issues. These include MACDs and preventive maintenance at any of the Hydro One sites across the entire Province. Selected Bell Canada staff have been specifically trained to work at the Hydro One sites and facilities.

Included in the 2004 cost is $1.8 million related to one-time fees required to put the Bell agreement into operational effect, including establishing inventories, network testing and coverage verification.

4.4.3 <u>Voice Services</u>

Voice Services investments consist of payments made to common carriers and vendors to use and lease voice circuits and equipment. Rates charged by common carriers are competitive. Voice Services include monthly charges, usage fees and equipment rentals for voice grade business telecom (local and long distance). Total Voice Service costs have varied over time as a result of contract renewals and renegotiations. Hydro One obtains discounted market level services and rates as part of the effective management of telecom services.

Hydro One has obtained voice long distance rate reductions from common carriers which are based on volume. The effect is to lower the forecasted long distance costs in 2007 through 2008.

4.4.4 Data Network Services

Data Network Services investments consist of payments made to third party common carriers such as Bell, MTS/Allstream, and Telus to lease data network circuits and equipment at market rates. The data network is used to connect servers and computers across the province for software applications.

In 2005, Hydro One completed a bandwidth upgrade to all office site locations, increasing the wide area network connectivity bandwidth across the Province. Hydro One continues to monitor and upgrade band width as applications are deployed to field offices in order to support business processes and business requirements. In 2007 and 2008 work is being undertaken to increase bandwidth to the various Hydro One offices to meet business performance requirements for the WEP applications and in advance of the Cornerstone Phase 1 application go live.

While network capacity grows each year to accommodate sharing more data among more functions, the Company has maintained strong cost control on data network components. Downward cost pressure is maintained through investments in efficient up-to-date IT hardware and negotiated network leases, even while network capacities grow and extend to new locations.

4.5 IT Management & Project Control

Table 27 lists the associated costs for IT Management and for Project Support and Control.

Table 27
OM&A IT Management & Project Control
($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
IT Management	**3.0**	**5.3**	**4.2**	**5.6**	**6.1**	**3.1**
Project Support and Control	**2.5**	**0.3**	**0.8**	**1.1**	**2.1**	**0.8**
IT Management & Project Control	**5.4**	**5.6**	**5.0**	**6.7**	**8.2**	**3.9**

IT Management oversees the delivery of information technology and telecommunication services used by all employees across all lines of business. IT Management includes the cost to coordinate, manage and plan the extensive IT infrastructure, to manage the daily issues around IT outsourced services, and to oversee projects. IT Management performs work covered through needs assessment, business case preparation, planning, development, and service delivery to the lines of business.

Increases in the costs in 2008 relate to the need hire additional architecture staff who have SAP experience as a result of the implementation of the Cornerstone project and additional security staff to ensure compliance with Bill 198 and NERC cyber security requirements. It had originally been contemplated these roles might have been filled by contract staff, however the roles are currently assessed as being required on an ongoing basis.

As the enabler and project controller, IT Management develops and implements IT strategies, policies and processes along with IT architectural standards for application interoperability, infrastructure capacity, network security, regulatory compliance and IT governance, and telecom capabilities and communications security. IT Management includes work associated with hardware procurement, training, detailing vendor responsibilities, architecture development, and research services that are required to match IT solutions to known business needs and opportunities. Work performed also includes keeping current on industry trends, product innovations, technology changes in infrastructure and applications, research, as well as planning for future investments.

Project Support and Control comprises the work required to monitor and control the delivery and cost of projects, including the services of external service providers. The Project Management function is focused on managing overall project delivery costs and ensuring efficient implementation through coordination among Hydro One, Inergi and various other service providers.

In 2007, Project Management work which was included in small project costs were moved to this category to better reflect the general nature of the work done. This transfer accounts for the cost increase in 2007 and 2008 as compared to 2006.

Cost variations are primarily attributable to architecture and infrastructure control costs driven by the number and scope of major capital programs underway in a given year. Staff will be needed to enhance the continuity of project oversight and regulatory requirements, consistent with IT and Corporate strategy. The increases in the test years are particularly driven by the Cornerstone project described in Exhibit D1, Tab 3, Schedule 5 Section 2.4.1 and by the Smart Metering project.

5.0 COST OF SALES – EXTERNAL WORK

5.1 Overview

Hydro One tracks and reports Cost of Sales for the competitive work segment of its unregulated revenues which includes the following external work: new customer connections and customer upgrades; emergency work for other Canadian and U.S. utilities; minor forestry work; and health, safety & environment training (refer to Exhibit E3, Tab 1, Schedule 1 and Exhibit E3, Tab 2, Schedule 1 for the categories of external business and associated revenues over the 2004 – 2008 period). These are one time competitive services requested by customers and are individually priced. The cost of sales for the 2004 to 2008 period is provided below.

Table 28
Cost of Sales – Distribution External Work
($ Millions)

	Historical			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
New Connects & Upgrades	4.9	4.8	3.9	4.4	3.8
Lines Other	22.6	9.9	2.0	1.9	1.3
Forestry	0	0.0	0.1	0.0	0.1
Health, Safety & Environment Training	0.6	0.6	0.6	0.7	0.7
Total	**28.1**	**15.3**	**6.6**	**6.9**	**5.9**

The overall 2004 to 2008 trend is downward due to a shift in customer responsibility for costs associated with new connections and system reinforcements as per OEB directives. The Lines Other costs in 2004 was significantly high because it includes $19.2 million of Hydro One Distribution support provided to Florida Power during two hurricanes.

Hydro One does not track and report cost of sales associated with revenues from regulated services. The rates and associated costs for these services in 2008 are based on the methodologies as per the 2006 Electricity Distribution Rate Handbook.

The Cost of Sales identified in Table 28 relate to unregulated services for New Connects and Upgrades and for Other External Work only. Hydro One does not track costs for all its unregulated service revenues identified in Exhibit E3, Tab 1, Schedule 1. In particular, costs related to Joint Use and Miscellaneous Revenues as described below are not included:

- royalty payments from Inergi,
- under-density agreement payments from Bell Canada and other customers in Northwest Ontario for maintenance of line sections Hydro One agrees to look after,
- specific negotiated joint use agreement with Bell Canada where Hydro One and Bell Canada share each others poles,
- specific negotiated joint use agreement with municipalities for streetlight attachments and land access rights.

The costing of external work is calculated the same way as for internal work as described in Exhibit C1, Tab 4, Schedule 1.

5.2 New Connections/Upgrades

Hydro One Distribution connects approximately 17,500 new customers to its distribution system each year, and approximately 6,500 upgrade services are also completed each year to meet customers’ increased electricity requirements as described in Exhibit D1, Tab 3, Schedule 3.

Both the new connection service and the upgrade service have elements of work that must be done by Hydro One Distribution under its Distribution License. This includes: working within Limits of Approach (pre-determined boundaries for live equipment, which is voltage level dependent but nominally for distribution equipment is 3 meters or 10 feet) of the distribution equipment to install any required equipment; connect the customer to Hydro One Inc.'s distribution system; and connect the meter at the customer site.

The remainder of the new connection/upgrade work may be performed by a qualified contractor of the customer's choice. Hydro One Distribution competes for this work since crews are usually on-site and set up. The above ground services include the installation of poles, conductor, and related equipment to run from the distribution line to the meter at the customer site. The underground services include digging the trench and laying the cable and related equipment. This type of project is known as contestable or competitive work and is what primarily contributes to the external revenues for this segment.

5.3 Lines Other

The Lines Other component consists of approximately $1 million to $3 million per year of costs, excluding the support to Florida in 2004 and 2005, and consists of the following categories.

5.3.1 Emergency Support

Emergency support to other North American utilities to get their business systems back up and running.

5.3.2 Subdivision Redesign

Hydro One Distribution will provide an initial subdivision design and will recover this cost through the staking fee charged to the developer. When the developer revises the subdivision plan, a redesign of the subdivision is needed. The cost of the redesign is borne by the developer.

If a subdivision design has been completed but construction has not commenced for a period of 12 months or more, a review of the subdivision design is necessary. This review includes a field visit and is necessary to determine if the original design is still viable or if a revised design is needed to supply the subdivision. The cost to do this additional work is also covered by the developer.

5.3.3 Distribution Generation Studies

The costs in Distribution Generation Studies are for undertaking connection impact assessments in response to requests from generation proponents. Hydro One Inc. does assessments based on a customer request that includes the proposed size of the generator and where it will be located. Connection impact assessments are technical studies that determine the impact of the new generation facility on the Distribution System and ensure the generator will comply with the technical requirements. The technical requirements generators must meet to connect to Hydro One Inc.'s distribution system are outlined in “Technical Requirements for Generators Connecting to Hydro One's Distribution

System". These requirements are in place to ensure public and employee safety, protect the integrity of Hydro One Inc. 's system and guarantee reliable and quality service to our customers. For more information about these studies, refer to Exhibit C1, Tab 2, Schedule 3.

5.4 Forestry

Forestry costs include trimming of trees on customer property that are interfering with the secondary i.e. the line running from our pole to customer's residence/building.

5.5 Health, Safety and Environment Training

External training covers a wide range of practical and classroom delivered courses. These include courses like Electrical Safety Awareness, a mandatory course for anyone working in the proximity of live electrical apparatus regardless of trade or occupation. Packaged delivery of technical courses for numerous trade and professional types are delivered for Lines, Forestry, Power Electricians, Metering technicians, Protection engineers and technicians. Customers include large (Toronto Hydro) and small utilities (Peninsula West Utilities Limited), large (INCO) and small (Wardrop Engineering) companies including Non Utility Generators (Trans Alta, Brighton Beach) that send trainees to a cross section of courses in various trades/disciplines.

6.0 OTHER SHARED SERVICES

Table 29
Total Distribution Other Shared Services ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Corporate Overhead	(45.0)	(46.2)	(59.8)	(46.6)	(47.7)
Environmental Provision	(9.5)	(7.1)	(11.6)	(6.3)	(7.9)
Indirect Depreciation	(9.0)	(9.9)	(11.6)	(10.5)	(10.3)
Deferred Pension Credit	(33.2)	(30.6)	(10.7)	0.0	0.0
Other	(10.8)	14.4	(12.6)	23.3	(12.4)
Total	**(107.5)**	**(79.5)**	**(106.3)**	**(40.1)**	**(78.3)**

6.1 Capitalized Overhead Credit

Table 30
Distribution Corporate Overhead Credit ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Corporate Overhead	(45.0)	(46.2)	(59.8)	(46.6)	(47.7)

Capitalized overheads represent that portion of allocated shared corporate and/or business unit functions and services that are deemed, through the capital overhead rate, to be supportive of Capital projects as opposed to OM&A projects. OM&A expense is thus reduced by the capitalized amounts. The overhead credit has increased from the 2004 level primarily due to the higher level of Capital spending.

The capitalized OM&A costs are distributed to Capital projects based on the allocation methodology accepted by the Board as discussed in Exhibit C1, Tab 5, Schedule 2. The capital works program is further detailed in Exhibit D1, Tab 3, Schedule 1. The total amount allocated to Distribution Capital in 2008 is $47.7 million.

6.2 Environmental Provision

Table 31
Distribution Environmental Provision ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Environmental Provision	(9.5)	(7.1)	(11.6)	(6.3)	(7.9)

In 2001, Networks business recognized a liability on its balance sheet for the present value of future estimated environmental expenditures necessary to deal with legacy contamination. The change in accounting policy from the previous as-incurred basis was adopted to align with the theoretically stronger U.S. generally accepted accounting principle that was expected to be imminent in Canada. Environmental work is initially recognized in the sustaining work program. The amount is then removed from OM&A and the liability / provision is amortized by the amount of the expenditures incurred. The resultant impact on OM&A expense of this environmental work is nil, since the amortization expense is grouped with 'Depreciation and Amortization' on the operating statement and the balance is transferred from OM&A to Depreciation expense.

6.3 Indirect Depreciation

Table 32
Distribution Indirect Depreciation ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Indirect Depreciation	(9.0)	(9.9)	(11.6)	(10.5)	(10.3)

Transportation and Work Equipment ("TWE") charges in the OM&A work programs include depreciation expense associated with the asset being used. For accounting classification purposes it is necessary to remove this depreciation amount from OM&A and appropriately charge it to Depreciation Expense.

The total amounts of indirect depreciation removed from OM&A and charged to Depreciation Expense in 2008 is $10.3 million.

6.4 Deferred Pension Costs

Table 33
Distribution Deferred Pension Costs ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Deferred Pension Costs	(33.2)	(30.6)	(10.7)	0.0	0.0

Since Hydro One Networks commenced operations, employer pension contributions have been paid from the Hydro One Pension Plan surplus. These notional contributions were not recorded as a cost of the Distribution business, nor were they recovered in rates. Commencing on January 1, 2004, Hydro One was legally required to make cash contributions for current and past funding costs related to staff who worked for, or retired from, Hydro One Networks. As a result, Networks commenced recognizing cash pension costs as a part of the cost of Networks' labour. A pension credit has been applied to recognize a deferral account on the balance sheet to record cash pension cost included in operating and maintenance costs associated with the Distribution business. This deferral account, plus interest, is in keeping with the July 2004 Board Decision and Order RP-2004-0180.

6.5 Other

Table 34
Distribution Other Costs ($ Millions)

	Historic			Bridge	Test
Description	**2004**	**2005**	**2006**	**2007**	**2008**
Other Costs	(10.8)	14.4	(12.6)	23.3	(12.4)

These costs represent material unexpected or non-recurring expenses. For example they include items such as insurance rebates, adjustments to provisions, vacation reserves, Gregorian or fiscal adjustments and inventory adjustments.

The 2007 and 2008 costs primarily include the Inergi Pension true-up and the Distribution rate hearing preparation costs and other miscellaneous adjustments.

HYDRO ONE - INERGI OUTSOURCING AGREEMENT

1.0 SUMMARY OF TERMS

- Hydro One Networks Inc. (Networks) entered into an outsourcing agreement with Inergi LP ("Inergi") in December, 2001 (the "Master Services Agreement" or "MSA").
- Inergi is a wholly owned subsidiary of Capgemini and is not an affiliate of Hydro One Networks Inc.
- "Base services" refers to the services of which Inergi assumed provision as of the commencement date of the agreement. Inergi provides base services at historical service levels and volumes at a fixed price that declines by 30% in real terms over the term of the agreement.
- Base services commenced under the MSA on March 1, 2002 ("commencement date") and include Customer Service Operations, Supply Management Services, Finance and Accounting, Information Technology, HR Payroll, and Settlements.
- In addition to base services and ongoing services added to the arrangement from time to time, Inergi also provides short term "project" services at predetermined rates.
- Inergi fees for base services actually payable in any year vary according to agreed changes in volume and scope along with adjustments for Cost of Living adjustments as defined in the agreement.
- In 2008, Networks expects to pay a fee of $115.9 million for base services.
- The arrangement involved the transfer of over 900 Networks' employees to Inergi.
- Networks owns substantially all assets involved in Inergi's delivery of base services.
- Inergi has subcontracted the call centre operations to Vertex Canada (Vertex). Vertex is not an affiliate of Hydro One Networks Inc.
- The MSA provides for benchmarking of fees in contract years 3, 6 and 9 and downward adjustment of pricing in the event the benchmarking exercise determines the bundled pricing of base services is not competitive.

- The 10-year term of the MSA expires on February 29, 2012.

During the review of Hydro One's Distribution rates for 2006 (RP-2005-0020/EB-2005-0378), the Board and intervenors assessed Hydro One's MSA with Inergi. The Board noted the "considerable scrutiny" given by intervenors to the agreement and concluded in its Decision, issued April 12, 2006, "that the Inergi contract represents a reasonable strategy by Hydro One to reduce costs, improve efficiencies and improve focus on the utility's primary operations. The Board is satisfied that the cost consequences flowing from the Inergi agreement for the test year are reasonable and therefore approved for ratemaking purposes."

2.0 STATEMENT OF WORK SUMMARY

The contract includes the MSA, associated Schedules and Statement of Work (SOW) for each line-of-business which provides details of the base services provided. The following table summarizes the current SOW for each line of business ("LOB").

Line of Business	Domain	Service Description
Information Technology	Infrastructure Operations	Services that facilitate the operation of shared devices and servers on a corporate level and services required to engineer and manage the computing network infrastructure
	End User Support	Help Desk and Desktop Support
	Application Maintenance and Sustainment	Services to maintain technology platform, operational quality assurance and application support customised to the service requirements and needs of the business applications
	Projects	Provides problem definition; requirement definition; business case development; design, development, configuration and testing; and commissioning, (including system enhancements) to meet specific line of business or enterprise needs.
	Cross Functional	Provides Service Management, Account Management, Vendor and Asset Management, and Resource Management to all other IT domains

Line of Business	**Domain**	**Service Description**
	Mainframe Operations and Services	Services that facilitate the use of the mainframe computer and associated infrastructure
Customer Service Operations	Inbound Call contact Handling	Provides customer call handling services for billing, customer services, collections, outages and emergencies for Residential and small business segment. Includes corporate switchboard, maintain the day to day operational configuration of the IVR system, and responding to other contacts such as letters and email.
	Bill Production	Issue electricity bills, including bill print, insert delivery to Canada Post and remittance, managing exceptions, accuracy and timely delivery. Maintain accuracy of customer billing records to enable timely and accurate billing and print, envelope and dispatch bills to Canada Post.
	Collections	Manage the collection of outstanding customer debts and negotiate and collect deposits.
	Data Services	Administration and data input of timesheets, work order task packages and service and work orders for field personnel and transmission operations.
	Business Customer Centre	Selection of services for business customers, including inbound call and contact handling, retail settlements, billing exceptions and manual bills.
	Application support	Provide direction and work management for variety of billing systems. ▪ Perform systems/business analysis to define system changes to address bug fixes & enhancements. ▪ User acceptance testing for all code changes
Settlements		Wholesale Settlements - Provide settlement and reconciliation services for power procured from the Independent Electricity System Operator and embedded Retail Generators with due consideration to legislative initiatives for fixed energy prices for low volume customers, transmission revenues and inter-utility load transfers, and cost of power reporting, and Retail Settlements - Provide complex billing for interval meter accounts.
Supply Management Services	Demand Planning	Preparing Material Requests and capital demand forecasts
	Demand Management	Maintaining market intelligence of applicable commodities, processing purchase transactions and inspecting and

Line of Business	Domain	Service Description
	and Procurement	expediting services to ensure delivery to contract commitments
	Sourcing, Vendor Management and Inventory Management	Services to support sourcing all commodities and services which include: managing and developing supply strategies (strategic sourcing), monitoring spend on all commodities and services, managing the size and composition of vendor base, resolving vendor issues, managing inventory levels, and negotiating vendor stocking arrangement.
	Process Development and Data Management	Services supporting the execution of daily transactions including ensuring the operation of automated systems and maintaining catalogue schema
	Transportation	Negotiating and managing transportation contract with logistics providers
	Asset Disposal	Managing the selling and disposal of surplus materials.
Human Resources Payroll	Pay Operations	Services necessary to calculate all pay cycles
	Payroll Accounting	Services necessary for the distribution of pay and production of back up information for all pay cycles
	Inquiries and Application Support	Services necessary to support the performance of other payroll domains, including technology support and issue resolution
Finance and Accounting Services	Accounts Payable (AP)	Services required for processing disbursements which include: maintaining Vendor Master Data and CCC Master Data, invoice processing, payments management, AP inquiries support, period end and reconciliations, management reporting and special projects.
	Billing and Accounts Receivable (AR)	Services required for processing non-energy miscellaneous billings and AR which include: maintaining AR Master Data, customer billing information, customer invoicing, customer collections support, applying AR payments and adjustments, AR inquiries support, period end and reconciliation, management reporting and special projects
	Fixed Asset and Project Cost Accounting	Provides fixed assets and project costing transaction processing, reconciliation of sub-ledger balances to general ledger accounts, reconciliation of the fixed assets and project costing suspense accounts, transfer of projects to fixed assets and recording sales and retirement of assets

Line of Business	Domain	Service Description
	General Accounting and Planning, Budgeting and Reporting	General Accounting – ensuring financial recognition consistent with corporate requirements, accounting adjustments, processing of transactions and maintenance of the general ledger system account blocks, support of financial systems and modules and interface and support for pay services and management reporting Planning, budgeting and reporting – provide advice, guidance, consultation and project support on routine operating processes and business support initiatives.

3.0 BENEFITS OF OUTSOURCING

The successful implementation of the outsourcing arrangements has resulted in significant cost savings to Networks as the price of services has declined since the Commencement date. The outsourcing arrangements have resulted in lower than historical costs at consistent and stable service quality. Networks has retained proper management control and decision making authority over the outsourcing arrangement to continue the safe, secure and reliable delivery of electricity in the Province of Ontario.

Networks has realized other positive business results that have enhanced the value of this business arrangement to the benefit of Networks' ratepayers. These benefits include the development of defined service levels, access to change management and intellectual knowledge that understands Networks business and can provide benefit to Networks operations, improved career opportunities for transferred Networks employees, and increased management attention to operation and maintenance of the core Transmission and Distribution business.

4.0 COST OF OUTSOURCING

Table 1 below contains the contracted price for base services over the planning period. This section explains the various inputs to fees shown in Table 1.

Table 1

Summary of Inergi Fees

$ millions

Description	Historic				Test
	2004	2005	2006	2007	2008
Contracted Fees for Base Services	97.9	94.4	92.3	90.8	88.4
Managed Contract Reimbursement	(6.8)	(6.2)	(5.9)	(5.6)	(5.3)
COLA	4.1	3.1	8.3	11.5	14.9
Pension & Benefits Fees	6.8	6.3	6.0	5.8	5.5
Volume, Scope & Other	8.0	4.0	10.7	19.1	12.5
Base Services Subtotal	110.0	101.5	111.3	121.5	115.9
Royalties	(2.0)	(2.0)	(2.0)	(1.5)	(1.5)
Pension Top-up	-	8.4	8.4	8.4	-
Supplier Initiatives	0.8	-	-	-	-
Total Contract Payments	108.8	107.9	117.7	128.5	114.4

4.1 Base Service Fees

The contracted fees for base services paid by Networks under the outsource services agreements will decline over time so long as service is maintained at then prevailing service levels and activity volume levels are within the normal range of those for historical periods. The declining price reflects Networks and Inergi's negotiated agreement that assumes Inergi will achieve cost savings over time through improved labour costs, reduced overheads, increased efficiencies, process re-engineering and technology improvements and that such savings are passed onto Networks as a guaranteed reduction in the fee for base services.

4.2 Managed Contract Reimbursement

Prior to the commencement date, Networks purchased certain IT products and services under contracts with third parties. It was contemplated that Inergi would assume the majority of these contracts and provide the related products or services directly as part of the fees for base services. The balance of the third party contracts would continue to be held by Networks, and simply 'managed' by Inergi. As of the commencement date, a final determination as to which contracts were to be assumed had not been made. The costs which Networks would otherwise have incurred under all third party IT contracts were included in Base Service fees as of the commencement date, to be adjusted later. However, payments to the third party vendors are made directly by Networks and Inergi reimburses Networks for those payments. Once certain contracts were identified for assumption by Inergi (mostly hardware and software contracts), Networks stopped paying these third party contractors. The actual assumption of these contracts over the first three years is reflected in a reduction of reimbursements and Networks' termination of the data centre agreement with IBM.

4.3 Cost of Living Adjustments (COLA)

Base Fees and most other fees are subject to COLA. The COLA formula is based upon the Statistics Canada Indices of total wages, salaries, and supplementary labour income in Ontario, and total number of employees in Ontario.

4.4 Pension and Benefit Fees

The employment of 913 Networks employees was transferred to the outsource service provider. Of these 913 employees, 569 were represented by the Power Workers Union (the "PWU") and a further 277 were represented by the Society of Energy Professionals (the "Society"). The remaining 67 managers were not represented by a bargaining unit.

Agreement for the transfer of collective bargaining rights to Inergi respecting the outsourced work was obtained from the PWU directly on December 14, 2001 and from the Society by way of arbitration award in December 2001.

In order to simplify bid evaluation, Networks requested pricing net of pension, supplementary pension and post retirement benefit costs. During the due diligence and contract negotiation phase of the contracting process with Inergi, it was agreed that Networks would fund these costs on the following terms:

- Inergi would be held harmless for pension (funding) costs and for the Other Post Retirement Benefits ("OPRB") accruing due to transferred staff prior to the deal, and
- Inergi would provide benefit plans to transferred employees which would be no less favourable than the Networks' plans in place prior to the transfer.

4.5 Volume, Scope & Other

The parties have adjusted the contract to reflect permanent changes in the volume of transactions or scope of services purchased which has resulted in adjustments to the fees for base services for the remainder of the agreement. Inergi's price of base services has increased from 2006 to 2007 by about $8 million primarily due to

1. increased volume of supply chain transactions
2. supply chain transformation services
3. late payment of 2006 supply inspection services
4. improvement of IT help desk and deskside services
5. late payment of 2005 and 2006 IT application sustainment services

Adjustments to the fees for base services for changes in scope and volume of services decline over the test years 2008, 2009 and 2010 and reflect anticipated improvements to efficiency of delivery of these services as contracted with Inergi.

4.6 Royalty Payments - Business Development

Inergi agreed to make royalty payments to Networks concerning new business to be delivered by TSDC, which Networks assists, Inergi or Capgemini in attracting. The reduction in Royalty payments in 2007 from $2.0M per year to $1.5M per year was negotiated in the original outsourcing agreement.

Marketing support includes:

- conference and sales support programs as agreed to by both parties,
- hosting site visits and participating in occasional promotional meetings, and
- acting as a reference when required.

Networks' out-of-pocket costs to support Inergi marketing efforts are more than offset by the minimum royalty payments shown in Table 1.

In addition to the forgoing, the contract requires Inergi to pay royalties as agreed upon to Networks where Networks permits Inergi to use Networks assets for the benefit of third parties. With the minor exception of the use of 8-10 laptops by Inergi management staff for multiple clients, no such usage has occurred.

4.7 Pension Top-up

Networks is obliged to fund over three years, the difference between the solvency liabilities for the transferred employees on the Commencement date and the end of 2004 and a 4% funding cushion, to the extent such amounts are not offset by pension fund performance during the same period. This shortfall has been determined by Networks' actuary to be $23.6 million and 1/36th of this amount was added to the monthly outsourcing fee commencing in January 2005. This adjustment is described as "Pension Top-up" in Table 1.

4.8 Expenditures Supporting Productivity Improvements (Supplier Initiatives)

The MSA required Networks to provide $15 million per year during the first three contract years to partially fund "Supplier Initiatives" in return for the promised declining fee schedule. The $15 million expenditure is aligned with expenditures Networks estimated it would have made to achieve its business plan savings had it not outsourced base services. Although the contract identifies specific initiatives that Inergi planned to undertake, Inergi was unconstrained as to how, or if, the initiatives were implemented as the price reductions were guaranteed.

An example of a Supplier Initiative was the Speech Recognition Initiative – Customer Service Operations. This initiative was designed to reduce the number of calls handled by agents through the implementation of self-serve telephony applications using Interactive Voice Response (IVR) and Speech recognition technology. The goal was to understand 85% of customer speech on the first pass in both Canadian English and French. By integrating Speech Recognition software in the existing IVR and Customer Service System platform, several of the high volume call types were automated freeing the agent to handle more complex and non-automated functions. In addition, Speech Recognition allowed all-speech user experiences for selected services. Speech Recognition technology is expected to improve customer satisfaction and experience.

4.9 Allocation of Inergi Fees to Distribution

Networks collects estimated total spend on the Inergi contract as part of its business planning process. This process captures all the costs associated with each area and includes all adjustments for inflation, change orders, re-basing and OPEB adjustments.

Rudden Report - Exhibit B describes the allocation of Networks estimates of the 2008 Inergi costs to Transmission and Distribution business. The table below shows the service activity, the estimated activity cost, the cost driver, the rationale for selection of the cost driver and the percentage allocation to the Distribution business.

Hydro One Inergi CCF&S 2008 Costs

CCF&S	Activity	2008 Cost ($M) Forecast	Cost Driver	Selection of Cost Driver	2008 % to Dx
Customer Support Operations	Inbound Calls / Correspondence	$21.6	Direct to Dx	Dx function per OEB	100%

Total	**4.0**	**4.6**	**4.5**	**4.2**	**4.5**

2.0 PROPERTY TAX

Hydro One is responsible for the payment of property taxes similar to every other land owner within the province of Ontario. Property taxes for Hydro One are regulated under the Electricity Act 1998, the Municipal Act 2001, and the Assessment Act 1990. Property taxes are paid on Hydro One owned distribution lands and buildings including Service Centre sites, Distribution Transformer Stations, and distribution lines. Property tax payments are made to over 400 municipalities each year by Hydro One.

A summary of annual distribution property taxes (including property proxy taxes) is presented in Table 2, below:

Table 2
($ Millions)

	Historic 2004	Historic 2005	Historic 2006	Bridge 2007	Test 2008
Property Tax	3.2	3.6	3.6	3.4	3.7

Total assessed value is assigned by the Municipal Property Assessment Corporation, and is updated utilizing the same schedule as the rest of the province. All Hydro One distribution owned properties, except distribution transformer station buildings, are assessed using Current Value Assessment – the valuation method used for other property owners within the province. Distribution transformer stations buildings are assessed at a statutory rate of $86.11 per square meter, per the Assessment Act R.S.O. 1990, chapter A31, Section 19.

Notices of Assessment are received and reviewed for accurate valuation and tax classification each year. Any incorrect classes and overvaluations are appealed through the Municipal Property Assessment Corporation, and/or the Assessment Review Board.

Additional property tax payments, called property proxy taxes, for owned distribution transformer station buildings are levied, payable to the Minister of Finance. The details of this additional assessment are contained within Ontario regulation 224/00 under the Electricity Act. Property proxy taxes are calculated for each distribution transformer station building owned by Hydro One and total $0.2 million per year and are included in the property tax amount.

Property taxes are increasing on an annual basis due to financial pressures on municipalities and school boards.

3.0 INDEMNITY PAYMENT TO PROVINCE

The Ontario Electricity Financial Corporation (OEFC) has indemnified Hydro One with respect to the failure of the transfer orders (orders used to establish the company as one of the successor companies to the former Ontario Hydro) in 1999.

The OEFC indemnification covers any defects in the transfer orders encompassing the following areas:

1) the transfer of any asset, right, thing, or any interest related to the business;

2) some adverse claims or interests of third parties or based on property title deficiencies arising from the transfer orders, except for some claims and rights of the Crown, and

3) claims related to any equity account previously referred to in the financial statements of Ontario Hydro including amounts relating to any judgement, settlement or payment in connection with litigation initiated by certain utilities commissions.

The Province has unconditionally and irrevocably guaranteed to Hydro One the payment of all amounts owing by OEFC under its' indemnity.

Hydro One Networks pays an annual fee of $5.0 million to the OEFC for the aforementioned indemnification. As the transfer order primarily relates to land assets, the amount allocated to Hydro One Distribution is based on the proportion of Hydro One Distribution land assets in relation to the total land assets of Hydro One. This results in $0.5 million of the $5.0 million total being allocated to Hydro One Distribution.

4.0 RIGHTS PAYMENT TO OTHER ENTITIES

Through agreements or permits (950 in total), Hydro One Distribution line facilities cross and/or occupy properties owned by railway companies and/or governmental bodies. Per the terms of the individual agreements, Hydro One pays an annual fee to the railway companies and the government entities for the right to cross and/or occupy their properties.

A financial summary of the annual right payment fees is presented in Table 3, below:

Table 3
($ Millions)

	Historic 2004	Historic 2005	Historic 2006	Bridge 2007	Test 2008
Rights Payment	0.3	0.5	0.4	0.3	0.4

CORPORATE STAFFING

1.0 OVERVIEW

Hydro One submitted its corporate staffing profile and strategy to the Board during two recent proceedings – EB-2005-0378, Hydro One Networks Inc.'s application for 2006 Distribution rates and EB-2006-0501, its application respecting its Transmission business' 2007 and 2008 revenue requirement. During these proceedings, Hydro One detailed its efforts to maintain the right mix of resources while implementing a more favourable cost structure, within the constraints of a heavily unionized company.

Hydro One's greatest corporate risk with respect to its human resources continues to be an aging workforce and, with a world-wide scarcity of core skills in the industry, a highly competitive labour market. By December 31, 2008, approximately 1,000 Networks staff, representing 24% of the current population, are eligible for an undiscounted retirement. This is a trend which is expected to continue through the next decade and is consistent with challenges faced by other utilities in the electricity sector throughout the world. Recent studies suggest that up to half the workforce in the North American electricity industry will be eligible for retirement in the next five years[1].

2.0 STAFFING STRATEGY

Hydro One utilizes a work-based approach to staffing, whereby the Company resources according to work programs rather than plans the work around the number of internal resources available. To address the fluctuating and seasonal nature of work programs, the Company maintains as much flexibility as possible by not hiring all regular staff. Instead, it utilizes a variety of labour resources, including regular, temporary, hiring hall and contract staff, which provides the needed flexibility to manage in a cost-effective manner.

Matching staff to dynamic work programs requires a rigorous approach to staff planning. The company must consider the amount of work to be done, the nature of the work and the skills required, as well as the most cost effective means of acquiring those skills, within the constraints of the collective agreements. Demographic and skills analyses are conducted annually to ensure that Hydro One retains the appropriate talent in the present and is positioned properly in the market to attract the talent we need in the future.

Progress has been made in attaining the optimal number and mix of staff required to complete the Company's increasing work programs. However, the increases in some of Hydro One's Distribution programs will add additional challenges, given the tight competition for labour and power system professionals. It is essential because of the long learning curves required for competent performance of our highly skilled jobs that we hire well in advance of expected retirements.

3.0 HYDRO ONE'S LABOUR PROFILE

As part of Hydro One's strategy to efficiently and economically manage its fluctuating work requirements, Hydro One utilizes four broad groups of staff – regular employees, temporary employees, casual workers (the Building Trade Unions -BTU's under agreements with the Electrical Power Sector Construction Association – EPSCA, the Labourers' International Union of North America - LIUNA, the Canadian Union of Skilled Workers - CUSW, and Power Workers Union - PWU Hiring Hall employees) and contract staff, discussed below.

[1] Lester B Lave et al, The Aging Workforce: Electricity Industry Challenges and Solutions, Electr J. (2007), doi: 10.1016/j.tej.2006.12.007

1) <u>Regular Employees</u> of Hydro One can be placed in three categories:

(i) PWU represented staff: The PWU is an industrial union that represents the trades, operators, technicians and clerical workers. They perform line work, forestry, electrical, mechanical, protection and control, meter reading, stock keeping, system operation, technical and clerical/administrative work. The majority of the PWU-represented employees in Hydro One have post-secondary education, predominately at the community college level. These include Hydro One electrical maintainers, line maintainers, mechanical maintainers, operators, technicians and administrative employees.

(ii) Society represented staff: The Society is a professional union that represents engineers, technical, administrative and supervisory staff. They perform engineering, high level technical and administrative work as well as supervisory functions. The majority of the Society-represented employees in Hydro One have either post-secondary education (university degrees) and/or post-graduate education. These include graduate engineers, finance and telecommunication specialists.

(iii) Management staff, who are excluded from representation because they carry out managerial duties or work on confidential labour relations matters or legal matters.

2) <u>Temporary Employees</u> are employees in any of the three categories set out above, engaged in work that is not of a continuing nature.

3) <u>Casual Workers</u>

Although the PWU does perform some construction work, the majority is performed by the PWU Hiring Hall, the Building Trades Unions (under agreements with EPSCA), the Labourers, and members of the Canadian Union of Skilled Workers

(i) Hiring Hall Employees (PWU) are utilized to meet fluctuating work demands, performing primarily supplemental construction and maintenance work on the distribution system. Non-recurring work peaks and special projects are resourced through the hiring hall.

(ii) Fifteen construction BTU's supply a contingent workforce through their hiring halls, negotiating their collective agreements with EPSCA. These represent the construction trades employed by Hydro One, with the exception of those represented by the CUSW and the Labourers.

(iii) The Labourers' International Union of North America (LIUNA) is a construction union that Hydro One negotiates with directly as opposed to via EPSCA.

(iv) The CUSW represents lines and electrical tradespersons who work on transmission construction, including the construction of lines over 50kV, transmission stations, switchyards, substations, system control centres, and associated telecommunications systems. Their members are contingent workers, accessed through the CUSW hiring hall to perform specific work programs and then laid off. They are paid a total wage package (including benefits and pension payments) for each hour worked. This relationship ensures that workers with the required skill set are hired in the right location for only the exact duration of the work assignment and that Hydro One has no on-going obligations with respect to benefits or pension for them.

4) Contract Staff are individuals engaged as independent contractors, not on the Corporation's payroll. Contract staff are retained for their particular skill sets on

projects, or to perform other work that is not of an ongoing nature. They are engaged at Hydro One for varying amounts of time and paid varying amounts commensurate with their skill sets and the market rate for that skill. Contract staff are tracked by work programs or activities and not by headcount. Where applicable, the procurement of contract staff is governed by the terms of the collective agreements between the Corporation and its respective unions where applicable.

4.0 RECRUITMENT

To help address the expected significant wave of retirements in its critical trades, technical and engineering groups, Hydro One continues to hire into its Graduate Training Program. Training and development is identified in consultation with the line organization and each graduate trainee takes part in an extensive program that involves rotations through various parts of the company as well as in-house and external workshops, seminars and courses. Since January 1, 2004, 59 graduate trainees have been hired through the Company's on-campus recruitment program, with the hiring of a further 40 to 50 graduate trainees anticipated in the Fall of 2007. New Graduates bring not only much needed skills but also new perspectives and fresh energy to the work of Hydro One.

Hydro One also continues its recruitment into trades apprenticeship and technical training programs and has partnered with universities and colleges to develop curricula that educate students in areas where we face a shortage of skilled professionals and trades people. Hydro One has taken a leadership role in support for power system engineering programs, assisting in developing on-line power system engineering programs, and providing scholarships to encourage enrolment in key areas where we face a labour shortage. Hydro One holds the Chair of the Electricity Sector Council, a Canada-wide organization composed of employers, bargaining agents, educators, associations and government representatives designed to deal with the skills shortage in the industry. The Council's primary goal is to increase the number of qualified individuals for employment within the industry. Hydro One also holds the Chair of the Canadian Electrical Association's Human Resources Committee. Its mandate is to assist the CEA Board in its oversight of HR support and development for the industry, monitor and report on emerging HR issues and share best practices and work collaboratively in development of mutually beneficial initiatives.

The Corporation is also partnering with the PWU in an initiative called "Trade Up for Success", which educates Grade 9 and 10 students and their parents in the benefits of choosing skilled trades careers and the educational requirements needed to enter applicable college programs.

In addition, Hydro One, with the clear support of the PWU and the Society, has become a corporate participant in Career Bridge – a national, private-sector, non-profit initiative, which aims to provide internationally qualified professionals with Canadian work experience in their field of expertise.

Hydro One will also continue its support of the University and College Co-Op Education Program, hiring approximately 200 co-ops a year. This is a mutually beneficial process in that Hydro One gains bright, skilled workers trained in the latest theories and practices to work for four- or eight-month work-terms, while the students gain "real world" work experience that can be used to develop their future careers We have also found that the Co-op programs have proven a rich source of talented candidates for Graduate Trainee positions by offering us an opportunity to assess the student's "fit" and long-term potential with the company. Once hired our experience shows that these former co-op students have a shorter learning curve than other new hires with no previous Hydro One experience.

5.0 TRAINING

In addition to the Graduate Training Program outlined above, Hydro One offers considerable training and development opportunities that are critical to the retention and motivation of staff.

5.1 Trades and Technical Training

Hydro One provides a comprehensive selection of trades and technical training, designed to target the specific needs of field staff in relation to the work requirements of the asset base.

5.2 Leadership and Senior Management Development

The primary objective of this program is to ensure that Hydro One has a systematic management development framework. This helps ensure we retain a competitive advantage by developing, maintaining, and enhancing those management competencies deemed to be essential.

Hydro One has established a Management Development Steering Committee to oversee the identification of Management Development needs in the Company. The committee includes senior managers from both line and support functions, and is also responsible for the succession planning process. Each year a Management Development Program Schedule is created based on the developmental needs of management staff.

5.3 Succession Planning

A Succession Planning Process has been developed for all senior management staff within the Company. The program's goal is to ensure that for each of the senior management positions, at least two successor candidates have been identified, and that a developmental plan for each of the candidates is developed and implemented.

6.0 SUMMARY

Attracting, motivating and retaining the right people is key to Hydro One's success. Despite the Company's efforts to date to ensure that we have an adequate supply of labour, it continues to face staffing challenges. In addition to the potential retirement of up to 1,000 employees in the next couple of years, there is a increasing distribution work program. Hydro One will continue to utilize a mix of regular, non-regular and contract staff in order to maintain the necessary flexibility to react to a changing environment.

In an industry with aging demographics and a highly competitive labour market, the Corporation needs to be positioned as an attractive employer if it is to succeed in recruiting and retaining staff with the requisite skills. To do so, it must provide a competitive compensation package and challenging and rewarding job opportunities. Hydro One believes its staffing stategy will allow us the flexibility to respond effectively and efficiently to any scenario that will arise over our business planning period.

COMPENSATION, WAGES, BENEFITS

1.0 OVERVIEW

Hydro One has experienced rapidly increasing transmission and distribution work programs since 2004. Resourcing of these work programs must occur on the most cost-effective basis possible within a highly competitive labour market.

Table 1 below outlines the compensation costs for Hydro One Networks employees from 2004 to 2008. The Company believes that the upward trend in these costs is reasonable in light of the steadily increasing transmission and distribution work programs since 2004, as well as the negotiated increases in labour rates.

The actual breakdown of compensation by employee category follows in Exhibit C2, Tab 3, Schedule 1.

Hydro One Networks Inc. Payroll* (M$)

Year	Total Wages	Base	Overtime	Incentive	Other**
2004	404.2	323.7	53.2	12.3	15.0
2005	397.9	321.1	50.6	8.4	17.7
2006	459.3	368.0	66.5	4.4	20.5
2007	495.5	414.7	60.9	6.6	13.2
2008	580.7	475.5	72.1	8.5	24.6

* This payroll reflects compensation costs associated with year-end headcounts for all EPSCA, PWU, Society and MCP staff.
** "Other" includes travel time, vacation bonus, unused vacation days paid out, standby allowance, shift allowance, vacation pay on termination.

2.0 COMPENSATION STRATEGY

Operating within an increasingly competitive labour market, Hydro One has faced, and continues to face, a number of challenges with respect to establishing and maintaining a more favourable cost structure. Most notably, more than 90% of the workforce is unionized, and came to Hydro One with pre-existing collective agreements. The collective agreements are complex and comprehensive and incorporate by reference the pension and benefit plans. Because 70% of the workforce is represented by a single union, the Power Workers' Union ("PWU"), the Corporation would be unable to continue operations for a sustained period in the event of a work stoppage by that union. Consequently, the primary focus in collective bargaining with the PWU has been on increasing productivity and on increasing management flexibility to run the operations rather than on seeking compensation concessions.

With respect to the Society, the corporation has substantially altered pension entitlements for new hires and recently negotiated a five year agreement which will provide labour stability and cost predictability. Highlights are provided in section 3.2 of this exhibit.

In terms of Management compensation, Hydro One has endeavoured to strike a balance between the need to attract and retain competent staff and the need to constrain costs. To this end it has increased hours of work for all Management staff and substantially altered pension and benefit provisions for new hires.

Hydro One has undertaken an independent benchmarking study on labour rates and overtime in response to the Board's directive EB-2005-0378. Hydro One issued a Request for Proposal for this study and ultimately engaged Hay Management Consultants. The study will benchmark sample Management, PWU and Society positions.

3.0 LABOUR AGREEMENTS

Hydro One has direct collective agreements with the Power Workers Union (PWU), the Society of Energy Professionals, the Canadian Union of Skilled Workers (CUSW) and the Labourers' International Union of North America (LIUNA) as well as collective agreements with each of the 15 Building Trade Unions (BTU's) through membership in the Electrical Power Systems Construction Association (EPSCA). The key agreements are with the PWU and the Society.

PWU – This industrial collective agreement covers wages, pensions, benefits and working conditions. The contract has been reduced in size and complexity since it was inherited from Ontario Hydro in 1999, in order to provide Management with the flexibility to direct and effectively utilize the workforce. However, wage rates, pension entitlements, and benefit coverage are prescribed and can be changed only through negotiations.

Society – This collective agreement covers wages, pensions, benefits and working conditions for professional staff. The Society had mandatory mediation/arbitration since the formation of Hydro One until 2005. Through arbitrated awards, Management attained some increases in flexibility and cost reduction in return for market rate wage increases. In 2005, mediation/arbitration did not apply and traditional bargaining took place. The resultant settlement, although obtained via arbitration was more responsive to Management's needs in that it established a two tier pension plan for new Society employees. As noted earlier, a renewal collective agreement was negotiated during the second quarter of 2007 and ratified on June 29, 2007.

3.1 PWU

Compensation of PWU-represented employees is negotiated through the collective bargaining process. An aging workforce in technical and trades positions in the utility industry is likely to limit the supply of skilled staff in the future, putting upward pressure on wages.

The key focus with respect to the PWU has been to achieve increased management flexibility to run the operations, as opposed to wide scale reductions in wages, benefits and pensions.

The gains made to date with respect to PWU negotiations include:

- PWU Incentive Plan non-renewal
- Lower meter reader B rate negotiated
- Modified duty hours
- Switching agents for stations
- Winter meal reduction
- Temporary headquarters established

The bulk of the gains were the result of 2005 contract negotiations with the PWU and total about $12 million between 2004 and 2008. Hydro One will be entering into new negotiations with the PWU in January 2008 in advance of expiry of the current contract on March 31, 2008.

It is likely an attempt by Hydro One to achieve significant cost reductions in wages, benefits and pension would result in a strike. The last PWU strike was in 1985 and lasted 12 days. It was handled by placing management and Society-represented staff in key functions to maintain operations/service to the extent possible. However, as a result of numerous downsizing programs, and re-organization of work, there are far fewer management staff available today with the requisite skills and experience to occupy key PWU positions during a strike. As a result, the Company would be unable to continue operations during a prolonged PWU strike.

3.2 Society

Compensation of Society-represented employees is negotiated through the collective bargaining process. Hydro One's goal is to compensate Society-represented staff at levels competitive in the market place in order to maintain the ability to attract, motivate and retain competent staff. For the utility industry, an aging workforce within operations management and specialist engineering positions is likely to limit the supply of skilled employees in the coming years, putting upward pressure on compensation. Further, utility hiring practices from the mid-1980's until recently have resulted in fewer engineers with requisite education and experience being available in the workforce.

In establishing rates for Society-represented staff, Hydro One considers the average industrial wage settlements, Consumer Price Index, and survey results from the Ontario Society of Professional Engineers. This survey is used as a major data source since engineers are the single biggest classification within the Society. As an employer, Hydro One focuses on the marketplace more than on inflation. Hydro One's goal is to occupy a certain position in that marketplace in order to attract, motivate and retain the kind of talent required.

With respect to the Society, the strategy prior to 2005 had been to achieve increased management flexibility to run the operations. Until then, the Society had mandatory mediation/arbitration as the method of dispute resolution, so there had been no strikes. Following the elimination of this approach in 2005, the Society conducted a 15-week strike. Subsequent arbitration resulted in a salary increase of 3% on April 1, 2005, and on April 1, 2006 and April 1, 2007. The expiration of that agreement was originally scheduled to occur on March 31, 2008. However, on April 5, 2007 both parties announced an early start to negotiations, having successfully concluded several months of co-operative work to resolve a variety of issues and disputes remaining between the parties. A new agreement was ratified on June 29, 2007 and, the Ontario Labour

Relations Board has granted permission to make the new collective agreement July 1, 2007.

Highlights of the agreement are below:

- The term is for five years, from April 1, 2008 to March 31, 2013. This has administrative savings since there is no need for bargaining for the next 5 years. It also ensures stability and predictability around a portion of the labour costs.
- Salaries will rise by 3% on April 1 2008, 2009 and 2010, and by 2.5% on April 1, 2011 and 2012, with cost of living adjustments provided in the last three years.
- Effective October 1, 2007, a new automatic step progression plan will replace the current performance pay plan (which had a mandatory 1% of base payroll payout per year).
- The salary range for all bands will be equivalent to 70-100% of current bands, with established progression steps. (replacing the existing 80-115% ranges).
- Unfair labour practice complaint and over 100 related grievances are resolved or withdrawn.
- Effective April 1, 2008, Hydro One will no longer subsidize the cost of optional life insurance.
- Hydro One will no longer add new spouses and children of re-married pensioners, surviving spouses of pensioners and surviving spouses of employees to the Health and Dental Plan.
- As a result of the change to the Society Purchased Services Agreement, Hydro One has no parameters or processes that restrict or inhibit its ability to contract out, other than the company can not lay off a Society represented employee as a direct result of contracting out his/her work.

In addition to the gains achieved during the recent round of negotiations, earlier notable gains have included:

- Cancellation of the annual incentive plan that had a maximum payment of 4% of base salary with a potential savings of $2.7M per year.
- Implementation of a two-tier pension plan for Society-represented employees hired after November 16, 2005 which is approximately 25% less costly than the existing plan for Society-represented staff hired prior to that date.
- Elimination of mandatory mediation/arbitration.

Hydro One believes these gains are consistent with the direction provided by the Board to continue its efforts to manage its overall compensation costs.

3.3 Management Compensation Plan ("MCP")

Following the Ontario Hydro demerger, Hydro One introduced a new Management Compensation Plan (MCP), which included base salary, benefits and variable pay. The MCP is designed around a structure comprised of 10 broad band levels.

The advantage of such a system is that it reduces the number of pay layers, simplifies administration, and provides increased opportunity for employees to progress as they gain skills and experience, without the frequent need to change positions. This plan is built around compensation goals and principles reflecting the need:

- To attract and retain competent executives.
- To achieve ongoing performance improvement.
- To align the interests of management and shareholder.
- To link compensation to the achievement of corporate objectives and individual performance.
- To provide flexible salary ranges, enabling executives to move up the ranges based on annual performance.

- To provide incentive pay on an annual basis and based on a rigorous performance management system.

Each management position is assigned to a salary band according to the accountabilities, size and complexity of the job. An employee's base salary within the pay band depends upon their expertise relative to the requirements of the job and is reviewed annually. Hydro One establishes reference positions using the Hay Methodology. All Hydro One MCP jobs are rated against these reference positions for scope and complexity.

Base salary adjustments for MCP staff are tightly managed and have never been applied as "across-the-board" economic increases, but rather to reflect improved competency in a job. In 2004, 2005 and 2006, 2.5%, 3% and 4% respectively were made available as base salary increases, by the Human Resource and Public Policy Committee of the Company's Board of Directors.

The variable pay concept is another key component of the management compensation strategy. Each of the 10 broad base salary bands has a maximum variable pay range associated with it. These maximums are percentages of the individual's base salary, and have been determined through an assessment of compensation practices in the target market. As noted earlier, two of the Hydro One management compensation principles are:

- Linking compensation to the achievement of corporate goals and individual performance.
- Providing incentive pay on an annual basis and based on a rigorous performance management system.

Hydro One believes that its short-term incentive program meets both of these principles in a cost-effective manner. The program provides an incentive payment, based on an employee’s performance against a specific set of annual performance criteria and factors in corporate performance. The incentive is re-earnable every year, so it is not built into the employee’s ongoing compensation. In years where performance is not strong, a reduced incentive, or no incentive pay, will be provided. Even in a year in which Net Income is achieved but other performance measures are not, there may not be an incentive payout. The re-earnable aspect of the program reflects a best practice approach since it minimizes the long-term compensation costs and allocates pay based solely on performance. Furthermore, the link between the performance factors and the Company's strategic goals (described in Exhibit A, Tab 3, Schedule 1) ensures that management performance is driven by a balance of considerations – the need for a safe workplace, customer focus, reliability, financial performance and employee and shareholder relations. These together, help create a high-performance, more efficient work environment. Achievement of these goals directly benefits the ratepayer and therefore it is appropriate that any incentive paid related to achievement of these goals, including net income, should be included in the revenue requirement.

Hydro One utilizes Hay Consulting to evaluate its positions relative to the market. Compensation adjustments are made as deemed necessary to attract, motivate and retain competent staff.

In May, 2007, the Agency Review Panel (the "Arnett Panel") submitted its report on Phase I of its review of Ontario’s provincially-owned electricity agencies. The Arnett Panel has provided the Government with a report on executive compensation. The Government supports the report and has indicated it will provide a directive to the Hydro One Board of Directors with respect to implementing the report’s recommendations.

Currently, the compensation strategy for MCP is that Hydro One targets total cash compensation at the 75th percentile of the target market comparator group, which is the Hay All Industrial Component. The organizations in this study represent corporations which are in the electricity sector or related fields and with which Hydro One competes for talent.

Hydro One's best performers are highly marketable, and several key management staff have left the company in recent years. The Hydro One succession plan has facilitated internal promotion and a smooth transition in most cases, but our internal replacement capacity is now significantly diminished in key areas. External recruitment has proved challenging as our compensation levels and structures have fallen below the market for top people. The Human Resources and Public Policy Committee mandate requires a review of the Management Compensation Structure every year. Hay Management is utilized to assist in the review. Recommendations are ultimately presented to the Board of Directors for approval. (Following a 2006 review, Hay recommended that the minimum and maximums of the majority of bands be increased in order to maintain market relativity)

In terms of Management compensation, Hydro One has endeavoured to strike a balance between the need to attract and retain competent staff and the need to constrain costs. To this end it has increased hours of work for all Management staff and substantially altered pension and benefit provisions for new hires.

4.0 PENSION AND BENEFITS

Hydro One Networks is a participant in the Hydro One Pension Plan ("Plan"). The Plan is a contributory, defined benefit pension plan whose members comprise represented employees of the Power Workers Union ("PWU"), Society of Professional Engineers ("Society"), non represented management employees, employee pensioners and beneficiary pensioners.

In an effort to contain escalating benefit and pension costs, in January 2004 the Corporation introduced revised pension and benefits plans for MCP hired after January 1, 2004. These new plans are approximately 25% less costly than the previous plans. As noted previously, the revised pension plan is also applicable to Society staff hired after November 16, 2005. Additional detail on pension costs is contained in Appendix A of this Schedule.

5.0 SUMMARY

As noted previously, in a heavily unionized environment, there are significant constraints on an employer’s ability to reduce compensation costs per employee. However, despite these constraints, the Corporation has made significant gains in the reduction of pension and benefits costs for MCP staff and pension costs for Society-represented staff. The elimination of the incentive plans for PWU and Society has reduced potential cash payouts to the PWU and Society by 6% and 4% respectively. Hydro One will also continue its focus on increasing productivity and management flexibility to run the business.

PENSION COSTS

1.0 PENSION COSTS

Hydro One Networks is a participant in the Hydro One Pension Plan ("the Plan"). The Plan is a contributory, defined-benefit pension plan whose members comprise represented employees of the Power Workers Union ("PWU"), the Society of Energy Professionals ("Society"), MCP employees, pensioners who were employees, and pensioners who are beneficiaries of employees or pensioners.

The Board has previously allowed cash payments related to pension obligations to be recorded in rates (RP-1998-0001). As well, in April 2006, the OEB in its Decision with Reasons, approved full recovery of Distribution pension costs included in OM&A (RP--2005-0020/EB-2005-0378).

Pursuant to the Inergi outsourcing agreement (see Exhibit C1, Tab 2, Schedule 6), Hydro One Networks is also required to pay, directly to Inergi, a predetermined estimate of Inergi's annual current service pension cost in each year for each of the ten years of the outsourcing.

The Hydro One pension cost allocated to Hydro One Networks is based on the ratio of base pensionable earnings for Hydro One Networks' staff, as compared to the total base pensionable earnings for all of Hydro One employees. The method of allocation of the pension cost and the Inergi annual pension charge is consistent among all shared services costs, for operating and capital costs, and is consistent with the methodology reviewed during RP-2005-0020/EB-2005-0378 and EB-2006-05-01.

For the Distribution business, the annual charge to be recovered through rates is estimated as follows:

Annual cash pension cost (millions)
(*may not add due to rounding*)

2008								
Corporate Pension Costs	Transmission		Distribution		Other		Total	
OM&A	$	27	$	33	$	3	$	63
Capital	$	18	$	23	$	-	$	41
	$	45	$	56	$	3	$	104
Inergi Annual Pension Charge								
OM&A	$	2	$	4	$	-	$	6

2.0 ACTUARIAL CALCULATION

The most recent actuarial valuation for the Hydro One Plan was as at December 31, 2003. In September 2004, Hydro One filed this actuarial valuation with the Financial Services Commission of Ontario (FSCO), which was reviewed during RP-2005-0020/EB-2005-0378. The valuation showed that the Plan had a deficit of $167 million, on a going-concern basis. The required contribution for the Hydro One companies was set at $81 million starting in 2004, variable based on the level of base pensionable earnings. Of this amount, about $60 million represented annual current service costs, and the remaining portion represented special payments over 15 years required toward the going-concern deficiency, and commuted value top-ups.

In accordance with applicable regulations, Hydro One has made all required contributions since January 1, 2004.

Hydro One's next actuarial valuation will be prepared as at December 31, 2006 and will be filed with FSCO in September 2007. The valuation will depend on investment returns, changes in benefits, and actuarial assumptions.

Pension costs for 2008 are estimated at $104 million respectively. These pension costs were derived from estimates prepared by Mercer Human Resource Consulting LCC (“Mercer”), the Plan’s actuary. The December 31, 2003 membership data and September 30, 2005 assets were extrapolated to December 31, 2006.

The estimated $104 million contribution in 2008 is comprised of $74 million in current service cost and $30 million in unfunded liability payment. The change from the $81 million contribution estimate in the 2003 actuarial valuation, or $23 million, is due to:

Impact of liability and service cost increase due to assumption changes	$20 million
Increase in current service cost reflecting staff growth	$ 8 million
Impact of asset gains	($5) million
	$ 23 million

Going concerns assumption in the 2003 actuarial valuation and in Mercer’s estimate for 2007 are the same except inflation was raised from 2.25% to 2.50%, consistent with market conditions. The inflation estimate is based on the spread between the yield on long-term Government of Canada Bonds and Government of Canada Real Return Bonds. This spread increased by 0.25% between December 31, 2003 and October 31, 2005 (the latest available yields at the time the estimate was prepared). The yield spread at July 31, 2006 is consistent with the yield spread at October 31, 2005.

The staff growth reflected in the increase in current service cost supports the requirements of the work program.

The short-term investment experience in 2004, 2005, and 2006 exceeded the long-term discount rate used to calculate pension plan liabilities at December 31, 2003. This investment experience in 2004, 2005 and 2006 is expected to contribute to a reduction in projected contribution requirements, starting in 2007, from the costs shown in this evidence. However, updated costs, and all other relevant assumptions, have not been finalized at the time this evidence has been prepared.

During 2007, actual contributions have commenced based on an estimated $100 million contribution level, consistent with estimates provided in RP-2005-0020/EB-2005-0378. Actual contribution requirements in 2007 and 2008 may differ that will depend on final membership data, plan assets and economic assumptions used in the actuarial report filed as at December 31, 2006. The difference between the estimated and actual pension costs will be tracked in a variance account (see Exhibit F1, Tab 3, Schedule 1).

3.0 PENSION PLAN GOVERNANCE AND PERFORMANCE

Hydro One is the Plan sponsor and administers the pension assets and obligations of the Plan. As of December 31, 2006, the Plan had a reported net asset value of $5,199 million and about 11,680 members. One-third of the Plan's members are active. The remaining Plan members are inactive, either retired or beneficiaries of retirees. The Plan governance was reviewed during RP-2005-0020/EB-2005-0378.

The Fund has consistently outperformed market indices. In the period from June 29, 2001 (the Fund's inception) to December 31, 2006, the Fund return was 9.54% and the Fund outperformed its target return number by 0.71%.

In addition, Fund performance has been favourable relative to that of other pension funds. Specifically, the Fund has a 20th percentile rank since inception.

COSTING OF WORK

1.0 OVERVIEW

Hydro One Distribution's work program is bundled into packages of work identified as programs or projects. Program and project costs are comprised primarily of activities associated with labour, equipment and material acquisition. Consistent with common industry practice, trade labour and equipment hours are distributed directly to benefiting programs and projects by using weekly-prepared timesheets. Standard hourly labour and equipment rates are then used to convert the reported hours into costs. Both labour and equipment rates are "fully loaded" to ensure that all associated support costs required to deploy resources and equipment are accurately and cost effectively distributed to the benefiting work. By creating predetermined standard rates, Hydro One Distribution sets cost targets to measure actual performance and to identify opportunities where, over time, cost efficiencies can be gained.

In terms of material costs, a standard material surcharge is included in this cost category to capture material procurement costs benefiting the particular program or project.

The cost compositions of these standard rates are explained in more detail in the Section 2 of this Exhibit.

Depending on the nature of the work, Hydro One Distribution's program or project costs also include additional costs beyond the major contributors identified above. These additional costs may include the costs of external contractors and/or miscellaneous job specific consumables such as travel expenses or the purchase of low value material. As well, certain programs (primarily customer demand work) benefit from staff support hours that are not distributed using weekly timesheets. These functions deal with a high volume of short duration customer demand requests and therefore it is neither practical nor cost effective to complete weekly timesheets. The costs of these activities are assigned monthly to the benefiting programs based on workload reviews and an assessment of the upcoming annual work program.

In terms of estimating and costing capital work, there may be circumstances when removal costs or customer contributions need to be separately identified. The cost of removal work is accounted for as OM&A and customer contributions are netted against our gross capital costs. Capital work also receives a monthly charge for its share of corporate and overhead costs and capitalized interest. The composition of these two cost categories and the annual calculation are explained in Exhibit C1, Tab 5, Schedule 2 and Exhibit D1, Tab 4, Schedule 1.

2.0 PROJECT / PROGRAM MAJOR COST CATEGORIES

2.1 Labour Rate

On an annual basis, the standard labour rates are derived based on information gathered through the annual budgeting process. Resource budgets for each major resource category are calculated and categorized into three basic cost components; forecast billable (direct charged) hours, forecast non-billable hours and forecast non-billable expenses. Total payroll and expense costs along with an assignment of support activity costs, divided by the forecast billable hours, create the standard labour rate. The cost elements embedded in the standard rate are illustrated in Table 1 and explained in the pages following, using the Regional Line Maintainer as an example.

Table 1

Regional Line Maintainer - Regular Staff 2008 Labour Rate	Billable $ per Hr.
Composition of the Standard Labour Rate	**$105.50**
Payroll Obligations	**$72.08**
Contractual time away from work	**$8.48**
Time not directly benefiting a specific Program or Project	**$4.84**
Support Activities	**$20.10**

2.1.1 Payroll Obligations ($72.08)

A brief description of the cost elements included in this category is provided below. Our compensation, wages and benefits are more fully explained in Exhibit C1, Tab 3, Schedule 2.

Base Labour and Payroll Allowances (54% of Payroll Obligations)

- Base Pay: Contractually negotiated and reflected in our wage schedules.
- Payroll Allowances: Allowances are also contractually negotiated and stated in our collective agreements. Regular staff (PWU) are entitled to travel, footwear and on-call allowances. Casual trades are entitled to travel and subsistence allowances where circumstances permit.

Company Benefits (42% of Payroll Obligations)

- Regular Staff: Comprised of Pension (28.9% of base pensionable earnings) and current and post employment benefits; health, dental, etc. (40.6 % of base pensionable earnings).

- Non-Regular Staff (eg: Lines Hiring Hall): Pension and Welfare contributions that are 40% lower in comparison to the company benefit contributions made on behalf of the regular employee.

Government Obligations (4% of Payroll Obligations)

- Consists of Canada Pension Plan (CPP), Employment Insurance (EI), Employee Health Tax (EHT) and Workplace Safety and Insurance Board (WSIB);
- In 2008, 6.3 percent is applied against total earnings (includes base pay, bonus, overtime, benefits and taxable allowances) to recover these costs.

2.1.2 Contractual Time Away from Work ($8.48)

This category consists primarily of employee vacation and statutory holidays, all established and identified in our collective agreements. Sickness and accident costs are also included and are based on historical trends and consider current company initiatives.

2.1.3 Time not directly benefiting a specific Program or Project ($4.84)

This category includes time for attendance at safety meetings, housekeeping and downtime often resulting from inclement weather. These estimates are based on historical trends and current initiatives.

2.1.4 Support Activities ($20.10)

Administrative Expenses and Centralized Support (39% of Support Activities)

- These costs include administrative expenses such as travel costs, cell-phones and other miscellaneous expenses that cannot be specifically attributed to a particular program or project. Also included, is an assignment of costs for centralized clerical support activities and other centralized support for maintaining mobile radios and supporting work management system requirements.

Field Support Staff (46% of Support Activities)

- These costs include management and technical staff providing support services to manage and monitor the status of the assigned programs and projects.

Networks Work Methods & Training (9% of Support Activities)

- Costs to design, develop and deliver work methods and training programs. Costs are assigned based on the forecasted consumption of these services as agreed to by the Work Methods & Training function and service recipient.

Networks Safety & Environmental Support (6% of Support Activities)

- Costs to design, develop and deliver safety and environmental practices primarily for staff working in field locations. Costs are assigned based on the forecasted consumption of these services as agreed to by the Safety & Environment function and the service recipient.

2.2 Fleet Rate

Hydro One owned fleet assets are categorized into 65 classes of equipment. For each equipment class a standard equipment rate is calculated by dividing the annual forecast cost to maintain each class of equipment by the annual forecast hours the class of equipment is required to work (utilization hours). Utilization hours are derived based on a review of historical trends and an annual review of the upcoming Work Program. Utilization hours are defined as the hours the equipment is being used "on the job". As illustrated in Table 2, the rate is fully loaded to ensure we attribute all associated costs to the benefiting work.

Table 2

Lines Maintenance Vehicle 2008 Fleet Rate	Billable $ per Hr
Composition of the Standard Fleet Rate	**$63.00**
Operations & Repairs	**$37.05**
Depreciation	**$19.94**
Fuel Costs	**$6.01**

Below is a brief description of each category. In addition, fleet rates for historical, bridge and test years are illustrated in Attachment A. A discussion on Fleet Management may be found in Attachment A of this exhibit.

2.2.1 Operations & Repair Costs (59% of Fleet Rate)

- This cost category consists primarily of repair costs (labour and parts) which are derived based on a forecast of the annual maintenance schedules for each piece of equipment. The age and the history of the vehicles are considered in the calculation. Throughout the year, all repair costs are charged directly to each piece of equipment. Operations cost include administration staff and their allocated share of central service support costs (facilities, telecommunications and work methods and safety training activities)

2.2.2 Depreciation (32% of Fleet Rate)

- Based on the current composition of the Fleet and the annual forecasted additions and deletions, the depreciation for each class is calculated based on the current depreciation policies in Hydro One. Operating leases are also included in this category. Fleet leases approximately 4% of its vehicles, predominantly light trucks.

2.2.3 Fuel Cost (9% of Fleet Rate)

- Fuel consumption cost is calculated based on past history, future fuel price projections and the composition of the class.

2.3 External Fleet Rentals

Due to the seasonal and fluctuating nature of the work program, Hydro One Distribution requires externally owned equipment to meet work program peaks. Similar to the process used to cost its own fleet, Hydro One Distribution calculates and uses standard rates to distribute these costs to programs and projects.

2.4 Material Cost and Standard Surcharge

Material costs charged to a project or program are based on the issue cost from Inventory, which is the Average Unit Price (AUP) or the direct-shipped purchase order price. On a monthly basis, the total monthly material charges are surcharged with a fixed percentage to cost effectively recover the costs associated with purchasing, transportation and inventory management. The percentages range from 5% to 14% depending on work program service requirements. The percentages are derived by assigning the costs of these activities to the work programs based on an annual assessment of the consumption of these services divided by the annual forecast of purchased material. The Supply Chain Management details are described in Attachment B of this exhibit.

The costs recovered in the surcharge are as follows:

- Inergi Contract Costs: Procurement, investment recovery and management of in-bound transportation of material. (Approximately 45% of the total costs);
- Hydro One Supply Chain Costs: Warehousing and out-bound transportation of material. (Approximately 55% of the total costs)

2.5 Standard Rates

When using standard rates, residual costs naturally arise when actual costs incurred differ from the standards. These variances are accounted for on a monthly basis and assigned to both capital and maintenance programs. The monthly assignments of residual costs are made to OM&A and Capital based on the program and project cost activities responsible for generating the year to date variances.

In terms of the standard rates themselves, year over year variation in the labour rate is primarily due to payroll obligation costs (e.g. wage and benefit changes). Information about employee pensions and benefits may be found in Exhibit C1, Tab 4 Schedule 2. Year over year variations in the fleet rate are due primarily to fluctuations in depreciation expenses and changes in the staff mix associated with fleet maintenance activities. Year over year variation in the material surcharge rate are due to increased transportation costs.

FLEET
(Including Repair and Fueling)

1.0 INTRODUCTION

Fleet Management Services provides centralized and turn key services that include maintenance, administration, vehicle replacement and disposal. Vehicles are maintained to an optimum level to ensure public and employee safety and compliance with laws and Ministry regulations including but not limited to CSA225, Highway Traffic Act and Commercial Vehicle Operator's Registration Regulations. Fleet Management Services has the role of minimizing environmental impacts; optimize Lines of Business productivity by minimizing downtime, travel time and optimizing technological and continuous improvement opportunities.

Fleet Management Services has adapted to the changing needs of its business through the following means:

- Internal customers changed from a fixed zone service provider to a mobile and firehall model;
- Fleet and facility rationalization;
- Improved equipment downtime and equipment utilization;
- Competitive and cost efficient fleet support;
- Flexible service delivery model that matches the internal customer's nomadic and variable work programs, including service delivery options that mirror the private sector, including shift work, extended hours of service and mobile service delivery;
- Timely, strategic and cost efficient equipment procurement and disposal;
- Long range Capital Replacement Program;
- Data collection and information management systems that match the nomadic business unit requirements.

2.0 MAINTENANCE MODEL

Fleet Management Services has developed a balanced maintenance model of mobile service delivery and centralized facilities. This model provides the appropriate balance of 35 provincially centralized locations that are based on cost effective analysis and forecasting within the 2007 Business Plan, geographical customer requirements, travel time, third party vendor support and response time. Mobile/satellite repair units also minimize the cost by providing timely on-site field support for the different types of nomadic work programs including vegetation control, new construction, and off-road tower maintenance. The combination of the internal and external program meets the requirements and rigor of Fleet Management Services' service level agreements and its customers' requirements of a mobile and firehall operating model. Any significant changes to the Business Plan or the company will be supported by changes to this flexible business model.

3.0 MANAGED SYSTEMS

In 2003, a strategic alliance was developed with Automotive Resources International (ARI) to implement a fleet management system in 2004. The implementation of the fleet management system created an automated web-based system that uses a single credit card for each vehicle to capture all operating costs including fuel, parts and repairs. The fleet management system incorporates programs required to manage contracts such as tender agreements, and the system prescribes spending guidelines and negotiated discounts. The system/program measures a variety of targets that reconcile approved purchase orders, estimates versus actuals, spend by vendor, discount by vendor and vendor complaints.

The benefits of this program include:

- Improved scheduling of preventative maintenance, reduced repair times, travel time and reduced equipment downtime;
- Increased access to the number of vendors for fuel, repairs and parts, thus minimizing cost and downtime;
- Improved cost and efficiency, through increased procurement strategies and larger economies of scale, including improved volume discounts for fuel, parts and service;
- 1-800 number for repairs, roadside assistance and towing. This program is guided by Hydro One approved spending limits and guidelines, as well as approved spending limits authorized by Hydro One Fleet Management Services personnel;
- Improved reporting and data collection.

This management system uses a variety of linked programs that include the Fleet Web Site, Intellifleet and Virtual Garage. This system which is for all vehicles and equipment, manages the data and information for all facets of the business including internal and external repairs. This system and associated programs are operated in partnership with ARI take advantage of internal and external intelligence and technology.

The proactive and user friendly maintenance program minimizes avoidable and expensive repairs, minimizes equipment downtime, and improves equipment utilization. Both internal and external service providers have access to the appropriate information through state of the art automated management systems allowing for quality decision making in all levels of the maintenance program. Examples of the information include:

- Real time vehicle history;
- Warranty criteria and warranty recovery;
- Work and resources scheduling tool;
- Pending and overdue work information alert system;

- Product information, including vendor specific;
- Repair and safe practices manuals;
- Process and policy information;
- Invoice and cost management details;
- Monthly and ad-hoc reports;
- Work order management;
- 24 hour roadside assistance.

Fleet Management Services controls and manages approximately 5,185 vehicles and other equipment primarily for distribution and transmission work (see Appendix A). Inventory levels are controlled and set by the Hydro One Lines of Business and Fleet Management Services within the guidelines set for staffing versus fleet ratio, type and volume of work programs, geographic locations and utilization targets. Fleet Management Services maintains 35 facilities to support 19 Forestry locations and four Brushing Crews, 1200 Distribution Stations and 280 Transmission Stations, 53 Provincial Lines Distribution locations and five Transmission Locations.

4.0 FLEET COMPLEMENT & UTILIZATION

As Capital Programs and OM&A have increased since 2000 the options to meet the increased equipment demand include; purchase additional equipment, lease/rent additional equipment or increase utilization of existing equipment. The optimum option is to increase utilization, which minimizes capital investment and maximizes the advantage of owned core equipment versus the additional cost of external rentals. The comparison of external equipment rental costs is 35 percent more than owned equipment rates. This is based on an internal study of the actual costs of equipment rentals versus the comparison of owned core equipment.

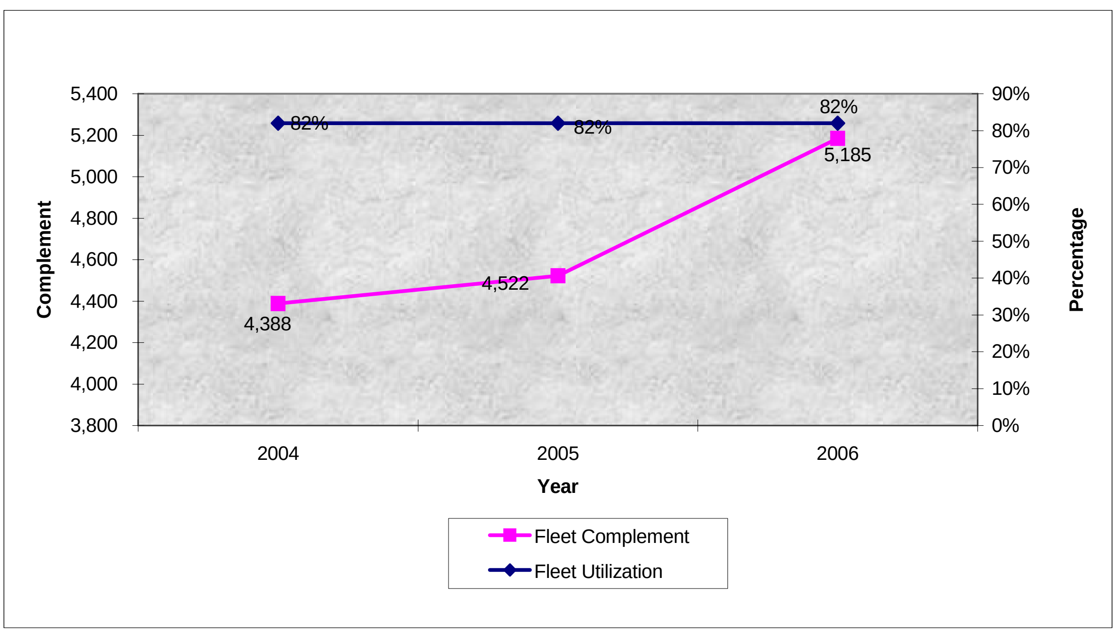
Benefits of Improving Utilization:

- Minimizes long term capital requirements
- Maximizes ability to respond to fluctuations in work programs
- Minimizes rental costs

Fleet Management Services has seen equipment utilization averages increase from approximately 65 percent in 2001 to approximately 82 percent in 2006 resulting in additional hours of yearly equipment utilization. The 2006 average equipment rate is $21.13; this is established by averaging all the individual equipment rates.

The increase in Fleet complement is directly related to the increase in Work Program and staffing levels.

Figure 1 Fleet Complement & Utilization



5.0 OM&A BUDGET

Fleet Management Services operating, maintenance and administration yearly budget is developed and managed based on the following criteria and all in costs of operating the fleet:

- Historical and forecasted costs based on estimated fixed and variable costs including fuel, depreciation, maintenance and repair, labour/staffing, external rentals and corporate allocations;
- Work program forecasts;
- Capital/Vehicle replacement program;
- Projected escalators.

Fleet Services develops an OM&A budget on a yearly basis for the following calendar year.

The total of the accounts that comprise the budget is based on:

- Historical cost and mechanical fitness evaluations;
- Work program forecast provided by LOB;
- Estimates provided by internal and external suppliers;
- Vehicle replacement program;
- Projected escalators.

Table 1
Fleet Management Services
Operating, Maintenance and Administration Yearly (OM&A) Budget Expenditures
($ millions)

	Historic			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Operations & Repairs	41.4	43.3	47.0	48.4	48.4
Depreciation	25.1	24.0	26.0	27.3	27.6
Fuel	12.9	16.6	18.8	17.5	17.5
Subtotal	**79.4**	**83.9**	**91.8**	**93.2**	**93.5**
Rentals	10.5	10.7	8.1	11.5	11.5
Total	**89.9**	**94.6**	**99.9**	**104.7**	**105.0**

The higher number of fleet units, along with higher fuel prices, is directly related to the increase in the Operations & Repairs and Fuel expenditures.

5.1 Operations & Repair Costs

This cost category primarily consists of repair costs (labour and parts) which are derived based on a forecast of the annual maintenance schedules for each piece of equipment. The age and the history of the vehicles are considered in the calculation. Throughout the year, all repair costs are charged directly to each piece of equipment. Operations cost include wages, allocated share of facility and telecommunication cost and work methods and safety training activities.

5.1.1 <u>Depreciation</u>

Based on the current composition of the Fleet and the annual forecasted additions and deletions, the depreciation for each class is calculated based on the current depreciation policies in Hydro One. Lease costs associated with Fleet's operating leases are also included in this category. Fleet leases approximately 6 percent of its vehicles, predominately light trucks.

5.1.2 <u>Fuel Cost</u>

Fuel cost is calculated based on past history and the current composition of the class. Throughout the year, fuel costs are charged directly to the particular piece of equipment consuming the fuel.

5.1.3 <u>External Fleet Rentals</u>

Due to the seasonal and fluctuating nature of our work program, Hydro One requires externally owned equipment to meet the peaks in our programs. Similar to the process used to cost our own fleet, standard rates are calculated and used to distribute these costs to our Programs and Projects.

APPENDIX A

Table 1
Vehicle Profile by Category

	Rentals	Heavy Transport	Light Transport	Radial Boom Derricks	Bucket Trucks	Trailers and Misc	Off Road
Total	153	343	2,239	209	437	1,703	254

1.0 VEHICLE PROFILE

Hydro One Fleet Services has six categories of equipment that are used to support the Dx structure. These include:

Light Transport Equipment - The equipment in this category is made up of:

- Cars;
- Vans;
- SUVs
- Pickups under 10,000 lb. Gross Vehicle Weight Rating (GVWR).

The primary use of these units is for transportation and minor services, meter reading and protection and control inspections.

Heavy Transport Equipment - The equipment in this category is made up of trucks and vans over 10,000 lb. GVWR, with either no attachments or with minor attachments (eg, ladder van). These units are used primarily for work that does not require attachments and support vehicles (eg, service trucks, cube vans, stake trucks and highway tractors).

Bucket Trucks - The equipment in this category is made up of units composed of a chassis, body and aerial device. The aerial devices' size range from 37 ft to 80 ft. Hydro One's standards in this class are:

- 42 ft single buckets;
- 46 ft double buckets c/w material handling;
- 55 ft double buckets c/w material handling;
- 65 ft double buckets c/w material handling;
- 80 ft double buckets c/w material handling.

Radial Boom Derricks - The equipment in this category is made of units composed of a chassis, body and radial boom derricks. This equipment is primarily used for the digging and setting of poles. Our present standards in this class are:

- Single axle;
- Tandem axle (great capacity and reach).

Off Road - The equipment in this category is made up of units that are used primarily for off road and that have been outfitted with either an aerial device, RBD or spray equipment for a specific type of work program. This class is all non-licensed equipment.

Trailers and Miscellaneous - The equipment in this category is mainly trailers used for moving material and equipment or storage. The miscellaneous equipment covered in this category includes, but is not limited to, boats, compressors, forklifts and backhoes.

Rentals - The equipment in this category is external rental units consisting of light transport equipment and work equipment used to support the seasonal and hiring hall requirements.

SUPPLY CHAIN MANAGEMENT

1.0 INTRODUCTION

Hydro One delivers end-to-end Supply Chain Services for the Distribution, Transmission and Remotes business. The focus is on the right product with the right quality, at the right place, right time and at the right cost. These services include strategic sourcing (purchase) of materials and services, storage and distribution of materials, transportation, inventory management, and investment recovery of disposed assets.

The 2008 cost for Supply Chain services is $26.5 million, with these costs allocated to work programs and projects through the material surcharge rate discussed in the main section of this schedule (section 2.3).

This Exhibit describes the cost levels in Section 1.1, followed by a description of components of Supply Chain Management in Sections 2.0 through 6.0: Policies and Procedures, Strategic Sourcing (purchase) of Materials and Services, Storage and Distribution of Materials – Warehousing, Transportation and Investment Recovery.

1.1 Supply Chain

Table 1
Supply Chain ($ million)

	Historic			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Total	**20.3**	**17.1**	**18.7**	**24.2**	**26.5**

Note: Costs exclude waste management costs (part of Transmission and Distribution OM&A) which were included in previous filings.

The growth in Supply Chain costs is a result of the growing work program. Supply Chain is planned to grow by 42% from 2006 through to 2008, supporting the growth in transmission and distribution work programs which is planned to grow by this same amount over this period. This growth in Supply Chain is driven by increasing volumes of works, as well as increased planning, sourcing, warehousing, transportation and inspection costs. Over the 2006 to 2008 period, the material surcharge rates have essentially remained the same.

In early 2002, Hydro One reached an agreement with Cap Gemini Ernst and Young Inc. in which non-core services were outsourced to Inergi LLP. Refer to Exhibit C1, Tab 2, Schedule 6 for further details. The Supply Chain of Hydro One was a part of this outsourcing contract. The components of Supply Chain performed by Inergi include purchase of materials and services, contract management and investment recovery.

The Inergi outsourcing agreement was contracted for the same service levels at a declining price over the term of the contract. The increasing overall cost levels represent increased volume of work and service levels to meet the business needs.

2.0 POLICIES AND PROCEDURES

Hydro One operates a fair and transparent procurement process that gives all companies equal opportunity to do business with Hydro One, consistent with its Procurement Policy and Principles.

Tenders and proposals are evaluated based on predefined evaluation criteria by cross-functional teams. The outcome of the evaluation is the foundation for awarding procurement contracts.

3.0 STRATEGIC SOURCING OF MATERIALS AND SERVICE

Hydro One manages its procurement and supply base by using strategic sourcing methodologies and processes in the acquisition of goods and services, representing in excess of $650 million in Hydro One annual expenditures for 2006. Strategic Sourcing is a disciplined business process for purchasing goods and services on a company-wide basis using cross- functional teams to manage the supply base as a valued resource.

The Strategic Sourcing methodology is a five-step process that includes expenditure analysis, market analysis, the development of a sourcing strategy, negotiation and award, and contract management. The main steps of sourcing strategies are described below:

- Involvement of internal stakeholders to communicate their business needs for the products and services.
- Cost reduction by increased leverage of company wide expenditures.
- Reduced total life cycle cost for materials and services, e.g. when purchasing equipment, the specifications are reviewed to ensure consistency with business needs, maintenance requirements are reviewed, installation services are identified, warranty services defined, order and invoice processes are evaluated to determine where greater efficiencies can be realized, lead time, inventory requirements etc.
- Improved security of supply through negotiating long-term agreements with fixed prices, or formula pricing, to ensure that Hydro One achieves best value.
- Improved and/or consistent quality of material and services.

4.0 STORAGE AND DISTRIBUTION OF MATERIALS - WAREHOUSING

In December 2004, Hydro One consolidated eight provincial warehouse locations into a central warehouse in Barrie. The central operating model included a change to the warehouse and distribution business model to re-deploy 18 field stock keepers to service

64 field service centres, and nine stock keepers assigned to the central warehouse. The field stock keepers are responsible for up to five sites, which they visit weekly to meet the delivery truck to receive shipments, put away material and order material. The central warehouse operation is responsible for the storage and distribution of materials for the service centres. Lastly, the private fleet was eliminated and deliveries to the service centres contracted to a third party transportation carrier. The benefits of the consolidated warehousing included total cost savings of $7 million in present value over 10 years.

The objective of the Warehousing operations is to maximize efficiencies in the central warehouse to realize the benefits of the warehouse consolidation. This requires such activities as:

- Continuously improving business processes such as receipting, shipping and cycle counting.
- Evaluating opportunities to streamline direct shipping and minimize cross-docking.
- Exploring the options of technology such as bar coding to improve operating efficiencies such as receipting, cycle counting, shipping and tracking inventory.
- Effectively managing and coordinating the delivery of materials on the scheduled delivery date to the service centres to ensure that the field operation receives the right material at the right time.
- Improving receipting efficiency by integrating with the contracted transportation company to provide visibility into the supply chain and scheduling the inbound shipment.

5.0 TRANSPORTATION

Hydro One manages its inbound and outbound transportation of materials through contracts with third party transportation companies. The transportation strategy is to actively manage the transportation cost of inbound and outbound traffic and reduce transportation cost year over year. Executing the transportation objectives will position Hydro One to improve transportation cost and operations throughout the supply chain.

6.0 INVESTMENT RECOVERY

The final step of the Supply Chain is the disposal and investment recovery of end-of-life assets. The revenue from the sale of the asset typically is applied back to the benefiting work. A breakdown of the sale of assets is as follows:

Table 2
Breakdown of Sales of Assets through Investment Recovery Program ($ Million)

Type of Sale	Recovery 2004	Recovery 2005	Recovery 2006	Recovery 2007	Recovery 2008
Vehicle Sales	2.2	1.7	1.8	2.0	2.0
Scrap Metal	0.9	1.9	1.7	2.0	2.0
Tools	0.0	0.1	0.0	0.0	0.0
Total	**3.1**	**3.7**	**3.5**	**4.0**	**4.0**

Hydro One will continue to focus on extracting the maximum value possible from the sale of end-of-life assets.

COST EFFICIENCY

BACKGROUND

Hydro One identifies cost efficiency initiatives as part of its business planning processes, and also uses benchmarking to help identify areas requiring improvement. Provided below is an overview of Hydro One's efforts to improve cost efficiency in the past and initiatives being undertaken to continue improving cost efficiency in the future.

In the OEB's Decision With Reasons on Hydro One's recent Transmission rate filing (Ref EB-2006-0501), issued on August 16, 2007, the Board stated "in the [compensation] study that Hydro One is [now] preparing, the Board expects it to provide empirical evidence which reveals the relative productivity of its workforce in comparison to other utilities". Since the Transmission Decision was issued on August 16, 2007, the day after Hydro One was required to submit its 2008 Distribution revenue requirement application, the Company has provided the additional information on cost efficiency initiatives which follows. This information includes a broad indicator of workforce productivity improvement which has been benchmarked against other large Ontario LDC's.

1.0 INTRODUCTION

Cost efficiency is a core element of the Hydro One Distribution strategy. Hydro One will continue to make prudent and responsible economic efficiency improvements consistent with its business strategy in order to deliver steady financial performance, sustain company assets and deliver safe, economic and reliable electrical energy. In this context, the focus on cost efficiency supports the Corporation's 2010 strategic performance goals and targets provided in Exhibit A, Tab 3, Schedule 1 including: creating an injury free work place with zero serious injuries and zero near misses; becoming a leading customer-focused company with a 90% level of customer satisfaction for all customer segments; and, becoming a leading ("top quartile") distribution and transmission utility in reliability, based upon like for like comparisons.

Hydro One Distribution has a strong track record of implemented initiatives and related cost savings over the past 6 years, having achieved over $380 million in cost savings, as it has focused on all aspects of the business including: labour utilization and productivity; new technology improvements; material and services costs; overhead costs; fleet costs; facility costs; business processes; and, out-sourcing of non-core business activities. Many of these business aspects are addressed elsewhere in the prefiled evidence. This exhibit summarizes and describes a number of the initiatives undertaken by Hydro One Distribution to manage costs in the past and other gradual improvements which are presently being undertaken.

Going forward, Hydro One is faced with a unique confluence of challenges:

1. Major growth in work programs;
2. IT infrastructure end of life; and
3. Staff demographic and hiring challenges;

These coincident changes in the operational environment provide Hydro One with an opportunity to transform its business in a step level change over the next few years. Through this business transformation, Hydro One anticipates that beyond the 2008 test year, it may be capable of rising to the challenge of meeting an annual 1% productivity target, as was the case in the OEB's second generation IRM.

2.0 PAST AND CURRENT COST EFFICIENCY INITIATIVES

Inline with the Company's continued focus on its core distribution business in Ontario, a number of new initiatives will be or have been identified and introduced in 2007 and

2008 to further streamline the business. These are in addition to many initiatives that commenced prior to 2007, as identified in the Company's evidence filed in EB-2005-0378 and EB-2006-0501, which have been or are being fully implemented or enhanced over the 2007-2008 period and beyond.

The following is a summary list of some major cost savings initiatives that have provided or will provide incremental cost savings for the distribution business over the 2004 – 2008 period. These initiatives have been selected based on their illustrative nature and their broad significance across the Hydro One Distribution business contributing to the resulting incremental cost savings:

- Developing a more multi-skilled workforce
- Increased staffing flexibility (e.g. use of hiring hall) to execute peak seasonal and project work
- Implementation of focused trades training programs
- New tools and technologies, such as the full implementation of information technology used for new connections
- Implementation of new processes and tools in the field to enable improved planning, scheduling and reporting of work
- Improvements in the fleet management business.
- The full use of temporary headquarters for work crews, which will reduce travel time and thereby increase "wrench" time on the job
- Targeted savings from strategic sourcing initiatives
- The centralized operation of the transmission and distribution systems
- Continued outsourcing of non-core work activities
- Improvements to collective agreements
- Integration and bundling of work, such as improvements to the management of equipment outages
- Smart meters installation

The company continues to look for opportunities to drive efficiencies and reduce compensation costs with its unionized staff, through joint participation between management and the unions on work efficiency improvements, as well as collective agreements. The gains associated with Hydro One's labour agreements are described in Exhibit C1, Tab 3, Schedule 2.

Hydro One also uses benchmarking and best practice information to find better ways to run its business, thus gaining cost efficiencies and improving work program effectiveness, as well as to provide some indication of progress across the key elements of Hydro One's 2010 strategic goals and performance targets (see Exhibit A, Tab 3, Schedule 1 pages 1 and 2). Hydro One's benchmarking efforts consist of both internal and external studies. The internal studies compare best practices between the various geographic work centres; this helps promote internal competition and ensures internally developed best practices are leveraged across the company. The primary purpose of the external studies is to identify best practices others are using which may improve Hydro One's performance. Examples of recent Hydro One benchmarking efforts are contained in Exhibit A, Tab 15, Schedule 2 – Distribution Benchmarking Studies. Benchmarking and best practice results are provided to our planners and service provider staff to help them develop performance and productivity improvement initiatives. Examples include;

- Lowering costs through use of Hiring Hall resources for lower skill manual brush cutting work.
- Reviewing forestry practices to ensure that the most effective methods of forestry management are being used. (e.g. using mechanical brush cutting)

The identification and implementation of additional cost efficiency initiatives will be a greater challenge as identifiable incremental efficiency gains are expected to be smaller in terms of potential cost savings and implementation is typically more challenging for a number of reasons including the need to leverage information technology based solutions coupled with business process changes and the challenges of implementing improvements which cross business unit boundaries.

For purposes of the business planning model, the cost savings are identified as year over year "incremental savings" defined as savings over and above those already embedded in the costs of individual programs. Accordingly, the first year impact of a new initiative or enhancements to an initiative are identified and the target associated with that initiative is subsequently monitored to establish the actual savings achieved. Under this concept of incremental savings, the savings beyond the first year are considered to be "embedded" savings for purposes of the annual business plans and are therefore not included in the annual estimates of incremental savings unless enhancements to those initiatives are made. As a result, the incremental savings estimates substantially understate the savings from those initiatives that have a cost efficiency impact over more than one year.

Table 1 identifies the estimated total incremental cost savings achieved from 2004 to 2006, as well as the incremental savings to be achieved in 2007 through to 2008 for Hydro One Distribution. While all savings estimates are for gross savings, it should be noted that the implementation costs are taken into consideration as part of the business planning process described in Exhibit A, Tab 14, Schedule 1.

Table 1
Total Incremental Cost Savings – Distribution

	2004	2005	2006	2007 Bridge	2008 Test	Total
OM&A Savings ($M)	13.4	10.5	5.9	3.3	7.5	40.7
Capital Savings ($M)	9.5	8.1	4.6	1.0	2.1	25.4
Total Savings ($M)	23.0	18.6	10.5	4.4	9.6	66.1
Total Spend** ($M)	**618**	**679**	**797**	**1,006**	**1,055**	**4,155**
Savings as % of Total Spend	**3.7%**	**2.7%**	**1.3%**	**0.4%**	**0.9%**	**1.6%**

** Total Spend includes capital plus OM&A expenditures

As compared to the first half of this decade, incremental savings between 2006 and 2008 are trending lower and are projected to remain lower, both in absolute and percentage terms, with the completion of many major cost efficiency initiatives and the implementation of smaller, fewer, and more challenging cross-business unit opportunities. Despite the challenges associated with identifying and implementing further efficiency gains, Hydro One anticipates that beyond the 2008 test year, it may be capable of rising to the challenge of meeting an annual 1% productivity target. As outlined in the following section, coincident changes in Hydro One's operational environment provide the Company with an opportunity to transform its business in a step level change over the next few years, which in turn may facilitate meeting this productivity target.

3.0 CONTINUED COST EFFICIENCY FOCUS & STEP LEVEL CHANGE

An ongoing focus for Hydro One's Distribution business has been the implementation and nurturing of a continuous improvement culture that recognizes the need to look for positive change in everything we do. As discussed in the previous section, this continuous improvement culture has resulted in the realization of substantial improvements and productivity gains earlier this decade and smaller gradual improvements more recently.

In addition to continuing to utilize benchmarking and best practice information, Hydro One is taking advantage of a unique set of circumstances to transform its business in a step level change over the next few years. Through this business transformation, Hydro One anticipates that beyond the 2008 test year, it may be capable of rising to the challenge of meeting an annual 1% productivity target. These coincident unique circumstances include:

- **Major growth in work programs** requiring increased staffing resources and support systems. This work program growth is driven by changes in conservation initiatives, installation of smart meters, vegetation management, increased demand in specific geographic areas, the need to replace aging assets, system expansion and generation mix. This will provide the opportunity to achieve greater economies of scale, leverage standardized processes and design standards, implement new work methods, etc
- **Replacement of the core enterprise wide IT systems**, which have reached end-of-life. Many of these systems are being replaced within an integrated corporate business transformation project named Cornerstone. This project will facilitate changes in business processes to allow for more effective use of information resulting in improved work execution.
- **Substantial shift in staff demographics** which will result in a large proportion of current staff retiring over the next decade, and backfilling with new staff on a relative scale not seen in decades. As the result of a renewed collective agreement, new Society-represented staff will be brought in at lower salary ranges

(the salary range for all bands will be equivalent to 70-100% of current bands, replacing the existing 80-115% ranges); different skill mixes could be sought while at the same time allowing for skills and knowledge transfer from senior staff; different work methods can be implemented; new staff will be trained on the new replacement core business process and IT systems (as noted in the previous bullet) and will not need retraining as required by existing staff, etc.

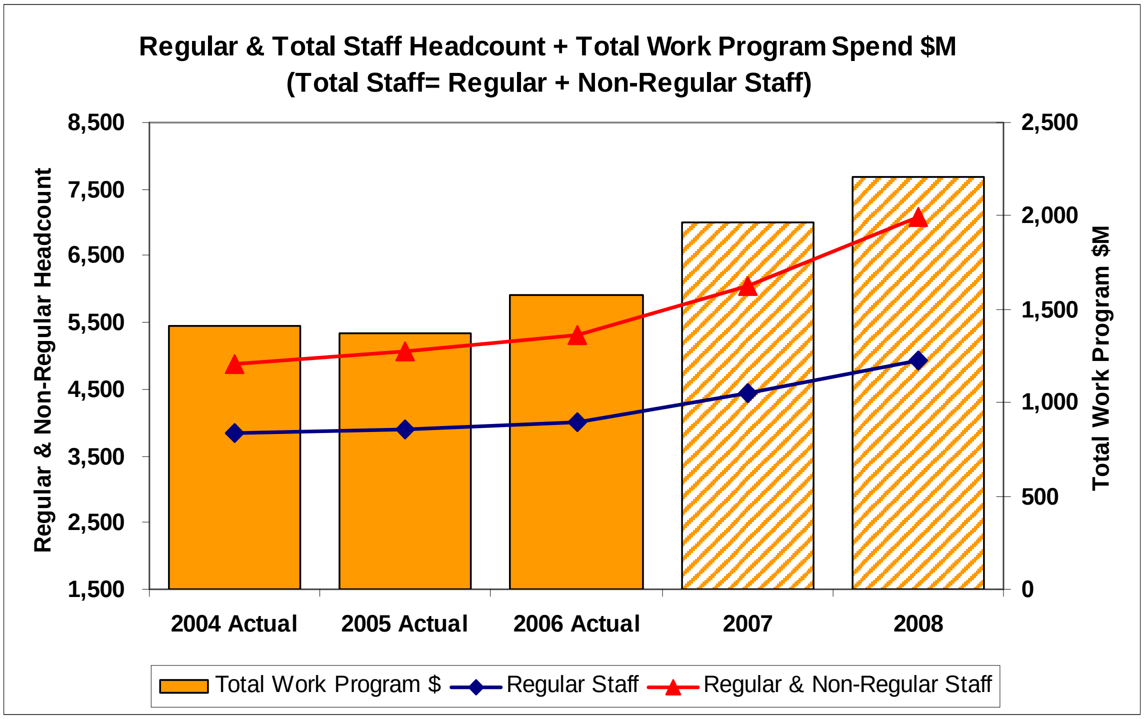
This set of changes in the operational environmental provides Hydro One with an opportunity to transform its business in a step level change over the next few years which will result in a variety of efficiency and effectiveness improvements over this period.

3.1 MAJOR GROWTH IN THE WORK PROGRAM

The growth in the total work program over the 2004 to 2008 period provides Hydro One with an opportunity to achieve better utilization of staff to accomplish this work.

One broad indicator of the better utilization of staff is shown in the following Figure 1 which provides a snapshot of the growth in Networks total work program expenditures (the sum of Distribution and Transmission business OM&A and capital expenditures) and total staffing resources (both permanent or regular and temporary or non-regular staff).

Figure 1



Despite a projected 40% increase in Hydro One Networks Distribution and Transmission businesses' work program expenditures between 2006 and 2008, whereas over this same time period the regular staff count is expected to only have grown by 23% and total staff resources (regular and non-regular) by 34%. This is an indication that Hydro One is getting more work done without a corresponding increase in resource levels.

The increase in the work program has also been enabled by Hydro One's work-based approach to staffing as discussed in Exhibit C1 Tab3 Schedule 1. Specifically, to address the fluctuating and seasonal nature of work programs, the Company maintains as much flexibility as possible by not hiring all regular (permanent) staff. Rather, knowledgeable, experienced and highly skilled internal staff plan and direct the "peak" work of non-regular (temporary, hiring hall and contract) staff, which provides the needed flexibility to manage in a cost effective manner. This flexibility provides a variable workforce which is matched to the peaking requirements of the workload at minimum costs. Specifically, the workload volume ramps up in the second quarter of the year and peaks in the third quarter; the flexible external workforce of non-regular staff is engaged in numbers to match this varying volume of work. To the degree possible, within the constraints of our labour agreements, contractors are also engaged to undertake "turn-key" projects.

Other work program improvements that leverage economies of scale include:

- Strategic alliances with suppliers and contractors can be modified to enable faster turnaround times for material and services.
- Hydro One has the opportunity to use higher efficiency customized transport and work equipment versus off–the-shelf equipment at an advantageous cost that is available to the Company because of the large volume of transactions it does with fleet equipment suppliers.

The implementation of the IT Architecture Strategy, as discussed in the next section, will also provide Hydro One with additional opportunities to glean further economy of scale savings as its work programs expand. For example, as Hydro One streamlines its businesses processes in conjunction with implementation of Cornerstone Phase I, with the increased volume of the Company's work programs, it will gain further savings than it otherwise would have.

In addition, one of the primary contributors to the increase in work program expenditures, installation of smart meters, when in place throughout Hydro One's distribution system early in the next decade, will in itself provide a live flow of high quality, detailed information which previously was not available. Hydro One is planning to apply, and leverage to the extent its economical, this new information to the advantage of its customers, by making more effective and efficient operating, replacement, maintenance and system expansion decisions.

3.2 IT ARCHITECTURE STRATEGY

The improvement of internal business processes is facilitated by an IT Architecture Strategy, which is driven by the need to replace outmoded end-of-life core business information systems. The replacement of these core IT systems will allow standardization and streamlining of work processes along with the integration of multiple databases that are currently used by different organizational units across the company. Implementation of Cornerstone Phase 1, as discussed in detail in Exhibit D, Tab 3, Schedule 5, is anticipated to contribute productivity gains through its lifetime, for total cost efficiency gains equal to about $200 million cumulative over the seven year lifetime of the new IT systems beginning in 2009.

These cost efficiency gains are derived largely from three key value levers underpinned by the Cornerstone Phase 1 application, process and organizational changes. These value levers are:

1) A single asset registry with a uniform hierarchy and selective integration to legacy databases. This saves time when inputting data, processing information, and searching for information.
2) Greater process transparency, integration and collaboration (enabled through the application and process changes) across Hydro One's lines of business. This results in fewer unique business processes thereby reducing learning and time to complete work tasks. This improves the quality of the information for better decisions and reduces the cross checking time required to reconcile errors.
3) Enhanced compliance to the underlying processes and data requirements.

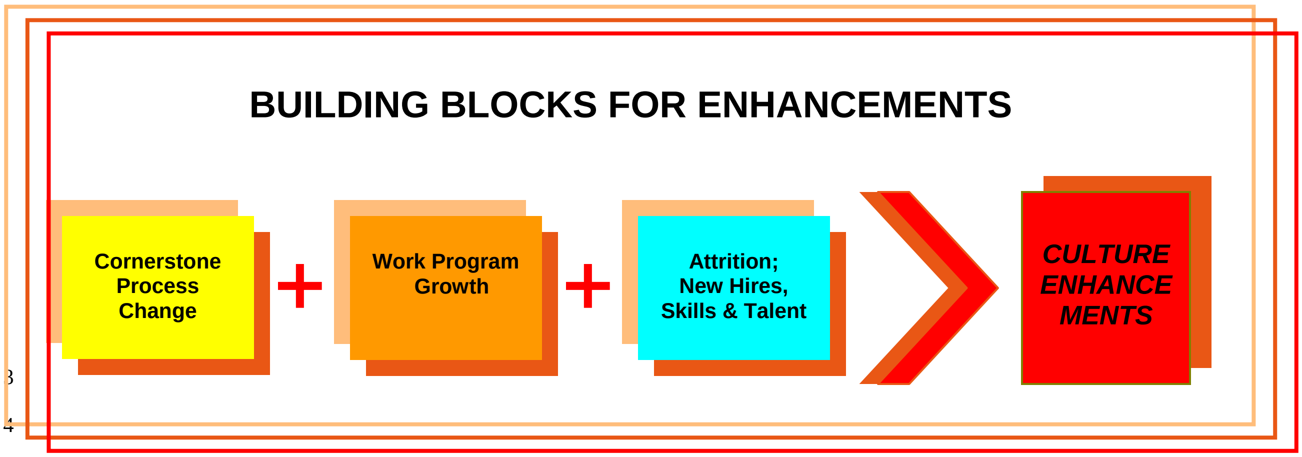
As the various phases of Cornerstone are implemented, further benefits from each phase are anticipated. With the move to an integrated and off the shelf vendor supported platform, Hydro One will also consider the integration of its GIS applications and implementation of integrated mobile technology solutions. It is expected that the use of mobile work applications and the use of GIS information will increase field force productivity. By leveraging all the new data which implementation of the IT Architecture Strategy and the smart meters program will deliver, Hydro One will become an even more proactive company in managing its assets. The extent of these future efficiency and productivity improvements is not yet fully known; preliminary work is being carried out to assess how best to use integrated technology platforms.

3.3 CULTURE CHANGE

With the impending substantial staff attrition due to demographics and coincident creation of new positions due to work program growth, Hydro One will use this opportunity to build on the existing corporate culture to further enhance its core characteristic of continuous improvement. As discussed in detail in Exhibit C1, Tab 3, Schedule 1, the Hydro One staffing strategy is focused on hiring through partnering with universities, colleges and Hydro One unions, as well as skills development and retention. In parallel with this, the enhanced corporate culture will build on the existing employee engagement, enthusiasm and innovation. Employees will continue to be encouraged and challenged to provide new ideas to move the company forward, in a collegial, motivating, and supportive environment.

As outlined earlier and illustrated below, Hydro One is at a stage in its evolution where the major change in its operational environment is providing an opportunity to build on the existing corporate culture so as to enable further productivity gains.

Figure 2



The rollout of the enhanced culture change process is currently underway:

1. A revised Human Resources Strategy has been approved by the Hydro One Board of Directors.
2. The Hydro One management team is ensuring that all levels in the organization are aware of the strategy, and are adhering to it.
3. Senior managers will be meeting directly with staff to ensure they understand the required cultural emphasis in the company.
4. Managers will be held accountable for ensuring that this emphasis is occurring in their organization
5. In order to assist with the change process, a new corporate template for change has been approved and is into the process of being rolled out. It is called “Organizational Alignment”, and will ensure each unit approaches change in the same manner.
6. This will be a long term program, and will coincide with the significant staff turnover which will be taking place over the next five to ten years.

Additional keys to the culture change being undertaken include:

- Hiring to a set of cultural selection criteria based on corporate values
- Expedited technical training and development
- Increased emphasis on leadership and cultural development programs based on corporate values

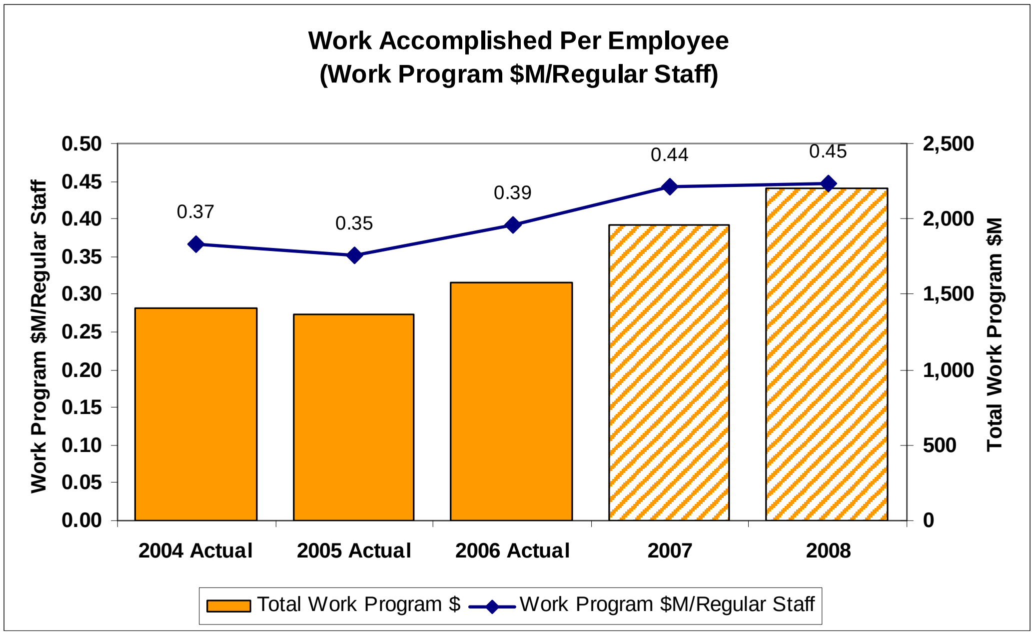
Concurrent factors to the culture change include:

- Increasing the level of business skills within the company to complement the technical skill base.
- An increase in the use of a balanced performance reporting system to identify effectiveness not just efficiency improvements. In addition, this balanced reporting will be cascaded down to the first line manager levels which will be populated by the new staff over time.

4.0 PRODUCTIVITY INDICATOR

In the OEB's Decision With Reasons on Hydro One's recent Transmission rate filing (Ref EB-2006-0501), issued on August 16, 2007, the Board stated "in the [compensation] study that Hydro One is [now] preparing, the Board expects it to provide empirical evidence which reveals the relative productivity of its workforce in comparison to other utilities". A broad indicator of workforce productivity improvement is provided in Figure 3, which displays the amount of work accomplished per regular staff count (as indicated by work program spend in $million per regular staff count) for Hydro One Networks (total Distribution and Transmission businesses).

Figure 3



Between 2004 and 2008 the work program accomplished (in $million) per regular staff count is projected to increase by 22% while the work program is expected to increase by over 50% in the same period. As outlined earlier in section 3.0, Hydro One is taking advantage of a unique set of circumstances to transform its business in a step level change over the next few years; this will enable the Company to continue to successfully and efficiently undertake increased work programs with proportionally fewer full-time staff.

As shown in the following Table 2, using the 2006 to 2008 data provided in their most recent rate filings, Hydro One Networks accomplishes substantially more work per regular staff count than the three largest Ontario LDC's. This is the case even when the large proportion of non-regular staff engaged by Hydro One to complete work, under the direction of regular staff, are factored into this measure. Note that it is Hydro One's understanding that LDC's typically employ large numbers of non-regular staff, however quantitative data on non-regular staff was not provided by LDC's in their most recent rate filings.

Table 2

Work Accomplished Per Employee+

Work Program $M/Regular Staff	2006 Actual	2007 Forecast	2008 Forecast
Hydro One	0.39	0.44	0.45
Hydro One Total Staff**	0.30	0.33	0.31
Horizon Utilities Corporation*	0.17	0.23	0.26
Ottawa Hydro	0.23	0.24	0.22
THESL *	0.22	0.22	0.23

+ A larger number is favourable as it indicates more work accomplished per employee
***Regular Staff FTE's**
**** Total Staff = Regular + Non-Regular Staff**

5.0 SUMMARY

In combination with ongoing incremental cost efficiency initiatives under way across the Company, three new major initiatives will together allow Hydro One Networks to transform its business in a step level change over the next few years:

1. Utilization of better economies of scale due to the larger OM&A and Capital work programs;
2. Implementation of the IT Architecture Strategy and Cornerstone; and
3. The culture change program currently underway.

Through these efforts, beyond the 2008 test year Hydro One anticipates that it may be capable of rising to the challenge of achieving an annual 1% productivity target, as was the case in the OEB's second generation IRM.

COMMON CORPORATE COSTS
COST ALLOCATION METHODOLOGY

Allocation of common costs to the distribution and transmission businesses and to each Hydro One affiliate is based on clearly articulated shared services and an established cost allocation approach based on cost causality principles.

The Common Corporate Costs OM&A programs include the provision of Corporate Common Functions and Services ('CCF&S'), Asset Management, Information Management Services, Operating programs, and Customer Care Services to support the Hydro One Networks Distribution and Transmission business.

Corporate Common Functions and Services include finance, human resources, legal, communications, risk management, internal audit, regulatory, corporate management activities, and strategic planning. Asset Management programs include developing asset strategies, policies and standards; identifying, planning and prioritizing specific OM&A and Capital work on distribution and transmission systems; real estate facility services and monitoring the execution of the annual work program.

A description of the Common Corporate costs has been provided at Exhibit C1, Tab 2, Schedule 6.

In RP-1998-0001, the Board issued a directive stating as follows: "The Board believes that OHSC should adopt a consistent approach to allocating overhead costs to distribution and transmission in order to ensure that customers of transmission and distribution pay a fair share of the costs associated with the services received by these respective business units. Therefore, in subsequent applications, the Board expects the Company to adopt a consistent allocation methodology to be used by NAM (Network Asset Management) and Network Services. OHSC should also be prepared, in the next rate application, to provide the rationale and justification for the approach selected."

In 2005, the Company commissioned a study by R. J. Rudden Associates (“Rudden”) to determine a methodology to allocate common costs among the business entities using the common services. The methodology developed represents industry best practices, identifying appropriate cost drivers to reflect cost causality and benefits received.

Hydro One accepted the results of the Rudden study as providing a reasonable and equitable approach to the assignment of common costs among the business entities using the common services. This methodology was utilized and subsequently endorsed by the Board in the previous Distribution rate decision RP-2005-0020/EB-2005-0378. The Board also considered it reasonable for the Company to employ the Rudden methodology in the subsequent Transmission rate application; this was done in EB-2006-0501. Hydro One’s test year submission in this Application reflects the same Rudden study methodology.

The elements of the OEB accepted Rudden methodology are outlined below:

- Identify the functions and services included in CCF&S
- Identify activities that are performed in order to provide CCF&S
- Distribute the 2008 budgeted cost to perform each function and service amongst the activities required to perform it, based on time and/or cost studies

- Distribute the cost of each activity amongst the business units based on direct assignment when possible, and based on cost drivers when not
- Allocate Asset Management activities on a detailed time study

Cost drivers were selected on the basis of cost causation. Where this methodology could not be implemented or established, cost drivers were based on benefits received. Other factors considered in assigning cost drivers included practicality, stability, and materiality.

As a result of the Rudden study, approximately 30% of the total Corporate Common Functions and Services OM&A expenditures have been directly assigned to the business units. The remaining 70% have been allocated based on the established cost drivers.

Hydro One's management participated in the study on behalf of the Transmission and Distribution businesses, reviewed the model and the results, and was satisfied that the overall allocation is reasonable. As well, the Hydro One subsidiaries have accepted the results as being reasonable.

In addition to the Rudden study addressing allocation of CCF&S, a time study was completed to allocate the balance of the Common Costs for Asset Management, Operating and Customer Care.

The allocation of Asset Management, Operating and Customer Care Management costs is based on a time study, as submitted in the Transmission submission EB-2006-0501 Exhibit C1-5-1. This time study is still relevant and yields an appropriate result.

Table 1 below reflects the results of the cost allocation for all common costs for Transmission, Distribution and other entities.

Table 1
Total Common Costs 2008
Allocation to Transmission, Distribution, and Other ($ Millions)

Function/Service	**Total**	**Transmission**	**Distribution**	**Other***
Common Corporate Costs	227.9	73.3	122.6	32.0
Asset Management	118.9	72.6	46.3	-
Operating	41.3	31.8	9.5	-
Customer Care Management	7.5	0.3	7.2	-
Total	**395.6**	**178.0**	**185.6**	**32.0**

* (Includes Hydro One Telecom, Hydro One Brampton, Remote Communities, Hydro One Inc. and Material Surcharge)

Table 2 identifies the results of the Hydro One Networks Inc. time study that are used to further break down costs between OM&A and Capital.

Table 2
Time Study Cost Allocation

	Transmission		**Distribution**	
	Oper. and Maint.	Capital Projects	Oper. and Maint.	Capital Projects
Operating	70%	7%	20%	3%
Customer Care Management	3%	1%	94%	2%
Asset Management (excl. facility cost)	42%	26%	23%	9%

The 2008 Asset Management costs of $118.9 million identified in Table 1 includes $10.8 million of real estate and other costs, $33.2 million in facility costs and $74.9 million in other Asset Management function costs as described in Exhibit C1, Tab 2, Schedule 6. The $33.2 million in facility costs can be further broken down into common head office facility costs of $14.7 million, and field facility costs consisting of $1.7 million for the Ontario Grid Control Centre, and $16.8 million for other field facilities. Table 3 provides the Distribution allocation for these costs. This results in $46.3 million allocated to Distribution in 2008 (Table 1).

Table 3
Asset Management Cost Allocation

	Transmission	Distribution
Asset Management – Excluding Facility Cost	68%	32%
Facility Cost		
- Common, Head Office Facilities	53%	47%
- Ontario Grid Control Centre	77%	23%
- Other Field Facilities	32%	68%
Total Asset Management	60%	40%

The following table provides the allocation of 2008 CCF&S costs to all business units.

Table 4
Allocation of 2008 CCF&S Costs ($ Millions)

Description	Total	Transmission	Distribution	Hydro One Telcom	Hydro One Brampton	Hydro One Remotes	Hydro One Inc.
Corporate Management	5.3	2.8	2.3	0.1	0.1	0.0	0.0
Finance	26.9	13.7	12.1	0.6	0.2	0.3	0.1
Human Resources	12.6	5.9	6.4	0.1	0.0	0.1	0.0
Corporate Communications	6.6	2.3	4.4	0.0	0.0	0.0	0.0
General Counsel & Secretariat	7.5	4.1	2.9	0.1	0.1	0.2	0.1
Regulatory Affairs	19.7	9.4	10.3	0.0	0.0	0.0	0.0
Corporate Security	2.5	1.3	1.2	0.0	0.0	0.0	0.0
Internal Audit	3.0	1.9	0.9	0.0	0.1	0.1	0.0
Total CCF&S Costs	**84.2**	**41.3**	**40.5**	**0.9**	**0.5**	**0.7**	**0.2**

OVERHEAD CAPITALIZATION RATE

This evidence will discuss the methodology used to allocate Common Corporate Functions and Services (CCF&S) and Asset Management costs to Capital Projects.

Hydro One capitalizes costs that are directly attributable to capital projects and also capitalizes overheads supporting capital projects. The Overhead Capitalization Rate is a calculated percentage representing the amount of overhead costs that are required to support capital projects in a given year.

In 2005, the company commissioned a study by RJ Rudden Associates to recommend a method to derive its overhead capitalization rate for CCF&S and Asset Management costs. In RP-2005-0020/EB-2005-0378, the Ontario Energy Board (OEB) accepted the study's methodology, recommendations and the allocation of costs for the test year from the study. The 2008 overhead capitalization rate is calculated consistent with the methodology accepted in the Rudden study.

Capitalized overheads for the Distribution business for the historical years and bridge year are shown in Table 1:

Table 1
Overhead Capitalized
Historical Years (2004-2006) & Bridge Year (2007)

	Historic			**Bridge**
	2004	**2005**	**2006**	**2007**
Total capitalized overheads ($M)	45.0	46.2	59.8	46.6
Capitalized overhead rate (%)	17.0	16.0	17.0	10.5

The Rudden overhead capitalization rate methodology, submitted in RP-2005-0020/EB-2005-0378, recommended a true-up (referred to as an E-Factor) in determining the overhead capitalization rate. The E-Factor represents the true-up between the amount of overhead costs actually capitalized for a prior year and the amount that would have been capitalized for that year using actual data instead of the estimates used in calculating the overhead capitalization rate. The study recommended the inclusion of an E-Factor in the calculation of the overhead capitalization rate for subsequent years. The actual data for 2006 would result in an E-Factor adjustment to be included in the overhead capitalization rate calculation for 2008. The E-Factor adjustment for the true-up of 2006 capitalized overheads was calculated to be ($14.4M). This amount is included as an adjustment to the derivation of the 2008 overhead capitalization rate.

Table 2 summarizes the overhead capitalization rates as determined by the Rudden methodology and the resultant allocation of costs.

Table 2
Overhead Capitalized
2008 Test Year

Overhead Cost Category	Capitalization Rate	Amount Capitalized ($M)
Corporate Functions and Services	7.9%	43.1
Asset Management and Operators	1.3%	7.2
Sub-Total	9.2%	50.3
E-Factor Adjustment (for 2006)	(2.7%)	(14.4)
Total (Including E-Factor)	6.5%	35.9

Note: For planning and actual charging purposes, the overhead capitalization rate is rounded to the nearest whole percentage point.

In 2007, the Rudden overhead capitalization rate methodology true-up principle continues to be adhered to, however it is being implemented in a more efficient manner. Beginning in 2007, Hydro One Networks is adjusting the overhead capitalization rate several times within the year as required to reflect actual changes in capital expenditures spending. This will improve the timeliness of the potential E-Factor true-up and result in a better alignment of overhead costs with the capital projects that they support. It is also proposed that the year-end E-Factor true-up, going forward, will be in included in the calculation of the overhead capitalization rate for the subsequent year.

COMMON ASSET ALLOCATION

This evidence will discuss the nature of Common Fixed Assets ("Shared Assets") and the method by which the costs of these assets are assigned to the Distribution and Transmission business units.

Similar to the common corporate costs discussed in Exhibit C1, Tab 5, Schedule 1, Hydro One has been able to maximize efficiencies through the centralization of the maintenance, management and purchase of shared assets at the corporate level. These assets include shared land and buildings, telecommunication equipment, computer equipment, applications software, tools and transportation and work equipment (“T&WE”).

1.0 SHARED ASSETS AND FACILITIES COSTS

Most fixed assets are directly assigned to the appropriate business unit. The remaining assets (4% of total assets) are considered shared assets, and are allocated to Transmission and Distribution as described later in this exhibit. Table 1, below, summarizes the total gross fixed assets and identifies the proportion of allocated shared assets.

Table 1
Summary of Gross Fixed Assets
as at December 31, 2006 ($ Million)

	Transmission	Distribution	Total
Total Fixed Assets	**9,793.3**	**5,866.5**	**15,659.8**
Shared Assets (in Total)	275.2	430.0	705.2
Shared Asset %	39.0%	61.0%	100%

Shared assets are sub-divided into two categories. Major Fixed Assets consist of land, buildings, applications software, and telecommunications equipment. Minor Fixed Assets include office furniture, computer equipment, tools and T&WE. Table 2, below, shows the proportion of major and minor shared fixed assets, accumulated depreciation and net book value as of December 31, 2006.

Table 2
Details of Shared Net Fixed Assets
as at December 31, 2006 ($ Million)

Asset	Gross Asset Value	Accumulated Depreciation	Net Book Value
Shared Major Assets	230.2	113.8	116.4
Shared Minor Assets	474.9	311.0	163.9
Total Shared Assets	**705.2**	**424.8**	**280.3**

2.0 ALLOCATION OF SHARED ASSETS IN SERVICE

Due to the nature of Hydro One's business, Shared Assets are not directly attributable to either the Transmission or Distribution business units. In addition, from year to year, the use of these shared assets changes, based upon changes in the underlying transmission and distribution work programs. Consequently, the methodology by which shared assets are allocated to the Transmission and Distribution business units is subject to periodic review. The intent of such a review is to ensure that the assignment of assets is reflective of their true use and that the costs are apportioned appropriately amongst the business units.

In 2005, the Company commissioned a study by R. J. Rudden Associates ("Rudden") to determine a methodology to allocate the assets which are not directly attributable to Transmission or Distribution. The methodology developed represents industry best practices, identifying appropriate cost drivers to reflect cost causality and benefits received. The Rudden study resulted in the allocation of shared assets based on the relative usage by Transmission and Distribution or by cost drivers, similar to those used for the common corporate functions and services.

The Company has accepted the approach of the Rudden study as a reasonable representation of the use of shared assets amongst the business units. This methodology was utilized and subsequently endorsed by the Board in the previous Distribution rate decision RP-2005-0020/EB-2005-0378, and also used in the subsequent Transmission rate Application EB-2005-0501. Hydro One's test year submissions in this Application reflect the same Rudden study methodology.

Table 3 below shows the Hydro One Common Asset allocation as at December 31, 2006.

Table 3
Hydro One Common Asset Allocation
as at December 31, 2006 ($ Million)

Total Gross Value All Hydro One Transmission & Distribution Assets $15,660 million			
Transmission (Total)	$9,793 m	Distribution (Total)	$5,867 m
Transmission (Direct)	$9,518 m	Distribution (Direct)	$5,436 m
Transmission (Common)	$275 m	Distribution (Common)	$430 m

DEPRECIATION AND AMORTIZATION EXPENSES

1.0 INTRODUCTION

The purpose of this evidence is to summarize the method and cost of Hydro One Distribution's depreciation and amortization expense for the 2008 test year.

The depreciation and amortization expense for Hydro One's Distribution business in its 2006 test year submission in RP-2005-0020/EB-2005-0378 was supported by an independent study by Foster Associates which was completed in June 2005. The Ontario Energy Board (OEB) accepted the costs flowing from the Depreciation Study for the purpose of supporting Distribution rates in 2006.

2.0 DEPRECIATION EXPENSE

The aforementioned Foster methodology was used in determining the depreciation expense for the 2008 test year.

Detailed depreciation schedules are filed at Exhibits C2, Tab 5, Schedule 1.

Hydro One Distribution implemented the new depreciation system in accordance with the OEB's decision (EB-2006-0501), reflecting the Foster Associates recommendations.

Table 1
Distribution Depreciation Expense
$ Million

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Depreciation On Fixed Assets	151.7	155.3	159.1	164.0	196.9
Less Capitalized Depreciation	(8.3)	(8.6)	(9.7)	(10.8)	(12.4)
Asset Removal Costs	22.5	24.0	30.4	26.5	22.8
Losses/(Gains) On Asset Disposition	(0.6)	(2.4)	(1.2)	n/a	n/a
Total	165.3	168.3	178.6	179.7	207.4

The increase in 2008 depreciation on fixed assets amount relative to the 2007 amount is due to the higher level of fixed assets in service in 2008, which includes Smart Meters and Cornerstone. Major and Minor Fixed Asset additions amounts for 2007 and 2008 are filed at Exhibit D2, Tab 3, Schedule 1.

Capitalized depreciation refers to depreciation on transport & work equipment and other minor fixed assets (e.g. tools) that is charged to capital work projects. For purposes of calculating the revenue requirement, capitalized depreciation is deducted from annual depreciation expense, as it is treated as capital expenditures.

Fixed asset removal costs are charged to depreciation expense on an “as incurred” basis.

Losses/gains on asset disposition relate to the sale of assets. Losses/gains on asset disposition are based on historic actuals and are not separately forecast for the bridge or test years.

3.0 AMORTIZATION EXPENSE

Amortization expense pertains to costs the Board has allowed Hydro One Distribution to defer for recognition at a future date. The Board has, in past decisions, approved the amount of the cost to be deferred for future recovery, the prescribed period or method of amortization, and prescribed time period over which the costs in each account should be amortized.

Historical, bridge and test year amortization schedules are filed at Exhibit C2, Tab 5, Schedule 1.

Table 2
Distribution Amortization Expense
$ Million

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Other Post Employment Benefits	23.7	23.7	23.7	23.6	23.6
Environmental Assets	9.5	7.1	11.6	8.4	7.9
Other Amortization	0.1	0.1	0.1	0.1	0.1
Total	33.3	30.9	35.4	32.1	31.6

3.1 Other Post Employment Benefits (OPEB)

Employee future benefits other than pension are recorded in Hydro One Distribution's financial statements using the accrual method as required by Canadian GAAP. The Ontario Energy Board has allowed for the recovery of past service costs, which arose on the adoption of the accrual method, in the revenue requirement on a straight-line basis over a 10-year period per the Board's RP-1998-0001 Decision. Hydro One recorded a regulatory asset of $419 million in 1999 to reflect the OEB's Decision and allocated this amount to the regulated businesses.

3.2 Environmental Assets

Hydro One Distribution provides for the net present value of estimated future expenditures required to remediate legacy environmental contamination. Since these expenditures are expected to be recovered in future rates, Hydro One Distribution has recognized these amounts as a regulatory asset. This balance is amortized on a basis consistent with the pattern of actual expenditures expected to be incurred, currently estimated to continue until the year 2030. Hydro One Distribution received approval for this deferral account as part of the Board's RP-2000-0023 Decision. There is a corresponding credit to OM&A for the environmental asset expenditures and this is discussed further in Section 6.2 of Exhibit C1, Tab 2, Schedule 6.

PAYMENTS IN LIEU OF CORPORATE INCOME TAXES

1.0 INTRODUCTION

Under the *Electricity Act, 1998*, Hydro One Networks Inc. is required to make payments in lieu of corporate income taxes (PILS) relating to taxable income earned by its distribution business. The Ontario Energy Board (OEB) has directed that the taxes payable method should also be used for regulatory purposes (2006 EDR Handbook section 7.1 "OEB 2006 regulatory expense methodology").

Under the taxes payable method, no provision is made for future income taxes that result from timing differences between the tax basis of assets and liabilities and their carrying amounts for accounting purposes. Accordingly, the taxes payable method will result in the PILS income tax payable being different than the amount that would have been recorded, had the combined Canadian Federal and Ontario statutory income tax rate been applied to the regulatory net income before tax. When unrecorded future income taxes become payable, it is expected that they will be included in the rates approved by the OEB and recovered from the customers at that time.

PILS installments are remitted by Networks to OEFC at the end of each month. Any balance owing at the end of the year is required to be paid by February 28th of the following year.

The 2008 Hydro One Distribution regulatory tax calculation has been prepared in accordance with the 2006 EDR Handbook and the 2006 EDR Tax Model.

2.0 INCOME TAX RATE (FEDERAL AND ONTARIO):

A combined rate of 34.50% has been used for 2008 (Federal 20.50% and Ontario 14%) Prior to 2008, a 36.12% combined Federal and Ontario income tax rate had been in effect from 2004.

3.0 RECONCILIATION BETWEEN REGULATORY NET INCOME BEFORE TAX AND TAXABLE INCOME

A reconciliation between the regulatory net income before tax (NIBT) and taxable income for the test year 2008 is provided in Exhibit C2, Tab 6, Schedule 1, Attachment A. This schedule contains the income tax component of the PILS computation. It also shows how the taxable income is computed by making adjustments to the regulatory NIBT for items such as depreciation, capital cost allowance (CCA) etc.

A reconciliation between the accounting NIBT and taxable income for the historical years is provided in Exhibit C2, Tab 6, Schedule 1, Attachment C.

In order to make it easier for parties to follow the historic reconciliations, we have grouped adjustments made to regulatory NIBT to arrive at taxable income into the following five categories:

1) Recurring items that must be added (deducted) because they have been included in the OM&A expenses in arriving at the revenue requirement or for which appropriate tax adjustments are made (e.g. depreciation vs. CCA);
2) Deferral accounts not included in the revenue requirement;
3) Reversal of accounting adjustments not included in the revenue requirement;
4) Recurring items not in the revenue requirement; and

5) Items where the impact is immaterial in total, and as such, have not been included in our business plan (applicable to test year only).

4.0 OVERVIEW OF PROCESS TO ARRIVE AT TAXABLE INCOME

The starting point for the computation of the Networks Distribution taxable income is the NIBT as shown on the utility's income statement for the year. There are typically many adjustments that are made to the NIBT to arrive at taxable income, since the NIBT is prepared using Canadian generally accepted accounting principles and taxable income is computed using the relevant tax legislation, interpretations and assessing practices. Essentially, the NIBT is increased by amounts that are not deductible for tax purposes (includes items such as depreciation, contingent liabilities, accounting losses, accounting provisions such as OPEB etc. and revenue that has been received but not recognized for accounting purposes (e.g. LV revenue)) and is reduced by amounts that are deductible for tax purposes but have not been deducted in computing NIBT (includes items such as CCA, the deductible portion of capitalized overhead, expenses incurred for which a deferral account has been set up on the balance sheet rather than being deducted through the income statement, accounting gains, OPEB payments etc).

Consequently, it is imperative that the NIBT be adjusted for amounts that have been included (or deducted) for accounting purposes that are not income (or deductible) for tax return purposes. This is a key point in comparing the historical years tax return data to that computed for the test year, since the tax return NIBT has been increased (or reduced) by amounts that have not been added (or deducted) in computing the regulatory NIBT (e.g. contingent liabilities, accounting gains, capitalized interest). That is, for test year 2008, only differences between the tax and accounting rules related to costs included in either the regulatory revenue requirement or rate base (e.g. CCA, capitalized overhead) are adjusted in arriving at taxable income.

5.0 TREAMENT DEFERRAL ACCOUNTS (REGULATORY ASSETS AND LIABILITIES)

Deferral accounts are typically recognized by utilities (i.e. on their balance sheet) for foregone revenue or for expenses that have been incurred for which recovery will be sought from ratepayers through future rates. Disposition of the deferral accounts is determined by the OEB often through a rate rider process.

For example, assuming that a $100 expense is incurred at a 35% tax rate, the utility will be allowed to deduct the $100 in computing taxable income for the year in which the expense has been incurred. If the OEB subsequently approves recovery of these expenses over a four year period through a rate rider, the income will be included in computing taxable income for the year in which it is billed to ratepayers. The net result is that the utility has recovered the $100 cost although the income/expense has been taxed or deducted in different years.

	Year 1	Year 2	Year 3	Year 4	Year 5	CUM
Income (deduction)	(100)	25	25	25	25	nil
Tax refund (payable)	35	(8.75)	(8.75)	(8.75)	(8.75)	nil
Cash inflow (outflow)	(65)	16.25	16.25	16.25	16.25	nil

Therefore, deferral accounts have not been included in computing tax payable for purposes of the revenue requirement since the tax benefit has or will be obtained through the tax system. It should be noted that this conclusion is consistent with the *"2006 EDR Handbook Report of the Board"* issued May 11, 2005 (Page 61) that stated as follows:"A PILS or tax provision is not needed for the recovery of deferred regulatory asset costs, because the distributors have deducted, or will deduct, these costs in calculating taxable income in their returns. The Handbook will reflect this treatment."

6.0 CONTINGENT LIABILITIES/ACCOUNTING RESERVES

Where an accounting provision is recognized for certain contingent costs that the utility may have to incur in the future (e.g. obsolescence provisions, lawsuits, staff reductions, etc.), the provision will reduce the NIBT of the utility. In each subsequent year, the balance for the contingent liability/accounting reserve is reviewed by the utility for reasonableness based upon the information available at that time. The balance may be adjusted upward or downward with NIBT either decreasing or increasing respectively. However, for tax purposes, a contingent liability or accounting reserve is not deductible. Rather, the amount will only be deductible (or capitalized) in computing taxable income for the taxation year in which the obligation has actually been settled. Therefore, to the extent that the current year NIBT has been increased (or decreased) by the contingent liability or accounting reserve provision, the NIBT must be adjusted to reverse the increase (or decrease) in computing taxable income.

No changes were forecast in those contingent liabilities reflected in 2008 and as such, it is not necessary to adjust the 2008 NIBT for contingent liabilities in computing taxable income. Therefore, such amounts are not included in the tax computation for purposes of the revenue requirement.

The contingent liabilities movement resulting in a $20.6 million deduction in 2004 and a $2.3 million add back in 2005 (Exhibit C2, Tab 6, Schedule 1, Attachment C, line 26), is required to reverse the accounting income inclusion resulting from the net reduction in the various contingent liability balances and/or the deduction of actual payments. As stated above, contingent liabilities are not relevant in computing taxable income.

7.0 REVERSAL OF 2004 ACCOUNTING GAIN RE: REGULATORY ASSETS

As a result of the uncertainty created by the Electricity Pricing, Conservation and Supply Act, 2002, Hydro One did not recognize certain regulatory assets such as those for suspended low voltage service costs (see Exhibit C2, Tab 6, Schedule 1, Attachment C, line 28). Such amounts were subsequently approved by the OEB in December, 2004 allowing Hydro One under the accounting rules to recognize the establishment of the underlying regulatory assets resulting in the $102 million accounting gain. Assuming that the current stable environment will continue, Hydro One anticipates full recovery for prudently incurred costs and therefore does not anticipate the recording of any significant gains that would be attributable to the recognition of unrecorded regulatory amounts in 2008.

It should be noted that for tax purposes, the accounting gain included in the accounting NIBT, is required to be reversed since tax is paid on the revenue for the year in which it is billed to ratepayers and not when recognized under the accounting rules.

8.0 CLASS 45, DISTRIBUTION ASSETS 55% CCA RATE:

In deriving the 2008 utility income taxes, Hydro One Distribution has reflected the proposed 10% increase in CCA rate for Class 45 to 55% (from 45%), for new assets acquired subsequent to March 19, 2007 (see Exhibit C2, Tab 6, Schedule 1, Attachment B).

9.0 FEDERAL LARGE CORPORATION TAX ("LCT"):

The LCT has been eliminated effective January 1, 2006, accordingly for 2008, no LCT component has been included in the PILS computation on Exhibit C2, Tab 6, Schedule 1, Attachment A.

10.0 ONTARIO CAPITAL TAX

Networks pays Ontario capital tax on its taxable capital as defined by the Corporations Tax Act (Ontario). However, for regulatory purposes, it recovers capital tax computed by reference to its rate base net of the applicable Ontario exemption, as directed by the OEB. Please refer to Exhibit C2, Tab 4, Schedule 1 for the calculation of the Ontario capital tax. For the test year, the Ontario capital tax rate used is the rate proposed in the March 23, 2006 Ontario budget of 0.285%. This compares to a capital tax rate of 0.3% applicable to the historical and bridge years.

The Ontario exemption is allocated amongst the related regulated entities, based on rate base.

COMPARISON OF WAGES AND SALARIES

1.0 REGIONAL MAINTAINER LINES – (PWU-REPRESENTED)

The following summarizes the key elements of this job classification and related compensation:

- works on transmission and distribution lines and associated apparatus using a range of mechanical and electrical skills and knowledge.
- Grade 12 plus six-year apprenticeship.

Table 1

Year	Total Wages	Base	Overtime	Incentive	Other*
2004	$98,822	$67,987	$26,377	$2,483	$1,975
2005	$102,325	$70,208	$29,186	$760	$2,170
2006	$111,439	$74,117	$34,639	$0	$2,683
2007	$114,782	$76,340	$35,679	$0	$2,764
2008	$118,226	$78,630	$36,749	$0	$2,847

NOTE: all of the above are average dollars.

2.0 SOCIETY REPRESENTED MP4 (Example -ENGINEER – JOURNEYPERSON LEVEL)

The following summarizes the key elements of this job classification and related compensation:

- Professional Engineer with 8-10 years experience;

- participates in the design and development of strategies and proposes effective recommendations related to the application and design and performance of various systems, e.g., electrical power systems/telecommunication;
- provides technical guidance and supervision to technical staff.

Table 2
Annual Salary (MP4)

Year	Total Wages	Base	Overtime	Incentive	Other*
2004	$96,423	$85,578	$8,028	$0	$2,817
2005	$69,200	$62,420	$3,125	$0	$3,656
2006	$95,524	$92,564	$1,207	$0	$1,753
2007	$98,390	$95,341	$1,243	$0	$1,806
2008	$101,342	$98,202	$1,281	$0	$1,860

NOTE: - 2005 results are lower due to the impact of the labour strike.
- all of the above are average dollars.

3.0 MANAGER – BAND 7 (MANAGEMENT COMPENSATION PLAN)

The following summarizes the key elements of this job classification and related compensation:

- university degree with several years experience;
- provides direction with respect to corporate strategies and policies, budget and programs, compliance and performance targets and expectations of continuous improvement;
- manages the coordination of work activities of supervisory professional staff;
- coordinates the activities of others in the performance of technical projects related to program processes, technical/operational business standards and procedures.

T2 CORPORATION INCOME TAX RETURN

055 Do not use this area

This form serves as a federal, provincial, and territorial corporation income tax return, unless the corporation is located in Quebec, Ontario, or Alberta. If the corporation is located in one of these provinces, you have to file a separate provincial corporation return.

Parts, sections, subsections, and paragraphs mentioned on this return refer to the *Income Tax Act*. This return may contain changes that had not yet become law at the time of printing. For more information on how to complete the return, see the *T2 Corporation – Income Tax Guide* (T4012).

Send one completed copy of this return, including schedules and the *General Index of Financial Information* (GIFI), to your tax services office or tax centre. You have to file the return within six months after the end of the corporation's tax year. For more information on when and how to file T2 returns, refer to the Guide under the heading "Before you start."

Identification

Business Number (BN) 001 87086 5821 RC0001

Corporation's name
002 Hydro One Networks Inc.

Has the corporation changed its name since the last time we were notified? 003 1 Yes [ ] 2 No [X]

If *Yes*, do you have a copy of the articles of amendment? . . . 004 1 Yes [ ] 2 No [ ]

Address of head office
Has this address changed since the last time we were notified? . . . . 010 1 Yes [ ] 2 No [X]
(If *Yes*, complete lines 011 to 018)

011 483 Bay Street, 8th Floor
012 South Tower

City	Province, territory, or state
015 Toronto	016 ON
Country (other than Canada)	**Postal code/Zip code**
017	018 M5G 2P5

Mailing address (if different from head office address)
Has this address changed since the last time we were notified? . . . . 020 1 Yes [ ] 2 No [X]
(If *Yes*, complete lines 021 to 028)

021 c/o
022
023

City	Province, territory, or state
025	026
Country (other than Canada)	**Postal code/Zip code**
027	028

Location of books and records
Has the location of books and records changed since the last time we were notified? . . . . 030 1 Yes [ ] 2 No [X]
(If *Yes*, complete lines 031 to 038)

031 483 Bay Street, 8th Floor
032 South Tower

City	Province,territory, or state
035 Toronto	036 ON
Country (other than Canada)	**Postal code/Zip code**

040 Type of corporation at the end of the taxation year

1 [X] Canadian-controlled private corporation (CCPC)
2 [ ] Other private corporation
3 [ ] Public corporation
4 [ ] Corporation controlled by a public corporation
5 [ ] Other corporation (specify, below)

If the type of corporation changed during the tax year, provide the effective date of the change . . . . 043 ______ YYYY MM DD

To which tax year does this return apply?

Tax year start 060 2006-01-01 (YYYY MM DD)
Tax year end 061 2006-12-31 (YYYY MM DD)

Has there been an acquisition of control to which subsection 249(4) applies since the previous tax year? 063 1 Yes [ ] 2 No [X]

If *Yes*, provide the date control was acquired . . . . 065 ______ YYYY MM DD

Is the corporation a professional corporation that is a member of a partnership? . . . . 067 1 Yes [ ] 2 No [X]

Is this the first year of filing after:
Incorporation? . . . . 070 1 Yes [ ] 2 No [X]
Amalgamation? . . . . 071 1 Yes [ ] 2 No [X]
If *Yes*, complete lines 030 to 038 and attach Schedule 24.

Has there been a windup of a subsidiary under section 88 during the current tax year? . . . . 072 1 Yes [ ] 2 No [X]
If *Yes*, complete and attach Schedule 24.

Is this the final tax year before amalgamation? . . . . 076 1 Yes [ ] 2 No [X]

Is this the final return up to dissolution? . . . . 078 1 Yes [ ] 2 No [X]

Is the corporation a resident of Canada?
080 1 Yes [X] 2 No [ ] If *No*, give the country of residence on line 081 and complete and attach Schedule 97.
081

Is the non-resident corporation claiming an exemption under an income tax treaty? . . . . 082 1 Yes [ ] 2 No [X]
If *Yes*, complete and attach Schedule 91.

If the corporation is exempt from tax under section 149, tick one of the following boxes:
085
1 [ ] Exempt under paragraph 149(1)(e) or (l)
2 [ ] Exempt under paragraph 149(1)(j)
3 [ ] Exempt under paragraph 149(1)(t)
4 [ ] Exempt under other paragraphs of section 149

Schedules – Answer the following questions. For each *Yes* response, attach to the T2 return the schedule that applies.

		Yes	Schedule
Is the corporation related to any other corporations?	150	X	9
Is the corporation an associated Canadian-controlled private corporation?	160	X	23
Is the corporation an associated Canadian-controlled private corporation that is claiming the expenditure limit?	161		49
Does the corporation have any non-resident shareholders?	151		19
Has the corporation had any transactions, including section 85 transfers, with its shareholders, officers, or employees, other than transactions in the ordinary course of business? Exclude non-arm's length transactions with non-residents	162		11
If you answered *Yes* to the above question, and the transaction was between corporations not dealing at arm's length, were all or substantially all of the assets of the transferor disposed of to the transferee?	163		44
Has the corporation paid any royalties, management fees, or other similar payments to residents of Canada?	164		14
Is the corporation claiming a deduction for payments to a type of employee benefit plan?	165		15
Is the corporation claiming a loss or deduction from a tax shelter acquired after August 31, 1989?	166		T5004
Is the corporation a member of a partnership for which a partnership identification number has been assigned?	167		T5013
Did the corporation, a foreign affiliate controlled by the corporation, or any other corporation or trust that did not deal at arm's length with the corporation have a beneficial interest in a non-resident discretionary trust?	168		22
Did the corporation have any foreign affiliates during the year?	169		25
Has the corporation made any payments to non-residents of Canada under subsections 202(1) and/or 105(1) of the federal *Income Tax Regulations*?	170	X	29
Has the corporation had any non-arm's length transactions with a non-resident?	171		T106
For private corporations: Does the corporation have any shareholders who own 10% or more of the corporation's common and/or preferred shares?	173	X	50
Has the corporation made payments to, or received amounts from, a retirement compensation plan arrangement during the year?	172		
Is the net income/loss shown on the financial statements different from the net income/loss for income tax purposes?	201	X	1
Has the corporation made any charitable donations; gifts to Canada, a province, or a territory; or gifts of cultural or ecological property?	202		2
Has the corporation received any dividends or paid any taxable dividends for purposes of the dividend refund?	203	X	3
Is the corporation claiming any type of losses?	204		4
Is the corporation claiming a provincial or territorial tax credit or does it have a permanent establishment in more than one jurisdiction?	205		5
Has the corporation realized any capital gains or incurred any capital losses during the tax year?	206	X	6
i) Is the corporation claiming the small business deduction and reporting income from: a) property (other than dividends deductible on line 320 of the T2 return), b) a partnership, c) a foreign business, or d) a personal services business; or ii) is the corporation claiming the refundable portion of Part I tax?	207	X	7
Does the corporation have any property that is eligible for capital cost allowance?	208	X	8
Does the corporation have any property that is eligible capital property?	210	X	10
Does the corporation have any resource-related deductions?	212		12
Is the corporation claiming reserves of any kind?	213		13
Is the corporation claiming a patronage dividend deduction?	216		16
Is the corporation a credit union claiming a deduction for allocations in proportion to borrowing or an additional deduction?	217		17
Is the corporation an investment corporation or a mutual fund corporation?	218		18
Was the corporation carrying on business in Canada as a non-resident corporation?	220		20
Is the corporation claiming any federal or provincial foreign tax credits, or any federal or provincial logging tax credits?	221		21
Is the corporation a non-resident-owned investment corporation claiming an allowable refund?	226		26*
Does the corporation have any Canadian manufacturing and processing profits?	227		27
Is the corporation claiming an investment tax credit?	231		31
Is the corporation claiming any scientific research and experimental development (SR&ED) expenditures?	232	X	T661
Is the total taxable capital employed in Canada of the corporation and its related corporations over $10,000,000?	233		33/34/35
Is the corporation a member of a related group with one or more members subject to gross Part I.3 tax?	236		36
Is the corporation claiming a surtax credit?	237		37
Is the corporation subject to gross Part VI tax on capital of financial institutions?	238		38
Is the corporation claiming a Part I tax credit?	242		42

Did the corporation emigrate from Canada during the tax year?	292	1 Yes [ ]	2 No [X]

Taxable income

Net income or (loss) for income tax purposes from Schedule 1, financial statements, or GIFI.			300	545,572,415	A
Deduct: Charitable donations from Schedule 2	311				
Gifts to Canada, a province, or a territory from Schedule 2	312				
Cultural gifts from Schedule 2	313				
Ecological gifts from Schedule 2	314				
Taxable dividends deductible under section 112 or 113, or subsection 138(6) from Schedule 3	320				
Part VI.1 tax deduction from Schedule 43 *	325				
Non-capital losses of preceding tax years from Schedule 4	331				
Net capital losses of preceding tax years from Schedule 4	332				
Restricted farm losses of preceding tax years from Schedule 4	333				
Farm losses of preceding tax years from Schedule 4	334				
Limited partnership losses of preceding tax years from Schedule 4	335				
Taxable capital gains or taxable dividends allocated from a central credit union	340				
Prospector's and grubstaker's shares	350				
Subtotal			►		B
Subtotal (amount A **minus** amount B) (if negative, enter "0")				545,572,415	C
Add: Section 110.5 additions or subparagraph 115(1)(a)(vii) additions			355		D
Taxable income (amount C **plus** amount D)			360	545,572,415	
Income exempt under paragraph 149(1)(t)			370		
Taxable income for a corporation with exempt income under paragraph 149(1)(t) (line 360 **minus** line 370)				545,572,415	Z

* This amount is equal to 3 times the Part VI.1 tax payable at line 724.

Small business deduction

Canadian-controlled private corporations (CCPCs) throughout the tax year

Income from active business carried on in Canada from Schedule 7	400	544,935,563	A
Taxable income from line 360, **minus** 10/3 of the amount on line 632*, **minus** 3 times the amount on line 636**, and **minus** any amount that, because of federal law, is exempt form Part I tax	405	545,572,415	B

Calculation of the business limit:

For all CCPCs, calculate the amount at line 4 below.

250,000	x	Number of days in the tax year in 2004 / Number of days in the tax year	/ 365	=		1
300,000	x	Number of days in the tax year in 2005 and in 2006 / Number of days in the tax year	365 / 365	=	300,000	2
400,000	x	Number of days in the tax year after 2006 / Number of days in the tax year	/ 365	=		3
		Add amounts at lines 1, 2, and 3			300,000	4

Business limit (see notes 1 and 2 below) . . . 410 ______ C

Notes: 1. For CCPCs that are not associated, enter the amount from line 4 on line 410. However, if the corporation's tax year is less than 51 weeks, prorate the amount from line 4 by the number of days in the tax year divided by 365, and enter the result on line 410.

2. For associated CCPCs, use Schedule 23 to calculate the amount to be entered on line 410.

Business limit reduction:

Amount C ______ x 415 *** 23,269,267 D / 11,250 = . . . ______ E

Reduced business limit (amount C **minus** amount E) (if negative, enter "0") . . . 425 ______ F

Small business deduction

Whichever amount is the least A, B, C or F . . . ______ G1

Amount G1		x	Number of days in the tax year before 2008 / Number of days in the tax year	365 / 365	x	16.00 %	=	G2
Amount G1		x	Number of days in the tax year in 2008 / Number of days in the tax year	/ 365	x	16.50 %	=	G3
Amount G1		x	Number of days in the tax year after 2008 / Number of days in the tax year	/ 365	x	17.00 %	=	G4

Small business deduction – total of amounts G2, G3, and G4 (enter amount G on line 9) . . . 430 ______ G

* Calculate the amount of foreign non-business income tax credit deductible on line 632 without reference to the refundable tax on the CCPC's investment income (line 604) and without reference to the corporate tax reductions under section 123.4.

** Calculate the amount of foreign business income tax credit deductible on line 636 without reference to the corporate tax reductions under section 123.4.

*** **Large corporations**

- The amount to be entered at line 415 is the total taxable capital employed in Canada **minus** $10,000,000 x 0.225%, calculated on Schedule 33, *Part I.3 Tax On Large Corporations*, Schedule 34, *Part I.3 Tax On Financial Institutions* **or** Schedule 35, *Part I.3 Tax On Large Insurance Companies.*
- If the corporation is not associated with any corporations in both the current and the preceding tax years, use the applicable schedule for the **prior** year. (Amount **P** in Part 6 of Schedule 33; Amount **O** in Part 6 of Schedule 34; Amount **DD** in Part 6 of Schedule 35)
- If the corporation is not associated with any corporations in the current tax year, but was associated in the preceding tax year, use the applicable schedule for the **current** year.
- For corporations associated in the current tax year, see Schedule 23 for the special rules that apply.

Accelerated tax reduction

Canadian-controlled private corporations throughout the taxation year that claimed the small business deduction

Reduced business limit (amount from line 425) ____ x 300,000 / line 4 above =			A
Net active business income (amount from line 400) *		544,935,563	B
Taxable income from line 360 **minus** 3 times the amount at line 636** on, and **minus** any amount that, because of federal law, is exempt from Part I Tax	545,572,415 C		
Deduct:			
Aggregate investment income (amount from line 440)	636,852 D		
Amount C **minus** amount D (if negative, enter "0")	544,935,563 ▶	544,935,563	E
Amount A, B, or E above, whichever is less			F
Amount Z from Part 9 of Schedule 27 ____ x 100 / 7 =	G		
Amount QQ from Part 13 of Schedule 27	H		
Taxable resource income (amount from line 435)	I		
Amount used to calculate the credit union deduction (amount E in Part 3 of Schedule 17)	J		
Amount on line 400, 405, 410, or 425 of the small business deduction, whichever is less	K		
Total of amounts G, H, I, J, and K	▶		L
Amount F **minus** amount L (if negative, enter "0")			M
Accelerated tax reduction – 7.00 % of amount M (enter amount N on line 637)			N

* If the amount at line 450 of Schedule 7 is positive, members of partnerships need to use Schedule 70 to calculate net active business income.

** Calculate the amount of foreign business income tax credit deductible at line 636 without reference to the corporate tax reductions under section 123.4.

SCHEDULE 141

NOTES CHECKLIST

Corporation's name	Business Number	Tax year end Year Month Day
Hydro One Networks Inc.	87086 5821 RC0001	2006-12-31

- This schedule should be completed from the perspective of the person who prepared or reported on the **financial statements**. This person is referred to as the "accounting practitioner", in this schedule.
- For more information, see RC4088, *Guide to the General Index of Financial Information (GIFI) for Corporations* and T4012, *T2 Corporation – Income Tax Guide.*
- Attach a copy of this schedule, along with any Notes to the financial statements, to the GIFI.

Part 1 – Accounting practitioner information

Does the accounting practitioner have a professional designation? . . . . . **095** 1 Yes [X] 2 No [ ]

Is the accounting practitioner connected* with the corporation? . . . . . **097** 1 Yes [X] 2 No [ ]

* A person connected with a corporation can be: (i) a shareholder of the corporation who owns more than 10% of the common shares; (ii) a director, an officer, or an employee of the corporation; or (iii) a person not dealing at arm's length with the corporation.

Note
If the accounting practitioner does not have a professional designation **or** is connected with the corporation, you do not have to complete Parts 2 and 3 of this schedule. However, you do have to complete Part 4.

Part 2 – Type of involvement

Choose the option that represents the highest level of involvement of the accounting practitioner: **198**

Completed an auditor's report . . . . . 1 [ ]

Completed a review engagement report . . . . . 2 [ ]

Conducted a compilation engagement . . . . . 3 [ ]

Part 3 – Reservations

If you selected option "1" or "2" under **Type of involvement** above, answer the following question:

Has the accounting practitioner expressed a reservation? . . . . . **099** 1 Yes [ ] 2 No [ ]

Part 4 – Other information

Were notes to the financial statements prepared? . . . . . **101** 1 Yes [X] 2 No [ ]

If *Yes*, complete lines 102 to 107 below:

Are any values presented at other than cost? . . . . . **102** 1 Yes [ ] 2 No [X]

Has there been a change in accounting policies since the last return? . . . . . **103** 1 Yes [ ] 2 No [X]

Are subsequent events mentioned in the notes? . . . . . **104** 1 Yes [X] 2 No [ ]

Is re-evaluation of asset information mentioned in the notes? . . . . . **105** 1 Yes [ ] 2 No [X]

Is contingent liability information mentioned in the notes? . . . . . **106** 1 Yes [X] 2 No [ ]

Is information regarding commitments mentioned in the notes? . . . . . **107** 1 Yes [X] 2 No [ ]

Does the corporation have investments in joint venture(s) or partnership(s)? . . . . . **108** 1 Yes [ ] 2 No [X]

If *Yes*, complete line 109 below:

Are you filing financial statements of the joint venture(s) or partnership(s)? . . . . . **109** 1 Yes [ ] 2 No [ ]

  - non-taxable dividends under section 83;
  - deductible dividends under subsection 138(6);
  - taxable dividends deductible from income under section 112, subsection 113(2) and paragraphs 113(1)(a), (b) or (d); or
  - taxable dividends paid for purposes of a dividend refund.
- The calculations in this schedule apply only to private or subject corporations.
- Parts, sections, subsections, and paragraphs referred to on this schedule are from the federal *Income Tax Act*.
- A recipient corporation is connected with a payer corporation at any time in a taxation year, if at that time the recipient corporation:
  - controls the payer corporation, other than because of a right referred to in paragraph 251(5)(b); or
  - owns more than 10% of the issued share capital (with full voting rights), and shares that have a fair market value of more than 10% of the fair market value of all shares of the payer corporation.
- File one completed copy of this schedule with your *T2 Corporation Income Tax Return*.
- For more information, see the sections about Schedule 3 in the *T2 Corporation Income Tax Guide*.
- "X" under column A if dividend received from a foreign source (connected corporation only).
- "X" under column B if the payer corporation is connected.
- "X" under column F1 if the dividends received are eligible to an addition of 45% for the purposes of the dividend tax credit for individuals.
- F2 – Enter the code that applies to the deductible taxable dividend.

Part 1 – Dividends received during the taxation year

Do not include dividends received from foreign non-affiliates.

			Complete if payer corporation is connected	
Name of payer corporation (Use only one line per corporation, abreviating its name if necessary) 200	A	B 205	C Business Number 210	D Taxation year end of the payer corporation in which the sections 112/113 and subsection 138(6) dividends were paid YYYY/MM/DD 220
1				

Note: If your corporation's taxation year end is different than that of the connected payer corporation, your corporation could have received dividends from more than one taxation year of the payer corporation. If so, use a separate line to provide the information for each taxation year of the payer corporation.

				If payer corporation is not connected, leave these columns blank.		
E Non-taxable dividend under section 83 230	F Taxable dividends deductible from taxable income under section 112, subsections 113(2) and 138(6), and paragraphs 113(1)(a), (b), or (d) 240	F1	F2	G Total taxable dividends paid by connected payer corporation 250	H Dividend refund of the connected payer corporation 260	I Part IV tax before deductions F x 1 / 3 * 270
1						
Total (enter amount of column F on line 320 of the T2 return)						J

For dividends received from connected corporations: Part IV tax equals: $\frac{\text{Column F x Column H}}{\text{Column G}}$

* Life insurers are not subject to Part IV tax on subsection 138(6) dividends.
Public corporations (other than subject corporations) do not need to calculate Part IV tax.

Part 2 – Calculation of Part IV tax payable

Part IV tax before deductions (amount J in Part 1)		
Deduct:		
Part IV.I tax payable on dividends subject to Part IV tax	320	
Subtotal		

Deduct:

Current-year non-capital loss claimed to reduce Part IV tax	330	
Non-capital losses from previous years claimed to reduce Part IV tax	335	
Current-year farm loss claimed to reduce Part IV tax	340	
Farm losses from previous years claimed to reduce Part IV tax	345	
Total losses applied against Part IV tax		x 1 / 3 =
Part IV tax payable (enter amount on line 712 of the T2 return)	360	

Part 3 – Taxable dividends paid in the taxation year for purposes of a dividend refund

	A	B	C	D
	Name of connected recipient corporation	Business Number	Taxation year end of connected recipient corporation in which the dividends in column D were received YYYY/MM/DD	Taxable dividends paid to connected corporations
	400	410	420	430
1	Hydro One Inc.		2006-12-31	195,468,483
2				

Note
If your corporation's taxation year end is different than that of the connected recipient corporation, your corporation could have paid dividends in more than one taxation year of the recipient corporation. If so, use a separate line to provide the information for each taxation year of the recipient corporation.

Total 195,468,483

Total taxable dividends paid in the taxation year to other than connected corporations	450	
Total taxable dividends paid in the taxation year for the purposes of a dividend refund (total of column D above plus line 450)	460	195,468,483
Eligible dividends paid that are included in line 460 (memo) (Press F1 for additional information)		

Part 4 – Total dividends paid in the taxation year

Complete this part if the total taxable dividends paid in the taxation year for purposes of a dividend refund (line 460 above) is different from the total dividends paid in the taxation year.

Total taxable dividends paid in the taxation year for the purposes of a dividend refund (from above)	460	195,468,483
Other dividends paid in the taxation year (total of 510 to 540)		
Total dividends paid in the taxation year	500	195,468,483

Deduct:

Dividends paid out of capital dividend account	510	
Capital gains dividends	520	
Dividends paid on shares described in subsection 129(1.2)	530	
Taxable dividends paid to a controlling corporation that was bankrupt at any time in the year	540	
Subtotal		▶
Total taxable dividends paid in the taxation year for purposes of a dividend refund		195,468,483

Part 2 – Amount to be included in income arising from disposition

(complete this part only if the amount at line K is negative)

Amount from line K (show as positive amount)					N
Total of cumulative eligible capital (CEC) deductions from income for taxation years beginning after June 30, 1988		400		1	
Total of all amounts which reduced CEC in the current or prior years under subsection 80(7)		401		2	
Total of CEC deductions claimed for taxation years beginning before July 1, 1988	402		3		
Negative balances in the CEC account that were included in income for taxation years beginning before July 1, 1988	408		4		
Line 3 minus line 4 (if negative, enter "0")		►		5	
Total of lines 1, 2 and 5				6	
Amounts included in income under paragraph 14(1)(b), as that paragraph applied to taxation years ending after June 30, 1988 and before February 28, 2000, to the extent that it is for an amount described at line 400			7		
Amounts at line T from Schedule 10 of previous taxation years ending after February 27, 2000			8		
Subtotal (line 7 plus line 8)	409	►		9	
Line 6 minus line 9 (if negative, enter "0")				►	O
Line N minus line O (if negative, enter "0")					P
Line 5			× 1 / 2 =		Q
Line P minus line Q (if negative, enter "0")					R
Amount R			× 2 / 3 =		S
Amount N or amount O, whichever is less					T
Amount to be included in income (amount S plus amount T) (enter this amount on line 108 of Schedule 1)				410	

Canada Revenue Agency | Agence du revenu du Canada

SCHEDULE 7

CALCULATION OF AGGREGATE INVESTMENT INCOME AND ACTIVE BUSINESS INCOME

Name of corporation	Business Number	Tax year end Year Month Day
Hydro One Networks Inc.	87086 5821 RC0001	2006-12-31

- This schedule is for the use of Canadian-controlled private corporations to calculate:
  - aggregate investment income and foreign investment income for the purpose of determining the refundable portion of Part I tax, as defined in subsection 129(4) of the *Income Tax Act;*
  - specified partnership income for members of one or more partnership(s); and
  - income from an active business carried on in Canada for the small business deduction.
- For more information, see the sections called "Small Business Deduction" and "Refundable Portion of Part 1 Tax" in the *T2 Corporation – Income Tax Guide.*

Part 1 and Part 2 – Aggregate and foreign investment income calculation

	Canadian investment income	Foreign investment income	Aggregate investment income	
The eligible portion of taxable capital gains included in income for the year	636,852	001	002 636,852	A
Eligible portion of allowable capital losses for the year (including allowable business investment losses)		009	012	B
Net capital losses of other years claimed on line 332 on the T2 return			022	C
Total of amounts B and C				D
Amount A **minus** amount D (if negative, enter "0")	636,852		636,852	E
Total income from property (in box 32 include income from a specified investment business carried on in Canada other than income from a source outside Canada)				
Taxable dividends				
Other property income				
Total income from property		019	032	F
Exempt income		029	042	G
Amounts received from NISA Fund No. 2 (CAIS) that were included in computing the corporation's income for the year			052	H
Taxable dividends deductible (total of Column F on Schedule 3)		049	062	I
Business income from an interest in a trust that is considered property income under paragraph 108(5)(a)		059	072	J
Total of amounts G, H, I, and J				K
Amount F **minus** amount K				L
Total of amount E **plus** amount L	636,852		636,852	M
Total losses from property (in box 82 include losses from a specified investment business carried on in Canada other than a loss from a source outside Canada)		069	082	N
Amount M **minus** amount N (if negative, enter "0")	636,852	079 L	092 O 636,852	

Note: The aggregate investment income is the aggregate world source income.
Enter amount L, foreign investment income, on line 445 of the T2 return.
Enter amount O, aggregate investment income, on line 440 of the T2 return.

Net taxable dividends	Canadian	Foreign	Total
Taxable dividends deducted per schedule 3			
Less: Expenses related to such dividends			
Total expenses			
Net taxable dividends			

Part 3 – Specified partnership income

A	B	C
Partnership name 200	Total income (loss) of partnership from an active business 300	Corporation's share of amount in column B 310

D	E	F	G	H	I
Adjustments [add prior-year reserves under subsection 34.2(5), and deduct expenses incurred to earn partnership income, including any reserve under subsection 34.2(4)] 315	Corporation's income (loss) of the partnership (column C **plus** column D) 320	Number of days in the partnership's fiscal period 325	Prorated business limit (column C ÷ column B) × [business limit* × (column F ÷ 365)] (if column C is negative, enter "0")** 330	Column E **minus** column G (if negative, enter "0")	Lesser of columns E and G (if column E is negative, enter "0") 340
Total	350			Total 385	360

Corporation's losses for the year from an active business carried on in Canada (other than as a member of a partnership) – enter as a positive amount .... **370** ____________

Specified partnership loss of the corporation for the year – enter as a positive amount (total of all negative amounts in column E) .... **380** ____________

Total of lines 370 and 380 .... ____________ ▶ ____________ J

Amount at line 385 or line J, whichever is less .... **390** ____________

Specified partnership income (line 360 **plus** line 390) .... **400** ____________

* Use one of the following business limits to calculate column G, whichever applies:

- $250,000 if the corporation's tax year ends in 2004;
- $300,000 if the corporation's tax year ends in 2005 or 2006; or
- $400,000 if the corporation's tax year ends after 2006.

** When a partnership carries on more than one business, one of which generates income and another of which realizes a loss, the loss is not netted against the partnership's income.

Part 4 – Determination of partnership income

Corporation's share of partnership income from active businesses carried on in Canada after deducting related expenses – from line 350 above (if the net amount is negative, enter "0" on line O) .... ____________ K

Add: Specified partnership loss (from line 380 above) .... ____________ L

Subtotal ____________ M

Deduct: Specified partnership income (from line 400 above) .... ____________ N

Partnership income (enter on line S below) .... **450** ____________ O

Part 5 – Income from active business carried on in Canada

Net income for income tax purposes from line 300 of the T2 return			545,572,415	F
Deduct: Foreign business income after deducting related expenses*	500			
Taxable capital gains **minus** allowable capital loss – amount A **minus** amount B* (page 1)**		636,852		
Net property income = amount F **minus** amount G, H, and N* (page 1)				Q
Personal services business income after deducting related expenses*	520			
		636,852 ►	636,852	
		Net amount	544,935,563	R
Deduct: Partnership income (line 450 above)				S
Income from active business carried on in Canada (enter on line 400 of the T2 return – if negative, enter "0")			544,935,563	T

* If negative, **add** instead of **subtracting**.
**This amount may only be negative to the extent of any allowable business investment losses.

Canada Revenue Agency / Agence du revenu du Canada

SCHEDULE 8

CAPITAL COST ALLOWANCE (CCA)

Name of corporation	Business Number	Tax year end Year Month Day
Hydro One Networks Inc.	87086 5821 RC0001	2006-12-31

SCHEDULE 10

CUMULATIVE ELIGIBLE CAPITAL DEDUCTION

Name of corporation	Business Number	Tax year end Year Month Day
Hydro One Networks Inc.	87086 5821 RC0001	2006-12-31

- For use by a corporation that has eligible capital property. For more information, see the *T2 Corporation Income Tax Guide*.
- A separate cumulative eligible capital account must be kept for each business.

Part 1 – Calculation of current year deduction and carry-forward

Cumulative eligible capital - Balance at the end of the preceding taxation year (if negative, enter "0")			200	130,644,309 A
Add: Cost of eligible capital property acquired during the taxation year	222	11,601		
Other adjustments	226			
Subtotal (line 222 plus line 226)		11,601 x 3 / 4 =	8,701 B	
Non-taxable portion of a non-arm's length transferor's gain realized on the transfer of an eligible capital property to the corporation after December 20, 2002	228	x 1 / 2 =	C	
amount B minus amount C (if negative, enter "0")			8,701 ►	8,701 D
Amount transferred on amalgamation or wind-up of subsidiary			224	E
Subtotal (add amounts A, D, and E)			230	130,653,010 F
Deduct: Proceeds of sale (less outlays and expenses not otherwise deductible) from the disposition of all eligible capital property during the taxation year	242	669 G		
The gross amount of a reduction in respect of a forgiven debt obligation as provided for in subsection 80(7)	244	H		
Other adjustments	246	I		
(add amounts G,H, and I)		669 x 3 / 4 =	248	502 J
Cumulative eligible capital balance (amount F minus amount J) (if amount K is negative, enter "0" at line M and proceed to Part 2)				130,652,508 K
Cumulative eligible capital for a property no longer owned after ceasing to carry on that business			249	
amount K	130,652,508			
less amount from line 249				
Current year deduction	130,652,508 x 7.00 % =		250	9,145,676 *
(line 249 plus line 250) (enter this amount at line 405 of Schedule 1)			9,145,676 ►	9,145,676 L
Cumulative eligible capital – Closing balance (amount K minus amount L) (if negative, enter "0")			300	121,506,832 M

* You can claim any amount up to the maximum deduction of 7%. The deduction may not exceed the maximum amount prorated by the number of days in the taxation year divided by 365.

T2 SCH 10 (04)

2006 CT23 Corporations Tax and Annual Return

For taxation years commencing after December 31, 2003

Corporations Tax Act – Ministry of Finance (MOF)
Corporations Information Act – Ministry of Government Services (MGS)

This form is a combination of the Ministry of Finance (MOF) **CT23 Corporations Tax Return** and the Ministry of Government Services (MGS) **Annual Return**. Page 1 is a common page required for both Returns. For tax purposes, depending on which criteria the corporation satisfies, it must complete either the **Exempt from Filing (EFF)** declaration on page 2 or file the **CT23 Return** on pages 3-17. Corporations that **do not** meet the EFF criteria but **do** meet the Short-Form criteria, may request and file the **CT23 Short-Form Return** (see page 2).

The **Annual Return** (common page 1 and MGS Schedule A on pages 18 and 19, and Schedule K on page 20) contains non-tax information collected under the authority of the *Corporations Information Act* for the purpose of maintaining a public database of corporate information. This return must be completed by Ontario share-capital corporations or Foreign-Business share-capital corporations that have an extra-provincial licence to operate in Ontario.

Ministry Use

MGS Annual Return Required? *(Not required if already filed or Annual Return exempt. Refer to Guide)* ☐ Yes ☒ No

Corporation's Legal Name *(including punctuation)*: Hydro One Networks Inc.	**Ontario Corporations Tax Account No. (MOF)**
Mailing Address: 483 Bay Street, 8th Floor South Tower Toronto ON CA M5G 2P5	This Return covers the Taxation Year Start (year month day): 2006-01-01 End (year month day): 2006-12-31
Has the mailing address changed since last filed CT23 Return? ☐ Yes — Date of Change (year month day):	Date of Incorporation or Amalgamation (year month day): 1999-03-04
Registered/Head Office Address: 483 Bay Street, 8th Floor South Tower Toronto ON CA M5G 2P5	Ontario Corporation No. (MGS): 1344260
Location of Books and Records: 483 Bay Street, 8th Floor South Tower Toronto ON CA M5G 2P5	Canada Revenue Agency Business No. If applicable, enter: 87086 5821 RC0001
Name of person to contact regarding this CT23 Return: BRIAN SOARES — Telephone No.: (416) 345-6782 — Fax No.: (416) 345-6978	Jurisdiction Incorporated: Ontario
Address of Principal Office in Ontario *(Extra-Provincial Corporations only)* (MGS): Ontario Canada	If not incorporated in Ontario, indicate the date Ontario business activity commenced and ceased: Commenced (year month day): Ceased (year month day): ☒ *Not Applicable*

If 280 is less than zero and you have a CMT credit carryover, complete A & B below.

If 280 is greater than or equal to zero, transfer 230 to **Page 17** and transfer 280 to **Page 17, and to Part 4 of Schedule 101: Continuity of CMT Credit Carryovers.**

CMT Credit Carryover available From Schedule 101 From 2333 •

Application of CMT Credit Carryovers

A.	Income Tax (before deduction of specified credits)			+ From 190	76,358,696 •
	Gross CMT Payable	+ From 276	23,520,352 •		
	Subtract: Foreign Tax Credit for CMT purposes	– From 277	•		
	If 276 – 277 is negative, enter NIL in 290	=	23,520,352 •	– 290	23,520,352 •
	Income Tax eligible for CMT Credit			= 300	52,838,344 •
B.	Income Tax (after deduction of specified credits)			+ From 230	75,320,181 •
	Subtract: CMT credit used to reduce income taxes			– 310	•
	Income Tax			= 320	75,320,181 •

Transfer to page 17

If A & B apply, 310 ***cannot exceed the lesser of*** 230, 300 ***and your CMT credit carryover available*** 2333.

If only B applies, 310 ***cannot exceed the lesser of*** 230 ***and your CMT credit carryover available*** 2333.

Capital Tax *(Refer to Guide and Int.B. 3011R)*

/our corporation is a Financial Institution (s.58(2)), complete lines 480 and 430 on page 10 then proceed to page 13.

If your corporation is not a member of an associated group and/or partnership and the Gross Revenue and Total Assets as calculated on page 10 in 480 and 430 are both $3,000,000 or less, your corporation is exempt from Capital Tax for the taxation year, except for a branch of a non-resident corporation. A corporation that meets these criteria should disregard all other Capital Tax items (including the calculation of Taxable Capital). Enter NIL in 550 on page 12 and complete the return from that point. All other corporations must compute their Taxable Capital in order to determine their Capital Tax payable.

Members of a partnership (limited or general) or a joint venture, must attach all financial statements of each partnership or joint venture of which they are a member. The Paid-up Capital of each corporate partner must include its share of liabilities that would otherwise be included if the partnership were a corporation. If Investment Allowance is claimed, Total Assets must be adjusted by adding the corporation's share of the partnership's Total Assets and by deducting investments in the partnership as it appears on the corporation's balance sheet, in addition to any other required adjustments (s.61(5)). Special rules apply to limited partnerships (Int.B. 3017R).

Any Assets and liabilities of a corporation that are being utilized in a joint venture must be included along with the corporation's other Assets and liabilities when calculating its Taxable Paid-up Capital.

Special rules and rates apply to Non-Resident corporations (s.63, s.64 and s.69(3)).

Paid-up Capital of Non-resident: Paid-up capital employed in Canada of a non-resident subject to tax by virtue of s.2(2)(a) or 2(2)(b), and whose **business is not carried on solely in Canada** is deemed to be the greater of (1) taxable Income in Canada divided by 8 percent or (2) total assets in Canada minus certain indebtedness in accordance with the provisions of s.63(1)(a) (Int.B. 3010).

Paid-up Capital

Paid-up capital stock (Int.B. 3012R and 3015R)	+	350	3,362,893,010

Subtract: Investment in partnership(s)/joint venture(s)	−	423	
Total Assets as adjusted	=	430	11,359,289,000
Amounts in 360 and 361 (if deducted from assets)	+	440	
Subtract: Amounts in 371, 372 and 381	−	441	1,369,940,011
Subtract: Appraisal surplus if booked	−	442	
Add or Subtract: Other adjustments (specify on an attached schedule)	±	443	
Total Assets	=	450	9,989,348,989

Investment Allowance (410 ÷ 450) x 390 Not to exceed 410	=	460	15,174,242
Taxable Capital 390 − 460	=	470	9,313,418,356

Gross Revenue (as adjusted to include the share of any partnership(s)/joint venture(s) Gross Revenue)	480	4,151,572,000
Total Assets (as adjusted)	From 430	11,359,289,000

Calculation of Capital Tax for all Corporations except Financial Institutions

***Note:** This version (2006) of the CT23 may only be used for a taxation year that commenced after December 31, 2003.*

Financial Institutions use calculations on page 13.

Important: If the corporation is a family farm corporation, family fishing corporation or a credit union that is not a Financial Institution, complete only Section A below.

OR If the corporation is **not** a member of an associated group and/or partnership, complete Section B below, then review only the Capital Tax calculations in Section C below, selecting and completing the one specific subsection (e.g. C3) that applies to the corporation.

OR If the corporation **is** a member of an associated group and/or partnership, complete Section B below and Section D on page 11, and if applicable, complete Section E or Section F on page 12. Note: if the corporation is a member of a connected partnership, please refer to the CT23 Guide for additional instructions before completing the Capital Tax section.

SECTION A

This section applies only if the corporation is a family farm corporation, a family fishing corporation or a credit union that is not a Financial Institution (Int.B. 3018).

Enter NIL in 550 on page 12 and complete the return from that point.

SECTION B

Calculation of Taxable Capital Deduction (TCD)

Number of Days in Taxation Year

Amount		Days		Total Days			
5,000,000	x	35 (Days before Jan. 1, 2005)	÷ 73	365	= +	500	
7,500,000	x	36 (Days after Dec. 31, 2004 and before Jan. 1, 2006)	÷ 73	365	= +	501	
10,000,000	x	37 (Days after Dec. 31, 2005 and before Jan. 1, 2007) 365	÷ 73	365	= +	502	10,000,000

Taxable Capital Deduction (TCD) 500 + 501 + 502 = 503 10,000,000

SECTION C

This section applies if the corporation is **not a member of an associated group and/or partnership.**

C1. If 430 and 480 on page 10 are both $3,000,000 or less, enter NIL in 550 on page 12 and complete the return from that point.

C2. If Taxable Capital in 470 **is equal to or less than the TCD** in 503, enter NIL in 550 on page 12 and complete the return from that point.

C3. If Taxable Capital in 470 **exceeds the TCD** in 503, complete the following calculation and transfer the amount from 523 to 543 on page 12, and complete the return from that point.

+ From 470 ____

− From 503 ____

= 471 ____ x From 30 100.0000 % (Ontario Allocation) x 0.3 % x 555 365 (Days in taxation year) = + 523 ____

365 (366 if leap year) *If floating taxation year, refer to Guide.*

Transfer to 543 on page 12 and complete the return from that point

continued on Page 11

Capital Tax Calculation *continued from Page 10*

SECTION D

This section applies ONLY to a corporation that is a member of an associated group (excluding Financial Institutions and corporations exempt from Capital Tax) and/or partnership. You must check either 509 or 524 and complete this section before you can calculate your Capital Tax Calculation under either Section E or Section F.

D1. [ ] 509 (X if applicable) All corporations that you are associated with do **not** have a permanent establishment in Canada.

If Taxable Capital 470 on page 10 is equal to or less than the TCD 503 on page 10, enter NIL in 550 on page 12 and complete the return from that point.

If Taxable Capital 470 on page 10 exceeds the TCD 503 on page 10, proceed to **Section E**, enter the TCD amount in 542 in Section E, and complete Section E and the return from that point.

D2. [X] 524 (X if applicable) One or more of the corporations that you are associated with **maintains** a permanent establishment in Canada.

You and your associated group may continue to allocate the TCD by completing the Calculation below. Or, the associated group **may file an election** under subsection 69(2.1) of the *Corporations Tax Act*, whereby total assets are used to allocate the TCD among the associated group. Once a ss.69(2.1) election is filed, all members of the group will then be required to file in accordance with the election and allocate a portion (portion is henceforth referred to as **Net Deduction**) of the capital tax effect relating to the TCD to each corporation in the group on the basis of the ratio that each corporation's total assets multiplied by its Ontario allocation is to the total assets of the group.

The total asset amounts and Ontario allocation percentages to be used for this calculation must be taken from each corporation's financial information from its last taxation year ending in the immediately preceding calendar year.

In addition, although each corporation in the associated group may deduct its Net Deduction amount as apportioned by the total asset formula, the group may, at the group's option, reallocate the group's total Net Deduction among the group on what ever basis the corporate group wishes, as long as the total of the reallocated amounts does not exceed the group's total Net Deduction amount originally calculated for the associated group.

Calculation

Do **not** complete this calculation if ss.69(2.1) election is filed

Taxable Capital From 470 on page 10 . . . . . + From 470 9,313,418,356

Determine aggregate taxable capital of an associated group (excluding financial institutions and corporations exempt from capital tax) and/or partnership having a permanent establishment in Canada

Names of associated corporations (excluding Financial Institutions and corporations exempt from Capital Tax) having a permanent establishment in Canada *(if insufficient space, attach schedule)*	Ontario Corporations Tax Account No. (MOF) (if applicable)	Taxation Year End		Taxable Capital
See schedule			+ 531	455,682,589
			+ 532	
			+ 533	

Aggregate Taxable Capital 470 + 531 + 532 + 533, etc. . . . . . = 540 9,769,100,945

If 540 above is equal to or less than the TCD 503 on page 10, the corporation's Capital Tax for the taxation year, is NIL.

Enter NIL in 523 in section E on page 12, as applicable.

If 540 above is greater than the TCD 503 on page 10, the corporation must compute its share of the TCD below in order to calculate its Capital Tax for the taxation year under Section E on page 12.

From 470 9,313,418,356 ÷ From 540 9,769,100,945 x From 503 10,000,000 = 541 9,520,897

Transfer to 542 in Section E on page 12

Ss.69(2.1) Election Filed

[ ] 591 (X if applicable) **Election filed.** *Attach a copy of Schedule 591 with this CT23 Return.* Proceed to **Section F** on page 12.

continued on Page 12

DOLLARS ONLY

Capital Tax Calculation *continued from Page 11*

SECTION E

This section applies if the corporation is a member of an associated group and/or partnership whose total aggregate Taxable Capital [540] on page 11 exceeds the TCD [503] on page 10.

Complete the following calculation and transfer the amount from [523] to [543], and complete the return from that point.

+ From [470]	9,313,418,356 •						**Total Capital Tax for the taxation year**
− [542]	9,520,897 •				Days in taxation year		
= [471]	9,303,897,459 •	x From [30] 100.0000 % Ontario Allocation	x	0.3 %	x [555] 365 / 365* (366 if leap year)	= + [523]	27,911,692 •
							Transfer to [543] *and complete the return from that point*

SECTION F

This section applies if a corporation is a member of an associated group and the associated group has filed a ss.69(2.1) election

+ From [470]	•	x From [30] 100.0000 % Ontario Allocation	x	0.3 %	= + [561]	•
− Capital tax deduction from [995] relating to **your corporation's** Capital Tax deduction, on Schedule 591					− From [995]	•
					= [562]	•
						Total Capital Tax for the taxation year
Capital Tax	[562] •	x	Days in taxation year [555] 365 / 365* (366 if leap year)		= [563]	•
						Transfer to [543] *and complete the return from that point*

* *If floating taxation year, refer to Guide.*

Capital Tax before application of specified credits	= [543]	27,911,692 •
Subtract: Specified Tax Credits applied to reduce capital tax payable *(Refer to Guide)*	− [546]	•
Capital Tax [543] − [546] *(amount cannot be negative)*	= [550]	27,911,692 •
		Transfer to Page 17

Total		829	839	849	869	889

Notes:

(1) Non-capital losses include allowable business investment losses, fed.s.111(8)(b), as made applicable by s.34.

(2) Where acquisition of control of the corporation has occurred, the utilization of losses can be restricted. See fed.s.111(4) through 111(5.5), as made applicable by s.34.

(3) Includes losses on amalgamation (fed.s.87(2.1) and s.87(2.11)) and/or wind-up (fed.s.88(1.1) and 88(1.2)), as made applicable by s.34.

(4) To the extent of applicable gains/income/at-risk amount only.

(5) Generally a three year carry-back applies. See fed.s.111(1) and fed.s.41(2)(b), as made applicable by s.34.

(6) Where a limited partner has limited partnership losses, attach loss calculations for each partnership.

(7) Include amount from 11 if taxable income is adjusted to claim unused foreign tax credit for federal purposes.

(8) Amount in 709 must equal total of 829 + 839.

(9) Include non-capital losses incurred in taxation years ending after March 22, 2004.

Request for Loss Carry-Back (s.80(16))

pplies to corporations requesting a reassessment of the return of one or more previous taxation years under s.80(16) with respect to one or more types of losses carried back.

- If, after applying a loss carry-back to one or more previous years, there is a balance of loss available to carry forward to a future year, it is the corporation's responsibility to claim such a balance for those years following the year of loss within the limitations of fed.s.111, as made applicable by s.34.
- Where control of a corporation has been acquired by a person or group of persons, certain restrictions apply to the carry-forward and carry-back provisions of losses under fed.s.111(4) through 111(5.5), as made applicable by s.34.
- Refunds arising from the loss carry-back adjustment may be applied by the Minister of Finance to amounts owing under **any Act administered by the Ministry of Finance**.
- Any late filing penalty applicable to the return for which the loss is being applied will not be reduced by the loss carry-back.
- The application of a loss carry-back will be available for interest calculation purposes on the day that is the latest of the following:
  1) the first day of the taxation year after the loss year,
  2) the day on which the corporation's return for the loss year is delivered to the Minister, or
  3) the day on which the Minister receives a request in writing from the corporation to reassess the particular taxation year to take into account the deduction of the loss.
- If a loss is being carried back to a **predecessor corporation**, enter the predecessor corporation's account number and taxation year end in the spaces provided under Application of Losses below.

								Enter in boxes	650	650	650	on the CT23.

Note 1. Include any property acquired in previous years that has now become available for use. This property would have been previously excluded from column 3. List separately any acquisitions that are not subject to the 50% rule. See Regulation 1100(2) and (2.2) of the *Income Tax Act* (Canada).

Note 2. The net cost of acquisitions is the cost of acquisitions plus or minus certain adjustments from column 4.

Note 3. If the taxation year is shorter than 365 days, prorate the CCA claim.

Note 4. Ontario recapture should be included in net income after deducting the federal recapture and the Ontario terminal loss is deducted from net income after including the federal terminal loss.

Ontario Cumulative Eligible Capital Deduction
Schedule 10

orporation's Legal Name	Ontario Corporations Tax Account No. (MOF)	Taxation Year End
Hydro One Networks Inc.	1800029	2006-12-31

- **For use by a corporation that has eligible capital property.**
- **A separate cumulative eligible capital account must be kept for each business.**

Part 1 – Calculation of current year deduction and carry-forward

Ontario Cumulative eligible capital – balance at end of preceding taxation year *(if negative, enter zero)*				130,644,309 A
Add: Cost of eligible capital property acquired during the taxation year	+	11,601 B		
Amount transferred on amalgamation or wind-up of subsidiary	+	C		
Other adjustments	+	D		
Total of B + C + D	=	11,601	x 3 / 4 =	8,701 E
Subtotal A + E			=	130,653,010 F
Deduct: Ontario proceeds of sales (less outlays and expenses not otherwise deductible) from the disposition of all eligible capital property during the taxation year	+	669 G		
The gross amount of a reduction in respect of a forgiven debt obligation as provided for in subsection 80(7) of the *Income Tax Act* (Canada)	+	H		
Other adjustments	+	I		
Total of G + H + I	=	669	x 3 / 4 =	502 J
Ontario cumulative eligible capital balance F - J			=	130,652,508 K

If K is negative, enter zero at line M and proceed to Part 2

Current year deduction 130,652,508 K x 7 % * = 9,145,676 L

* *The maximum current year deduction is 7%. However, you can claim any amount up to the maximum.*

Enter amount in box 651 *of the CT23*

ntario cumulative eligible capital – closing balance K - L *(if negative, enter zero)* = 121,506,832 M

Note: Any amount up to the maximum deduction of 7% may be claimed. Taxation years starting after December 21, 2000, the deduction may **not** exceed the maximum amount prorated for the number of days in the taxation year divided by 365 or 366 days.

Part 2 – Amount to be included in income arising from disposition

Only complete this part only if the amount at line K is negative

Amount from line K above *show as a positive amount*			N
Total cumulative eligible capital deductions from income for taxation years beginning after June 30, 1988		1	
Total of all amounts which reduced cumulative eligible capital in the current or prior years under subsection 80(7) of the ITA		2	
Total of cumulative eligible capital deductions claimed for taxation years beginning before July 1, 1988	3		
Negative balances in the cumulative eligible capital account that were included in income for taxation years beginning before July 1, 1988	4		
Line 3 deduct line 4		5	
Total lines 1 + 2 + 5		6	
Line T from previous Ontario Schedule 10 for taxation years ending after February 27, 2000		7	
Deduct line 7 from line 6			O
N - O *(cannot be negative)*			P
Amount on line 5 ____ x 1 / 2			Q
P - Q			R
Amount on line **R** ____ x 2 / 3			S
Lesser of line **N** or line **O**			T
mount to be included in income S + T			

Note: For taxation years ending after February 27, 2000 and before October 18, 2000 use 8/9 to calculate **S**

Ontario Scientific Research and Experimental Development Expenditures CT23 Schedule 161

Corporation's Legal Name	Ontario Corporations Tax Account No. (MOF)	Taxation Year End
Hydro One Networks Inc.	1800029	2006-12-31

This schedule is used to calculate Ontario Scientific Research and Experimental Development Expenditures (SR & ED). The rules used in the calculation of Ontario SR & ED follow the federal rules with the exception of the new Ontario measure introduced in the 2001 Ontario Budget and implemented in Bill 127 which received Royal Assent on December 5, 2001.

This schedule must be completed by all corporations performing qualified Ontario SR & ED in a "specified taxation year" or in the taxation year immediately preceding the first specified taxation year of the corporation and filed with the current CT23 or CT8. Other corporations may use this schedule, if they have claimed or are claiming a different SR & ED amount for Ontario than for federal income tax purposes.

- **"Specified Taxation Year" (STY)** is the taxation year of the corporation that begins after February 29, 2000 **and** ends after December 31, 2000.
- **"Investment Tax Credit Amount" (ITC)** means, in respect of a corporation for a taxation year, an amount deducted by the corporation for a preceding taxation year under subsection 127(5) or (6) of the *Income Tax Act* (Canada) (ITA).
- **"Qualified Ontario SR & ED Expenditure" (QORD)** means,
  - A. A qualified expenditure within the meaning of subsection 12(1) of the *Corporations Tax Act* (CTA) that is made or incurred by a corporation in a STY or in the taxation year immediately preceding the first STY of the corporation, or
  - B. An expenditure made or incurred by a partnership in a fiscal period that ends in a STY of a corporation if,
    - the corporation is member of the partnership at any time in the STY, and
    - the expenditure would be a qualified expenditure within the meaning of subsection 12(1) of the CTA if it were made by a corporation.
- **"Ontario Allocation Factor" (OAF)** has the meaning given to that expression by subsection 12(1) of the CTA.

- If a corporation includes a federal ITC amount in determining the amount of the Ontario pool of deductible SR & ED expenditures for a STY, the following amounts are adjusted by the OAF:
  - Amount of recaptured federal ITC relating to QORD for property disposed of in the preceding taxation year in 442 on page 2.
  - Amount of federal ITC relating to QORD claimed federally in the preceding taxation year(s) in 462 on page 2.
  - Amount of federal ITC relating to QORD allocated from partnerships in the current taxation year in 465 on page 2.

- Federal ITCs earned on shared-use equipment (SUE) reduce the capital cost of the property acquired for federal and Ontario income tax purposes in the taxation year after the taxation year in which the ITC is claimed federally. The amount of the federal ITC that relates to QORD on SUE is added to the SR & ED pool for Ontario purposes in the taxation year after the taxation year in which the ITC is claimed federally.

Ontario Scientific Research and Experimental Development Expenditures CT23 Schedule 161

Corporation's Legal Name	Ontario Corporations Tax Account No. (MOF)	Taxation Year End
Hydro One Networks Inc.	1800029	2006-12-31

Ontario Pool of Deductible SR & ED Expenditures for the current taxation year

Total allowable SR & ED expenditures (capital and current) (From line 400 federal T661 (T2 SCH32))			+ 400	
Less: Government and non-government assistance (From line 430 federal T661 (T2 SCH32))			− 430	
Preceding year's amount of federal ITC claimed for SR & ED (From line 435 federal T661 (T2 SCH32))			− 435	153,159
Sale of SR & ED capital assets and other deductions (From line 440 federal T661 (T2 SCH32))			− 440	
Amount of recaptured federal ITC (From line 453 federal T661 (T2 SCH32)) relating to QORD for property disposed of in the preceding taxation year	442			
Gross-up for Ontario allocation factor From 442 [ ] ÷ 100.0000 % (From 30 of the CT23 or CT8)			− 444	
Subtotal: 400 − 430 − 435 − 440 − 444			= 445	-153,159
Add: Repayments of government and non-government assistance (From line 445 federal T661 (T2 SCH32))			+ 446	
SR & ED expenditure pool transferred on amalgamation or wind-up (From line 452 federal T661 (T2 SCH32))			+ 452	
Amount of federal ITC recaptured in the preceding taxation year (From line 453 federal T661 (T2 SCH32))			+ 453	
Preceding year's balance in pool of deductible Ontario SR & ED expenditures (From 480 of the preceding taxation year)			+ 460	
Federal ITC relating to QORD **claimed** federally in the preceding taxation year(s)	+ 462	153,159 (From 575 on Page 3)		
Amount of federal ITC relating to QORD allocated from partnerships in the current taxation year	+ 465			
Subtotal 462 + 465	= 468	153,159		
Gross-up for Ontario allocation factor From 468 [153,159] ÷ 100.0000 % (From 30 of the CT23 or CT8)			+ 470	153,159
Subtotal: 445 + 446 + 452 + 453 + 460 + 470 (If the amount in 473 is negative, enter zero, in 475, 477 and add 473 to 615 of the 2002 CT23 or CT8 or 616 of the 2003 or later CT23 or CT8. If the amount in 473 is positive, enter the amount in 475.)			= 473	
Amount available for deduction			= 475	
Deduction claimed in the taxation year for Ontario (Enter the SR & ED expenditure pool deduction claimed in the taxation year in 679 of the CT23 or CT8)			− 477	
Ontario current taxation year closing balance in pool of deductible SR & ED expenditures 475 − 477			= 480	

(Transfer this amount to 460 as the carry forward amount for the next taxation year.)

Ontario Scientific Research and Experimental Development Expenditures CT23 Schedule 161

Corporation's Legal Name	Ontario Corporations Tax Account No. (MOF)	Taxation Year End
Hydro One Networks Inc.	1800029	2006-12-31

Calculation of Preceding Taxation Year Amount and Account Balances - Federal ITC from SR & ED Expenditures relating to QORD.

- This page is used to calculate the amount of the federal ITC that relates to SR & ED performed in Ontario for certain taxation years and is used to increase the amount of the Ontario SR & ED pool on page 2.
- All amounts on this page are based on the preceding taxation year since the amount of the federal ITC that relates to QORD can only be used to increase the Ontario pool for SR & ED in the current taxation year if there was a federal ITC claimed for federal purposes in the preceding taxation year that related to QORD.
- **Do not include amounts** of federal ITCs that relate to QORD that were **allocated from a partnership.** These amounts are added to your SR & ED pool for Ontario in the taxation year that they are allocated from a partnership to a corporation, not in the year after they are claimed federally.

Opening Balance: (Enter amount 590 from Schedule 161 of the preceding taxation year, if any)	+	500	
Add: Amount of federal ITC earned, relating to QORD (QORD portion of line 540 federal T2 SCH31 for the preceding taxation year)	+	510	153,159.
Amount of federal ITC earned, relating to QORD, transferred on amalgamation or wind-up (QORD portion of line 530 federal T2 SCH31 for the preceding taxation year)	+	520	
Subtotal: 500 + 510 + 520	=	535	153,159.
Deduct: Amount of federal ITC, relating to QORD, claimed federally (QORD portion of line 560 federal T2 SCH31 for the preceding taxation year)	+	540	153,159
Amount of federal ITC, relating to QORD, carried back federally to a preceding taxation year(s) (QORD portion of line P federal T2 SCH31 for the preceding taxation year	+	550	
A refund of federal ITC, relating to QORD, claimed federally (QORD portion of line 610 federal T2 SCH31 for the preceding taxation year)	+	560	
Amount of federal ITC, relating to QORD, deemed as a remittance of co-op corporations (QORD portion of line 510 federal T2 SCH31 for the preceding taxation year)	+	570	
Subtotal: 540 + 550 + 560 + 570 (Transfer this amount to 462 on Page 2)	=	575	153,159.
Deduct: Amount of federal ITC, relating to QORD, expired per the ITA after 10 taxation years (QORD portion of line 515 federal T2 SCH31 for the preceding taxation year)	–	580	
Closing Balance: 535 – 575 – 580 (Transfer this amount to 500 as the opening balance for the next taxation year.)	=	590

Totals (see note 1, 2 and 3)	725	740 153,159	755 153,159	770	785

otes:

1. The amount in 725 should equal the amount of the investment tax credit at the end of the preceding taxation year less line 515 in Part 12 of the federal T2 SCH31 for the preceding taxation year.
2. The amount in 785 should equal the closing balance in line 620 in Part 12 of the federal T2 SCH31 for the preceding taxation year.
3. It is important that the amounts in the deductions columns on this page correctly reflect the year of origin of the federal ITC claimed because only amounts relating to QORD can be used to increase the Ontario SR & ED pool.

RATE BASE

1.0 INTRODUCTION

This exhibit provides the forecast of Hydro One Distribution's rate base for the 2008 test year and provides a detailed description of each of the rate base components.

In accordance with the 2006 Electricity Distribution Rate Handbook ("Handbook"), the rate base underlying the test year revenue requirement includes a forecast of net fixed assets, calculated on a mid-year average basis, plus a working capital allowance. Net fixed assets are gross plant in service minus accumulated depreciation and contributed capital[1]. Working capital includes an allowance for cash working capital and materials and supplies inventory.

2.0 UTILITY RATE BASE

Utility rate base for the distribution system for the test year is filed at Exhibit D2, Tab 1, Schedule 1. The calculation of Net Utility Plant is provided at Exhibit D2, Tab 3, Schedule 1 and 2.

Hydro One Distribution's forecast rate base for the test year is $4,382.0 million.

---

[1] Contributed capital refers to amounts contributed by third parties to specific capital projects, e.g. Joint Use Assets, Customer Contributions

Table 1
Distribution Rate Base ($ Millions)

Description	Test 2008
Gross Plant	6,450.1
Accumulated Depreciation	(2,364.6)
Net Plant	4,085.5
Cash Working Capital	273.2
Materials and Supplies Inventory	23.3
Distribution Rate Base	**4,382.0**

The mid-year gross plant balance reflects the capital expenditure programs forecast for the bridge and test years. These programs are described in detail in the company's written evidence at Exhibits D1, Tab 3, Schedules 1 through 5 and in the supporting schedules filed at Exhibit D2, Tab 2, Schedule 2. The justification for capital projects in excess of $1 million are filed at Exhibit D2, Tab 2, Schedule 3.

The net plant component of the 2006 rate base approved in the RP-2005-0020/EB-2005-0378 was $3,423.3 million. The 2008 net plant of $4,085.5 million is $662 million or 19.3% higher than that last approved. Continuity schedules are provided in Exhibit D2, Tab 3.

Table 2
Continuity of Fixed Assets Summary ($ Million)

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Opening Gross Asset Balance	4,941.9	5,224.8	5,492.7	5,866.5	6,177.3
In-Service Additions	285.1	290.7	379.9	513.7	595.9
Retirements	(31.8)	(23.2)	(10.9)	(210.1)	(50.8)
Sales	(16.3)	(3.6)	(10.3)	-	-
Transfers	45.9	4.0	15.1	7.2	0.6
Closing Gross Asset Balance	5,224.8	5,492.7	5,866.5	6,177.3	6,723.0
Mid Year Gross Asset Balance	5,083.4	5,358.8	5,679.6	6,021.9	6,450.1

In-service additions reflect the placing in service of Hydro One Distribution's capital programs. These programs are described in detail at Exhibit D1, Tab 3, Schedules 1 through 5.

In its RP-2005-0020/EB-2005-0378 Decision, the Board accepted the application of the Foster Associates depreciation study, which Hydro One indicated would be implemented for GAAP purposes in 2007. The depreciation study requires that plant older than the proposed amortization period be immediately retired from service. As a result, retirements in 2007 include a one-time adjustment to reflect the write-off of minor fixed assets ($52 million) that reached the end of their normal service life and the removal of conventional meters ($121 million) due to replacement as part of the Smart Meter program. Normal retirements ($37M) comprise the remainder.

In 2008, retirements of $51 million consist of $14 million resulting from assets reaching their end of life, $11 million due to the retirement of the Distribution portion of Passport, and $25 million from normal retirements.

Transfers over the period reflect the company's efforts to properly reflect the use of its shared service assets by the transmission and distribution systems as asset use changes over time. During 2004, the company conducted a thorough review of these shared assets to determine an allocation basis that more accurately reflected their proposed use. The 2006 transfers primarily reflect the transfer of wholesale meters to Distribution due to the deregistration of the meters.

The nature and composition of Hydro One Distribution's assets are described in detail in Exhibit D1, Tab 1, Schedule 2.

3.0 WORKING CAPITAL

Per OEB direction, in RP-2005-0020/EB-2005-0378 Hydro One Distribution retained Navigant Consulting Inc. to undertake a lead-lag study. The OEB accepted the results of the Navigant study and the provision for working capital in 2008 incorporates the results of this study.

The Cash Working Capital requirement for the distribution system is based on the following factors:

- the forecast of OM&A,
- the retail cost of power,
- capital and income taxes,
- the net lead-lag days determined.

The other component of Working Capital is materials and supplies inventory.

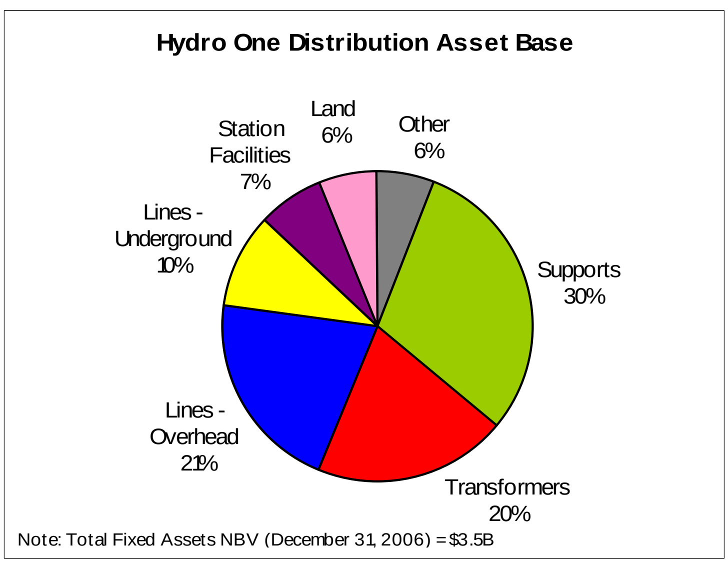
The application of the methodology from the lead lag study results in a net cash working capital requirement including the impact of GST of $273.2 million for the test year. This is an increase of $7.6 million from the $265.6 million level approved by the Board in RP-2005-0020/EB-2005-0378. Details of the Working Capital requirements for Hydro One Distribution are filed at Exhibit D1, Tab 1, Schedule 3 and Exhibit D2, Tab 4, Schedule 1 for the test year.

DISTRIBUTION ASSETS

1.0 INTRODUCTION

At Dec. 31, 2006, Hydro One Distribution managed $3.5 billion of distribution net fixed assets to provide the safe and reliable delivery of electricity, from transmission and generation systems, to approximately 1.2 million customers across the Province of Ontario. The assets consist of about 119,900 circuit kilometers of distribution line, 1006 distributing stations (including 75 regulating stations).The major power system components include; conductors, switches, transformers, insulators, reactors, capacitors, connecting hardware, associated protection and control equipment, foundations, grounding systems and revenue meters. The functional breakout of Hydro One Distribution’s asset base is shown in Figure 1 below.

Figure 1



Note: Lines-Underground includes all feeder type, i.e., subtransmisison, primary and secondary distribution feeders.

2.0 KEY CHARACTERISTICS OF THE DISTRIBUTION SYSTEM

Hydro One Distribution operates in a large service territory characterized by low customer densities. The distribution system has been designed and is operated to industry standards. The system is mainly radial in design, with very little redundancy in supplies to customers, which is consistent with rural utilities. Due to this configuration, most component failures require immediate repair to restore service.

Almost exclusively, with the exception of voltage transformation at 88 high voltage distribution stations (HVDSs), Hydro One Distribution's power system assets are operated at voltages below 50kV, and all of Hydro One Distribution customers are supplied at voltages below 50 kV.

The key characteristics of Hydro One Distribution's system are shown in Table 1 below.

Table 1

Hydro One Distribution System Assets		
Customers	Distribution	1,170,000
	Large Users > 5 MW	44
	LDC	34
Fixed Assets (NBV YE2006)		$3.5 Billion

Poles (line supports)	1.65 million
Distribution Stations	931
Regulating Stations	75
Station Transformers and Regulators	1,477
Pole-mount & Pad-mount Transformers	475,000

WORKING CAPITAL AND LEAD/LAG

1.0 INTRODUCTION

Working capital is the amount of funds required to finance the day-to-day operations of a regulated utility and is included as part of rate base for ratemaking purposes. The determination of working capital relies on a lead-lag study.

In 2005, Hydro One commissioned Navigant to carry out a lead-lag study. In the OEB's RP-2005-0020/EB-2005-0378 Decision with Reasons, the OEB accepted the results of the Navigant lead-lag study.

2.0 SUMMARY

Hydro One Distribution's net cash working capital requirement for the 2008 test year is $273.2 million or 11.2% of OM&A ($477.7M) and Cost of Power expenses ($1,959.3M). The net cash working capital requirement was calculated using the Navigant methodology accepted in RP-2005-0020/EB-2005-0378. Table 1 summarizes the net cash working capital requirements determined by using the lead/lag days from the Navigant study filed in RP-2005-0020/EB-2005-0378 and updated to reflect the 2008 test year revenue, expense and GST amounts (Table 2).

The methodology used to determine the net working cash required is based on the Navigant study that was accepted by the OEB, and it takes the following into consideration:

- the three most important elements of revenue lags i.e., service, billing and collections;
- the most important elements of expense lead such as payroll and benefits, operations, maintenance, administration expenses, cost of power, taxes and interest;

Table 1

MATERIALS AND SUPPLIES INVENTORY

1.0 STRATEGY

Hydro One Distribution is committed to optimizing materials and supplies inventory in support of our customer satisfaction and reliability strategic objectives, as well as meeting OEB service quality indicator targets. Having the right material at the right work location at the right time is key to meeting these objectives.

Significant strides have been made to reduce inventory levels through various initiatives managed through supply chain. However, the need to maintain additional inventory to supply growing work program levels and higher material costs have offset the reduction of inventory levels.

2.0 INVENTORY

As of December 31, 2006, Hydro One Distribution carried inventory valued at $23.1 million. Table 1 below provides the inventory levels for 2004 – 2008. Included are both the year-end levels and annual average for each year due to the monthly fluctuations that occur during the year.

Table 1
Inventory Levels 2004 – 2008 ($ Million)

$ M	2004	2005	2006	2007 Forecast	2008 Forecast
Year End Actual					
- **Materials & Supplies**	15.7	16.7	22.6	23.2	23.4
- **Smart Meters**		5.4	0.5		
Total Year End Actual	15.7	22.1	23.1	23.2	23.4
Annual Average Materials & Supplies	16.3	17.4	25.2	23.1	23.3

Over the 2004 – 2006 period, particularly in 2006, annual inventory levels excluding smart meters increased by 44%. Further slight increases are expected over 2007-2008 period and onward.

The slight increase in inventory is primarily driven by a growing work program and increased material prices. A large number of aging assets required refurbishment and replacement, contributing to the required inventory levels. The unit prices have increased with the suppliers for the new contracts due to the market increase in the price of steel and other commodities. This increase is reflected in the inventory value of transformers, wire and cable, insulators, arresters and some poles.

Most of Hydro One Distribution's materials and supplies are sourced from inventoried stock. The basis of forecasting inventory levels assumes that historical inventory patterns are maintained, and modified as appropriate to reflect planned work program changes.

Inventory is held for the maintenance of existing assets and new development activities. Inventory primarily includes component parts - lines, poles, wire and cable, switches, transformers, protective devices, metering systems, minor parts such as circuit breaker contacts, pallet switches, insulators – and consumable items such as lubricants, gaskets, and protective clothing.

Key drivers that influence the inventory level include the OEB customer service quality indicator for connection of new services that require LDC's to connect new services in 5 or less working days for at least 90% of the requests for new connections, vendor lead-time, and demand levels for the forecasted work program.

2.1 Monthly Inventory Levels 2004-2006

The actual monthly inventory numbers for 2004 - 2006 are shown in Table 2 below.

The inventories of consumable material are seasonal in nature, driven primarily by storm season and new connections. Monthly inventories are ramped up to meet these increased needs. The trend indicates lower inventories at the beginning and end of each year, with an increase during the spring and early summer. This spring and summer timeframe increase is due to the building of storm inventory for distribution transformers and related hardware. The drop at the end of the year is due to the consumption of storm stock. December 2005 also included $5.4 million of smart meters inventory, which were consumed during 2006, resulting in an ending balance of only $0.5 million.

Table 2
Historical Monthly Inventory Levels 2004 – 2006

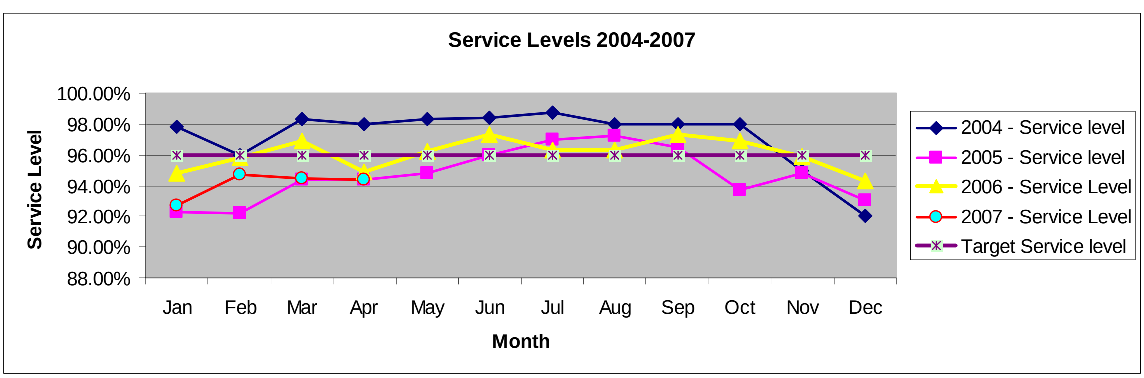
Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2004	15.3	16.6	17.2	16.7	15.9	16.3	16.6	17.3	16.3	16.3	15.2	15.7
2005	16.8	16.8	17.3	17.2	20.1	16.3	16.5	15.9	16.6	16.1	16.6	22.1
2006	23.9	25.3	27.4	27.6	26.8	26.0	26.3	24.9	23.3	23.7	23.6	23.1

3.0 PERFORMANCE METRICS

3.1 Service Levels

As a mean of driving improvement in the provision of materials from inventory, a service level metric has been adopted which represents the percentage of the time the warehouse was able to fill an order by the required date. Table 3 below provides the monthly trend of the service level metric over the 2004 to May 2007 period. The current target for the service level metric is at 96%.

Table 3
Inventory Service Level Monthly Trend



Inventory service levels are within the 96%-98% range for most of 2004. The decline in service level at the end of 2004 and part way through 2005 was due to a transition period of closing warehouses across the province and opening the Barrie central warehouse..

The 2006 inventory service levels fluctuated within approximately 1% of the current target of 96%. This reflects efforts to optimize inventory to ensure the required material is available when needed as well as collaborative forecasting with key suppliers to ensure product is available.

The inventory service level dips at the beginning and end of 2006 as well as at the beginning of 2007 were due to a large number of storms and associated inventory "stock-outs". The 2007 service level is increasing and is expected to reach the current target of 96%.

3.2 Inventory Turns

Another performance metric associated with materials and supplies is inventory turns.

Inventory turns are a measure of how quickly a company replenishes its entire stock of materials and supplies annually. The more turnovers there are, the less time inventory sits idle, which helps improve cash flow.

Inventory turns are calculated by dividing the value of annual issues from the warehouse by the yearly average value of inventory on hand. The 2006 inventory turns is 3.6. This indicates Hydro One Distribution replaces its inventory, on average, approximately every three months. For 2007, inventory turns are projected to improve to about four.

ASSET CONDITION ASSESSMENT & ANALYSIS

1.0 INTRODUCTION

This Schedule summarizes Hydro One Distribution's Asset Condition Assessment (ACA) practices, processes and ACA findings for key distribution system components, equipment, and facilities. Hydro One Distribution's ACA practices are based on studies carried out by Acres International Ltd, comparisons with other members in the electrical utility industry and expert opinion available within Hydro One. The practices are also based on a review of good utility practice.

ACA is one of the tools that are used to detect and quantify the extent of asset degradation of distribution system equipment and to provide a means of estimating remaining asset life based on condition. The rate of change in asset condition over time helps to identify deterioration trends. This information also helps to establish maintenance, refurbishment or replacement requirements based on the asset's ability to perform reliably. It must be recognized that the level of ongoing maintenance can have a pronounced effect on the life of some assets, and where this is the case, it is the ACA results that provide a barometer to assess the effectiveness of these maintenance programs, as well as identifying future end-of-life (EOL) replacement requirements.

Hydro One Distribution monitors the condition of its assets through a number of activities that include targeted asset condition assessments, maintenance activities, EOL assessment studies and incident investigations. These techniques are used to identify assets whose performance could have serious negative impact on Hydro One's business values and therefore require refurbishment or replacement, or in some cases, removal. The information is also used to decide on changes to maintenance practices when this is the economical solution. ACA information is a significant factor in determining the priority of work requirements for Sustaining Capital and OM&A programs.

2.0 OVERVIEW

The effective and efficient operation of the asset management model requires accurate, timely and sufficient asset information for decision making purposes. This information is used to support investment decision processes by enabling the assessment of risks to the Business Values ("BVs") and Key Performance Indicators ("KPIs") for various alternatives. For additional information concerning the BVs and KPIs refer to Exhibit A, Tab 3, Schedule 1.

The effective management of distribution assets requires the identification and optimum mitigation of risk to the BVs. This is achieved by balancing lifecycle costs and the related asset performance. If the asset management focus were strictly on improving or maintaining asset condition without due consideration of the resultant risk mitigation, then the result would be unnecessarily high expenditure levels. A specific asset health or condition does not automatically prescribe a set course of action or its timing. Other considerations include operating conditions (e.g. loading levels), technical obsolescence, asset demographics, spare parts availability, asset performance (e.g. asset failure rates, reliability trends), environmental factors, financial implications and the long term strategy for managing a particular asset type. Additional details concerning work program prioritization can be found in Exhibit A, Tab 14, Schedule 5.

Recognizing that gathering detailed condition information on every individual asset and every "nut and bolt" is both practically infeasible and not required, distribution assets were grouped into 20 logical asset classes. These classes were prioritized and further grouped into three categories, Priority 1 (P1); Priority 2 (P2); and Priority 3 (P3) based on their value to the business. These priorities determine the importance of acquiring condition information. The asset priority results are shown below.

Figure 1: Prioritization of Assets

Priority 1 (P1) • High Value • High Risk	Priority 2 (P2) • Moderate Value • High Risk	Priority 3 (P3) • Low Value • Lower Risk
Asset Class	Asset Class	Asset Class
Station Transformers	Station Reclosers & Breakers	Other Spares
Station Land Assessment & Remediation (Site Contamination)	Station HV Switches & Fuses	AC/DC Service Equipment
Overhead Line Sections	Station Sites and Structures	Feeder Protection (Switch/Fuse)
Wood Poles	Mobile Substations	Oil Containment
Right of Way (ROW) Vegetation	Transformer Spares	PCBs – Stations
	Submarine Cables	Switches – Lines
	Underground Cables	Reclosers - Lines
		Transformers - Lines

P1 assets represent the highest priority assets and are of high value (in terms of total sustaining program expenditures) and high risk to the business. P2 assets are second in priority with moderate program expenditures and high risk; and P3 assets are lowest in priority with low program expenditures and lower risk to the business. For the high value/high risk P1 assets, detailed asset condition assessments are carried out that involve documenting asset description, demographics, condition criteria, and condition assessment results. For P2 assets, in some cases detailed asset condition assessments are carried out, but not to the same level of detail as with P1, and in other cases, the management of condition relies on routine or time based maintenance programs.

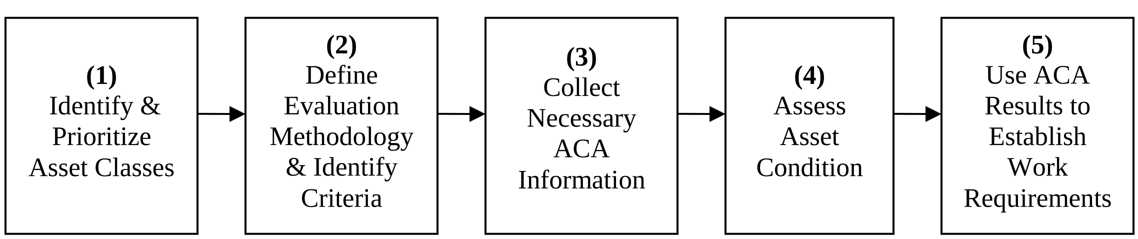
The P3 assets are managed to a great extent using routine programs (e.g. line patrols, defect corrections, trouble call response) that collect condition data as necessary and ensure they are maintained to Hydro One Distribution's standards. The routine programs put in place for P3 assets have longer cycles and use data to trigger asset management actions.

3.0 THE ACA PROCESS

Hydro One Distribution carries out asset condition assessments using an approach that describes the ACA objectives, prioritization, process, and criteria to be used for assessing the condition of its distribution assets. Hydro One Distribution assesses the condition of its assets through inspections, testing, and preventative maintenance activities, making improvements to its data collection process and carrying out special condition surveys or EOL assessment studies when required. Valuable asset condition information may also be obtained through incident investigations and special EOL studies for specific assets.

An outline of the steps involved in the asset condition assessment process is illustrated in Figure 1 below.

Figure 2: General ACA Process



The major steps in the ACA process as depicted in Figure 1 are:

1. Identify asset classes and prioritize them (i.e. P1, P2, P3) based on the value the assets represent to the business, which in turn determines the importance of acquiring condition information.

2. Define the asset information needed to determine and evaluate asset condition against predefined condition indicators based on failure mode analysis and expected results or specifications for higher priority asset classes.

3. Collect the necessary asset condition information. Define the measurements, and coordinate and schedule the necessary work to collect relevant asset condition information that will enable the development of appropriate work programs or projects to respond to condition deficiencies and mitigate the BV risks. This information may be obtained through regular testing, surveys, inspections or studies.

4. Analyze the asset condition and performance information to identify population condition, performance trends and high risks and impacts of asset condition on meeting business objectives, including service quality standards.

5. Use the asset condition assessment results to support detailed Sustaining and Development Capital and OM&A programs and projects. ACA information is a critical input to determine the level of work required in conjunction with other factors such as equipment performance, environmental considerations, availability of spares and customer reliability.

3.1 Asset Condition in Comparison to Asset Defects

The ACA process is intended to measure asset degradation, the criticality of the degradation, and the remaining asset “life.” When considering ACA, it is important to understand the differences between defect management and regular maintenance versus long term asset degradation and asset condition assessment. Defects are usually well defined and associated with failed or defective components which make up an asset and affect the operation and reliability of the asset well before end of life. These do not normally affect the life of the asset itself, if detected early and corrected. Defects are routinely identified during inspection and dealt with by maintenance activities to repair or replace failed components and thereby ensure continued reliable operation of the asset.

Long term degradation is generally less well defined and is not easily determined by routine visual inspection. The asset condition assessment's purpose is to detect and quantify long-term degradation and provide some means of quantifying remaining asset life. This includes identifying assets that are of "high risk" or at end of life that will require major capital expenditure to refurbish or replace, or eliminate altogether.

4.0 ASSET CONDITION SUMMARY AND RESULTS

The following sections highlight the prioritized asset classes that Hydro One Distribution uses and provides the most recent set of summarized ACA results for high priority asset classes. Subsequently, detailed, analysis and comments are provided on the results.

4.1 Detailed ACA Results for P1 Assets

The application of the ACA process to each asset quantifies the proportion of the assets that will require work through planned sustaining and development programs. A summary of the P1 asset conditions based on data collected up to the end of 2006 are shown in Table 4.1 below.

Table 4.1: Summary of Priority 1 (P1) ACA Results

Asset	ACA Results		
	"Poor" or "Very Poor"	"Fair"	"Good" or "Very Good"
Stations			
Transformers	3%	1%	96%
Land Assessment & Remediation (LAR)	5%	0%	95%*
Lines			
Distribution Line Sections	-	-	-
Wood Poles	4%	1%	95%
ROW Vegetation Management	31%	39%	30%

* Includes sites that are contaminated but that have been addressed through remediation activities, or present low environmental risks. The low risk contaminated sites are included in the "good to very good" category as there are no plans in place for further remediation in the foreseeable future based on site specific risk assessments.

A consistent approach has been used in developing asset condition assessment results so that the meaning of the categories is generally understood across the asset classes. It must be recognized that condition ratings in the table above represent a snapshot in time and may not include factors that may accelerate deterioration or increase the percentage of assets which are in a deteriorated state in the future. These factors include changing demographics (a large number of assets reaching the critical stage where degradation accelerates, as is the case with wood poles), degree of damage caused by failures of sub-systems (as may be the case with transformers where a fault may shorten the life of a transformer), or environmental factors that may be influenced by changes in regulations. The categories developed are:

- "Very Poor" and "Poor" condition assets are high risk and will require replacement, refurbishment or other remedial action within the next 5 years to correct significant deterioration. The exception is for rights-of-way vegetation as explained below.
- Fair" condition assets have experienced noticeable deterioration but should survive another 5 years with regular maintenance, and future work will be based on subsequent risk assessments.

- "Good" to "Very Good" Condition assets are currently at a lower risk than the other categories.

As noted above, Rights-of-Way vegetation does not fall into the time frames noted, as conditions change more rapidly for vegetation than with other asset classes. The more suitable descriptions for rights-of-way vegetation are: "Very Poor" and "Poor" category relates to feeders that will require maintenance within 2 years; "Fair" which relates to rights-of-way that may require maintenance in 3 to 4 years depending on further analysis; and "Good" to "Very Good" which relates to rights-of-way that have been recently (i.e. within 3 years) maintained or those that will not require attention within the next 4 years.

The following sections provide details on the key asset groups and highlight ACA results based on information and observations gathered up to December 31, 2006.

4.1.1 <u>Distribution Station Transformers</u>

The condition of station transformers is assessed using the following methods:

- Dissolved Gas in oil Analysis (DGA) and Standard Oil Tests involve withdrawing a sample of oil from a transformer with follow-up laboratory analysis to determine quantities and type of gas in the oil and the condition of the oil. The results provide an indication concerning the degradation of oil and insulating material.
- Furan testing is an additional oil test that provides information regarding the condition of the paper insulation in the core of the transformer. Degradation of paper causes it to lose its tensile strength and results in release of furans.
- Winding Doble Test is an electrical test used to identify the insulation quality within the transformer core measuring the dielectric loss of leakage current.

- Bushings, control cabinets, transformer tanks and cooling systems are inspected visually.

Hydro One Distribution makes use of proactive measures and diagnostic methods and tools such as noted above to facilitate early detection of deteriorating transformer condition and incipient failure to detect the remaining life of these costly assets. Based on DGA results, about 3% of distribution station transformers are at high risk of failure and will need to be replaced within the next five years. These transformers will be proactively taken out of service should their condition deteriorate further to prevent failures and reduce impacts to Hydro One Distribution's customers.

It must be recognized that transformers are a very important class of distribution assets. At this time, 97% of in-service transformers are in "Fair" to "Good" or "Very Good" condition, but this could change relatively quickly if they are not maintained in an ongoing and prudent manner. Events that can lead to rapid deterioration include; electrical failures of components or faults occurring from animal contact, lightning, contamination of equipment, etc; mechanical failure caused by movement of internal windings, or failures caused by malfunctioning cooling systems. These failures can cause damage that is not easily detected and can lead to rapid deterioration of condition, especially in aging equipment, as is the case with Hydro One Distribution's transformers. As a result, station transformers can move from the "Fair" and "Good" categories into the "Poor" category very rapidly due to normal wear and exposure.

Hydro One Distribution's proactive efforts based on ACA results appear to be showing some improvement in transformer failures. This is highlighted in Table 4.2 below that identifies the number of transformer failures experienced during 2004 to 2006. It must be recognized that the proactive maintenance strategy adopted during 2005 is in the initial stages, as such the change in the number of failures is not conclusive, but is providing a directionally positive indicator.

Table 4.2: Summary of Transformer Failures 2004 to 2006

Year	Number of Transformer Failures (Forced Outages)
2004	37
2005	32
2006	25

In total, Hydro One Distribution purchases about six to ten transformers annually to replace failed units that are beyond repair and to maintain adequate spares coverage. The proposed Sustaining OM&A (Exhibit C1, Tab 2, Schedule 2) and Capital (Exhibit D1, Tab 3, Schedule 2) programs provide appropriate funds to effectively manage the life cycle of these costly assets and will address those transformers identified to be at high risk over the next 5 year period, either by replacement or refurbishment if it is determined to be a cost effective solution.

4.1.2 Site Contamination – Land Assessment & Remediation

Hydro One Distribution assesses the environmental condition of Distribution Stations by examining soil, ground water and the surface run off from a site. Soil contamination is determined by the laboratory analysis of soil samples. Soil samples can be obtained from shallow open excavations or by drilling to gain samples at various depths. Ground water quality is determined by the laboratory analysis of ground water samples taken from monitoring wells that are installed on station property or adjacent property. Surface water runoff quality is determined by the laboratory analysis of runoff water samples taken by automated sampling devices. The results of these lab tests is then compared to contaminant levels permitted in provincial and federal regulations.

The chemical contaminants that exist on some sites were as a result of leaks and spills from equipment, or from previous industry accepted applications of certain long lasting chemicals (e.g. wood preservatives, herbicides) that complied with environmental regulations at the time that they were used. The primary contaminants of concern are:

- Arsenic (AS) – From arsenic trioxide, a registered herbicide at the time, used for total vegetation control within Distribution Stations from the 1950s until about 1965
- Total Petroleum Hydrocarbons (TPH) - From leaked or spilled transformer mineral insulating oil
- Polychlorinated Biphenols (PCBs) – From leaked or spilled transformer insulating oil
- Pentachlorophenol (PCP) – From treated wood poles

Hydro One Distribution has assessed all distribution station sites for site contamination and has found that about 45% do contain some degree of contamination, and of those, 5% still require remediation to ensure the contaminates do not present any threat to humans and the surrounding environment.

Remediation activities are scheduled using a risk based ranking system that focuses on high risk sites and on mitigating the risk of off-property impacts related to human and ecological exposure. Medium risk sites, are those containing some degree of contamination that is unlikely to migrate off-site but the risks are high enough to warrant sampling and monitoring on an ongoing basis. The remaining sites may contain some degree of contamination, but the risk of off site contamination is very low, or samples do not show any significant levels of arsenic, PCBs or TPH.

The plan that is being implemented under the Land Assessment and Remediation (LAR) program is highlighted in Sustaining OM&A under Stations (Exhibit C1, Tab 2, Schedule 2).

4.1.3 Distribution Overhead Line Sections

Hydro One Distribution does not conduct asset condition assessments on Overhead Lines Sections in the same manner as other P1 assets. This particular asset is considered unique compared to other P1 assets as it consists of a grouping of diverse overhead line components (e.g. conductor, insulators and wood poles) each of which have very different characteristics, condition deterioration factors, and maintenance requirements. It is for this reason, and the fact that it would be extremely costly to collect ACA information system wide on all of the lower level components that comprise a line section, that Table 4.1 above does not contain a percentage breakdown for Overhead Lines Sections.

The most practical and cost-effective approach for assessing the condition of distribution line sections is to collect relevant information on individual components. This includes collecting information on degradation levels of components that make up the line section. The information is obtained through:

- pole testing and line patrol activities as outlined in Sustaining OM&A (Exhibit C1, Tab 2, Schedule 2), which provides information on defects and condition of wood poles.
- a business process whereby field staff report suspect conditions that require more detailed assessments.
- reliability information indicating poor performance of a feeder or section.

When a critical mass of components reaches end-of-life, such that it is more cost-effective to refurbish an entire line section than to replace components individually, then a Line (Refurbishment) Project is undertaken as proposed in Sustaining Capital (Exhibit D1, Tab 3, Schedule 2).

As noted above, it is cost prohibitive to collect asset condition information on all distribution line sections nor is it necessary, as many of the line sections are in good condition. The process noted above is considered to be the most practical and cost effective means to manage the condition of these assets.

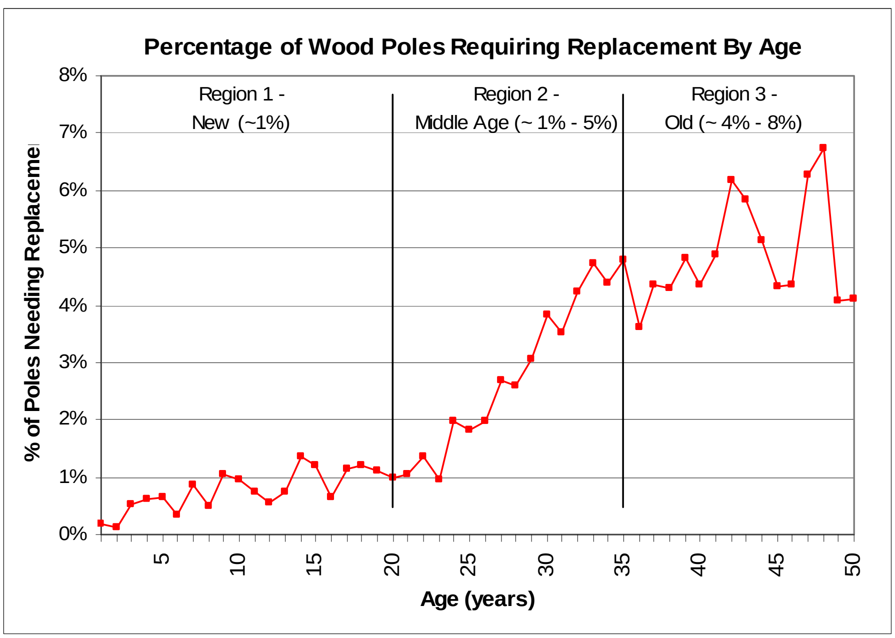
4.1.4 Wood Poles

Information used for determining the condition of wood poles is gathered from pole inspections and tests. Visual inspections identify numerous defects such as split tops, leaning poles, lightning damage, broken poles, wood pecker damage, rodent damage, shell rot, fire damage, insect infestation and other mechanical damage. The number and severity of these defects is used to assess condition. In addition, sounding tests using a hammer are employed to detect the presence hollow areas in the pole, shell separation, or external decay. Poles that appear to have internal rot are further tested using a drill test that measures the shell thickness (amount of wood in good condition in the outer area of a pole).

Based on inspection and testing results accumulated up to the end of 2006, Hydro One Distribution estimates that approximately 4% of the wood poles in the system are in “Poor” to “Very Poor” condition. The exact locations of these poles are identified during the normal course of the inspection cycle. Once identified, poles that are found to be in very poor condition are replaced in an expedient manner and those found to be in poor condition are replaced as part of the Wood Pole Structure Replacement Program as described in Exhibit D1, Tab 3, Schedule 2. The finding that approximately 4% of poles are at risk supports the need to maintain pole assessment plans proposed in Sustaining OM&A (Exhibit C1, Tab 2, Schedule 2) and to maintain pole replacements at levels proposed in Sustaining Capital (Exhibit D1, Tab 3, Schedule 2).

ACA results have also been analyzed in relation to Hydro One Distribution's wood pole demographics. Figure 3 below, indicates the percentage of poles that required replacement (i.e. "Poor" or "Very Poor" condition) relative to their age based on inspection and testing data.

Figure 3: Wood Pole Inspection & Testing Results Relative to Pole Age



The results indicate that the likelihood of a pole requiring replacement during its first 20 years is relatively low (i.e. approximately 1% - Region 1). Between years 20 and 35, the likelihood of a replacement increases rapidly (i.e. over 4% - Region 2). Beyond year 35 indications are that replacement rates are in the 4% to 8% range.

Figure 4: Hydro One Distribution Wood Pole Demographics

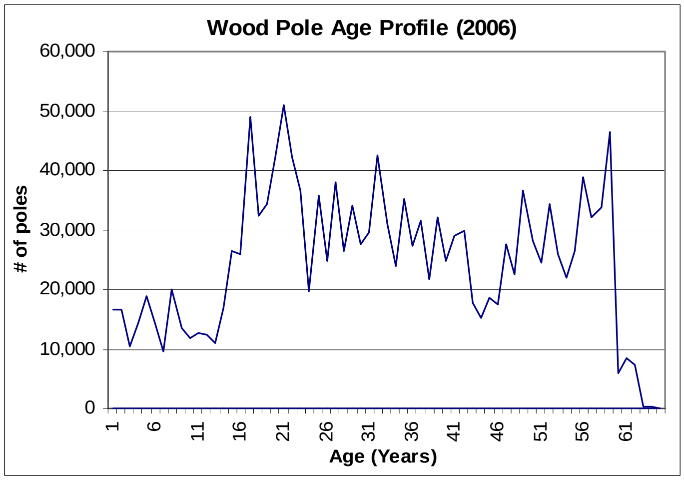


Figure 4 above is a representation of Hydro One Distribution's wood pole demographics and of particular interest is the large number of poles that are currently between 15 and 20 years of age. These poles will move through Region 2 illustrated in Figure 3, over the next 10 years where the replacement rates increase rapidly from approximately 1% to over 4%. In the past, the number of poles/year that have entered this Region has been about 30,000 to 35,000, but over the next 10 years the number will increase to as much as 50,000, thereby increasing the number of poles expected to be found at end of life. This information indicates that in the future one can expect an increasing number of pole replacements.

The leading indicator discussed above and the results from the current pole assessment program, support the need to replace those poles found to be substandard under the pole assessment program, as the number of replacements in the future will in all likelihood increase.

4.1.5 Rights-of-Way Vegetation

Vegetation asset condition assessments are undertaken by collecting data on various vegetation parameters including tree clearances (i.e. percentage of trees within 1m of the conductor), overhang (i.e. percentage of trees overhanging the conductor), danger trees, tree densities, and average brush height and average brush density (i.e. stems per line span). This information is combined to yield asset condition assessment results for feeders and is used to prioritize line clearing and brush control programs.

Assessment of vegetation conditions identify that about 31% (31,000 km) of rights-of-way are in the “Very Poor” and “Poor” category and are at risk and require clearance work within the next two years. The increase in percentage of rights-of-way in this category (about 3%) over the last two years is primarily attributed to a need to redirect resources during 2006 in response to the unusually high number of storms, and the 2005 labour disruption. As a result, accomplishment levels were below plan.

ACA results and the performance of specific feeders are the primary inputs that are used to schedule line clearing and brush control work on overhead lines. For Hydro One Distribution, the condition of rights of way is of great concern, as vegetation caused interruptions are the single greatest contributor to unreliability, as illustrated in Exhibit A, Tab 3, Schedule 1, and Exhibit C1, Tab 2, Schedule 2.

The projected accomplishment of 12,900 km during 2007 and the 12,500 km during 2008 will not fully address the “Poor” and “Very Poor” locations over these two years. These conditions will diminish over the next few years, but will not be fully addressed until one maintenance cycle has been achieved.

4.2 Comments on ACA results for P2 Assets

The following sections provide ACA information for P2 assets. It is recognized that P2 assets are of lower priority, and as a result, detailed analysis is not carried out to the same extent as with P1 assets. In a number of cases it may not be cost effective or practical to acquire the necessary information to support detailed ACA analysis, in which case maintenance processes and reliability indicators are used to manage the assets. This is further discussed in each of the asset groups below.

4.2.1 Station Reclosers

Hydro One Distribution currently manages approximately 6,000 distribution station reclosers consisting of single-phase and three-phase units, and about 170 circuit breakers. These pieces of equipment are currently on a six-year maintenance interval for refurbishment or replacement and amount to 1,000 units/year. Due to the comprehensive maintenance program, separate detailed asset condition assessments are not completed for station reclosers and breaker assets. The condition of these assets is monitored through reliability/performance data and the ongoing maintenance program funded under the Stations Program in Exhibit C1, Tab 2, Schedule 2.

4.2.2 High Voltage Fuses

There are approximately 1,000 3-phase sets of High Voltage fuses installed on the Hydro One Distribution system. The cost effective method of collecting ACA information on this asset group is to inspect these devices during regular station maintenance activities, Devices that are found to be in substandard condition are replaced in an expedient manner under the Station Program in Exhibit C1, Tab 2, Schedule 2.

4.2.3 Station Sites and Structures

Based on ongoing inspections carried out during regular maintenance and asset condition assessment findings, stations that require significant improvements to site facilities are completed as part of the station refurbishment work described in Exhibit D1, Tab 3, Schedule 2. This work includes, as appropriate, the refurbishment or replacement of fences, high voltage and low voltage structures, buildings, yards and roads. The first phase of the assessment is completed during the regular station inspections and if required, a more detailed assessment is made to establish the condition of wood poles, steel structures, building envelope and roof, etc. The refurbishment plans in Capital Sustaining (Exhibit D1, Tab 3, Schedule 2) will address those sites that have been identified to be in poor condition.

4.2.4 Mobile Substations

Mobile substations are comprised of a trailer and distribution equipment such as transformers, switches, fuses or reclosers as well as ancillary electrical systems. Trailers are inspected on a regular basis as required by the Ministry of Transportation and electrical equipment is inspected in detail on an annual basis. Inspection standards for the related electrical equipment are identical to that of a distribution station, but more frequent, as these assets must perform when called upon to do so. Any significant defects are logged and immediate plans are made to correct these. Minor defects are corrected as part of the Stations Program in Exhibit C1, Tab 2, Schedule 2.

Out of Hydro One Distribution's 28 mobile substations, 2 need to be refurbished during 2008 to maintain an operational fleet of 28 units. Replacement of major electrical equipment and refurbishment of the trailers is carried out under sustaining capital; refer to Exhibit D1, Tab 3, Schedule 2.

4.2.5 Transformer Spares

Hydro One Distribution utilizes 1,477 in-service transformers and regulators, ranging in size from 0.5 to 40 MVA in 71 different categories and requires a complement of spare transformers in order to respond to about 32 failures per year (average over the last four years). The majority of spare transformers are stored in a central location and are inspected on an annual basis to ensure that they are serviceable when required. Primary activities include the visual inspections of main components, i.e., bushings, cabinets, tanks and cooling systems. The visual inspection standards for spare transformers are identical to that of in-service units, and if required oil samples are taken and analysed. Spare transformers are maintained in a serviceable condition, such that they are available for deployment if required.

A comprehensive transformer spare complement strategy has been developed to ensure the correct number and types of spares are available. Additional details are provided in Sustaining Capital, Exhibit D2, Tab 2, Schedule 3.

4.2.6 Submarine and Underground Cables

Hydro One Distribution's system contains about 4,200 km of underground cable and 2,200 km of submarine cable. The maintenance activities for these assets involve a three-year inspection for urban circuits and a 6-year inspection for rural circuits in accordance with the requirements of the Distribution System Code.

For underground cables, the inspections involve visual examination of the components associated with the cable termination, pothead, elbows, and cable riser poles. For the large majority of cables, which are buried directly underground, no examination of cable or splices is undertaken. For a few cables that are in ducts some examination of the external condition may be carried out for troublesome or critical circuits. For submarine cables, the inspections involve visual examination of the cable between the transformer and where it enters the water. A specific area of concern is the location where cables enter the water, as this is the location where damaging corrosion of the armour wires (neutral wires) has been observed. Neutral corrosion has been identified as a potential safety issue.

Hydro One Distribution’s management practices for underground and submarine cables also include performance criteria: two failures within a section of cable would normally lead to the decision to replace the cable. The decision whether to repair or replace is made on condition information from a visual assessment and performance of the cable, and if deemed necessary, laboratory testing is carried out before decisions are made concerning replacement. The condition of these assets is managed on an ongoing basis form data gathered during inspections and performance monitoring. The underground cable system is relatively new and has not shown any significant deterioration trends, but this is not the case with submarine cable. Over the last 5 years, a number of cable locations have been identified during inspections as requiring section replacements due to corrosion of the neutral wires at the shore. Funding for these repairs is discussed in Exhibit D1, Tab 3, Schedule 2.

Hydro One Distribution’s program for managing distribution underground and submarine cables is generally consistent with the approach adopted by many other utilities for such cables.

SUMMARY OF CAPITAL EXPENDITURES

1.0 SUMMARY OF CAPITAL EXPENDITURES

The requested capital expenditures result from a rigorous business planning and work prioritization process that reflects risk-based decision-making to ensure that the appropriate and cost-effective solutions are put into place to meet Hydro One Distribution objectives set out below. This process is described in detail at Exhibit A, Tab 14, Schedule 1 through 5.

The capital expenditures in this filing represent investments in items that will ultimately become in-service capital assets supporting the Hydro One Distribution business. Specifically, these expenditures include:

a) Planning, purchase, construction and commissioning of specific assets providing future economic benefits;
b) additions to or replacement of specific assets; and
c) betterments that result in improvement of capacity, efficiency, useful life span, or economy of specific assets.

The capital programs address Hydro One Distribution's integrated set of needs to meet its objectives of: public and employee safety; compliance with the market and regulatory code and rules (the Distribution System Code), environmental requirements and Government direction; maintenance of distribution business service quality and reliability at targeted performance levels; and meeting system growth and assets end-life requirements. The development of programs to sustain and enhance assets takes the comprehensive asset condition data into consideration, as discussed in Exhibit D1, Tab 2, Schedule 1, as well as other factors.

Hydro One Distribution's capital expenditures are grouped into four different investment categories: Sustaining, Development, Operations, and Shared Services & Other Capital , the latter of which includes Customer Care capital expenditures and expenditures for fleet, service equipment, real estate, information technology and telecom. Table 1 provides a summary of Hydro One Distribution’s capital expenditures for the historical, bridge and test years.

Table 1
Summary of Distribution Capital Expenditures ($ Million)
Including Capitalized Overheads and AFUDC

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Sustaining	104.9	117.3	186.3	223.6	317.1
Development	138.6	141.7	146.8	154.2	167.7
Operations	6.3	4.7	2.1	2.0	3.6
Shared Services & Other Capital	22.2	53.4	57.4	96.7	77.8
TOTAL	272.0	317.2	392.6	476.6	566.2

Capital expenditures totaled $393 million in 2006 and $477 million in 2007 and are forecasted to be $566 million in 2008. The growth in capital is primarily due to increases in Sustaining Capital related to the requirements for smart meters and associated systems; increased Development Capital requirement related to customer growth; and, requirements in other Capital Programs related to the information technology initiative called Cornerstone. Investment Justification Documents (IJDs) in support of capital projects or programs in excess of $1 million are filed at Exhibit D2, Tab 2, Schedule 3.

In accordance with the accepted Rudden recommendation on overhead capitalization rate, beginning in 2007 Hydro One Networks is adjusting the overhead capitalization rate within the year to reflect projected changes in spending. This will better align the overhead capitalization rate with overhead costs of the capital projects supported. This adjustment, called E-Factor, trues up 2006 capitalized overheads by -$14.4 million. This is included as an adjustment to the derivation of the 2008 overhead capitalization rate. The Rudden E-Factor adjustment for the overhead capitalization rate is described in detail at Exhibit C1, Tab 5, Schedule 2.

2.0 SUSTAINING

The Sustaining capital expenditures include the costs for investments required to ensure that existing distribution system facilities function as originally designed. Hydro One Distribution manages its distribution sustaining program within three program categories, namely stations, lines and meters (includes smart meters). Details of the expenditures under this program are filed at Exhibit D1, Tab 3, Schedule 2.

3.0 DEVELOPMENT

The Development capital expenditures consist of the investments required to serve new customers and meet increased demand of existing customers. Development capital includes programs for customer connections and capacity reinforcements. Details of the expenditures under this program are filed at Exhibit D1, Tab 3, Schedule 3.

4.0 OPERATIONS

The Operations capital program represents investments in infrastructure required to sustain the Central Distribution Operations function, which is operated from Hydro One's Ontario Grid Control Centre. Details of the expenditures under this program are filed at Exhibit D1, Tab 3, Schedule 4.

5.0 SHARED SERVICES & OTHER CAPITAL

Shared Services & Other Capital consists of the sustainment and enhancement of existing equipment and infrastructure, including computer-related hardware and software and transport and work equipment ("T&WE") as well as projects initiated to improve business support functions. The capital requirements for the Cornerstone Project and Customer Care are also incorporated in Shared Services & Other Capital. Details of the expenditures under this program are filed at Exhibit D1, Tab 3, Schedule 5.

SUSTAINING CAPITAL

1.0 INTRODUCTION

Distribution Sustaining Capital represents investments required to ensure that existing distribution system facilities function as originally designed. Hydro One Distribution manages its distribution sustaining capital program by dividing the program into three program categories, namely: stations, lines and meters

Stations, lines and meter program categories include investments in equipment and related components required to deliver electricity through the distribution system, as well as investments that facilitate the efficient use of joint-use of assets. Investments covered under the Sustaining Capital program are proposed for the purpose of maintaining the long term and short term functionality of assets, to ensure public and employee safety, comply with regulations and contractual requirements and to provide a level of reliability that is aligned with corporate objectives.

Hydro One Distribution's Sustaining Capital programs and proposed spending levels for 2008 are described below.

2.0 DISCUSSION

Distribution stations, lines and meter assets, and their components, are subject to deterioration that will eventually impede their ability to function as originally designed. Asset deterioration depends on factors such as geographic environment/location, utilization, age, weather and maintenance practices. As assets deteriorate, equipment performance reliability usually suffers, resulting in increased environmental risks, an increase in potential safety hazards to the public and employees, and decreased system reliability. Ultimately, assets deteriorate to the point that they are no longer able to perform their function(s) in a cost-effective manner, at which point replacement becomes necessary rather than continue to repair or maintain.

Sustaining Capital programs fund both planned work and demand (unplanned) work. Planned work is required to preserve functionality of the existing distribution system by replacing deteriorated components with new components that are designed to perform an equivalent function. The identification of specific facilities for possible replacement is based on data collected during the Asset Condition Assessment (ACA) process described in Exhibit D1, Tab 2, Schedule 1. The condition of assets is one consideration in determining replacement. Other factors include historic performance, asset criticality, availability of spare equipment, load growth, and local customer impacts as well as the business drivers that form part of the work program prioritization process described in Exhibit A, Tab 14, Schedule 5. The prioritization process allows all distribution programs to be ranked and compared to one another so that investments can be directed to where they provide the maximum business value.

Demand capital work involves asset replacement that is required during service interruptions and in response to contractual and other commitments with road authorities and joint use partners, i.e., cable and telecommunication companies. The varying nature of this work requires Hydro One Distribution to forecast costs based on historical averages with adjustments made to reflect recent changes in expenditure patterns or work requirements.

Demand work requires an immediate or timely response to customer needs and is initiated by interruptions to service, line and station inspection findings, and by request from customer and property owners. Hydro One Distribution maintains infrastructure, equipment and resources to respond to these issues within the time lines specified by the

Distribution System Code. Planned work on the other hand, does not generally pose the same degree of urgency and is scheduled over time, based on knowledge of the condition of the assets.

The Sustaining Capital spending for 2008 and prior years is provided in Table 1 below.

Table 1
Sustaining Capital
($ Millions)

Description	Historic Cost			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Stations	11.0	9.1	8.5	7.7	10.3
Lines	92.7	106.8	162.1	138.8	139.5
Meters	1.2	1.4	15.7	77.1	167.3
Total	**104.9**	**117.3**	**186.3**	**223.6**	**317.1**

The increase in spending for 2008 relative to historic expenditures is attributed to the following reasons:

- Implementation of smart meters, in accordance with government direction.
- Planned pole replacement during 2008 is greater than historic replacements based on ACA finding.
- An increase to the 2008 planned line refurbishment and component replacement levels to address end of life assets, and reliability and safety risks.
- Material and equipment increases in the order of 20% to 40%.
- An updated projection for storm response costs to reflect historical spending on this activity which is critical to providing customers with reliable service.

Additional details concerning these increases and year over year variations in spending are provided below.

2.1 Stations

Hydro One Distribution has 1,006 distributing and regulating station facilities, which are used for the delivery of power, voltage transformation and switching. Station facilities contain many of the following components: power transformers, instrument devices, reclosers, fuses, disconnect switches, bus, insulators, power cables, support structures, cable terminators, surge arrestors, station service supplies, grounding systems, fences, and buildings.

Hydro One Distribution's service to customers is also performed with a fleet of 28 mobile substations used primarily for emergency response to power disruption at stations. The mobile substations are also used during planned maintenance programs and capital refurbishment at distributing stations to reduce power interruptions. Investments for mobile substation are included in the Sustaining Capital program to ensure these mobile assets are available for the above purposes.

Stations Sustaining Capital funding covers capital investments required to replace or upgrade assets located within distributing and regulating stations, and mobile substations. The work is divided among three programs. Funding for 2008, along with the spending levels for the bridge and historic years are provided in Table 2 below.

Table 2
Stations Sustaining Capital
($ Millions)

Description	Historic Cost			Bridge	Test
	2004	**2005**	**2006**	**2007**	**2008**
Strategic Spare Transformers	4.8	1.7	2.8	0.6	3.5
Mobile Substation Refurbishment	1.1	0.4	1.0	0.3	1.5
Station Projects & Demand	5.1	7.0	4.7	6.8	5.3
Total	**11.0**	**9.1**	**8.5**	**7.7**	**10.3**

2.1.1 Management of Transformer Assets

Power transformers are devices used to reduce the voltage of the electricity being distributed, and to provide voltage control. Distribution power transformers convert a high level voltage (typically 115kV, 44kV, or 27.6kV) to a lower distribution voltage (typically 27.6, 25, 13.8, 12.47, 8.32 and 4.16 kV).

The management of transformer assets is a key component of the Stations Capital Sustaining program. The reliability of supply provided by power transformers is managed through proactive maintenance activities and a coordinated use of strategic spare transformers and mobile substations. These programs are interdependent and have proven to be a cost-effective approach for managing transformers for a largely rural utility such as Hydro One Distribution. This approach reduces capital expenditures for distribution facilities as discussed below while still providing reliable delivery of electricity to customers.

Hydro One Distribution's system is largely a radial system characterized by little or no load transfer capability, and by design the majority of distributing stations are equipped with only one power transformer. The consequence of this system design is that a transformer failure at a distributing station results in a service interruption to all customers supplied from that station. Since service to customers cannot be restored until the function of the distributing station is restored, in many instances mobile substations are dispatched to the affected station to provide service restoration. The mobile substation remains in place until such time as a spare transformer can be brought in to replace the failed unit. The extent to which spare transformers are available will influence the reliance on mobile stations for extended periods. Alternatives to this management process include having a spare a transformer at every distributing station or building added supply lines to provide a redundant supply. These alternatives have been assessed to be cost prohibitive on a system wide basis.

Mobile substations also facilitate maintenance at distributing stations by carrying the station load while the station is isolated for planned maintenance work. The extent to which mobile substations are in-service for an extended period of time, due to unavailability of spare transformers, will limit the ability to complete the required planned maintenance and capital work at distributing stations.

Details of the programs used to manage strategic spare transformers and mobile substations are provided below.

2.1.1.1 Strategic Spare Transformers

Hydro One Distribution has 1,337 station transformers and 140 regulators in service. Hydro One's distribution stations have experience an average of 32 major station failures a year over the last 4 years. In a number of instances, station failures require removing the transformer off site and subsequent replacement from the strategic spare transformer inventory. The strategic spare inventory is maintained by purchasing new transformers if required and by refurbishing existing, unserviceable units, i.e. transformers that failed or were required to be removed from service based on poor condition as determined through the ACA process.

The majority of distribution transformers that fail, or that are found to be unserviceable based on ACA results, can be refurbished economically. Repair costs can vary significantly, from $15,000 to $150,000 per transformer, depending on the nature of the failure and whether the damage results from external or internal faults. Before a transformer is refurbished, Hydro One Distribution first determines whether the transformer is needed as a spare, and estimates the refurbishment costs by dismantling the transformer and assessing the extent of damage. If refurbishing the transformer versus buying a new transformer is economically justified and is technically acceptable, the existing transformer is refurbished and added to the pool of strategic spare transformers.

Due to the importance of these system elements to customer reliability, Hydro One Distribution maintains a spares inventory of transformers and regulators that is based on the number and type of transformers and regulators in-service, reliability of equipment in use and the availability mobile substations. Historically, each year two to six station transformers cannot be returned to the spares inventory. In these cases, the complement of spare transformers is reduced unless replacement transformers are purchased, or transformers become available through system reinforcement projects, i.e. transformer replaced in response to an increase in customer load is freed-up for another use. This program funds the purchase of transformers to maintain a spares compliment that meets system needs and ensures reliability.

Funding of this program enhances customer reliability by reducing the reliance placed on mobile substations for extended periods, making them available to respond to emergencies and to assist in carrying out the planned maintenance on distributing stations, thereby ensuring equipment performance.

The 2008 spending requirement for this program is $3.5 million. Historically expenditures have fluctuated from year to year based on the number of failed transformers that are beyond repair and replaced by transformers from the spares pool. Those transformers removed from the spares pool that become permanent field installations need to be replaced in the spares inventory to maintain adequate spares coverage. In addition, system failures are monitored and if there is an appreciable increase in the failure rate of a specific class of transformer, there may be a need to increase the number of spares within the subject group to manage reliability to acceptable levels.

The 2008 spending involves the purchase of 3 new spare transformers and 1 regulator to increase the compliment of spares to the required levels.

Funding reductions in this program would result in an increased utilization of mobile substations at failed transformer locations thereby negatively impacting planned maintenance and jeopardizing reliability at a number of distribution stations.

For additional details refer to the Investment Justification Document (IJD) in Exhibit D2, Tab 2, Schedule 3.

2.1.1.2 Mobile Substation Refurbishment

A mobile substation is essentially a distribution station mounted on a trailer suitable for traveling on public roads. These mobile units consist of a transformer, high voltage and low voltage switches, high voltage and low voltage fuses, and connecting bus. There are 28 of these units strategically located across the Province. The primary purpose of mobile substations is to provide emergency backup to distributing stations and restore service to customers following the failure of a station, but they also facilitate planned maintenance programs at distributing station assets by mitigating power disruption to customers. Given Hydro One Distribution's largely radial distribution system with single transformer distributing stations, the utilization of mobile substations provides a cost effective alternative to constructing redundant transformation at stations.

As mobile substations age, the undercarriage, wheels, axles, and suspension require replacement when routine maintenance cannot restore the integrity of the components. Funding of this program allows for the efficient refurbishment of mobile substations based on the results of a monthly condition assessment required to ensure they are roadworthy and comply with Ministry of Transportation licensing requirements.

The 2008 spending requirement for this program is $1.5 million, which allows for the refurbishment of two mobile substations. The 2008 spending is higher than the bridge year and the historic expenditures, due to a need to replace a failed mobile substations transformer which was not part of the funding required in past years.

Inadequate funding would have an adverse impact on station emergency response and on planned station maintenance capability, and would jeopardize customer reliability.

For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

2.1.2 Stations Projects and Demand (Unplanned)

Station Refurbishment Projects

The level of investment required to refurbish a station will vary as a function of the condition of the station. Some stations will require replacement of frost-heaved structures, power equipment components, and/or security fence replacements. In other cases, the work required may be more significant, such as transformer refurbishment or the complete rebuild of a station on an existing or a new site. The latter may be the case particularly for the older wood pole and timber structure station styles.

Station condition is determined using the ACA process as discussed in Exhibit D1, Tab 2, Schedule 1. About 8 to 15 stations are refurbished annually based on condition, utilization and environmental risks. The number of stations scheduled for refurbishment on an annual basis at this time is currently in the order of 1% of all Hydro One distributing stations. Considering the age of these assets, (i.e. 30 to 40 years) this is a relatively low number of annual refurbishments, largely attributable to Hydro One Distribution's comprehensive maintenance program and a proactive transformer spares management, as discussed in this Schedule and in Exhibit C1, Tab 2, Schedule 2.

Funding levels of this program will impact the amount of breakdown maintenance in future years and negatively impact customer reliability. The 2008 spending for station refurbishment work is $2.5 million. For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

The station refurbishment program also includes the costs associated with refurbishment of spill containment facilities identified through station inspections as requiring work for the purpose of environmental compliance and performance. These projects are managed separately from the larger refurbishment work. The 2008 spending for spill containment facilities is $0.3 million.

Component Replacement & Demand

Component replacement projects involve replacing such defective equipment as reclosers, surge arrestors, fences and switches that have been determined to be at end of life. The condition of equipment and station components is assessed during routine inspections, ACA and during planned and unplanned maintenance activities.

The demand work completed under this program covers the capital component of work required to address the failure of distributing and regulating station components and to correct situations that could cause a power interruption or present a safety hazard. When station components fail, the consequence is typically a service interruption to customers. Station interruptions can impact a large number of customers, typically from 1,000 to 10,000 customers per interruption. Emergency and corrective work must be carried out in a timely manner in order to minimize the risks to customer reliability, and public and employee safety.

This program covers the capital costs of emergency and corrective work at stations that involve plant retirement. Work that does not involve plant retirement is covered under the Sustaining OM&A, Exhibit C1, Tab 2, Schedule 2.

In most cases, smaller components such as reclosers, insulators, connectors, switches, etc. will be repaired, temporarily bypassed, or replaced on site. The failure of a large component, such as a transformer, may require moving the equipment off site and repairing it at a central location and then returning it to that specific site. If a prolonged service interruption is anticipated, service is typically restored through the temporary use of a mobile substation or replacing the failed unit with a spare transformer.

The 2008 spending for both component replacement and demand work is $2.6 million. For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

Summary

The 2008 spending requirement for all Stations Projects and Demand work totals $5.3 million. The proposed funding is within the range of historic expenditures. Spending from year to year can vary as the spending is based on a number of factors, e.g., number and type of stations to be refurbished, number of failures, condition of assets, asset performance, criticality of assets, availability of spare equipment and local reliability impacts.

Reductions in this program will result in defective equipment and station components remaining in service for longer periods of time, thereby increasing the risk of failure and adversely affecting customer supply reliability. Reduced funding would also increase environmental risks associated with oil entering the environment as a result of an increased likelihood of transformer failures.

2.2 Lines

Distribution lines total 119,900 circuit-km province-wide and are used to deliver power to Hydro One Distribution customers. Lines are constructed on road allowances where possible, or on rights-of-way for which Hydro One Distribution has legal rights to access and occupy. Line components include poles, conductor, transformers, switches, fuses, surge arresters, voltage regulators, capacitors, insulators, reclosers and grounding devices. A small proportion of distribution line inventory is located underground in some of the more urban locations or underwater (submarine) for servicing cottages and residences on islands. The underground and submarine inventory represents approximately 5 % of the total circuit-km.

Sustaining Capital funding for lines includes capital investments required to maintain existing assets associated with overhead, underground, and submarine distribution lines. The work is divided among three programs as noted in Table 3. Funding for 2008 and spending for the bridge and historic years are provided in Table 3 below.

Table 3
Lines Sustaining Capital
($ Millions)

(d) – indicates this is a demand program

.

2.2.1 Trouble Call and Storm Damage Response

This demand program provides capital investment for responding to problems on distribution lines that require immediate attention as a result of trouble calls or storm damage. During 2006, an unusually high number of storms passed through Ontario that caused extensive damage to the distribution system.

A trouble call typically captures the work required to restore the supply of power to customers following an unplanned interruption. However, a trouble call may also be required in response to a customer complaint (e.g. about power quality) or to correct a defect on a distribution asset that, if not addressed, could present a safety concern or potentially result in an interruption of power to customers. Hydro One Distribution must address trouble calls in order to comply with legal and regulatory requirements, to correct known hazardous problems and to maintain reliable electric service in accordance with good utility practice.

The majority of costs associated with trouble calls are incurred in the Sustaining OM&A, Exhibit C1, Tab 2, Schedule 2. In cases where capital plant is replaced as part of a trouble call, all labour and material costs are capitalized under this program. Where a trouble call is as a result of damage to the distribution system caused by a third party (e.g. motor vehicle accident), Hydro One Distribution will endeavour to recover the cost of making the repairs. Any costs recovered are credited to this program. Historically, damage by third party interference has totaled about $4 million per year with recovery of approximately $2.5 million.

Hydro One Distribution also capitalizes storm restoration costs where a storm results in the replacement of capital plant units and the distribution system experiences significant damage. Storms normally interrupt the supply of power to many thousands of customers. The impact storms have on Hydro One Distribution's system during any given year will depend on the number, type (e.g. wind, snow, ice) and severity of the storms. Historically the number of storms varies widely and the number of days affected by storms has ranged from 20 to over 50 days annually. There is also variation in the number of "force majeure" storms impacting the distribution system, with force majeure defined as a major storm affecting more than 10% of Hydro One Distribution's customers. During 2004, Hydro One Distribution experienced one force majeure storm whereas during 2006 there were eight - an usually high number that caused extensive damage to the distribution system. Given the variability in the number, type and severity of storms, storm-related damage can change significantly from one year to the next

The extent of storm-related damage is also affected by work in other sustainment programs. Reducing vegetation management will increase the likelihood of trees and branches contacting a line under storm conditions as vegetation growth encroaches on the right-of-way and damaged or diseased trees remain near line facilities for longer periods of time. As well, if assets in need of repair or replacement are not addressed, there is an increased likelihood that assets such as poles may fail under adverse weather conditions.
All work associated with storm restoration, with the exception of overtime costs and the costs to clear vegetation (e.g. trees, brush) from the storm-impacted distribution lines, are

captured under this program. Overtime and forestry costs related to storm restoration are not capitalized, because these activities do not restore the capital assets to a better condition than existed before the storm, and provides no added benefit to future customers.

The funding level requested is based on an assessment of historical trends in costs and volume of work, taking into account any known factors that could impact historic trends.

The 2008 spending requirement for this program is $53.4 million, net of $2.5 million recovered for third party damage. The 2008 spending is close to that for the bridge year and 2005 actual. The 2008 spending is based on a 4-year average of historical spending with adjustments made to incorporate recent trending in volumes and cost.

The 2008 spending is considerably lower than in 2006, as that was an unusually high year for storm damage. During 2006 the company experienced eight major storms, requiring an unprecedented 36 days of storm damage restoration. Associated with the 2006 storm damage were expenditures of $62 million in capital (compared to a previous range of $14 million to $26 million) and $21 million in forestry and lines maintenance (compared to a previous range of $1 and $8 million). The majority of damage during these storms was attributed to falling trees and branches in close proximity to lines. These storms contributed 57% of SAIDI, and it is expected that the customer outage durations would have been significantly less under the vegetation management program planned for 2008.

Hydro One Distribution’s ability to quickly respond to the significant and repeated storm events in the summer and fall of 2006 resulted in the company winning the prestigious Edison Electric Institute's "Emergency Recovery Award" for outstanding efforts to restore electric service to its customers following such severe storms.

For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

2.2.2 Joint Use and Line Relocations

Joint Use

The joint-use component of this program covers the work required to modify existing Hydro One distribution line assets to accommodate telecommunication or cable television lines, street lighting owned by municipalities, or power circuits for various Local Distribution Companies (LDCs).

Hydro One Distribution carries out joint-use projects in accordance with long-standing agreements between Hydro One Distribution and joint-use partners. The cost sharing provisions in these agreements allow Hydro One Distribution to recover its costs resulting from requests to add new attachments to poles. Historically, 25% to 35% of a joint-use project costs are recoverable. The recoverable portion represents the residual value of the line assets at the time the joint-use project is initiated plus the incremental cost for any modifications required for the new joint-use facilities. The unrecoverable portion of the costs recognizes that these projects generally result in increased life of the facilities that benefit Hydro One Distribution customers, due to a reduction of future investment needs.

All recoverable joint-use costs are paid by joint use partners at the time of the attachment. In addition, annual fees not included in this program are levied per attachment to compensate for on-going incremental maintenance costs due to the presence of these attachments on the pole. Revenues associated with these annual fees are discussed in Exhibit E3, Tab 1, Schedule 1.

The joint-use program is driven by external demand for work, which Hydro One Distribution is required to provide in accordance with existing agreements. The number of joint-use projects has historically ranged from 80 to over 200 projects per year. The variation is due in large measure to communication companies providing or enhancing service to their customers.

Line Relocations

The line relocation component of this program covers the work required in response to road modifications initiated by Provincial and municipal road authorities, or by individuals who require assets relocated for the purpose of developing their property. Hydro One Distribution is obligated to relocate plant at customers' request in accordance with the requirements specified in its Conditions of Service. The relocation of plant to accommodate road modifications must be done in a timely manner as per the requirements of the Public Service Works on Highways Act, R.S.O. 1990, and associated Ministry of Transportation guidelines. Relocations may entail the construction of new plant and the removal of old plant.

The cost of relocation projects is either fully or partially recoverable, depending on the specific circumstances of the project. Typically, a customer requesting a plant relocation must pay Hydro One Distribution for all costs incurred in moving the plant. In the case of projects associated with road relocations, the applicable statute defines the recoverable portion of the relocation work, which is typically 20% to 35% of the total cost. The unrecoverable portion of relocation costs represents the benefit to Hydro One Distribution, and its customers, of having new assets in place that reduce future investment needs.

The number of relocation projects can vary significantly from year-to-year depending on the number of government infrastructure improvement projects and economic conditions influencing individual third party development projects.

Summary

Since the number and scope of joint-use and line relocation projects is variable, the funding level requested for 2008 is based on historic costs, taking into account any observed trending and currently identified joint-use or relocation work.

The 2008 spending requirement for this program is $23.7 million, which is net of $9.0 million in recoverable costs. The 2008 spending maintains the spending during 2006 and is 12% below the bridge year expenditures.

For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

2.2.3 Asset Replacement

Distribution lines asset replacement programs involve replacement of line components and line sections determined to be at end of life, and line modifications to address safety and reliability issues. These projects and programs are closely coordinated and integrated with System Capability Reinforcement plans (Exhibit D1, Tab 3, Schedule 3), where appropriate, in order to maximize the benefits of these expenditures.

The asset replacement work is divided into three programs with funding for 2008, and spending levels for the bridge and historic years, as provided in Table 4 below.

Table 4
Asset Replacement
($ Million)

Description	Historic Cost			Bridge	Test
	2004	2005	2006	2007	2008
Wood Structure Replacement	19.1	18.5	30.3	40.1	39.8
Waste Management Capital*	0.5	0.2	0.2	0.1	1.2
Line Projects	15.6	14.5	17.0	19.8	21.4
Total	**35.2**	**33.2**	**47.5**	**60.0**	**62.4**

* The 2004, 2005 and 2006 costs were for PCB transformer replacements.

2.2.3.1 Wood Structure Replacement

Wood poles deteriorate over time. When the condition has deteriorated to a point where there is a significant risk of failure under adverse weather conditions, poles are deemed to be at end of life and must to be replaced to ensure reliability and safety. Planned replacement of poles is much less costly than "emergency" or reactive type replacements, is less disruptive to customers, and eliminates safety issues. Replacing defective poles on a reactive basis not only costs more than planned replacement, but also results in increased overtime with longer outage durations to customers and increased safety risks. There is a strong business need to replace substandard poles before they negatively impact the system.

Over 50% of the distribution system's 1.65 million poles have been assessed since 2002 and about 4% of those poles tested were found to be in a sub-standard condition. The number of sub-standard poles in the system is forecast to be near a historic high and will increase unless the deteriorated poles are replaced. Refer to the Asset Condition Assessment and Analysis, Exhibit D1, Tab2, Schedule 1 for further details concerning the forecast for pole replacements. The need for pole replacements in 2008 is identified through the pole assessment and testing program carried out under the lines maintenance program as discussed in Exhibit C1, Tab 2, Schedule 2, section 3.2.2.1.

The 2008 funding will permit replacement of 7,000 poles which is an increase from the 5,200 poles replaced in 2006, and the 6,852 poles replaced in 2007. Candidates for replacement are determined through the pole assessment and testing program, which identifies poles that exhibit wood decay, checks and other defects that may jeopardize the structural integrity of a pole. The end of life determination for wood poles complies with the Canadian Standards Association (CSA) criteria for pole strength that specifies replacement when a pole has reached 65% of its original strength. This testing and replacement program maximizes reliability to customers, reduces public safety risks, complies with legal requirements and ensures optimal utilization of the wood pole population.

The 2008 spending requirement for this program is $39.8 million, which is an increase over the historic years. The increase is a result of the number of poles identified to be at end of life as a result of the pole assessment program. Historic expenditures prior to 2006 were in the $20 million per year range with an average accomplishment of 3,000 poles replaced. This compares to the 2008 level of 7000 poles. Year over year historic variations are attributed to variations in the number of poles assessed, and the number remaining to be replaced under this program, taking into account the integration with other programs. For example, sub-standard poles may also be replaced as part of system capability reinforcement and sustaining projects.

Reduced funding of the pole replacement program will increase reliability and safety risks and will prevent Hydro One Distribution from fully meeting due diligence obligations to remove known defective assets that present a hazard to workers and the public.

For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

2.2.3.2 Waste Management Capital Program

The 2008 Waste Management Capital program funds the replacement of waste storage tanks that have been determined to be at end-of-life. The 2008 spending for this program is $1.2 million and is greater than the bridge year and historic years. Expenditures can vary significantly from one year to next depending on the particular need that must be addressed. Prior years' spending was to address PCB contaminated line transformers, as such the nature and need for the work was substantially different than that proposed for 2008, and a direct comparison of spending levels is not appropriate.

For additional details refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

2.2.3.3 Line Projects

This program funds the refurbishment of entire feeders or sections of a feeder when the cost of maintaining individual components in the circuit becomes excessive, or a number of components have reached, or are near end-of-life, jeopardizing the reliability of the electrical supply. A decision as to the most appropriate course of action is made in each case taking into account overall condition of poles, wire and cables, condition of associated components, access for maintenance and repair, current and future load requirements and environmental considerations. These projects are further integrated with any system capacity reinforcement plans for the area.

Additional projects funded under this program address significant safety hazards and environmental issues. Specific projects in this category involve the replacement of submarine cable where the concentric neutral wires have corroded and present a hazard to the public, as well as line modifications to correct hazardous water crossings. The program also funds structural modifications required to accommodate osprey nesting sites where the location of the nest may cause power interruptions.

In addition to the projects noted above, this program funds the replacement of individual line components such as switches, reclosers and wood arms that have been determined to be defective.

The 2008 spending requirement for this program is $21.4 million and is 8% greater than the bridge year. The 2008 spending is 26% greater than 2006 expenditures. These increases are attributed to increased volume of line refurbishment, based on findings from the ACA, and an increase in planned component replacement to manage reliability and safety.

Reduced funding of this program would limit Hydro One Distribution’s ability to economically replace integrated groupings of assets identified through ACA. The alternative of replacing individual defective assets when they fail in service would be on a reactive basis and at a premium cost. Reactive replacement would result in more frequent and longer duration outages affecting customer reliability and public and employee safety.
For details concerning projects valued at $1 million or greater, refer to the IJDs in Exhibit D2, Tab 2, Schedule 3.

To illustrate the benefits of sustaining projects, Table 5 below highlights the change in reliability for a number of projects carried out over the 2004 to 2005 period. All of these projects involved replacement of end-of-life components. As can be seen in Table 5 below, the refurbishment projects resulted in appreciable improvements in the number of feeder interruptions experienced per year and the customer hours of interruption experienced per year.

Table 5: Sample of Distribution Feeder Refurbishment Projects and Associated Reliability Improvements

Number of Feeder Refurbishment Projects	Overall Average Improvement in Number of Interruptions per Year	Overall Average Improvement in Customer Hours of Interruption per Year

2.3 Meters

Meter capital addresses spending requirements for smart meter installations and customer retail meters. Funding for the meters program for 2008 and spending in the bridge and historic years, are provided in Table 6 below.

Table 6
Metering Capital
($Million)

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Smart Meters	-	-	14.1	76.7	164.8
Customer Retail Meters	1.2	1.4	1.6	0.4	2.5
Total	**1.2**	**1.4**	**15.7**	**77.1**	**167.3**

2.3.1 Smart Meters

On June 23, 2004 the Minister of Energy issued a directive to the Ontario Energy Board that establishes targets for the installation of smart meters for all Ontario customers by 2010. Hydro One Distribution's share, based on its proportionate share of customers in the province, is 240,000 by 2007 and approximately 1.2 million by 2010. The planned installation for 2008 is 370,000.

Hydro One is accountable for owning and installing the smart meters, collecting customer metering data over a telecommunications network ("AMRC" and "WAN") to a computer application ("AMCC"), passing the data to the data warehouse of the IESO which has been appointed as the Data Company ("DataCo"), and receiving the data back for customer billing purposes.

Hydro One's plan for the deployment of smart meters has been developed to ensure the highest long term customer value through a vision and a number of operating principles that will protect the investment from early obsolescence, while at the same time recognizing and balancing the inherent risks associated with new technology and large projects. Accordingly, Hydro One Distribution's smart metering plan is to deploy a solution that meets the Ministry of Energy's requirements at the lowest possible cost and is an enabler for other business processes and transformations. In pursuit of this plan, the Company has adopted the following operating principles:

- Develop and deploy an end-to-end architecture for both information technology and communications infrastructure that recognizes long term business needs and provides a migration path from the minimum requirements of a smart meter system;
- All hardware and devices will conform to industry standards and will be based on open architecture design (i.e. to the extent possible use non-proprietary applications);

- Material development will not occur until all, including third party, requirements are understood; and,
- A staged implementation will be deployed across all work streams to mitigate risk. This includes Advanced Metering Infrastructure ("AMI") technology, business process design, systems development and integration and customer communications.

With respect to its smart metering program, Hydro One Distribution has participated in or been affected by the following proceedings since late 2004:

- RP-2004-0203/ EB-2005-0198 – On March 17, 2005, the Board approved Hydro One Networks' plan for CDM, in which $7.8 million was allocated to smart metering to address initial start-up costs and deployment.
- EB-2005-0529 – The Board's Decision on Generic Issues respecting Smart Meters, issued March 21, 2006, which approved a $0.30 meter cost per residential customers per month, to be recovered through their monthly service charges, beginning May 1, 2006.
- EB-2006-0246 – Hydro One Networks Inc.'s Smart Meter Plan - 2006-2010 was submitted on December 15, 2006, according to the Board's Smart Meter Filing Guidelines and Requirements, issued October 26, 2006.
- EB-2007-0542 – The Board's Decision on Hydro One Networks' 2007 Distribution Rates issued April 21, 2007, approved an amount of $0.93 per month per metered customer, beginning May 1, 2007.
- EB-2007-0063 – Combined Proceeding on Smart Metering was initiated by the Board on May 18, 2007, to determine the prudence and recovery of costs associated with smart metering activities for 13 distributors, including Hydro One Networks Inc., which under the Regulations, are licensed to conduct discretionary metering activities. The Board's Decision was released on August 8, 2007. The Board determined that the purchasing decisions of the thirteen utilities involved in this

proceeding were implemented with the necessary due diligence and the terms of the contracts are prudent. The Board also allowed the cost of installation using internal staff and agreed the cost of installation in rural areas will be higher. The Board agreed with the overall costs incurred to May 31, 2007 related to the minimum functionality of all installed meters other than the cost of capital associated with project management – in this areas the Board disallowed half of the requested amount and provided Hydro One the opportunity to justify this remaining amount in this hearing. The justification of this amount is provided in Exhibit F1, Tab 1, Schedule 1.

As a result of these decisions (particularly the latter two), Hydro One Distribution's smart meter plans, including its assessments of minimum functionality and the required architecture, procurement process, contracts with vendors, plans for smart meter deployment, risk assessment and mitigation plan, and associated costs, have already been provided to the Board and will not be repeated in detail here.

The smart meter program is proceeding well. During 2006, Hydro One Distribution was able to pilot its meter installation process (with 28,000 installations) and automation tools, and to develop unit costing for mass market deployment. Statements of work and contracts were developed with the selected major vendors, which enabled detailed pricing for the majority of the products and services required. Total meter deployment from 2006 through 2007 is projected to meet the Company's target of 240,000 meter installations by the end of 2007. Other activities, such as installation of the network communications infrastructure are progressing. The "back-office" infrastructure and process design is underway and initial results from meter communications reliability testing are promising.

Hydro One Distribution's capital spending requirement of $164.8 million in 2008 reflects the continuing deployment of smart meters throughout its service territory. The related activities encompass both minimum and incremental functionality work:

- Activities associated generally with the government's regulations concerning minimum functionality, which account for $64.2 million and $136.5 million in 2007 and 2008 respectively, include the following work:
    - Installing additional smart meters and advanced metering communications devices ("AMCDs");
    - Building and expanding the advanced metering regional collector ("AMRC"), and underlying networks to accommodate an increasing number of meters coming on- stream; and
    - Commissioning and placing into service, hardware and software for the advanced metering control computer ("AMCC") to enable it to communicate and transmit quality meter data to and from the meter data management and meter data repository (MDM/R) and the Company's CIS.
- Incremental functionality activities associated with effective use of the smart meters to provide time-differentiated billing to customers and provide Hydro One the ability to leverage its AMI system for other business benefits, which account for $12.5 million and $28.3 million in 2007 and 2008 respectively, include the following work:
    - Upgrades to our CIS system to provide for Time of Use billing and related required settlement changes. This aspect of the Smart Meter program is rooted in the government's desire and directive to create a conservation culture of which time of use rates are an integral part;
    - Integration of the end to end systems including business process redesign, This integration ties the AMI systems implemented under minimum functionality with the IESO's MDMR and Hydro One's CIS system to

allow the collection of time differentiated consumption data required for TOU billing; and,

- The added cost of super capacitors in meters and batteries in the regional collectors (AMRC) that provide for real time outage reporting after and during loss of power. Having the ability to pin point outages and tie this information to our outage management system has the potential to increase customer service and reduce costs. When outages occur, especially during a major storm, there are instances where faults and damage are "nested". In these situations, without the knowledge of the state of individual services, it takes longer to locate outages and it is possible for crews to fix a problem and leave the area only to return to fix other problems downstream. This is inefficient and extends outage times. Since Hydro One is changing all its meters by 2010, this provides a good opportunity to deploy this functionality effectively.

- Project management activities associated with the overall smart meter program, which account for $2.4 million and $0.1 million in 2007 and 2008 respectively, are included in the costs above.
  - Due to the scope, complexity and specialized nature of the above tasks, the project management services and operation of a project management office (PMO) is provided by Capgemini. Capgemini was selected as the system integrator for Hydro One's smart meter program through a competitive RFP process in 2005. Although Hydro One is providing overall direction to Capgemini, the project management services and PMO are typically provided by the system integrator and is not a role that Hydro One is able to resource internally. Additional details on Capgemini's project management function are also provided as part of the

discussion in Exhibit F, Tab 1, Schedule 1 on smart meter Regulatory Asset accounts.

- The project management costs drop off in 2008 as the bulk of the PMO work Capgemini was engaged to do is planned to be largely complete by the end of 2007.
- The total project management costs incurred to the end of 2008 are forecast to be about $5 per installed smart meter unit. This is a substantial drop from the unit cost of $21.7 per installed smart meter unit reflected in the combined smart meter proceeding when the project management costs incurred to date were spread over the 62,194 units installed to the end of May, 2007.

The 2008 expenditure level is an increase over that of 2007, reflecting the higher number of planned meter installations of 370,000 in 2008 compared to 212,000 in 2007. Further details on this program are provided in the IJD in Exhibit D2, Tab 2, Schedule 3.

A reduction in the requested funding would compromise the Company's capability to deliver its planned results for 2008. These would include the installation of an additional 370,000 meters, continued development of the communication network needed to support the installed meters, modifications to the core systems to support TOU billing and the required re-engineering of business processes. Loss of this capability would severely jeopardize Hydro One's capability to meet the ambitious targets which have been set by the government.

2.3.2 Customer Retail Meters

The sustaining capital retail meter program includes the installation of meters at shared distribution stations, customer initiated meter upgrades, meter conversions at the acquired

LDCs, and sustainment of the retail meter inventory. Each of these initiatives are discussed in detail below.

The largest initiative during 2008 is an expenditure of $2.0 million related to the Company's installation of new meters at shared distribution stations. This expenditure is required to improve metering associated with Low Voltage facilities. For additional details, refer to the IJD in Exhibit D2, Tab 2, Schedule 3.

Meter upgrades are a customer-driven initiative. As required by the Distribution System Code, Hydro One Distribution upgrades an existing customer's demand meters to interval meters when their average annual monthly peak demand is equal to or greater than 1,000 kW. Hydro One Distribution's policy for new customers requires installations of interval meters if their average annual monthly peak demand is forecast to be greater than or equal to 200 kW. As well, Hydro One Distribution is planning to upgrade non-standard meters at acquired LDCs. In total, the spending for these initiatives is $0.4 million.

The Retail Meter Inventory Sustainment Program is required in order to efficiently replace in-service meters that fail, are obsolete, or that cannot be returned to service through the re-verification program. The historic level of about 2,000 new meter purchases annually need not continue in 2008, as the Smart Meter Program will cover the cost of replacing failed or obsolete meters. However, about 80,000 meters which do not qualify for smart meter replacement, still require an adequate inventory, with about 100 new meter purchases per year. The total spending for this initiative during 2008 is $0.1 million.

The 2008 spending requirement for this program is $2.5 million. This proposed funding level is $2.1 million higher than that for the bridge year and $1.1 million higher than the historic average. The increase is mainly due to the need to fund the new meter installations at shared distribution stations. These increases are offset to some degree by savings from the lower inventory of electro-mechanical meters required as a result of Measurement Canada's dispensation on meter testing ad verifications through the implementation of the smart meter program.

DEVELOPMENT CAPITAL

1.0 INTRODUCTION

Development capital are investments required to connect new load and generation customers and to enhance existing or construct new distribution facilities. These investments ensure the system's capability to provide a secure and reliable supply of electrical energy in response to new large customer connections and cumulative system-wide load growth demands and new generators. Growth is predicted through the combined use of load-forecast models, historical growth patterns, and specific load measurements taken at times of heavy loading during the year. Also considered in this program are system reconfiguration and additions in order to improve reliability.

2.0 DISCUSSION

Development capital programs fund both planned and demand (unplanned) work. Demand work represents the largest component of the program and involves work required to connect new customers or to modify customers' present service on an as required basis. Planned work includes projects designed to increase the capability of existing lines and stations, or to construct new lines and stations in response to system load growth forecasts. These programs follow the work prioritization process described in Exhibit A, Tab 14, Schedule 5.

The spending for 2008, along with the spending levels for the bridge and historic years are provided in Table 1 below.

Table 1
Summary of Development Capital
($ Million)

Description	**Historic**			**Bridge**	**Test**
	2004	**2005**	**2006**	**2007**	**2008**
Connections, Upgrades and Cancellations	94.2	100.3	104.6	105.9	103.9
System Capability Reinforcement	37.7	32.4	29.7	36.9	44.0
Distribution Generation Connection	0.0	0.3	1.5	1.8	8.4
Wholesale Revenue Meters	6.8	8.7	11.1	9.7	11.4
TOTAL	**138.6**	**141.7**	**146.8**	**154.2**	**167.7**

The 2008 proposed spending is approximately 18% above historic averages, with the increase primarily attributed to:

- Additional system reinforcement spending to address the cumulative impact of increased utilization of the distribution system.
- Material and equipment cost increases above forecasted escalation. Since 2005, the electrical industry has experienced increases in material and equipment costs in the order of 20% to 40%.
- Increase in anticipated Distribution Generation connections to meet Government Programs.
- Change in new customer connection mix moving towards more high cost subdivision connections.
- Increase in volume of the more costly full Wholesale Revenue Meter conversions to comply with market rules.

2.1 Connections, Upgrades and Cancellations

Connections, Upgrades, and Cancellations are considered demand work as these are driven by individual customer requests. The company must respond to these requests therefore they are not discretionary. The volume and funding levels of these programs for 2008 are based on consideration of historical cost and volumes, and forecast of economic variables such as Ontario GDP and Ontario Building Permits. The Investment Justification Documents (IJDs) for this program may be found in Exhibit D2, Tab 2, Schedule 3.

The Service Cancellations program involves the removal of Hydro One Distribution owned equipment. These costs are accounted for under depreciation and are therefore not identified in the capital cost tables.

The proposed funding for Customer Connections, Service Upgrades and Meter Purchases for 2008 and the spending levels for the bridge and historic years are provided in Table 2 below.

Table 2
Customer Connections & Service Upgrades
($ Million)

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Customer Connections	69.1	75.3	80.1	84.6	80.2
Service Upgrades	21.3	21.8	21.4	19.7	23.1
Meter Purchases	3.8	3.2	3.1	1.6	0.6
TOTAL	**94.2**	**100.3**	**104.6**	**105.9**	**103.9**

2.1.1 Customer Connections

To comply with its obligations under section 28 of the *Electricity Act, 1998*, Hydro One Distribution is required to provide a connection service to new industrial, commercial, residential, seasonal, and farm customers when requested. In response to OEB requirements, Hydro One Distribution has established service quality indicators to monitor the responsiveness of Hydro One Distribution to customer's requests. Hydro One Distribution determines the division of costs between Hydro One Distribution and the customer based on its connection policies, which are in accordance with the Distribution System Code requirements.

In 2005 and 2006 new connections averaged around 17,600 customers a year of varying types that include residential, seasonal, farm, commercial and industrial, with the largest number being residential. Hydro One Distribution provides services for all aspects of a new connection. Activities include line layout, staking, property approvals, installation of poles and conductor, installation of transformation and meters, and approvals required for any new Hydro One Distribution facilities. Customers located adjacent to a line are referred to as "lie along" customers, and under current connection policies, are not required to contribute to the connection cost for a standard type of connection. Customers requiring enhancements to the "standard connection" are required to pay for the incremental cost of these enhancements. As required by the Distribution System Code those non "lie-along" customers requiring line extensions are required to contribute to the cost of the connection, as are larger customers who require system modifications to accommodate a new increase in load.

It is estimated that about 17,600 new connections will be added to the Hydro One Distribution's system during 2008 which is in line with the recent historic average and validated by projected load forecasts. Exhibit, Tab 14, Schedule 3 sets out the distribution load forecasting details and the methodologies used. Customer capital contributions have averaged around $19 million over 2005 and 2006, and are expected to remain around that level. Included in capital contributions is the recovery of cost for connection activities such as line staking, service layout, etc. as regulated by the OEB. These miscellaneous connection charges are further discussed in section 2.5 of this Schedule.

Funding of $0.7 million has been included in this program in 2008 for the elimination of Long Term Load Transfers (LTLT). It is expected that the majority of these will be a "standard connection" type, but a number of these will require added facilities in order to connect to Hydro One Distribution's system. The elimination of LTLT is a requirement of the Distribution System Code.

The 2008 spending requirement for this program is $80.2 million after deducting amounts recovered from customers.

The 2008 spending is the same as 2006 and 6.5% greater than 2005 expenditures with the increase attributed to escalations and year over year variations in the mix and volumes of connection types.

2.1.2 Service Upgrades

To comply with its obligations under section 28 of the *Electricity Act, 1998*, Hydro One Distribution is required to respond to existing customers who require a larger service to accommodate additional load and/or modify the electrical service entrance. The costs are classified as upgrade costs. A service upgrade normally requires the replacement of secondary service wires and the preparation of a service design. Also, it may be necessary to upgrade transformer(s), replace meters or install additional transformers. Volumes of service upgrades for 2008 are projected to be 5,500 based on historic demand.

For standard service upgrades, Hydro One Distribution will provide a service layout, pole-mounted transformer, and a meter if required. Hydro One Distribution, in accordance with Distribution System Code requirements, has developed policies concerning the customer capital contributions. As such, cost for service modifications that exceed the standard upgrade installation type would be recovered from the customer on a user-pay basis. Over the 2005 and 2006 period these contributions have averaged about $4.0 million.

The 2008 spending requirement for this program is $23.1 million after deducting amounts recovered from customers, and is about 7% above average historic spending. The increase in cost over historical levels is largely attributed to escalation in equipment and material costs and change in customer mix and volume.

2.1.3 Meter Purchases

New Connections, and in some cases Service Upgrades require the purchase of new meters. Expenditures for these meters are highlighted in Table 2 above.

Projected spending for 2008 is $0.6 million which is 62% less than the bridge year and about 80% less than historic averages. The decrease in spending in this program is attributed to the expectation that most of the meters used in new connections and service upgrades will be smart meters, and will be funded under the smart meter program described in Exhibit D1, Tab 3, Schedule 2.

2.1.4 Service Cancellations

For a variety of reasons, customers may want to disconnect from the distribution system. In these cases, Hydro One Distribution owned equipment is removed, and the remaining installation is left in a safe condition. Costs related to this customer-driven activity are classified as cancellations, and Hydro One Distribution bears the cost of the work involved. Removals of this type are accounted for under depreciation.

Volume of Service Cancellations has been in the range of 4,700 to 5,300.

2.2 System Capability Reinforcement

Investments in System Capability Reinforcement provide for new and modified distribution system facilities to accommodate increase in customer load, system modifications and additions to improve system reliability, as well as additions to the system that will improve operations and asset life cycle planning. These investments are described below with details concerning spending levels provided in Table 1.
The IJDs for projects and programs greater than $1 million can be found in Exhibit D2, Tab 2, Schedule 3.

2.2.1 Capability Reinforcement

Funding for Capability Reinforcement includes investments required to ensure continued capability of the existing system to reliably supply customers in compliance with the Distribution System Code. The need for System Reinforcement projects is identified through system planning studies and load flow analysis funded under Development OM&A, Exhibit C1, Tab2, Schedule 3.

Each year new residential and rural customers are connected to the system, as are larger commercial and industrial customers. For those loads less than 500 kW, which are the majority of the new connections, system impact assessments are not required. As these customer connections accumulate over time, system elements such as conductors, transformers, regulators, switching elements are operated near their maximum ratings during periods of high load and require relief, or these elements will eventually fail resulting in damage to equipment and power interruptions. As well, the addition of customers may result in violations of service standards (i.e. voltage levels and protection criteria) if needed upgrades to system facilities are not done. For load connections greater then 500 kW, station and feeder capability assessments are completed to determine if the system is able to support the increase in load. System improvements for these situations are funded under this program with customer connection costs funded under the New Customer Connection and Service Upgrades program as outlined above in this Schedule.

Solutions to address increasing customer load can take the form of an increase in conductor size, new supply lines, a new regulating station, voltage conversion, new or increased transformation at a distribution station, or for a significant increase in customer load, the solution may involve new transmission facilities. Hydro One Distribution's planning approach assesses alternatives in a comprehensive manner that includes assessing both distribution and transmission alternatives to arrive at the optimum long-term solution. Changes in system losses are also calculated for alternatives and these become part of the decision criteria. For those situations where the preferred option involves the addition of a transmission facility, Hydro One Distribution is required to contribute to the cost of construction of transmission facilities as stipulated in the Transmission System Code.

Capability Reinforcement investments, for the most part, address customer growth after the fact except for the larger load connections that require significant modifications to the distribution system prior to connection. This program addresses customer growth that has in some cases occurred many years ago, but the system has remained within rated limits until such time as an incremental load increase will approach the system rating/service and/or protection limits. The system is monitored as detailed in the Development OM&A Exhibit C1, Tab 2, Schedule 3 to ensure that conditions that pose a threat to customer reliability and quality of power are addressed in a timely manner.

Investments under this program are designed to address both Hydro One end-use customer load growth and load growth within embedded LDCs supplied by Hydro One Distribution.

In order to maintain the integrity of Hydro One Distribution's system, address system load growth and comply with service quality standards, 2008 spending of $40.9 million is required for Capability Reinforcement Projects. IJDs for projects greater than $1 million are contained in Exhibit D2, Tab 2, Schedule 3.

2.2.2 Reliability Enhancement and System Monitoring Projects

Hydro One Distribution has established a reliability performance objective as highlighted in Exhibit A, Tab 3, Schedule 1, with the target of reaching first quartile distribution reliability by 2010 when compared to similar utilities, and thereby enhancing customer service. Analysis of potential reliability improvement initiatives has revealed that cost effective improvements can be achieved by increasing efforts in vegetation management and through improving the operability of the distribution system by adding sectionalizing capability at strategic locations on the system. During 2008 it is planned to spend $2.2 million on installing additional sectionalizing. For further details refer to the IJD contained in Exhibit D2, Tab 2, Schedule 3.

As Hydro One Distribution is predominantly a rural utility, real time monitoring of the system is not economically feasible on a system wide basis. However, Hydro One Distribution has implemented a program for real time data acquisition at strategic locations on the system. The areas of focus are heavily loaded stations that have significant risks of exceeding line and distribution station ratings. Improvements in the area of electrical system data acquisition will improve the operations of the system and customer supply. The 2008 spending for real time monitoring is $0.9 million.

2.2.3 Summary

Under System Capability Reinforcement, approximately one hundred projects are completed annually with costs ranging from $30,000 to $5 million and varying in duration from two months to more than a year. It is expected that this level of investment will be needed to address system capability issues as well as those anticipated to arise during future planning studies and load flow analysis.

The 2008 spending for System Capability Reinforcement is $44.0 million, which is an increase of 20% over the bridge year and 32% above the historic average. The increase over the historic period is in part attributed to escalation in equipment and material costs. The remaining increase is a reflection of the cumulative impact of increased utilization of the distribution system and the corresponding increase in volumes required to address local customer growth, as well as the continuation of the sectionalizing project planned for 2008.

Reduced funding in this program would result in overloading of system components, causing power quality degradation and resulting in an increased risk of substandard supply conditions with possible equipment failure. In turn, this would lead to customer complaints and more frequent and longer duration interruptions. As well, there is a risk that system protection and co-ordination schemes may be adversely affected, resulting in equipment damage.

2.3 Generation Connections

In accordance with its Distribution license, Hydro One Distribution is required to connect new generators that comply with the requirements of the Market Rules, the Distribution System Code, and all applicable codes, standards, and rules. The number of new generators applying for connection, and the potential number which will actually connect, have grown immensely due to the provincial government's initiatives to promote distributed generation, and the resulting procurements implemented by the OPA. In particular, the Renewable Energy Standard Offer Program (RESOP) has led to about 1,000 projects applying for either Initial Feasibility Assessments (IFAs) and/or more detailed Connection Impact Assessments (CIAs). The numbers of these renewable projects applying to Hydro One is a result of most high potential renewable areas in the province falling within our distribution service territory. There is also some demand resulting from the Net Metering program and from load displacement projects. Applications continue to be submitted under these programs and the OPA's recommendation to implement a new Clean Energy Standard Offer Program (CESOP) could lead to substantially more demand.

The actual number of projects that will connect is still quite uncertain. As of June 30, 2007, 34 of the 113 projects that have received a CIA have gone on to request an estimate and 8 projects have actually signed a Connection and Cost Recovery Agreement (CCRA) committing to pay for connection. The forecast number of connections on which the plan is based is shown in Table 3 below.

Table 3 – Generation Connections

Category	2008
Large Generators	4
Mid-size Generators	40
Small Generators	20
Net Metering Generators	20
Load Displace. Generators	1
Power Quality Monitoring	25

The investments included for generation connections cover connection facilities as well as local system improvements required for reliable generation incorporation into the distribution system and avoidance of negative impacts on other customers. Work may include reconductoring circuits, altering facilities including protective devices, and upgrading breakers because of increased short circuit values.

Generation developers are normally responsible for all connection costs resulting in the majority of these cost being recoverable through capital contributions. However, in some cases, the generator may not be the sole beneficiary of a required system improvement. Hydro One Distribution is required to pay for the portion that would benefit other distribution system customers. It is estimated that the costs related to benefits to others amount to about 30% for connection of generators in the large (>10MW) category, 25% for mid-size (500kW to 10MW) projects and 15% for small (<500kW) generators. In aggregate this results in $2.8 million of the net costs in 2008.

Upgrades to Hydro One's distribution lines (poles in particular) may also be required in cases where the customer chooses to make use of Hydro One facilities rather than build their own. Based on Hydro One's experience with joint use , it is anticipated that in these situations, Hydro One will be accountable for 83% of the upgrade costs and the customer will contribute 17%. Provision for the associated costs is included in this filing and results in net costs of $4.4 million in 2008.

Power quality (PQ) impacts on Hydro One's distribution system and customers is a key issue associated with certain types of generators (such as wind). To ensure this is appropriately understood and managed, Hydro One Distribution is installing PQ meters in the vicinity of possible wind generation connections to enable monitoring of customer PQ issues in these areas. The associated capital is not covered by contributions from generators and amounts to $1.2 million in net costs in 2008.

The total net 2008 Capital requirement of $8.4 million for this program is $6.6 million higher than the bridge year and $6.9 million higher than 2006 primarily due to a larger number of connections with some increase due to increased costs for shared use facilities.

2.4 Wholesale Revenue Metering

Wholesale revenue meters (WRM) are defined in the Market Rules as revenue metering that measures the flow of electricity from the IESO-controlled grid at transformer stations, distribution stations and other points of supply to distribution companies and direct wholesale customers. WRM's are used to settle the purchase of energy, and where the point of supply is directly connected to the IESO-controlled grid, they are used to settle the purchase of transmission services with the IESO administered market.

Wholesale meters fall into two categories: those under the transitional arrangement in accordance with the Market Rules and those assigned to Hydro One Distribution for wholesale settlement with the IESO-administered market.

In accordance with Market Rules, accountability for legacy WRM owned by Hydro One Transmission will move to market participants, including Hydro One Distribution, during the period 2003 to 2008. By the end of 2008, it is projected that Hydro One Distribution will be responsible for a total of 375 WRMs. This number has changed over time, as a number of meters that were transitioned have been de-registered from the Wholesale Market and are no longer categorized as WRMs.

In the year accountability is assumed by Hydro One Distribution the legacy WRM must be upgraded, either fully or partially, to comply with the Market Rules. Partial upgrades at a meter point include the upgrade of meters, and may include upgrades to some, but not all, current and voltage transformers. Measurement Canada and the IESO have made provision for the transition by allowing partial upgrades during the first seal expiry, with remaining non-compliant components to be upgraded at the second seal expiry if not already completed. This capital program funds the cost of these upgrades.

The 2008 spending requirement for this program is $11.4 million. These costs align with the schedule set out for WRM conversion driven by the seal expiry date as stipulated by Measurement Canada. Project costs vary from year to year based on volume of meters requiring conversion and on scope of work associated with the particular meter, i.e., partial or full conversion.

Further details on this program can be found in the IJD in Exhibit D2, Tab 2, Schedule 3.

2.5 Miscellaneous Connection Charges

Embedded within the capital contributions identified above for Customer Connections and Service Upgrades, there are a number of miscellaneous services as identified in Table 4 below. The rates for these services are approved and regulated by the OEB. The revenues that will be generated from these services are netted from the costs to undertake the work described below. The related costs and revenues are included in Section 2.1.1 –

Customer Connections. A description of these services and associated volumes are provided below.

Table 4 – Miscellaneous Services

Service Description
1. Crossing Applications – Pipeline, Railroad, Water
2. Line Staking
3. Service Layout Fee – Basic
4. Service Layout Fee –Complex
5. Central Metering (new) < 45kW
6. Conversion to Central Metering < 45kW, > 45kW
7. Temporary Service

2.5.1 Crossing Applications

When a customer requests new line construction where the overhead or underground/submarine line will cross existing pipelines, railroad lines, or bodies of water, approvals must be granted from the respective authorities prior to construction. In these cases, the line must be designed and the design, showing the proposed location, clearances, etc., transferred to an engineering drawing. The engineering drawing is then submitted for approval to the approving authority. The cost of the fieldwork, design, preparation of drawings, and processing the application and the cost from the approval authority if any, are borne by the customer.

	2004 volume	2005 volume	2006 volume	2007 volume	2008 Volume
Crossing Applications	**155**	**142**	**91**	**130**	**130**

2.5.2 Line Staking

For new line construction initiated by a customer, Hydro One Distribution specifies the route, the spacing of poles, the size of conductors, type of insulators, class and height of poles, and any tree or brush clearing required. The staking information is used by the customer's contractor or by Hydro One Inc.'s Customer Operations business to ensure the construction is in accordance with current standards.

	2004 volume	2005 volume	2006 volume	2007 volume	2008 Volume
Line Staking	**289**	**241**	**205**	**200**	**200**

2.5.3 Service Layout

Hydro One Distribution will provide an initial service design (layout) at no charge to the customer, regardless of the customer class or the complexity of the design. However, if the customer wishes to alter the initial design, the additional design costs, as determined by the complexity of the design, are recovered from the customer.

For the majority of service designs for residential, farm, and single-phase commercial services, the design is relatively simple and routine. For large three-phase commercial, industrial, and some farm services, the design complexity increases as the size of the load to be serviced dictates special consideration of transformation capability, special metering needs, conductor sizing, etc.

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Service Layouts (altered)	**232**	**264**	**264**	**260**	**260**

2.5.4 Central Metering

Pole-mounted central metering is an option a customer may choose when the customer has several buildings on one property that all require electrical service. One central metering installation replaces the need for each building to have its own service and its own metering resulting in savings to the customer.

For installations where the load is greater than 45kW, the expected revenue to Hydro One Distribution offsets the cost of the required instrument transformers. For installations where the load is less than 45kW, the customer is charged for the costs of the instrument transformers. These costs are considered incremental as the normal metering installation sized to a load of less than 45kW would not require the special transformers.

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Central Metering	**1,095**	**1,095**	**1,095**	**950**	**950**

2.5.5 Conversion to Central Metering < 45kW, > 45kW

Customers who request a conversion of conventional metering to central metering require a new service layout, a change in their account, the removal of existing meters and equipment, and installation of new equipment. This involves site visits for the layout and equipment modifications, and administrative work. If the installation is to supply a load of less than 45kW, the customer is charged for the associated labor plus the incremental cost of the instrument transformers. For loads in excess of 45kW, labor costs only are charged to the customer but there is no incremental cost to the customer for the instrument transformers.

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Conversion to Central Metering < 45kW, (approx. numbers)	**792**	**792**	**792**	**800**	**800**
Conversion to Central Metering > 45kW (approx. numbers)	**126**	**126**	**126**	**150**	**150**

2.5.6 Temporary Services

Temporary services are available to construction sites, etc., for any period requested by the Customer. In these circumstances, the customer is charged a fee to establish and remove the temporary service. If the customer also requires transformation, an additional charge is applicable.

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Temporary Services	**211**	**211**	**211**	**211**	**211**

OPERATIONS CAPITAL

1.0 INTRODUCTION

Operations capital investments are required to implement, enhance and modify the physical infrastructure, systems and tools that are required for distribution operations. These investments deliver improvements to Distribution System performance in the form of reduced outage duration, improved product quality, information required for regulatory reporting in accordance with the Distribution System Code and improved information to customers. They also deliver efficiency improvements to Hydro One Distribution's operating function and ensure that the sustaining costs for infrastructure, systems and tools are minimized.

2.0 DISCUSSION

During 2003 and 2004 Hydro One Distribution consolidated the central operations function to the Ontario Grid Control Centre (OGCC) and now operates the 27.6kV and 44kV subtransmission system and dispatches for the entire distribution system from one central location. Operations relies on a number of systems and tools to efficiently carry out the operating function at the OGCC. The primary systems are the Network Management System (NMS), the Outage Response Management System (ORMS) and the Interactive Voice Response (IVR) system. Details concerning each of these systems are provided in Exhibit C1, Tab 2, Schedule 4.

These systems are all functioning well and fully delivering their intended benefits. Further significant benefits can be achieved from the NMS and ORMS systems by enhancing the monitoring and control of the distribution network and improving the management of historical information. As well, Hydro One Distribution is carrying out a multi-year program to install smart meters. Incorporating the information from these smart meters into the ORMS system will improve the efficiency and performance of outage management and communication with customers. In addition, the smart meter initiative provides a communication network which enables remote control of new distribution equipment via the Network Management System.

The proposed spending for 2008 along with the spending levels for the bridge and historic years are provided in Table 1 below.

Table 1
Operations Capital

Description	Historic			Bridge	Test
	2004	2005	2006	2007	2008
Operations Capital	6.3	4.7	2.1	2.0	3.6

The increase in 2008 over the bridge and historic years is required to continue with the proposed investments to improve Operating efficiencies as noted above.

3.0 SYSTEM ENHANCEMENT PROJECTS

Specific projects planned for 2008 are described below. Investment Justification Documents (IJDs) for projects with net capital requirements over $1 million can be found in Exhibit D2, Tab 2, Schedule 3.

3.1 Distribution Operating Facilities Sustainment and Enhancement

Although the Operating amalgamation was completed in 2004, some Distribution Operating Facilities commissioned in 2001 and 2002, which were moved to the OGCC, will be requiring refurbishment and capacity expansion in 2008. This project work includes ORMS and a portion of the IVR system.

The enhancement based project work provides for real time feeder analysis in NMS to improve the management of the sub-transmission feeders, enabling the ability to deploy alternate feeder configurations quickly and expedite restoration of some or all of the affected customers.

The combined cost of these projects is $0.8M in 2008.

3.2 Outage Response Management for Smart Meters

ORMS currently gets all of its information on prevailing outages from customer phone calls. This is achieved through interfaces to the software used by the Call Centre agents and to the Call Centre IVR system. The installation of smart meters and the telecommunications to retrieve data from them creates the opportunity to improve the efficiency and accuracy of ORMS with respect to the prompt identification of the existence, location and extent of outages and the monitoring of momentary outages.

The cumulative benefits to ORMS will be improved reliability performance through better and more complete monitoring and reporting, enabling quicker response times and timely correction of emerging issues.

This investment will require new hardware and software features in the central smart meter data collection facilities and in ORMS to allow this information exchange to take place in near real time. It is expected that it will take one to two years for Hydro One's suppliers of these systems to deliver these features. Funding of $0.5 million is required in 2008 for the first phase of this project to complete detailed requirements and pilot testing.

3.3 System-Data Archiving and Historical Data Management for Distribution Operations

NMS and ORMS contain a large quantity of data on the historical performance of the Distribution System assets, response times to outages, customer supply performance, outage causes, etc. Extracting the data from the existing databases involves a large amount of manual effort and time delays. This is costly and severely curtails the discovery process needed to identify all the asset and performance issues. This investment will provide long term archiving of distribution operations data as well as data mining and analysis facilities that will allow distribution system planning staff the ability, on a self-serve basis, to retrieve and analyse information to improve system planning and asset investment decisions. The benefits will be better decision-making on distribution system investments, as well as saving labour costs in the data extraction, reporting and analysis processes. Hydro One originally planned to complete this work earlier, but adjusted the schedule to allow integration with the Cornerstone architecture. This integration should reduce implementation cost and allow improved correlation between this historical information and such data as work program accomplishments contained in the new work management system. The 2008 cost for this project is $1.3 million. For additional details, refer to the IJD in Exhibit D2, Tab2, Schedule 3.

3.4 NMS Enhancements for Distribution Monitoring and Control

Hydro One has a program to install sectionalizers on feeders and monitoring and control facilities in Distribution Stations. The program targets the worst performing feeders and most heavily loaded Distribution Stations and is an element of Hydro One's strategy to improve Distribution System reliability performance. While sectionalizers and Distribution Station monitoring facilities deliver benefits while operating on a stand-alone basis in automatic configuration, greater benefits are achieved when they can be remotely monitored and operated from the control centre. This investment provides the system enhancements required at the OGCC to deliver those benefits. The 2008 cost for this project is $1 million. For additional details, refer to the IJD in Exhibit D2, Tab2, Schedule 3.

SHARED SERVICES AND OTHER CAPITAL

1.0 INTRODUCTION

Capital expenditures under the Shared Services program support the Sustainment, Development, and Operations work programs of Hydro One Networks Inc. As such they consist of assets that are largely shared by both the Distribution and Transmission businesses. Shared assets include Information Technology installations such as applications software and computer equipment, land, buildings, office equipment, transportation and work equipment (T&WE), tools, and service equipment.

Shared services cost levels are fully reviewed as part of the annual business planning process described in Exhibit A, Tab 14, Schedule 1.

Table 1
Shared Services & Other Capital Allocated to Distribution 2004-2008 ($ Millions)

	Historic			**Bridge**	**Test**
	2004	2005	2006	2007	2008
Information Technology	10.6	19.5	19.3	46.7	43.3
Facilities & Real Estate	2.8	1.8	2.1	6.4	4.4
Transport & Work Equipment	8.8	30.4	31.3	31.2	39.2
Service Equipment	3.2	1.6	2.2	4.5	5.3
Conservation & Demand Management	0.0	0.0	2.9	7.9	0.0
Other	(3.2)	0.1	(0.5)	0.1	(14.4)
Total	22.2	53.4	57.4	96.7	77.8

Table 1 is a summary of the Distribution portion of the Shared Services Capital over the Historical, Bridge, and Test year. Exhibit C1, Tab 5, Schedule 3 outlines the appropriate cost allocation drivers that have been utilized to derive the Distribution allocation of this capital.

The following table provides an overview of the various cost categories for the period 2004 through 2008, highlighting the total capital spending for Shared Services and Other Capital, as well as the portion allocated to the distribution business.

Table 2
Total Shared Services & Other Capital ($ Millions)

	Historic			**Bridge**	**Test**	
	2004	2005	2006	2007	2008	2008 Dx
Information Technology*	20.0	39.6	34.3	95.2	90.2	43.3
Facilities & Real Estate	5.9	2.6	3.6	9.6	9.8	4.4
Transport & Work Equipment (T&WE)	13.5	40.5	41.2	41.1	51.6	39.2
Service Equipment	4.9	3.1	3.9	7.9	9.3	5.3
Conservation & Demand Management	0.0	0.0	2.9	7.9	0.0	0.0
Other	(2.2)	3.1	6.1	1.8	(14.4)	(14.4)
Total	42.1	88.9	92.0	163.4	146.4	77.8

* include Customer Care capital expenditures

The growth in Shared Services and Other Capital is primarily driven by the need to support a larger work program and, accordingly, a larger work force. The need for additional T&WE and facilities is need to support the activities associated with the execution of the Hydro One Distribution work program. In addition, this capital cost growth is associated with an over-all IT strategy that includes the replacement of many of the current large information systems (i.e. Work Management) as they reach their ‘end of life’. The Cornerstone initiative, part of the Information Management costs shown above, is a major business transformation initiative that deals with not only end of life replacement issues but also provides a platform for further effectiveness and efficiency gains at Hydro One. (Reference Section 2.0 of this exhibit)

Sections 2.0 through 8.0 details the capital requirements which make up the Shared Services Capital program.

2.0 INFORMATION TECHNOLOGY

Information Technology (IT) refers to computer systems (hardware, software and applications) that support business processes used by employees throughout the organization. IT infrastructure includes the voice and data telecommunication networks; data centre installations; and computer equipment (servers, computers and printers) that enable employees to access IT systems. Staff access software applications from offices, and field locations using the wide area network, local area networks or through virtual private network connections.

Capital programs include annual maintenance investments so that existing IT assets are kept current to maintain continuity of operations and minimize risks of interruption or failure. IT capital programs also include investments in newly developed projects to either replace old technology or to introduce new technological processes to serve the business operations.

For accounting purposes, IT capital expenditures are defined to include software expenditures for projects and programs that in total cost more than $2 million. Also included in this category are minor fixed assets and hardware expenditures such as desktop computers, which are required as part of ongoing refresh and replacement programs. IT investments are made in accordance with approved business strategies, follow the IT Governance process described in Exhibit C1, Tab 2, Schedule 6, and are subject to a formal review process.

A significant capital investment in major enterprise applications and systems was made concurrently with the de-merger of Ontario Hydro in 1999 to ensure the new company would have the required business systems and to ensure the de-merged systems would be Y2K compliant.

Investments in enterprise applications made at or around that time were "best of breed" applications and included: Customer One - customer information and billing system (1998); PassPort - accounts payable, purchasing, inventory and supply management system (1999); PeopleSoft - financial and human resources system (1999). Other than in 2002, when an upgrade was made to the PeopleSoft system, the applications have not been upgraded. Certain of the applications have undergone significant customization to provide additional functionality since the date of their installation.

These applications have reached, or are approaching, their end of life. An application approaches its end of life when the application does not provide sufficient functionality or does not have additional capacity to be redesigned or modified to add such functionality to meet current and foreseen business needs. Additionally these older versions are no longer, or will no longer be, supported by the software vendors. Work which is planned for the major application replacement program (Cornerstone) in 2006, 2007 and 2008 is discussed below under the heading Development Projects.

Hydro One's approach to ensuring ongoing reliability and capacity is to upgrade and/or renew/replace applications and systems when required to either meet changing business needs, when the software application or systems are no longer vendor supported, or to mitigate business risks. Hydro One's objective is to maintain its systems as near to a current basis as possible to ensure its technology environment is vendor supported.

In addition to the replacement cycle for existing systems, organic business growth and increased reliance on technology requires the systems to grow to accommodate the business needs. In data storage, Hydro One has observed increases averaging 30% per annum. According to a June 2006 White Paper by IBM, this is in line with Industry expectations estimated at 37% per annum. Faster processing speeds to address upgraded application requirements are also facilitated through server and storage improvements or replacements. The increasingly heavy reliance of technology in the field and at field locations has continued to place an upward demand on the IT data infrastructure in terms of volume, speed, connectivity and concurrent use. Field office locations are increasingly utilizing larger more complex business applications such as Passport, Customer One, ArcFM (Geographic Information Spatial application used for Distribution design work) and outage management applications (ORMS). Data networks (wide area and local area networks) are monitored on an ongoing basis and upgrades are made as required to address the business needs and to ensure that application performance is acceptable.

2.1 Total IT Capital Expenditures

As noted above IT capital expenditures are driven by the business need to upgrade applications and hardware that are no longer vendor supported, to mitigate business risks, to address additional business requirements, to maintain system performance and to meet the custodial requirement of ensuring technology assets are being properly and appropriately managed and maintained.

Table 3 lists the capital expenditures for programs and projects**.**

Table 3
Total IT Capital Expenditure
($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Software Refresh & Maintence	**3.0**	**14.2**	**8.6**	**11.9**	**7.1**	**3.3**
Minor Fixed Assets Program	**8.8**	**14.6**	**13.2**	**17.5**	**14.6**	**8.3**
Development Projects	**8.2**	**10.8**	**12.5**	**65.8**	**68.6**	**31.7**
TOTAL	**20.0**	**39.6**	**34.3**	**95.2**	**90.2**	**43.3**

Capital IT expenditures respond to the needs of three general business drivers and are undertaken as projects or programs:

- Software Refresh and Maintenance Program ensures continued operations of the installed IT application infrastructure
- Minor Fixed Assets (MFA) program ensures the continued operations of the installed IT hardware infrastructure. Expenditures in this category address equipment needs which are generated by the growth in demand for IT services, in addition to the replacement of end-of-life and under-capacity assets in IT and in the Business Telecom network.
- Development Projects replace or upgrade older and end-of-life applications or develop new applications or processes, including those:

- that have become inadequate for current functional needs;
- that require new applications to improve Business operations
- that result from legislative or market driven initiatives

Software Refresh and Maintenance includes costs related to upgrading existing operating systems.

MFA includes desktop computing equipment, field tablet computers, mainframe and storage systems, servers, and peripherals and telecommunication infrastructure including PBX's, computerized telephony interfaces etc. Other capital items include systems applications and operating systems required to operate the IT and telecommunication infrastructure hardware.

Development projects include the cost for new applications or the replacement of exiting applications which are at end of life.

The following architecture principles underlie IT strategy and planning and as such will guide the required application upgrades that will take place over the next 5 years:

- Applications will be "off the shelf" with built-in protocols (tested and generally used throughout like industries).
- The system architecture will be on an open standards platform allowing systems to run on any hardware platform.
- Middleware, interfaces and hubs, will be used as appropriate to facilitate application interconnectivity.
- Systems architecture and chosen applications will be:
    - robust (generally understood to mean unlikely to fail, but rapid response if it does)

  - secure (generally understood to mean 3-tiered, fire-walled and password protected)
  - flexible service oriented architecture (generally accepted as the most appropriate and efficient IT strategy).
- System hardware will be upgraded as required to support the new application.
- Costs will be managed on a total cost of operations basis.

In support of new and planned applications the current hardware infrastructure will be upgraded and designed to:

- improve disaster recovery processes;
- improve system security;
- facilitate the increased application of mobile technologies;
- continue the transition to storage area networks that benefit from generally accepted industry practices;
- secure improved functionality from new and expected technology.

IT capital project spending increases significantly from 2002 through 2008 and beyond as existing enterprise applications are upgraded and replaced. The larger number of smaller projects which had been undertaken in 2003 through 2006 will decline and be replaced by a phased series of large projects.

The major planned capital projects that will be funded in 2007 and 2008 are described below.

2.2 Software Refresh and Maintenance Program Capital Expenditures

Table 4 lists the capital expenditures for the software refresh and maintenance program.

Table 4
Software Refresh and Maintence Program Capital Expenditure
($ Millions)

	Historic			Bridge	Test	
Description	**2004**	**2005**	**2006**	**2007**	**2008**	**2008 DX**
Software Refresh & Maintenance	**1.7**	**2.6**	**1.0**	**11.9**	**7.1**	**3.3**
Windows (O/S)	**1.4**	**11.6**	**7.6**	**0.0**	**0.0**	**0.0**
TOTAL	**3.0**	**14.2**	**8.6**	**11.9**	**7.1**	**3.3**

Hydro One utilizes just over 700 commercial software programs in order to equip its employees with the required technologies to perform their tasks efficiently and safely. The software refresh and maintenance program provides the needed software vendors' releases, periodic version upgrades, and replacements of applications that meet the total capital threshold of $2 million aggregated.

Applications are replaced or upgraded with the line of business involvement to address their business needs and to ensure that applications remain compatible with current IT platforms and other interfacing applications. In this manner, vendor support is maintained to help fix breakdowns or other issues that may occur with the applications. Funding decisions are made based on software lifecycles, vendor schedules, reliability requirements, and experience with similar initiatives/projects.

In 2005-2006 work was undertaken to upgrade the Microsoft Windows operating system technology from Windows NT and Windows/Office 98 to Windows XP and Office 2003 for all users operating on the Hydro One system. In addition to upgrading the desktop operating system and e-mail application the platform was simplified and consolidated to improve system reliability, redundancy and to ensure better security. Coincident with the XP software investment in 2005/2006 a significant increase in MFA investments for computers, servers and storage was required to replace those operating on the old Windows NT/98 platform to retain functionality in the XP/2003 environment.

Software refresh and maintenance expenditures identified for 2007 and 2008 include an upgrade to the Open Market Systems to utilize the functionality of the existing Company hub technology, increased use of Citrix solutions, virtualization of the Storage Area Network to improve data retention and stabilize storage costs, collaboration technology investments using Windows Sharepoint, and a number of other technology investments related to intrusion detection, firewalls, enhanced security and to a greater use of portal technologies.

In 2007, application investment was undertaken in the area of security related to intrusion detection and network access controls; upgrades to oracle database versions and database management tools; upgrades to the middleware application , the informatica tool and to the mainframe operating systems.

2.3 Minor Fixed Assets

Table 5 lists the capital expenditures for IT Minor Fixed Assets.

Table 5
IT Minor Fixed Assets Programs Capital Expenditures
($ Millions)

	Historic			Bridge	Test	
	2004	2005	2006	2007	2008	2008 DX
IT Mainframe, Servers and Strorage Program	1.8	5.9	4.7	11.5	5.9	3.4
IT Desktops, Laptops, Tablets, Printers & Plotters	5.0	6.9	5.9	4.8	7.1	4.0
Telecom Networks & PBX/Voicemail	2.1	1.7	2.5	1.2	1.6	0.9
TOTAL	8.8	14.6	13.2	17.5	14.6	8.3

Minor Fixed Asset investments are for IT hardware and include specific programs to refresh older hardware such as computers. Equipment refresh is planned to ensure that if system upgrades or applications are added over the life of the hardware that the system will continue to be functional with only a minimal upgrade being required. This strategy minimizes the costs of ownership, ensures operational risk is kept at an acceptable level, and maintains functionality. Planned funding is based on equipment lifecycles. This work is broken down into the categories discussed below for the expenditures shown in Table 5.

2.3.1 MFA: IT Mainframe, Servers and Storage Sustainment program

This investment in servers and mainframe computing capability is an ongoing infrastructural obligation for Hydro One information technology.
The majority of the costs in the MFA category in 2006 were spent on replacement of UNIX servers and on Windows servers. The UNIX server replacement cost has been brought forward from future years to ensure improved system reliability and to respond to and manage projected annual growth in demand for additional IT processing and storage capacity. The replacement of the UNIX servers with more modern and efficient equipment addresses the end of life issues, which the Company would face with some of the existing UNIX servers.

Included in the 2006 and 2007 work program are improvements to the current Disaster Recovery (DR) strategy and processes. In 2007 costs included upgrading the mainframe computer and the associated operating system. The DR program allows for the recovery of critical Hydro One systems in the event of a major technology disruption. The DR project will take advantage of the replacement of a number of existing UNIX servers and storage devices by transferring the replaced units to the recovery and back-up role.

UNIX and Windows servers are used to run business applications, networks, web services and email. Data storage devices are used by business applications and email to store and retrieve data. In assessing when to replace or add additional servers and storage devices vendor's end-of-support-life, capacity requirements, maintenance costs, and systems criticality are assessed. Hardware upgrades are ongoing costs and are needed to maintain reliable service for business applications.

The funding for the mainframe, servers and storage refresh program varies year to year depending upon hardware lifecycles, capacity management, and business requirements for increased processing capacity. In 2005 and 2006 the spend increased to address end of life issues with a number of e-mail exchange and file servers which were replaced coincident with the Windows XP/2003 project. In 2007 costs, as noted, include server upgrades to the DR site and the consolidation of and replacement of servers at the main data centre. In 2008 costs in this category include servers and infrastructure which are undergoing refresh at the Grid Operations Data Centre. Distribution applications supported at the operations centre include distribution outage and reporting applications.

2.3.2 MFA: IT Desktops, Laptops, Tablets, Printers, and Plotters Sustainment Program

Desktop and laptop computers are used by most Hydro One staff for office productivity applications (email, word processing, spreadsheet, presentation, and personal databases) and for business applications such as PassPort, ArcFM and PeopleSoft among many others. Rugged tablet computers are used by field staff using Geographical Information System (GIS) based applications for doing system design and asset condition assessments. Printers and Plotters are used by most Hydro One staff throughout the company.

Hardware upgrades are required to accommodate new software processing requirements, to replace end of life equipment and to maintain reliability. Properly programmed equipment refreshes can maintain or reduce maintenance costs. Hardware maintenance and capability costs tend to increase with aging hardware that is no longer under vendor warranty. Hydro One’s intent is to replace desktop computers every four years, laptops every three years, and printers and plotters every four to five years. This is consistent with industry practice and ensures that spares which are maintained by service technicians are consistent with the computer population at Hydro One.

Hardware and support service pricing combinations are compared in the market regularly and at times of major purchases in line with corporate procurement policies.

The funding for desktops, laptops, tablets, printers, and plotters varies year to year depending upon hardware lifecycles, business needs and projected requirements to meet forecast work programs. Funding costs in 2005 and 2006 reflect the acceleration in the laptop and desktop refresh program and tied back to the XP upgrade, whereby obsolescence caused by the added application requirements caused 2,100 and 2,382 desktop/laptop units respectively to be replaced.

Tests using XP applications on existing laptop computers, which had been enhanced with additional memory, did not result in acceptable performance. The cost of enhancing the existing equipment combined with the still suboptimal performance of the equipment when XP software was installed, and then combined with the hardware's end of life issues, negated any business benefit that might have been achieved by delaying the full replacement of the equipment. Therefore, the decision was made to purchase new hardware that met current needs and standards. Ongoing sustainment funding for laptop and desktop equipment and peripheral replacement consistent with the refresh objectives noted above, is reflected in the cost projections for 2007. Costs for 2008 include additional equipment which will be purchased for new staff.

2.3.3 MFA: Telecom Networks and PBX/Voicemail Sustainment Program

The telecom assets of Hydro One are many and have a large variety of install dates, lifecycles, and capacities. Data and voice hardware is improved or replaced over time as part of ongoing program management. Continuous initiatives are undertaken to improve data and voice communication efficiency across the wide area networks, the local area networks, the virtual private networks. These upgrades are also necessary to ensure systems are supported by third party vendors.

The telecom MFA program includes the work to rewire local area networks, replace end of life data network switches and routers, upgrade telephone PBX switches, and replace un-interruptible power systems (UPS). Work in this category includes the replacement of end of life hardware and software in the Internet Security Node which is used for authenticating Market Open business to business transactions and for internet access to Hydro One Networks Inc. applications.

The Telecom MFA program is needed to maintain reliable telecommunications availability plus capacity as well as network security against intrusions by computer hackers, viruses and worms. IT will replace telecommunications hardware facilities that are at end of life, no longer able to meet changing function, capacity or performance needs, and/or expensive to repair and unreliable because they are no longer supported by vendors.

The telecommunication hardware includes wiring, switches, and routers used to provide local area network (LAN) and wide area network (WAN) services to offices throughout Ontario. The business telecom network is used to transmit data required to run business applications, for email, to perform ongoing systems and information backups and to push new applications or software upgrades to end users in the field.

PBX/Voicemail hardware includes private branch exchange (PBX) and key set telephone switches, and voice mail equipment used to provide business telephone services to Hydro One employees at central and field locations throughout the province.

Within the Hydro One voice and data network there are more than 500 routers/switches and hubs that connect to 70 PBX's and 35 smaller multi-line office sets. A majority of the routers/switches and hubs are reaching end of life.

The investment in business telecommunications Networks and PBX/Voicemail is undertaken to replace end-of-life assets and to maintain service reliability and security. The strategy is again to replace equipment that is no longer supported by vendors. For network equipment the refresh occurs about every five years and about every ten years for PBX/Voicemail equipment.

The funding for business telecommunications Networks and PBX/Voicemail varies year to year depending upon hardware lifecycles, business needs for increased bandwidth and availability of resources. Changes to business applications and work methodologies, the introduction of new applications and new work processes, may require the upgrades to occur more frequently.

2.4 IT Development Projects Capital Expenditures

Table 6 lists the capital development project expenditures of IT.

Table 6
IT Development Projects Capital Expenditures
($ Millions)

The following IT Capital projects are active in the Bridge year 2007 and/or are planned for the Test year, 2008.

2.4.1 Cornerstone Project

The major software applications used by Hydro One consist of Peoplesoft (Finance and HR), Passport (Supply Chain, Procurement, Accounts Payable) and Customer One (CSS: Customer Service System). These systems were implemented in anticipation of the de-merger of Ontario Hydro and to address Y2K concerns. The applications were modified extensively following their implementation to provide the required business functionality. Functionality of these core systems was also enhanced by the addition of some 700 separate applications, which allow the field and head office staff to complete their work.

These core systems are aged and beyond economical maintenance. They no longer efficiently fulfill the Company's growing needs for information management and reporting. The PassPort system has been the daily source of asset and work information since its inception in the de-merger days of the late 1990's. The financial system, Peoplesoft, uses PassPort information and derives financial reporting information. The CSS system is used for billing and collections and by customer service representatives to address customer inquires on a daily basis. The systems have limited interconnectivity, which has resulted in the requirement for manual input duplication or other workarounds. Bridging of data and the development of workflow between systems is costly and complex.

All three of these extremely critical systems have been customized and altered to varying degrees to meet the current needs of the Company, over the past several years. Vendors are unwilling to support these older applications and have been unable to help with add-on customized changes that have been initiated. As software vendors for these applications are moving to new architectures, support for these older applications is being phased out. This leaves the Company with the option of continuing with these applications and developing its own support expertise or migrating to more current versions, or potentially replacing the existing applications with a more integrated and current application platform.

Continuing with these applications however limits the company's ability to employ current technology, to make use of mobile business solutions, and to address evolving business needs and processes. Even if the Company were to support its own legacy applications, the risk with the business systems would increase as the existing hardware would also require replacement with more modern systems. These more modern systems might not be able to operate the older applications.

This investment, which addresses replacement of the core business systems, in a phased approach, positions the company on a robust, secure and flexible enterprise base and will allow the replaced applications to be upgrade on a continual basis, without the cost of a significant one time upgrade.

The Cornerstone name and concept has been adopted inside the company to assist in communicating with every employee the ‘how’ and ‘when’ of changes that will benefit them throughout the conversion.

The Cornerstone Project envisions four staged replacements of core applications which are scheduled to occur between 2008 and 2011. Hydro One intends to retain outside consultants and software application vendors, through a competitive bidding process, to assist it with its replacement program.

The capital work program for Cornerstone commenced in 2007. Work is currently ongoing with Phase 1 of the project (described below) and work has begun on Phase 2 and Phase 3 planning.

The four phases of the Cornerstone Project are:

Phase 1 – EAM (Enterprise Asset Management) Core Functionality (Target In-Service Q2 2008)

As discussed in the project IJD, found in Exhibit D2, Tab2, Schedule 3, the EAM initiative will replace the existing Passport applications with a modern EAM solution. The result will be an integrated EAM application which will allow for more effective information transfer within the Company and provide the basis for connectivity with the other core systems as they are replaced or upgraded.

The first part of Cornerstone is to replace the current installation of PassPort 6. The current version, which supports work management, supply chain and certain asset management processes is old, unsupported, and has been heavily customized since its installation in 1998 and has been in a “locked down” mode and no software code changes have been made since 2004.

The PassPort 6 version is no longer supported by the software vendor, Indus. This means that the vendor will not provide ongoing application fixes for the application and may not be able to fix the application if it breaks. Additionally the continuous customization which was undertaken to extend the life of the Version 6 now significantly complicates upgrading the current application and requires the system be replaced.

Hydro One commenced with Phase 1 after obtaining the Hydro One Board approval in February 2007. Phase 1 will provide similar and enhanced functionality to the existing Passport application, will improve business processes, will put in place governance and structure around data collection and management, will address Bill 198 and other regulatory issues, will change business processes and by turning on or up modules within the application suite will serve as the basis for future phases of the project.

The chosen EAM solution is an SAP suite of applications using SAP 2005 and the SAP netweaver platform. The application will use service oriented architecture principles and the architecture and solution will be overseen and approved by SAP Canada.
The upgrade will be an “off the shelf” “vanilla” solution and implementation. Accenture has been chosen through a competitive RFP process to be the system integrator and will deliver a solution utilizing work practices based on its high performance utility model. The Accenture agreement includes a holdback clause to ensure the solution is delivered.

The Cornerstone project philosophy is to make changes to corporate processes and to utilize the built in functionality of the application tool to support those processes. This enables the application to upgraded and business processes to be continually improved through enhancements provided by the application vendor. Hence, a significant portion of this project relates to change management, streamlining business processes and putting in processes and process measures to ensure ongoing adherence to the new business model and to the business rules embedded in the application.

Inergi is working closely with Hydro One, in its role as outsource business service provider and as an end user of the applications and revised business processes. Inergi and its parent company, Cap Gemini, are working with Accenture to ensure the solution delivered meets Hydro One’s needs. Accenture, SAP and Cap Gemini/Inergi have all committed to delivering the required solution and working in a collaborative and open process. Accenture, SAP and Cap Gemini/Inergi, along with Hydro One staff all have central roles on the project and are active participants in the project governance process.

Governance over the project includes oversight by a sub committee of the Hydro One Board of Directors, Executive and project level reviews and an ongoing Quality Assurance /Quality Control process implemented by Accenture. Hydro One executives have included in their performance compensation a portion of their compensation which is specifically related to the success of the project.

Phase 1 of Cornerstone was undertaken following an exhaustive selection and discovery process completed in 2006 and early 2007 which was used to confirm cost and scope. Costs for Phase 1 represent the current estimate of how the project costs will be incurred in each of 2007 and 2008.

A similar exercise has not been completed for future phases and the costs associated therein are to be reviewed at an appropriate point prior to final approval. Included in 2008 are project start up and initiation costs for subsequent phases.

Value added, beyond the value from a like-for-like replacement, is expected in all phases of Cornerstone.

The benefits from Phase 1 are based upon a fulsome understanding of the benefits from the SAP application. These benefits are derived from three key value levers underpinned by Cornerstone Phase 1 application, process and organizational changes. These value levers are:

1) Centralizing to a single asset registry with a uniform hierarchy and selective integration to legacy databases;
2) Providing greater process transparency, integration and collaboration (enabled through the application and process changes) across Hydro One's lines of business (LOB); and,
3) Enhancing compliance to the underlying processes and data requirements.

Phase 1 corporate savings total $200 million and are based upon 12 areas of identified benefit over the period from mid 2008 to end of 2015. These identified benefits include:

- Enhanced crew productivity due to better materials availability through more efficient forecasting, planning and execution.

- Estimated Benefit – $35.5 million

- Optimized O&M and Capital spend through enhanced asset analysis and maintenance.
  - Estimated Benefit – $50.3 million
- More accessible information from Electronic Asset Management systems through better leverage of IT.
  - Estimated Benefit – $19.9 million
- Improved contract compliance and management through reduction in P-Card and non-PO spend for direct purchase materials and services.
  - Estimated Benefit – $35.0 million
- Improved system reliability through higher quality asset data and avoided emergency “trouble” work.
  - Estimated Benefit – $21.6 million
- Work bundling for routine inspections and Preventive Maintenance work.
  - Estimated Benefit – $6.3 million
- Increased back-office productivity (Designer/Clerical) through reduced costs of tracking work to be scheduled and time prioritizing work.
  - Estimated Benefit – $12.2 million
- Improved inventory performance through reduced expediting, material handling, storage costs, returns and excess/obsolete inventory.
  - Estimated Benefit – $9.5 million
- Improved warehouse shipping processes and payment reconciliation.
  - Estimated Benefit – $1.6 million
- Improved ERS processes through better automation.
  - Estimated Benefit - $7.5 million
- Greater control governance around one-time setup vs. regular AP vendor setup.
  - Estimated Benefit - $0.6 million

- Improve Transmission customer satisfaction through more detailed reporting and improved connection process.
    - Estimated Benefit - intangible

Each of the future phases build on the foundation set by Phase 1 and each of Phases 1 through 3 will utilize the interconnected SAP application platform. Each phase is stand-alone to the extent that each will add its own benefits to the overall Cornerstone program.

As future phases are developed, it is expected that the cumulative benefits of the Cornerstone program will improve; however, the extent is not quantifiable at this time as this is dependent on further refinement of scopes of work for future phases as well as the impacts of such factors as Smart Meters as these become better known.

Phase 2 – Upgrade PeopleSoft – HR and Finance Functionality

The PeopleSoft financial and HR modules were installed in 1998 and the HR module was upgraded in 2002 and subsequently customized. PeopleSoft has been purchased by Oracle, and support for older versions of the PeopleSoft applications will be phased out as PeopleSoft moves to an integrated platform with Oracle applications.

As in Phase 1, the main objective is not only to install an off-the-shelf solution, but also to adopt industry-standard practices that are enabled by the off-the shelf packages. Integration of the new financial and HR application with the modules installed in Phase 1 will enhance financial reporting capabilities.

Recent discussions with Peoplesoft have indicated that the existing applications will not be supported past 2008. The Company will implement a temporary solution utilizing temporary "patch" support from another vendor. However, as these systems are core to the Company's financial reporting and human resource management ability the project timelines may be advanced such that this Phase of the Cornerstone project is commenced prior to starting work on Phase 3. The relatively contained nature of the project allows this to occur without disrupting work on Phase 1.

Phase 3 – Enhanced EAM Functionality

This phase is intended to enhance the functionality and information available to the Asset Manager. Key deliverables for Phase 3 include:

- the release of the additional functionality offered by the system replacement implemented in Phase 1 (EAM-Core)
- replace most of the existing end-user applications with the EAM solution or with specialized packaged point solutions designed to integrate with the EAM, especially focused on Asset Management capabilities
- enhance reporting capabilities
- integrate the asset repository with Geospatial Information Systems (GIS) and technology.

Phase 4 - Replace Customer Information System Functionality

The Customer Service System (CSS) or Customer -1 application was purchased in 1997 from Andersen Consulting. The application has undergone significant modifications in order to address the changes in the Ontario regulatory environment and to meet OEB requirements. This is an extensively customized product which is very costly to maintain and very costly to modify to meet new business needs.

The Hydro One IT strategy is to make modifications to the existing system to extend its useful life and to address known regulatory and business requirements. The system itself is robust but difficult to work with. Improvements to the system, which are discussed below, are intended to stream line work processes, provide additional functionality and to make changes to the application less costly.

To obtain full functionality with the newer systems, and to improve workflow and improve customer satisfaction the intent of Phase 4 is to replace the existing Customer -1 system with a more integrated application which would interface with the application suite implemented in Phases 1-3.

Andersen Consulting no longer supports the application and Hydro One is part of a user group who continue to maintain the core functionality of the Customer -1 application. The number of users in the user group, who support the application, is however declining, as more of the utilities using the Customer-1 application are switching to newer integrated CSS applications.

Inevitably, the Customer -1 application will have to be replaced. No application solution has been chosen at this stage and Hydro One intends to maintain its flexibility to take advantage of business and application solutions as they become available.

2.4.2 CIS/CSS Hybrid Upgrade Project/CRM

Capital spending for this area is for 2 end customer impacting projects – Customer Information System (CIS) application changes and the upgrade of the existing Customer Relationship Management (CRM) applications

The CIS is the term given to a suite of billing and customer applications which includes the Customer-1 application and the Open Market Systems. To improve their existing performance, and prior to their replacement with Phase 4 of the Cornerstone project, Hydro One intends to make a series of investments in the CIS and related applications ($2.9M in 2007 and $2.0M in 2008) to improve current performance and reliability.

Some aspects of previously planned work to update applications in Customer Care will become part of the Cornerstone project.

This project is allocated 100% to distribution account categories. The upgrade is labeled as "hybrid" because some components will be upgraded and others will not, rendering the resultant configuration as a hybrid application, rather than a full replacement or upgrade.

The Customer-1 application is the predominant part of the CIS suite of applications. It provides the technology backbone for billing, customer care, field services, and open market services to customers and key constituents.

Upgrades were made to the CIS platform in 2006 and changes which improve business efficiency will continue in 2007 and 2008.

Undertaking the Hybrid project will enable the CIS application to remain functional until its upgrade or replacement in 2011. It is expected through investment in a Hybrid program, rather than in replacement of the existing CIS application at this time, that Hydro One will maintain flexibility and have a number of options available to it in light of the Government's smart metering program.

Timing as to when this work may occur, or how much work is able to be done is dependent on the Smart Meter project and on any OEB mandated rate changes. The CIS

Hybrid, Smart Metering and rate change projects require access to the same CIS system or elements of the system, and the scheduling and testing of any application code changes, and system maintenance programs requires resource co-ordination.

Customer Relationship Management refers to the applications used by Hydro One to track information, work programs and projects for its large distribution and transmission customers. Hydro One intends to replace the existing applications which are at end of life with an SAP CRM solution. The solution will be implemented initially on a stand alone basis and will be integrated at a later date into the Cornerstone ERP solution.

Data in the current CRM applications will be reviewed prior to its being exported to the new solution. The SAP implementation will follow the same Cornerstone philosophy where no modification or customization will be allowed to the base code. This will enable Hydro One to utilize application upgrades provided by the application vendor.

A Systems Integrator for the project implementation, including business process change and change management will be selected through a competitive RFP process.

2.4.3 CTI Upgrades

In 2007 work will be completed on the upgrade to the contact centre's computer-telecom-interface (CTI) technology and applications. This technology enables contact centre agents to handle customer inquiries in a variety of media, such as telephone calls, emails, faxes and posted letters. These changes will provide for the requisite flexibility to meet growing and changing customer needs going forward. This project is allocated fully to Distribution accounts.

2.4.4 ACPi/WEP Project

This project will complete the IT provisioning for work planning, crew scheduling, dispatching and time recording functions to the Lines of Business users such as Customer Operations, Grid Operations and E&CS. The result will be the Work Planning and Reporting System (WPRS).

This will be achieved by leveraging the system integration tool that is being delivered through the ACPi (ArcFM, CSS, Passport integration) project. The WEP project will add work planning and crew scheduling plus the application to view assigned activities for time capture and job status. New applications will be utilized by field staff in Customer Operations regarding the dispatch of the high-volume of short duration jobs.

There is a wide range of benefits for this project including efficiency in resource utilization by organizing work orders by geographical area and better tracking of resource assignments. There are additional benefits for Finance in the areas of time capture and up front time approval.

The WEP application will interface with the Cornerstone solution through the use of the hub technology solution developed in the ACPi project.

2.4.5 IREIS Project

This project converts and stores geospatial information data, which will be accessed through the Integrated Real Estate Information System.

2.4.6 Mobile IT Project

Mobile IT ($3.0 million in 2008) will equip field forces with the tools required to access current and planned asset data applications when in the field. In 2007, Hydro One is undertaking a study to develop a cohesive IT Mobile strategy.

The strategic review is intended to assess how to best use technology in the field and how to best support what work processes. The study will consider the Cornerstone project as well as the enhanced process functionality provided by the WEP suite of applications to develop a direction that the Company will follow in building mobile applications.

Direction from the strategic review will enable the Company to respond to staff and vehicle location safety needs, mobile computing requirements, consider Smart Network preparedness and optimization of the Smart Metering initiative.

The investment provides additional commercial software products, enhancements to existing software products and the installation, configuration and integration of those products along with associated hardware (database and application servers and upgraded hand-held devices). This project will permit field management and staff access to critical systems and information regarding work crew projects, field assets and optimal scheduling as part of work management processes.

2.4.7 Asset Data Collection and Data Mart Project

Through the use of handheld tablets system information data is being collected on the current state of the Distribution system. The scope of the project provides software to analyze the information and allow it to be transferred and used in the corporate

Geographical Information System (GIS). The information will assist in the efficient expansion, operation, and maintenance of the distribution system.

Costs included in the period 2006 to 2008 relate to systems and applications costs for the data collection work being performed on distribution poles and lines assets. In 2007, $0.9M has been identified for capital items associated with distribution data collection project.

3.0 FACILITIES & REAL ESTATE

This section addresses the capital expenditures that are required to acquire (own or lease) and maintain Hydro One Networks Inc.'s workspace (office space and service centres). The distribution facilities represents approximately $4.4 million of overall capital estimated spending in 2008, as illustrated in Table 7, below.

Table 7
Total Real Estate Capital Expenditures ($ Millions)

	Historic			**Bridge**	**Test**	
	2004	2005	2006	2007	2008	2008 Dx
Major	5.1	2.6	3.0	6.5	9.2	4.0
MFA	0.8	0.0	0.6	3.1	0.6	0.4
Total	5.9	2.6	3.6	9.6	9.8	4.4

3.1 Major Capital

The Real Estate major capital program allows for the provision of workspace of head office facilities, including Ontario Grid Control Centre – Barrie, field administrative & service centre facilities, and other work locations such as the London Call Centre.

The increase in costs over the 2006 to 2008 period reflects the increased operational requirements as a result of the program expansion resulting in the Distribution and Transmission Businesses. Key components of this expanded work program are discussed below.

The capital program focuses on undertaking critical component replacement work on a priority basis (e.g. roof replacement). As a result of the planned and corrective replacement of these critical components, the amount of capital spent varies year over year. Contracted facility service providers conduct regular inspections of administrative and service centre sites across the province to ensure critical building/site components are inspected regularly and major structural and related problems are identified. Maintaining building and site assets in a condition that ensures their longer-term viability, while meeting the workspace needs of employees on a day to day basis, is critical to the successful completion of a variety of corporate work activities. Equally important is ensuring that employee workspaces are consistently maintained to a standard that meets current work requirements and complies with all corporate, legislative and other related safety and environmental regulations. This program also considers the facilities portfolio accommodation strategy in terms of facility improvements, building additions, and new facilities in line with the Company's changing operational requirements.

Key Program work activities include:

- New buildings, buildings additions and major facility renovation as part of facility program accommodation strategy that responds to need to address aged facilities (reaching their end of life) and is in line with current and projected operational and work programs requirements including staff growth at locations across the Province.

- Replacement of major building components including roof structures, windows, heating, ventilating and air conditioning (HVAC) systems and other structural elements and building systems;
- Dealing with environmental issues that may arise such as mould;
- Water treatment upgrades to improve quality and reliability of water supply, including conversions to municipal supply;

The Company in particular is looking for new space standards to meet accommodation needs and achieve their customer, technologies, health and safety initiatives. Forecast expenditures for 2008 for distribution are $4 million.

3.2 Minor Fixed Assets (MFA)

As noted in Table 7, MFA expenditures are based on spent on replacement of furniture or additional furniture due to increased staff levels. Forecast expenditures in this area are $0.4 million for 2008.

4.0 TRANSPORT AND WORK EQUIPMENT (TWE) REPLACEMENT PROGRAM

This section identifies the Transport and Work Equipment (TWE) capital expenditures for the period 2004 to 2008. The increase in capital expenditures is directly related to the increase in work programs and additional staffing required to execute these work programs identified by each of the Lines of Business. Fleet capital requirements are primarily based on industry standards (manufacturer's recommendations) for life cycle expectancy, the remaining capital value, and operating cost drivers which are then linked to the Business Plan and Work Programs. Light vehicles are replaced after 6 years or

180,000 km, service trucks are replaced after 6 years or 200,000 km, and work equipment is replaced after 8 to 10 years or 230,000 km.

Table 8
Capital Expenditures ($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total	13.5	40.5	41.2	41.1	51.6	39.2

The objective of the TWE Replacement Program is to promote an orderly system of purchasing and funding a standardized fleet replacement process and to plan for future transportation requirements. The TWE Replacement Program annually analyzes 5-year cycles for capital investment requirements and maintains a safe and efficient fleet. It is critical to evaluate and forecast spending requirements to minimize fluctuating spending patterns and to stabilize long term capital investment. The fleet capital program, on an annual basis, is evaluated against the business plan and is subject to the work program prioritization and forecasting process.

Business cases for the program are prepared and approved and the equipment is strategically procured through a tendering process.

The TWE Replacement Program reviews:

- Equipment capital forecast;
- Equipment productivity, functionality, and future requirements;
- Equipment standards, equipment age, mechanical condition, kilometers traveled and cost per kilometer, downtime, and repair time;
- Safety/risk;

- Work programs, evaluating staff and equipment complement;
- Tendered procurement process;
- Fleet's Original Capital Value and Net Book Value;
- Historical and future utilization;
- Strategic procurement; and
- Cost versus 5-year business plan.

The guidelines for vehicles considered for replacement are based on vehicles meeting predetermined criteria including, but not limited to: manufacturer's life expectancy, average cost per kilometer, regulated maintenance standards, safety/risk, and beneficial purchasing cycles. As vehicles reach the targeted criteria, a vehicle maintenance evaluation is performed and, in some cases, the unit may be reassigned to other functions with "low usage" requirements. The replacement program measures the age and value of the fleet and meets the requirements and due diligence of a typical Utility fleet.

The benefits of our replacement program include:

- Maximum safety, productivity and utilization;
- Minimum downtime, repair time, and fleet complement;
- Reduced operating costs.

Hydro One Networks Inc. Fleet Operations has increased its yearly capital expenditures significantly in order to replace its aging equipment.

Over the 2004 to 2008 period, the Sustainment, Development, and Operations work programs have grown by over 70% and the growth of the TWE replacement program is aligned with this.

$20 million of planned capital was brought forward to 2003 from 2004 based on the substantial increase in the work program for 2004 and 2005.

The actual capital expenditures for new vehicles in 2005 ($40.5 million), 2006 ($41.2 million) and 2007 ($41.1 million), along with the budget in 2008 ($51.6 million) are based on the additional vehicles required to execute the planned work programs. The additional capital identified in 2008 is a direct reflection of the increase in the work programs and additional staffing indentified by all the Lines of Business.

4.1 Capital vs. Operating Leases

The evaluation of leasing as a financial alternative to the approved capital program was evaluated during the 2003 strategic sourcing initiative. The evaluation included the review of both capital and operating leases and the total operating costs. The risks and benefits generated by leasing were evaluated and it was decided the risks outweighed the modest benefits. The results therefore indicated that leasing was not cost effective.

The requirement for short term rentals (as distinct from long term rentals) is recognized and is included with our operating expenses in Exhibit C1, Tab 4, Schedule 1, Attachment A.

4.2 Procurement Initiatives

Fleet Services follow capital procurement objectives for material and service, listed below, to achieve cost reductions over the next five years:

- Profile the commodities, collect and analyze cost drivers;
- Analyze the supply market;

- Develop a strategy for sourcing;
- Select the suppliers through a rigorous RFP process;
- Conduct negotiations.

These procurement initiatives have allowed Hydro One Networks Inc. to control pricing for 3 year terms with preferred vendors.

5.0 SERVICE EQUIPMENT

Table 9 below identifies the expenditures for Service Equipment for the 2004 to 2008 period.

Table 9
MFA Service Equipment ($ Millions)

	Historic			Bridge	Test	
	2004	2005	2006	2007	2008	2008 Dx
Total	4.9	3.1	3.9	7.9	9.3	5.3

Minor fixed assets for service equipment represents capital items ≥ $2,000 required by our staff to carry out the construction and maintenance work programs. Capital items < $2,000 are expensed to OM&A. Minor fixed asset expenditures for service equipment are required to replace end of life service equipment, replace technologically obsolete service equipment when new standards and safer work practices come into effect, and provide for sufficient levels of new service equipment consistent with work program expansion and increased staffing levels.

Purchases in this category include specialized transportation equipment for off-road work sites and mobile equipment required to carry out a variety of work such as all terrain vehicles, boats, barges, snowmobiles and related accessories to transport crews to off-road work sites. It also includes measuring and testing equipment to carry out a variety of work activities including trouble shooting, performance testing of equipment, wood pole density testing, battery testing, etc.; tools; AED devices used by Health & Safety & Environment group to promote more safety and emergency awareness and other miscellaneous equipment.

In order to complete overhaul and maintain large power transformers and manage the related oil requirements over the planning period, the largest portion of the purchases are Mobile equipment such as dryair supply machines, oil filters, oil tankers, mobile degassifiers, heater banks, insulated tanks and Schnabel car upgrades .

Higher year over year spending in 2007 & 2008 is the result of end-of-life replacement of specific large transport equipment and to accommodate planned growth in distribution and transmission work program.

6.0 CONSERVATION AND DEMAND MANAGEMENT

Table 10
Conservation & Demand Management ($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total	0.0	0.0	2.9	7.9	0.0	0.0

Capital expenditures are related to load control programs under development and to distribution loss reduction. Board Decision RP-2004-0203 / EB-2004-0461 December 7, 2004 – line 125, relating to the approval of Utility C&DM Plans indicated that any capital projects related to C&DM should be placed in the utility's rate base.

The objective of the "Residential Load Control Program" is to assess residential customer response and the potential load impact of controlling central air conditioning, pool pumps, and electric hot water heating during system peak periods through installation of load control units and interval meters. Air conditioning and water heating are significant contributors to both summer and winter peak loads on Hydro One Network Inc.'s system. Accordingly, potential demand savings from load control could contribute significantly to Hydro One Network Inc.'s demand management effort. Customers will experience reductions in their energy usage without a significant effect on their comfort.

The "Distribution Network Loss Reduction Program" will be beneficial to all Hydro One Network Inc. customers. The program involves identifying and implementing projects where incremental investments will result in an overall economic benefit to customers by reducing system delivery losses.

Work under the loss reduction program was initiated following a study prepared by Kinetrics in 2005 as part of 2006 Distribution Rates proceeding RP-2005-0020/EB-2005-0378. In its Decision with Reasons for Proceeding RP-2005-0020/EB-2005-0378, the Board approved $8M in capital spending on loss reduction initiatives.

7.0 CUSTOMER CARE

Capital investments are required to build or upgrade the major Information Technology (IT) systems used in the delivery of Hydro One Distribution's Customer Care work program. The major IT systems supporting the delivery of the Customer Care service programs are: the Customer Information System (CIS) application suite and the Contact Centre Technology suite.

The CIS is an application suite providing billing, metering, contact, and service order support. The CIS is principally made up of the Customer Service System (CSS), and the Open Market Systems, which interface with the CSS. The Contact Centre Technology includes a suite of applications used at the contact centres, to queue and route calls, manage resources, provide Interactive Voice Response equipment and provide other support to call handling.

Capital expenditures for the Customer Care work program are cyclical in nature. There are years when no capital expenditure is required to be invested to support the IT system infrastructure. In other years, expenditures are required for major development or replacement of existing infrastructure, or to develop new infrastructure to keep pace with industry standards, address regulatory requirements, or address end of life issues.

Renovations to the Customer Information System (CIS) suite of applications began in 2006, with two initiatives: an initiative of data clean-up to update the 911 addresses in CIS and correct other data discrepancies; and, an initiative to implement process efficiencies for bill exception handling. Upgrades to the Contact Centre Technology, initiated in 2005, will be completed in 2007.

The capital expenditures related to these projects are identified in Table 6.

8.0 OTHER SHARED SERVICES

Table 11
Other Shared Services Capital ($ Millions)

	Historic			Bridge	Test	
	2004	**2005**	**2006**	**2007**	**2008**	**2008 Dx**
Total	(2.2)	3.1	6.1	1.8	(14.4)	(14.4)

Other costs are comprised of a variety of minor costing elements.

2004 to 2005 costs represent an (over)/under recovery of burdened rates which were assessed to be attributable to the capital program, but not applied back to specific programs; as well as other adjustments to capital projects.

The 2006 other costs include the Transmission capital contribution refund to Transalta as well as other small adjustments.

Other capital in 2007 includes an adjustment for contributed capital related to the Transmission earnings sharing mechanism, as well as other minor adjustments to capital projects. In 2008 Other capital comprises a credit related to the true-up of capitalized overheads in the Distribution business for 2006, as described in Exhibit C1, Tab 5, Schedule 2.

ALLOWANCE FOR FUNDS USED DURING CONSTRUCTION

The interest rate used for construction work in progress (CWIP), which is referred to as Allowance for Funds Used During Construction (AFUDC) reflects the Board's decision in EB-2006-0117, effective November 28, 2006. This decision prescribed that the interest rate to use for CWIP, effective May 1, 2006, would be the Scotia Capital All-Corporates mid-term Yield, as published on the Bank of Canada website and updated quarterly. As a result the 2008 test year reflects a forecast of the prescribed CWIP rate, respectively, while the historical years reflect CWIP at Hydro One Distribution's previously approved embedded cost of debt.

Table 1
Allowance for Funds Used During Construction

Year	AFUDC Rate %	($ millions)
2004	7.0	4.5
2005	6.8	4.4
2006	6.3	5.4

Justification for Programs or Projects
In Excess of $1 Million

Date: August 2007

Hydro One Distribution- Investment Justification
Spare Distribution Transformer Investments

Investment Driver: DC108 **Reference #:** **S1**

Investment Name: Spare Distribution Transformer Investments **In-Service:** December, 2008

Need:

This investment is required to maintain the distribution spare transformer population at sufficient levels to respond to equipment failures.

Not proceeding with this investment would result in a lack of spare transformers, a deterioration of overall customer supply reliability and increase the risk of prolonged outages during equipment failures.

Investment Summary:

Hydro One Distribution's system utilizes 1,477 in-service transformers and regulators, ranging in size from 0.5 to 40 MVA in 71 different categories and up to 70 years in age. These devices are made up of several components and sub-systems, which are subject to wear and tear, resulting in occasional failure. The average life of the in-service transformers and regulators is in the range of 30-50 years and the average age is increasing.

Over the last four years the distribution system has averaged about 32 transformer failures per year. Following a failure, a spare transformer is usually moved into service reducing the available spares complement. As the age of transformers increases, it becomes crucial that a sufficient number of replacement transformers be available as functional operating spares, as the number of failures are expected to increase. A comprehensive transformer spare complement strategy has been developed to ensure the correct number and type of spares are available in order to respond to failures.

This investment addresses the current gap and requires the purchase of three transformers and one regulator. The ratings are as follow:

- One 7.5/12.5 MVA, 115.5/8.8 kV transformer
- One 5 MVA, 27.6/8.32-4.16 kV transformer
- One 6 MVA, 44/13.2 kV transformer
- One 10 MVA, 12.47 kV regulator

Results:

- Purchase three (3) step-down transformers and one (1) regulator to meet future failure demand.
- Maintain customer connection reliability by restoring full operating capability through the timely and unencumbered dispatch of operating spare transformers.
- Maintains the availability of mobile substations for failure response and to support the Stations OM&A and Capital programs, as mobile substations would be used in lieu of spare transformers, if spares were not available.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (MFA) (A)	3.5
Operations, Maintenance & Administration (OM&A) and Removals (B)	-
Gross Investment Cost (A+B)	**3.5**
Recoverable (C)	-
Net Investment Cost (A+C)	**3.5**

*Includes Overhead and Allowance for Funds Used During Construction (AFUDC) at current rates

Hydro One Distribution– Investment Justification
Mobile Substation Refurbishment

Investment Driver: DC 108 **Reference #**: **S2**

Investment Name: Mobile Substation Refurbishment **In-Service**: December, 2008

Need:
This investment is required to provide for the safe operation of a fleet of 28 mobile substations and to maintain their performance at acceptable levels.

Consequences of not proactively managing the population of mobile substations include increased safety risks during transportation, an inability to restore power in a timely manner and the unavailability of replacement transformers required to complete maintenance programs thereby increasing reliability risks.

Investment Summary:

Hydro One Distribution's spare transformer strategy requires the availability of mobile substations for first-response power restoration**.**

As transportable mobile units, mobile substations must adhere to the requirements of the Highway Traffic Act. They receive annual inspections (time-based) for trailer certifications and power system components, as well as detailed inspections that occur each time units are dispatched for service. Inspection reports are used to track asset condition and to prioritize refurbishment.

This investment provides $1.5 million to complete mobile substation refurbishments to correct equipment deficiencies, and to replace reclosers on Unit # 30 (115/27.6 kV) and to purchase a new 27.6/8 kV transformer for Unit # 02**.**

Results:
- Maintain customer reliability by ensuring the availability of mobile substations to restore power when in-service transformers fail.
- Ensures mobile substations remain in good repair and do not present safety hazards.
- Minimize the life cycle costs of station facilities by reducing operating and maintenance expenditures and outage requirements through an integrated spares and mobile substation utilization.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.5
Operations, Maintenance & Administration and Removals (B)	-
Gross Investment Cost (A+B)	**1.5**
Recoverable (C)	-
Net Investment Cost (A+C)	**1.5**

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution– Investment Justification
Distribution Stations Refurbishment

Investment Driver: DC108 **Reference #:** S3

Investment Name: Distribution Stations Refurbishment **In-Service:** December 2008

Need:
This investment is required to maintain customer reliability and performance of distribution stations, as well as ensuring employee safety by addressing end-of-life assets.

Not proceeding with this investment would decrease distribution system reliability and compromise employee safety.

Investment Summary:
Hydro One Distribution's system is designed as a single-element, radial-fed distribution network. Distribution stations are a major element in this chain and are composed of individual components that must function as designed in order to maintain reliability and employee safety.

Stations require refurbishment because equipment and structures loose their capability to perform as intended based on ageing and/or utilization. Investments are prioritized based on ACA results, historical performance, availability of spares and additional criteria that includes, customer satisfaction, safety, and improvement in design standards.

Refurbishment that includes end of life transformer, structure and recloser replacement will be completed at the following stations: Iroquois Dam DS, Sioux Narrows DS, Navan DS, Brockville Parkdale DS, Lindsay Eglington DS and Parkhill South DS. Site expansion and structure egress cable relocation is planned for Durham Elgin DS to allow for the connection of a mobile substation. This will be achieved by separating the three feeders (currently egressing on one pole) onto three difference poles.

Results:
- Maintain customer reliability by replacing end-of life assets and by introducing updated designs and components.
- Replace end of life assets to comply with regulatory requirements.
- Address employee safety issues.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.5
Operations, Maintenance & Administration and Removals (B)	0.3
Gross Investment Cost (A+B)	**2.8**
Recoverable (C)	-
Net Investment Cost (A+C)	**2.5**

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution– Investment Justification
Demand and Planned Component Replacement

Investment Driver: DC108 **Reference #:** S4

Investment Name: Demand and Planned Component Replacement **In-Service:** December 2008

Need:
This investment is required to maintain the safe operation and acceptable performance of Distribution Stations by addressing emergency situations and replacing end of life components

Not proceeding with this investment would decrease customer reliability and compromise employee safety.

Investment Summary:

Demand Work – $1.8M
This investment provides $1.8 million to repair equipment when it fails, or when there is a need to repair equipment in a timely manner to secure reliability or safety. These failures are difficult to predict, but must be repaired quickly because they generally result in customer interruptions or present significant safety risks. Funding levels are based on historical trends and adjusted to reflect recent experience.

Planned Component Replacement – $0.8M
Components are replaced when their condition has deteriorated to a point where there is a risk of failure and the component has reached end of life, or where the performance has reached unacceptable levels. Component replacements are identified through ACA, routine station inspections and safety investigations, and can include reclosers, switches, fences and gates, surge arrestors, and transformer components.

Part of the component replacement program will address end of life breakers and reclosers by replacing these with new vacuum reclosers. This is a new technology that provides cost savings through improved performance, reduced maintenance and these reclosers provide added protection flexibility.

Results:
- Respond to outages in an expedient manner and address immediate reliability and safety risks.
- Improve system reliability by replacing end of life components.
- Replace end-of-life assets to comply with regulatory requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.6
Operations, Maintenance & Administration and Removals (B)	-
Gross Investment Cost (A+B)	**2.6**
Recoverable (C)	-
Net Investment Cost (A+C)	**2.6**

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date August 2007

Hydro One Distribution – Investment Justification
Trouble Calls and Storm Damage

Investment Driver: DC106 **Reference #**: **S5**

Investment Name: Trouble Calls and Storm Damage **In-Service:** December, 2008

Need:

This demand program funds the repair of assets where there has been a power interruption, or where situations pose reliability or safety risks that require immediate attention. The facilities covered under this program include all distribution line assets.

Failure to respond to trouble calls and storm damage, and situations where components or equipment are near failure would result in unacceptable safety and reliability risks to Hydro One Distribution.

Investment Summary:

Hydro One Distribution's system services about 1.2 million customers that place a high value on both reliability and quality of power. This is a demand program needed to restore power, maintain reliability and safety, and respond to customer needs in a manner that meets regulatory requirements. It includes:

- Emergency pole replacements
- Emergency equipment and component replacements
- Response to power quality issues
- Submarine and underground cable failures/problems
- Storm Damage response
- Damage claims

Hydro One Distribution is obligated to provide this service in accordance with good utility practice and the requirements of the Distribution System Code.

Trouble call response affects the company's performance on a number of OEB-specified service quality requirements; specifically, SAIDI and CAIDI reliability indices.

The funding of this program is based on historical accomplishments where the average volume of work and expenditures over the last 4 years is the primary consideration in setting forecast levels, although other mitigating factors may be considered (e.g. discounting extraordinary storm years).

The funding of this program is based on historical accomplishments as follows:

	2004	2005	2006	2007 Projected	2008 Proposed
Poles Replaced (units)	890	1,428	1,393	1,150	1,250
Equipment Replaced (units)	2,806	3,091	2,877	2,800	2,900
Storm Damage ($M)	14.0	26.3	62.0	26.0	26.0

Results:

- Ensures Hydro One Distribution promptly meets its obligation to provide customers with safe and reliable service.
- Comply with regulatory requirements.

Costs:

- The costs for forestry and premium time incurred as part of storm damage restoration are captured as part of OM&A Trouble Calls.
- Includes $2.5M that is recovered through damage claims.

	2008 ($M)
Capital * and MFA (A)	55.9
Operating, Maintenance & Administration and Removals (B)	4.2

Date: August 2007

Hydro One Distribution – Investment Justification
Joint Use and Line Relocations

Investment Driver: DC103 **Reference #:** **S6**

Investment Name: Joint Use and Line Relocations **In-Service:** December, 2008

Need:

This is a demand program that covers joint-use work that Hydro One Distribution is obligated to provide in order to meet its contractual obligations to joint use partners in accordance with existing Joint Use Agreements.

This program also covers line relocation work that must be carried out at the request of Municipal and Provincial road authorities as per the requirements of the Public Service Work on Highways Act and associated Ministry of Transportation guidelines. It also includes relocation work requested by customers in accordance with Hydro One Distribution's Conditions of Service.

Investment Summary:

Investment details for the two components of this program are provided below:

Joint Use

This work covers changes/upgrades to Hydro One Distribution assets to accommodate the use of the assets by joint use partners such as telecommunication or cable companies (communication circuits), municipalities (street lighting) or local distribution companies (power circuits). The cost sharing provisions in joint use agreements allow Hydro One Distribution to recover its costs resulting from requests to add new attachments to poles. Costs recovered include those to increase pole class to accommodate changes in pole loading, increased height to obtain appropriate ground clearances for public safety, as well as costs associated with premature retirement of in-service assets.

Line Relocations

The Line Relocation component of this program covers the work required in response to road modifications initiated by Provincial or Municipal Road Authorities, or by individuals who require assets relocated for the purpose of developing their property. Hydro One Distribution occupies road allowances at no cost and in return is required, on occasion, to install, relocate or reconstruct its facilities in order to accommodate the specific requirements of the road authorities. Most commonly, this involves relocating lines to accommodate changes to roads, highways and bridges. The cost of the plant relocation is either fully or partially recoverable, depending on the specific circumstances of each project.

The number of relocation projects can vary significantly from year to year depending on the number of government infrastructure projects and economic conditions influencing individual 3rd party development projects.

This program involves the management and construction of 400 to 600 line projects on an annual basis.

Projected spending is based on historical costs taking into account any observed trending and identified joint-use and relocation work scheduled for 2008.

Results:

Hydro One Distribution will meet its contractual and legal obligations, and maintain property rights for Hydro One Distribution lines located on road allowances.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	32.7
Operating, Maintenance & Administration and Removals (B)	1.2
Gross Investment Cost (A+B)	**33.9**
Capital Contribution (C)	(9.0)
Net Capital (A+C)	**23.7**

*Includes overhead and Allowance for Funds Used During Construction at current rate

Hydro One Distribution – Investment Justification
Wood Structure Replacement Program

Investment Driver: DC102 **Reference #: S7**

Investment Name: Wood Structure Replacement Program **In-Service**: December, 2008

Need:
This program is needed to ensure that sub-standard wood poles that have reached their end-of-life are replaced on a timely and economic basis.

Not proceeding with this investment would increase the risk of failure under adverse conditions, leading to reduced reliability, as well as increasing public and employee safety risks.

Investment Summary:
Hydro One Distribution's system includes about 1.65 million wood poles that support approximately 113,500 kilometers of overhead circuits. This program funds the replacement of poles that have been determined to be at end-of-life as established through pole assessment techniques based on industry standards. Wood poles deteriorate over time and when their strength is reduced to the point that there is a risk of failure under adverse weather conditions, they are deemed to be at end of life. Planned replacement of poles costs much less than "emergency" or reactive replacement and will be much less disruptive to customers. As such, over the long term, there is a compelling business need to replace poles in a proactive manner, consistent with good utility practice.

Pole replacements are determined through Hydro One Distribution's pole assessment program. As of the end of 2006 approximately 50% of the pole population will have been tested, tagged with barcodes and had their respective geographic coordinates identified and recorded. Annual testing targets are to remain at about 300,000 poles. Historically, about 4% of those inspected have been found to be substandard. Based on the 2007 pole testing program and deducting substandard poles that will be replaced under other programs, it is projected that 7,000 poles will need replacement during 2008. The replacement of these poles will remove substandard poles from the system thereby maintaining reliability, and ensuring compliance with Canadian Standards Association requirements for end of life pole replacement.

Aside from this program, poles are also replaced under other programs including those dealing with trouble calls and storm damage, system capability reinforcement, sustainment projects, line relocations and joint use modifications. It is estimated that an additional 9,000 to 13,000 poles will be replaced under these other programs.

Results:
- Replace end-of-life assets to comply with utility standards, and regulatory and legal requirements.
- Maintain customer reliability by replacing end of life wood pole structures.

Costs:

	2008 ($M)

Hydro One Distribution – Investment Justification
Waste Storage Tank Replacement

Investment Driver: DC104 **Reference #:** **S8**

Investment Name: Waste Storage Tank Replacement **In-Service Date:** December 2008

Need:

This investment is required to fund the replacement of Hydro One Distribution's end-of-life PCB storage tanks (shipping containers) to prevent oil leaks and spills and to comply with legislative requirements.

Not proceeding with this investment will potentially harm the environment and place Hydro One Distribution in non-compliance with Environmental Regulations should oil and waste leak from the existing deteriorated containers.

Investment Summary:

As part of operations, Hydro One Distribution manages activities (e.g. clean up, notification, documentation, storage transportation, containment, security, inventory, inspection, reporting) related to PCBs and other wastes. The wastes, which may be in the form of liquid (e.g. oil) or solid (i.e. spill remnants, discarded contaminated equipment - pole transformers, capacitors, reclosers), are collected at numerous sites throughout the province and placed in storage tanks (for liquids) and containers (for solids). Once economical quantities of a particular waste class are gathered in these units, disposal is arranged through third party facilities.

For Hydro One Distribution waste management, the current inventory of tanks and containers is distributed at 90 sites in the province. The vast majority of waste storage tanks and containers are on average more than 20 years old. The ageing population includes a number of units that are at end-of-life and need to be replaced, i.e. corroded and developing cracks. This investment covers the replacement of PCB and waste storage tanks at 29 service centers. This investment is the second year of a 4 year program.

The deteriorated and end-of-life shipping containers pose a high risk of leakage and are very difficult to inspect or maintain due to their enclosed and compartmentalized nature. These units cannot be repaired and must be replaced to ensure environmental compliance.

Results:

- The replacement of PCB and other waste product storage tanks that are approaching end-of-life so that Hydro One Distribution can prevent spills and damage to the environment.
- The prudent management of environment risks and compliance with regulatory requirements.

Costs:

hydro one

Hydro One Distribution – Investment Justification
Defective Crossarm Replacement Program

Investment Driver: DC107 Reference #: **S9**

Investment Name: Defective Crossarm Replacement Program **In-Service:** December, 2008

Need:

This investment is required to address defective wood crossarms on the Hydro One Distribution system. Having been identified as defective, these crossarms must be replaced on a planned basis to address safety and reliability risks and to comply with the requirements of the Distribution System Code.

Not replacing defective crossarms would lead to reduced feeder reliability, potential safety hazards and violation of the Distribution System Code.

Investment Summary:

Distribution lines' equipment deteriorates over time and must be replaced when it reaches end-of-life. Crossarms are a major component on the distribution system as they are fastened to poles and support the insulators and conductors. Once these components have reached end-of-life (i.e. wood rot, severely cracked, twisted or burnt) the likelihood of their failure increases and safety and customer reliability risks reach unacceptable levels.

Each defective wood crossarm that is identified through visual inspections as part of the patrol program is given a defect rating. Crossarms that are found to be in extremely poor condition are scheduled for emergency replacement under the trouble call program. The remainder of the defective crossarms are recorded and are scheduled for replacement in order to prevent failures and address reliability issues..

In 2008, 2,000 cross-arms are expected to be replaced, from those identified during line patrols from previous years.

Results:

- Replace approximately 2,000 defective wood crossarms during 2008 to eliminate known safety hazards to the public and to Hydro One Distribution staff
- Replace defective wood crossarms before failure and thereby address customer reliability risks.
- Replace end of life components to comply with regulatory requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.7
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	**1.9**

*Includes Overhead at current rates. No Allowance for Funds During Construction is charged due to monthly capitalization.

Date: August 2007

Hydro One Distribution – Investment Justification
Submarine Cable Replacement Program

Investment Driver: DC107 Reference #: **S10**

Investment Name: Submarine Cable Replacement Program **In-Service**: December, 2008

Need:
This investment is required replace sections of submarine cables at the shoreline, whose neutral/armour wires have corroded and pose safety and reliability risks, and to replace deteriorated submarine cables that have experienced a high rate of failure.

If this work is not completed, there is a likelihood of serious injury to the public as a result of fault current from damaged cables at the shoreline. Furthermore, customer reliability expectations may not be met.

Investment Summary:
There are approximately 2,200 circuit kilometers (single-phase) of submarine cable that are used mainly to supply seasonal island dwellings. These cables lie in rocky terrain and cross small and larger lakes, where it is difficult and expensive to build overhead lines. As a result, submarine cables provide the most cost effective solution by which to serve customers in these areas.

Asset condition assessments and past failures have shown that many of the cables, particularly at the shoreline are exposed to the elements. The ice and rocks abrade the protective armour wire allowing corrosion of the steel. This results in a loss of mechanical strength and creates a discontinuity in the grounding of the cable. The sheathing on the cable may also crack allowing water to migrate into the insulation causing an electrical failure. The problem occurs predominantly in rocky cottage locations, where it can expose the public to voltage hazards at the shoreline.

The cables to be repaired or replaced are identified during line patrols and through outage monitoring. The locations are normally identified at least a year in advance of the work being completed, allowing adequate time for planning. The cable sections proposed for replacement are prioritized based either on the condition of the armor wire where exposed at the shoreline, or based on the historical failure rate.

It is more cost effective to splice in new sections of cable at the shoreline where the damage to the cable has occurred rather than replace the entire cable. Splicing in new sections of replacement cable reinstates the mechanical protection required to protect the cable from ice and public interference. An entire cable is replaced when it reaches end-of-life, as determined by the number of failures the cable has experienced, and the length of corroded or missing neutral.

Results:
- Address end of life Submarine Cables.
- Maintain customer reliability with reduced outage frequency and duration.
- Eliminate known safety hazards to the public associated with damaged submarine cables.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.3
Operations, Maintenance & Administration and Removals (B)	0.2

Date: August 2007

Hydro One Distribution – Investment Justification
Havelock TS 57M1 Feeder Refurbishment

Investment Driver: DC 107 **Reference#: S11**

Investment Name: Havelock TS 57M1 Feeder Refurbishment **InService:** December, 2008

Need:

This investment is required to address the end-of-life condition of poles, crossarms and insulators on the 44 kV Havelock TS 57M1 Feeder, specifically the 3.2 km line section south of Bancroft DS.

Not proceeding with this investment risks prolonged outages, reliability issues, and increased public and employee safety risks due to the likelihood of wood pole and component failures.

Investment Summary:

This investment identifies section refurbishment work that is required on the Havelock TS 57M1 feeder line section located in the Bancroft area. This is a radial feeder, roughly 90 km in length that supplies about 7,500 customers with a winter peak load of roughly 15 MVA. Annual load growth is expected to be in the 1% to 1.5 % range over the planning period.

In 2003, an asset condition assessment of this feeder indicated that 23 km of the line section between Eels Lake RS and Bancroft DS had reached end-of-life. The poles in this line section are of 1948 vintage. The plan was to re-establish this section in phases, from 2004 to 2008, as a new 44 kV circuit on road allowance underbuilt with a rural 12.48 kV circuit. Poor feeder performance (long outages) stems from the fact that the section of feeder proposed for relocation is in poor condition and is difficult to access.

By the end of 2007, about 20 km of line section will have been addressed. The investment of $2.1M in 2008 is required to complete the final 3 km of rehabilitation of this feeder.

Results:

- Maintain system security and customer delivery reliability.
- Improved accessibility and outage response time.
- Reduce safety hazards to the public and employees by replacing end of life components.
- Replace end of life components to comply with regulatory requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.1
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	**2.3**
Recoverable (C)	-
Net Investment Cost (A+C)	**2.1**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Kingsville TS M3 & M6 Feeder Refurbishment

Investment Driver: DC107 **Reference #: S12**

Investment Name: Kingsville TS M3 & M6 Refurbishment **In-Service:** December, 2008

Need:

This investment is required for section refurbishment work on the Kingsville TS 27.6 kV M3 and M6 feeders.

Not proceeding with this investment risks prolonged outages, reliability issues, and increased public and employee safety risks due to the likelihood of wood pole and component failures.

Investment Summary:

These are radial feeders that together supply about 7,000 Hydro One Distribution, Chatham-Kent Hydro, and Essex Power customers. The M3 feeder supplies about 2500 Hydro One customers and embedded distributor – Chatham-Kent Hydro. The M6 feeder is used almost exclusively to supply embedded distributor Essex Power. Both feeders have a history of poor performance in terms of both outage duration and frequency. Annual load growth is expected to be about 1.5% over the planning period.

The M3 and M6 feeders supply over 40 MW of load with limited back-up supply during the peak summer months. This investment is required to address the end-of-life condition of poles and cross-arms on the two 27.6 kV feeders.

The main line section to be addressed is the 5 km M3/M6 double-circuit line section between Town Line Road (near switch B99X) and Hwy 77 (north of the former Town of Leamington). The other section to be addressed is the 2.5 km single-circuit M3 line section from Hwy 77 to Wheatley RS. Both line sections are within a high lightning strike area.

An asset condition assessment of the line sections has been completed, indicating that 130 poles should be replaced due to inadequate pole height and end-of-life pole condition.

The plan is to complete 130 pole replacements, addressing pole condition and correct clearance deficiencies. In addition, lightning protection will be installed in those sections where pole replacements are being completed.

Results:

- Maintain system security and customer delivery reliability by replacing end of life components.
- Improve feeder lightning performance in a high lightning strike area.
- Reduce potential safety hazards to the public and Hydro One employees by replacing end of life components
- Replace end of life components to comply with regulatory requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.5
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	**1.7**
Recoverable (C)	-
Net Investment Cost (A+C)	**1.5**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution– Investment Justification
Lindsay TS D4M7 Phase 4 of 5

Investment Driver: DC107 **Reference #: S13**

Investment Name: Lindsay TS D4M7 Phase 4 of 5 **In-Service Date:** December, 2008

Need:

This investment is required to address the end-of-life condition of poles and crossarms on the 44 kV Lindsay TS D4M7 feeder; specifically the 3.7 km line section between Bulmer's Road and Fairburn Road, in the Fenelon Falls area.

Not proceeding with this investment risks prolonged outages, reliability issues and increased public and employee safety risks due to continuing feeder deterioration.

Investment Summary:

This investment consists of section refurbishment work that is required on the Lindsay TS D4M7 feeder. This is a 36 km long line supplying approximately 4,200 customers. Annual load growth is expected to be in the 1% to1.5% range over the planning period. The section proposed for rehabilitation is more than 50 years old.

An Asset Condition Assessment study of this feeder and other rural feeders in the area has been completed. Findings of this study identified that about 65% of the poles on the 16.5 km line section between Bobcaygeon Duke DS and Switch D406-2 have reached, or are very near to end-of-life. The study also revealed that the neighbouring F1 and F2 rural feeders, located on the road allowance would require refurbishment within the next 5-10 years.

In order to address these issues, a number of possible alternatives were analysed and compared. The preferred plan is to relocate the entire 16.5 km section of feeder onto road allowance in the same location as the rural feeders also nearing end-of-life, and in the process transfer the rural feeders onto the new 44 kV structures. This solution would address both component end-of-life and improve reliability by providing improved access to the 44 kV feeder by relocation to road allowance from off-road.

This is the fourth phase of a five year plan. Under this phase, a 3.7 km section of new line will be built, with provisions for underbuild circuits (rural and Joint Use) from Bulmer's Road to Fairburn Road.

An investment of $1.2 million is required to complete Phase 4 of 5 phases to rehabilitate this feeder.

Results:

- Replace end-of-life assets to comply with regulatory requirements.
- Address public and employee safety risks by replacing end of life assets.
- Improved customer reliability by relocation from off road to road allowance and by replacing end of life assets.
- Reduce vegetation management costs by relocating onto road allowance.
- A reduction of losses of 3.1 kW during peak periods.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.2
Operations, Maintenance & Administration and Removals (B)	0.1
Gross Investment Cost (A+B)	**1.3**

Net Investment Cost (A+C)	**1.2**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Longlac TS M1 Feeder Refurbishment

Investment Driver: DC 107 **Reference #**: **S14**

Investment Name: Longlac M1 Feeder Refurbishment **In-Service:** Dec, 2008

Need:

This investment is required to address the end-of-life condition of poles, crossarms and insulators on the 44 kV Longlac S M1 Feeder, specifically the 4.3 km section starting at Longlac West DS to Picnic Point Road.

Not proceeding with this investment risks prolonged outages, reliability issues, and increased public and employee safety risks due to the likelihood of wood pole and component failures.

Investment Summary:

This investment is part of a multi-year plan started in 2003 to refurbish a 22 km section of Hydro One Distribution's Longlac TS 16M1 feeder. The Longlac TS 16M1 feeder is a 44 kV circuit supplying all load east of Geraldton including the town of Longlac and the area's lumber industry. This feeder is a radial supply to this area, with a main trunk roughly 36 km in length and approximately 50 years old. This feeder supplies about 1,220 customers with a winter peak load of roughly 18.3 MVA. Load growth is expected to be between 1% and 4%, with the likely need for a 2^{nd} 44 kV circuit by 2014.

An ACA study of the feeder identified that the majority of poles had components that had reached end of life. In the past several years the town of Longlac had experienced several long duration outages, primarily related to end of life crossarm and insulator failures that needed to be addressed. A number of alternatives were considered in determining the most cost effective solution to provide an acceptable level of security to customers and replace end of life, or near end of life components. The alternative selected was to rebuild the entire 22 km line section in poor condition and re-establish the feeder as a new 44 kV circuit with a rural underbuilt 7.2/12.48 kV circuit, as well as provisions for a future 2^{nd} 44 kV circuit.

This investment represents the final 4.3 km on the main line of the Longlac TS M1 feeder to be rehabilitated.

Results:

- Maintain system security and customer delivery reliability by replacing end of life assets.
- Reduce potential safety hazards to the public and Hydro One employees.
- Replace end of life components to comply with regulatory requirements.
- A reduction in line losses of 10 kW at peak periods.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.1
Operations, Maintenance & Administration and Removals (B)	0.1
Gross Investment Cost (A+B)	**1.2**
Recoverable (C)	-
Net Investment Cost (A+C)	**1.1**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Minden TS 87M1 Phase 3 of 4

Investment Driver: DC 107 **Reference #: S15**

Investment Name: Minden TS 87M1 – Phase 3 of 4 **In-Service:** December 2008

Need:

This investment is required to address the end-of-life condition of poles, crossarms and insulators on the 44 kV Minden TS 87M1 Feeder, specifically 4.5 km of the line section between Haliburton and Tory Hill, located in the Minden area.

Not proceeding with this investment risks continued prolonged outages, reliability issues, and safety concerns for the public and employees.

Investment Summary:

This investment identifies refurbishment work that is required on a section of the Minden TS 87M1 feeder located in the Minden area. This radial feed, roughly 40 km in length, supplies about 5,000 customers with a peak load of roughly 10 MVA. Annual load growth is expected to be in the 1% to 1.5 % range over the planning period.

An assessment of the condition of the line has indicated that 11 km of the 24 km line section between Haliburton DS and Tory Hill DS has reached end-of-life. The poles in this line section have tested poorly, with the majority identified as substandard.

After assessing alternatives, it was identified that the preferred plan was to re-establish this section as a new 44 kV circuit on road allowance with a rural 12.48 kV underbuild circuit, in phases, over a number of years. Poor feeder performance stems from the fact that the section of feeder proposed for relocation is in poor condition and is difficult to access, being located in extremely rugged terrain.

A cost of $2.0M is required to complete phase 3 of 4 for the rehabilitation of this feeder. The remaining 2.5 km of new overhead line section will be completed in phase 4.

Results:

- Improve system security and customer delivery reliability by replacing end lf life components
- Improved accessibility and outage response time.
- Reduce potential safety hazards to the public and Hydro One employees.
- Replace end of life components to comply wirh regulatory requirements.
- Reduce vegetation management costs by relocating onto road allowance.
- A reduction in line losses of 28 kW.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets	2.0
Operations, Maintenance & Administration and Removals	0.2
Gross Investment Cost	**2.2**

Net Investment Cost	**2.0**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Hydro One Distribution – Investment Justification
Town of Thessalon Rebuild – Part 2 of 4

Investment Driver: DC107 **Reference #: S16**

Investment Name: Town of Thessalon Rebuild – Part 2 of 4 **In-Service:** December, 2008

Need:
This investment is required to address the end-of-life condition of poles, conductor, and associated overhead line components operating at 2.4 kV in the Town of Thessalon.

Not proceeding with this investment would present reliability and safety risks to residents of Thessalon associated with overhead line assets that are at end of life.

Investment Summary:
The Town of Thessalon is an acquired Municipal Electric Utility that has a 2.4 kV delta distribution network supplied from two 25kV/2.4 kV Distribution Stations with a total load of about 4.0 MVA.

An ACA has concluded that the majority of the 2.4 kV system in Thessalon is at end-of-life and in need of replacement. Specifically;
- more than 50% of the poles are at end-of-life.
- there are numerous sections of frayed and/or "suspect" conductor.
- numerous instances of substandard clearances, including clearances to joint-use tenants and street lights.
- substandard conductor ground clearances.

In addition, an ungrounded 2.4 kV delta distribution network is not a common North American electric utility installation. Hydro One Distribution Standards do not cover a 2.4 kV delta system, and as such there are no approved work methods, materials, or construction standards for this system.

A review of the options for addressing the end-of-life assets and non-standard system in Thessalon concluded that the preferred alternative is to re-build the Town's distribution network and convert it to 25/14.4 kV operation in four stages This voltage is consistent with the existing Hydro One Distribution system supplying the area around Thessalon. Completion of this work will allow the elimination of two Distribution Stations.

Phase 1 of this plan will be completed in 2007. This investment covers phase 2 of the recommended plan.

Results:
- Replace end-of-life distribution line assets and bring the distribution network in the Town of Thessalon up to present-day Hydro One Distribution Standards.
- Mitigate reliability and safety risks associated with end-of-life distribution line assets.
- Replace end of life assets to comply with regulatory requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets	1.3
Operations, Maintenance & Administration and Removals	0.2
Gross Investment Cost	**1.5**
Recoverable	-
Net Investment Cost	**1.3**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Fort Frances TS M1 Feeder Rehab Phase 3

Investment Driver: DC107 **Reference** #: **S17**

Investment Name: Fort Frances TS M1 Rehab **In-Service:** December, 2008

Need:

This investment is required to address the end-of-life condition of poles and crossarms on the 44 kV Fort Frances TS M1 feeder, specifically the 14 km line section between Straton and Pinewood.

Not proceeding with this investment risks prolonged outages, reliability issues, and leads to continuing feeder deterioration.

Investment Summary:

Hydro One Distribution's Fort Frances 22M1 feeder is a 44kV line emanating from Fort Frances TS that feeds 7 Hydro One Distribution stations as well as a major customer, Abitibi Paper. It supplies the communities that are situated along the Rainy River west from Fort Frances.

This investment is the third phase of a multi-year plan that includes refurbishment work on a 14 km line section of the Fort Frances TS M1 between Straton and Pine River DS. The M1 feeder is a 94 km long line supplying approximately 3,500 customers. Annual load growth is expected to be less than 1% over the planning period.

An Asset Condition Assessment study of this feeder has been completed. Findings of this study identified that there is a need to address deteriorated line sections of this feeder. The sections proposed for rehabilitation are 50 plus years old and represent about 30% of the total feeder length. The preferred plan is to rehabilitate the feeder over a number of years, replacing poles and insulators, but not the conductor. The conductor is adequate to meet future customer load requirements and has a remaining life of at least 20 years. This solution would address both component end-of-life and the reliability issues.

Results:

- Improved customer reliability and address safety issues by replacing end of life components
- Replace end-of-life assets to comply with regulatory requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets	1.8
Operations, Maintenance & Administration and Removals	0.2
Gross Investment Cost	**2.0**
Recoverable	-
Net Investment Cost	**1.8**

*Includes overhead and Allowance for Funds Used During Construction at current rates

Hydro One Distribution - Investment Justification
Metering for Shared Use Distribution Charges

Investment Driver: DC109 **Reference #**: **S18**

Investment Name: Metering for Shared Use Distribution Charges **In-Service Date**: December 2008

Need:

This investment is required for metering which is used to determine Local Distribution Companies' (LDCs') shared use of Hydro One owned distribution stations.

Investment Summary:

In situations where LDCs consume power at Hydro One owned distribution stations, the LDC's energy consumption is measured,to allow the determination of the LDC's shared use of the distribution station. The 2008 spending will install new meters at 20 sites at the cost of approximately $0.1 million at each location.

Results:

- Charge the approved OEB Shared Use Distribution Charge to those LDCs using Hydro One distribution stations.
- Recover the capital cost of the investment through the application of the approved OEB rate.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.0

Date: August, 2007

Hydro One Distribution – Investment Justification
Smart Metering - 2008

Investment Driver: CC851 **Reference #: S19**

Investment Name: Smart Metering **In-Service: January, 2010**

Need:

The Provincial Government has mandated the installation of smart meters in 800,000 homes by 2008 and installations in all homes by 2010. These meters must be capable of being read daily and of providing energy consumption data to the customer by the next business day. This investment is required to meet these requirements.

Provincial regulations provide the authorization for Hydro One Distribution to proceed with this initiative.

Investment Summary:

Meeting this mandate requires a new communication/IT infrastructure that encompasses Advanced Metering Infrastructure ("AMI") capable electronic meters, supporting telecommunications, back office integration and business process re-design, customer information system ("CIS") upgrades and other supporting IT software/hardware systems.

Hydro One will rely on the IESO as the Data Company (DataCo) appointed by the Ontario Ministry of Energy to provide the meter data management/repository ("MDM/R") functionality. Accordingly, no costs have been included in Hydro One's plan for the processing and storage of consumers' consumption information and data received from other LDCs. Only expenditures required to interface between Hydro One's AMI system and the MDM/R and the MDMR and Hydro One's CIS have been included.

Hydro One is accountable for owning and installing the smart meters ("AMCD"), collecting customer metering data over a telecommunications network ("AMRC" and "WAN") to a computer application ("AMCC"), and passing the data to DataCo's data warehouse, and receiving the data back for customer billing purposes.

Hydro One Networks Distribution Business' share of the Provincial target is forecast to be about 1.3 million meter installations by 2010, with about 240,000 installations by 2008. The company is on track to meet these targets.

This project carries risks. Smart meters are a relatively new technology without significant deployment to date. Evolving directions regarding specifications, accountabilities and timelines also remain a risk. For example, until a smart meter entity (SME) -- the data warehouse that is inserted in the middle of the meter-to-bill process – is created, and plans developed, Hydro One cannot finalize its plan to integrate its AMR to provide hourly data or develop TOU billing capability. It has done extensive work to identify these risks and mitigate them to the extent possible, however.

Capital expenditures in 2008 will be focused on:

- The installation of additional smart meters and related advanced metering communications devices ("AMCDs");
- Building and expanding the advanced metering regional collector ("AMRC") and underlying networks to accommodate an increasing number of meters coming on-stream;
- Commissioning and placing into service, hardware and software for the AMCC to enable it to communicate and transmit quality meter data to/from the MDM/R and the company's CIS
- Upgrades to our CIS system to provide for TOU biliing and related required settlement changes
- Integration of the end to end systems including business process redesign, and
- Project management and the expertise required to accomplish the above tasks.

Operating expenditures in 2008 will be focused on:

- Maintaining and operating hardware, software and software licenses associated with the AMCC;
- Telecommunication charges associated with operating the LANs and WAN;
- Maintaining smart meters that have been placed into service;

- Managing, developing and implementing business process redesign, change management (including staff training) and customer communication related work; and
- Responding to higher customer inquiries pre- and post-installation of smart meters on customer premises.

Results:

- 370,000 incremental meter installations in 2008 (for a total of 610,000).
- Communications network required to support the installed meters, also in place.
- Core systems modified/built to support limited commencement of time of use billing.
- Business proceses re-engineered to support smart metering.
- Limited cost savings in the areas of meter reading, meter sampling and reverification.

Costs:

Hydro One Distribution – Investment Justification
New Connections, Upgrades and Service Cancellations - 2008

Investment Driver: DC201 **Reference #: D1**

Investment Name: New Connections, Upgrades and Service Cancellations **In-Service:** December, 2008

Need:

These investments are required to meet the on-going demand to connect new customers to Hydro One Distribution's network, upgrade services of existing customers, and the cancellation of service.

Not proceeding with these investments would result in non-compliance with Distribution license requirements and with obligations under the Distribution System Code. This work is therefore a regulatory requirement.

Investment Summary:

Each year, Hydro One Distribution connects new customers to the distribution network, upgrades services for existing customers and removes facilities when customers cancel services.

As part of the obligations in Hydro One's electricity distribution license and the distributor's responsibilities in the Distribution System Code (DSC), Hydro One Distribution is required to make an offer to connect all distribution customers on a non-discriminatory basis, upon written request for connection.

A service upgrade occurs when a customer requires a larger service entrance. A service upgrade normally requires the preparation of a service layout and replacement of secondary service wires. Transformers may also have to be upgraded, meters replaced and possibly additional transformation installed.

For cancellations of existing service, Hydro One Distribution is required to remove the idle assets (transformers, poles, service wires, meters, etc.) for safety and security reasons. The cost for this work is charged to depreciation, where most other costs associated with new connections and upgrades are capitalized.

Individual investments within these programs are managed on a project basis. Projects include design (service layouts), labour, material and other costs associated with actual physical connection or removal.

A standard connection consisting of a service layout, overhead transformation, 30 m of overhead conductor, and standard retail metering (including smart meters) is provided free of charge to new customers that "lie along" the existing network, as per the DSC requirements. For customers that require expansion of the network in order to be connected, a discounted cash-flow calculation is used to determine customer contributions. The capital contribution is based on any shortfall between future revenues and the cost of connection, network expansion and reinforcement. Customer contributions for system expansions, plus other recoverable costs beyond the standard connection, are forecast at $23.7M for the year.

Projected cost for these programs are primarily based on historic demand and forecast load growth that takes into consideration the Ontario Gross Domestic Product and Ontario Building Permits.

Results:

- Connect new customers.
- Upgrade the services of existing customers.
- Remove assets when services are cancelled.
- Satisfy the requirements of the Distribution System Code and Distribution License.

Costs:

	2008($M)
Capital* and Minor Fixed Assets (A)	127.6
Operations, Maintenance & Administration and Removals (B)	6.7
Gross Investment Cost (A+B)	**134.3**

Hydro One Distribution – Investment Justification
2008 Demand Investments

Investment Driver: DC202 **Reference #:** **D2**

Investment Name: 2008 Demand Investments **In Service:** December 2008

Need:
This investment is required to provide a capability for the Customer Operations' function to resolve lower cost critical issues identified by customers or system impact assessments on a short lead-time basis.

Not proceeding with this investment would result in deteriorated service reliability and quality causing decreased customer satisfaction and substandard supply. Damage to distribution system assets could result.

Investment Summary:
Minor distribution system modifications are required to address system needs identified by customer power quality complaints, reliability concerns, system impact assessments and customer connection requests. Responding to these needs ensures an adequate supply of electricity to customers.

Technical criteria are used in assessing system/customer needs. Minor system modifications/betterments addressed by this plan include items such as protection coordination, and installing new equipment or equipment upgrades. Modifications that will cost over $0.1M are assessed individually and are subject to a separate approval.

Results:

- Maintain reliability and quality of service within supply standards.
- Address customer and reliability issues in an expedient manner.

Cost:

	2008($M)
Capital* and Minor Fixed Assets (A)	1.1
Operations, Maintenance & Administration and Removals (B)	0.1
Gross Investment Cost (A+B)	**1.2**

Hydro One Distribution – Investment Justification
Subtransmission Feeder Sectionalizing - 2008

Investment Driver: DC202 **Reference #:** **D3**

Investment Name: Subtransmission Feeder Sectionalizing **In-Service :** December, 2008

Need:

This investment is required to achieve a corporate goal to move Hydro One Distribution reliability to upper-quartile.

If this investment is cancelled, customers would not receive the benefits of improved reliability on the worst performing subtransmisison feeders. As well, not proceeding with this investment would present customer and reputation risks as a result of not having targeted system modifications that cost effectively improve the reliability of supply to distribution customers.

Investment Summary:

Feeder sectionalizers automatically isolate a portion of the feeder for downstream faults, reducing the number of customers affected. Subtransmission feeders (27.6 kV & 44 kV feeders supplied from Transformer Stations (TSs)) offer the greatest opportunities to improve reliability since they supply large amounts of load, and historically have not employed automatic sectionalizing for faults. Since 2005, the approved Business Plan has included funding for installing mid-feeder sectionalizers on the worst performing feeders over the period 2005-2007. The program has been extended to 2008 to complete the program, as not all feeders were completed during the 2005 to 2007 period due to the need to complete other higher priority work.

This investment is to provide mid-feeder sectionalizing on 32 subtransmission feeders in 2008, bringing the total number of feeders provided with sectionalizing to 86, with 30 feeders completed in 2005-2006 and 24 planned for 2007. The feeders have been selected based on having the highest number of customer interruptions and interruption hours (highest contributions to provincial SAIDI & SAIFI), plus the suitability for sectionalizer application.

This investment represents the final phase of the provincial program to install subtransmission feeder sectionalizing on the poorest performing subtransmission feeders.

Results:

- Individual sub-transmission feeders will see customer outages and outage durations reduced on average by about 25%.
- Feeder sectionalizing will improve reliability. On average, this investment will reduce provincial SAIFI and SAIDI by 1.5% and 1.8% respectively bringing the total expected improvement at the end of the program to 4.5% and 5.5% respectively.

Costs:

	2008($M)
Capital* and Minor Fixed Assets (A)	2.2
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	**2.4**
Recoverable (C)	-
Net Capital Cost (A+C)	**2.2**

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Hydro One Distribution – Investment Justification
Armitage TS M12 Feeder Extension

Investment Driver: DC202 **Reference #:** D4

Investment Name: Armitage TS M12 Feeder Extension **In Service:** June 1, 2008

Need:

This investment is required to provide adequate 44 kV feeder capacity in the southern area of Whitchurch-Stouffville.

Not proceeding with this investment would lead to overloaded assets and the inability to serve new load presenting reliability, customer, regulatory and reputation risks as a result.

Investment Summary:

Whitchurch-Stouffville is a high-growth suburban community north of the City of Markham. Significant load growth is occurring in the southern part of the town, including several large commercial loads. The expected growth rate is 3.2 % per year. The existing 44 kV feeders in the area are unable to supply the additional load.

Two existing 44 kV feeders supplying the southern part of Whitchurch-Stouffville had exceeded their planning criteria in 2006. The situation is expected to worsen as additional load is added.

Various alternatives were analyzed and compared to address the situation. The preferred plan is to extend Armitage TS M12 by 6km and reconfigure it to supply the southern part of the town and relieve existing feeders. The work is consistent with the feeder development recommendations of the Whitchurch-Stouffville supply study.

Results:

- Provide adequate 44 kV feeder capacity to supply southern Whitchurch-Stouffville.
- Relieve overloaded feeders.
- Line losses will be reduced by 740 kW.
- Implement a cost effective life cycle plan.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.7
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	1.9
Recoverable (C)	-

Date: August 2007

Hydro One Distribution – Investment Justification
Holland Junction TS Feeder Development

Investment Driver: DC202 **Reference #: D5**

Investment Name: Holland Junction TS Feeder Development **In-Service:** December, 2008

Need:

This investment is required to provide adequate 44 kV feeder capacity in northern York Region.

Not proceeding with this investment would lead to overloaded assets and the inability to serve new load presenting reliability, customer, regulatory and reputation risks as a result.

Investment Summary:

Northern York Region, including the areas of Newmarket, Aurora, Bradford, East Gwillimbury and Whitchurch-Stouffville, is largely supplied from Armitage TS. Significant load growth is occurring in all of these areas due to increases in population as well as commercial and industrial developments. The load growth for the Hydro One Distribution area is expected to be 3.1 % per year for the next several years.

Armitage TS has exceeded its LTR rating and requires relief. Hydro One Networks has been directed by the Ontario Energy Board to construct a new transformer station in the vicinity of Holland Junction in King Township. The anticipated in-service date for the transformer station is prior to the 2009 summer peak.

Various alternatives were analyzed and compared to address the situation. The preferred plan is for Hydro One Distribution and Newmarket Hydro to each construct four 44kV feeders from the new TS. This project is for Hydro One Distribution to construct two 44 kV feeders from Holland Junction TS to Hwy 11.

Results:

- Transfer load from Armitage TS to Holland Junction TS.
- Provide adequate 44 kV feeder capacity to supply Northern York Region at least cost.
- Line losses will be reduced by 74kW
- Implement life cost cycle plan

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.8
Operations, Maintenance & Administration and Removals (B)	0.3
Gross Investment Cost (A+B)	3.1
Recoverable (C)	-
Net Investment Cost (A+C)	2.8

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Hydro One Distribution – Investment Justification
Curve Inn DS new T2 and feeder

Investment Driver: DC202 **Reference #:** **D6**

Investment Name: Curve Inn DS T2 and Feeder **In Service:** December, 2008

Need:

This investment is required to provide adequate 27.6 kV transformation capability in the southwestern part of the Municipality of Clarington.

Not proceeding with this investment would present reliability, customer, reputation and regulatory risks as the result of overloading assets

Investment Summary:

The southwestern part of the Municipality of Clarington is a high-growth suburban area adjacent to City of Oshawa. Significant load growth is occurring in this area, including several large commercial and residential developments. The existing facilities in the area are unable to supply the additional load.

The load growth in Clarington southwest is projected to be 3.8% per year for the next 5 years. The areas are largely supplied by Park Road DS which has a station capacity of 35.7MVA. This capacity will be exceeded in year 2008 when the load on the station is expected to reach 36.8MVA.

Various alternatives were analyzed and compared to address the situation. The preferred plan is to add a new 12 MVA transformer at the existing Curve Inn DS and provide load relief to Park Road DS by transferring Wilmot Creek community load to Curve Inn DS. This investment will address the growing loads in the Municipality of Clarington for the next 5 years, The load relief will also improve the supply reliability to the Wilmot Creek community, as the new feeder will be about 5 km shorter.

Results:

- Provide additional transformation capability.
- Relieve overloading of Park Road DS.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.7
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	2.9
Recoverable (C)	-
Net Investment Cost (A+C)	2.7

Date: August 2007

Hydro One Distribution – Investment Justification
Gardiner TS II 44 kV Feeders

Investment Driver: DC202 **Reference #: D7**

Investment Name: Gardiner TS II – 44 kV Feeders **In Service:** June 2008

Need:
This investment is required to relieve loading on Gardiner TS and Frontenac TS that supply Hydro One Distribution. Transferring load to a new TS is the least cost option for maintaining adequate capacity and supply reliability.

Not proceeding with this investment would result in an inability to relieve the existing overloaded Gardiner TS and Frontenac TS thereby resulting in decreased customer satisfaction and substandard quality of supply.

Investment Summary:
Based on the results of system studies and an analysis of alternatives, the preferred solution is the construction of a new transformer station (Gardiner TS II) on the site of the existing Gardiner TS. This will require Hydro One Distribution to build new feeder egresses from 3-44 kV feeder positions. This will enable Gardiner TS and Frontenac TS loads to be reduced below their rating (136.6 MVA and 105.9 MVA respectively) for at least the next 10 years.

This investment funds a capital contribution to Hydro One Transmission as stipulated in the Transmission System Code for building the new TS in the amount of $1.0 million, as well as the cost of installing IESO compliant metering at a cost of $0.3 million.

Results:
- Provide adequate transformation capacity to supply Hydro One Distribution's load growth.
- Optimize transformer and feeder utilization and balance by transferring load to the new TS.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.3
Operations, Maintenance & Administration and Removals (B)	-
Gross Investment Cost (A+B)	1.3
Recoverable (C)	-
Net Investment Cost (A+C)	1.3

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Brockville Area Upgrade

Investment Driver: DC202 **Reference #: D8**

Investment Name: Brockville Area Upgrade **In Service:** December 2008

Need:

This investment is required to meet growing loads in the Brockville area, ensure that system protection criteria are met, and address failed distribution system components.

Not doing the proposed work will lead to overloading of feeders, inability to serve additional loads in some parts of the municipality, increasing customer dissatisfaction with power quality, reducing the ability to provide timely service restoration following outages, risk that system protection criteria are not being met and reducing reliability.

Investment Summary:

The Brockville "City" area requires supply capacity reconfiguration at the distribution voltage level. Distribution customers are supplied either directly at 44 kV from the transformer station, or at 4.16 or 8.32 kV from distribution stations. An assessment of the supply to Brockville shows heavy/imbalanced feeder loading and aged/failed underground conductors have been identified. One 44 kV line is loaded beyond Hydro One's planning criteria (loading is 27 MVA compared to 25 MVA which initiates a capability review).

Limited capability to supply new loads or provide satisfactory outage restoration exists. Brockville's total load is 61 MVA with 1.5% growth.

This investment will improve feeder loading and balance, provide improved alternate supply capability, and satisfy the need to ensure that distribution protection criteria are observed. Failed distribution system components will be replaced and upgraded to be capable of handling future demands. System protection will be reviewed and modified as required on the eight DSs in the Brockville area to ensure safe and reliable operation of the system.

Results:

- Distribution Station and feeder capacity will be adequate to serve loads in Brockville over the next 5 to 10 years.
- Voltage and power quality will be within CSA and industry standards.
- Deterioration of reliability will be avoided.
- Due diligence regarding protection settings will be satisfied.
- Losses will be reduced by 30 kW.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.2
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	2.4
Recoverable (C)	-
Net Investment Cost (A+C)	2.2

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Ingersoll North DS Voltage Conversion

Investment Driver: DC202 **Reference #**: **D9**

Investment Name: Ingersoll North DS Voltage Conversion **In Service:** December, 2008

Need:

This investment is needed to address end-of-life conditions at the 27.6/8.32 kV Ingersoll North DS, and to supply forecast new loads in the Hwy. 19 & Hwy. 401 area near Ingersoll.

Not proceeding with this investment would present customer, regulatory and reputation risks as a result of deteriorating performance of assets that are at end-of-life, and insufficient system capacity for forecast loads.

Investment Summary:

Ingersoll North DS is a 3.6 MVA, 27.6/8.32 kV station that currently supplies 3.2 MVA of load via a 8.32 kV feeder (the F2 feeder). The station is 55 years old and has been deemed to be at end-of-life based on a detailed condition assessment\. The F2 feeder supplies load along Hwy. 19 south of Ingersoll towards Hwy. 401 and then the surrounding rural areas to the south of the Hwy 401. Along Hwy. 19, two developments are planned, a new residential subdivision and a new auto parts plant. Both developments will "lie-along" the existing F2 feeder.

To address the end-of-life conditions at Ingersoll North DS, as well as supply the new load connections in the area, the preferred plan is to eliminate Ingersoll North DS through a combination of 27.6/16 kV voltage conversion and the installation of step-down transformers at strategic locations. In order to achieve this, a new metered 27.6/16 kV Supply Point is required, and approximately 25 km of insulation upgrades, protection changes and removals are required.

Results:

- Replace DS assets that are at end-of-life.
- Provide sufficient distribution feeder capacity to serve forecast new loads along Hwy. 19, south of Ingersoll.
- Reduce peak Line Losses by 130 kW.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.9
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	2.1
Recoverable (C)	-
Net Investment Cost (A+C)	1.9

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Kleinburg TS Feeders to Bolton

Investment Driver: DC202 **Reference #: D10**

Investment Name: New Kleinburg TS Feeders to Bolton **In Service:** December, 2008

Need:

This investment is required to provide adequate 44 kV and 27.6kV feeder capacity in the Bolton area.

Not proceeding with this investment will continue to present reliability, customer, regulatory and reputation risks as a result of overloaded assets.

Investment Summary:

Bolton is a high-growth suburban community in the town of Caledon, north of Brampton and west of the City of Vaughan. Bolton is experiencing significant load growth that includes several large commercial and industrial developments. The expected growth rate is 3.3 % per year. The existing 27.6 kV and 44 kV feeders in the area are unable to supply the additional future load.

Two existing 44 kV feeders and three 27.6kV feeders supplying the Bolton area exceeded their planning criteria in 2006. The situation is expected to worsen as additional load is added.

Various alternatives were analyzed and compared to address the situation. The preferred plan is to build two new feeders, one 44 kV and one 27.6 kV from Kleinburg TS for about 12 km on the same pole line and reconfigure the supply in the northern part of Bolton, thereby relieving the existing overloaded feeders.

Results:

- Provide adequate 44 kV and 27.6 kV feeder capacity to supply Bolton area.
- Line losses will be reduced by 47 kW.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	3.6
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	**3.8**
Recoverable (C)	-
Net Investment Cost (A+C)	**3.6**

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Hydro One Networks – Investment Justification
Belle River TS M2 Feeder to Haycroft DS

Investment Driver: DC202 **Reference #:** **D11**

Investment Name: Belle River TS M2 Line to Haycroft DS **In Service:** December, 2008

Need:

This investment is needed to address the overloading of 115/27.6 kV Tilbury West HV DS.

Not proceeding with this investment would present customer, reliability, regulatory and reputation risks as the result of overloading assets.

Investment Summary:

Tilbury West HV DS supplies the Town of Tilbury (Chatham-Kent Hydro service territory) and the Hydro One service territory surrounding the town. The Town of Tilbury is located along Hwy 401 about 45 km east of the City of Windsor.

Tilbury West HV DS is a 15/25 MVA 115/27.6 kV station. Load in the HV DS exceeds its rated capacity by 3 MVA. The preferred (least cost) plan to transfer part of the station's load on to the new Belle River TS was placed into service in May 2006.

This investment covers the extension of the Belle River TS M2 feeder by about 7.5 km to Haycroft DS. Haycroft DS will be transferred from the Tilbury West HV DS F1 feeder to the Belle River TS M2 feeder, thereby reducing the load on Tilbury West HV DS to within acceptable standards.

Results:

- Improve reliability by providing adequate load relief for Tilbury West HV DS for the next 10 years, at least cost.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.9
Operations, Maintenance & Administration and Removals (B)	0.1
Gross Investment Cost (A+B)	2.0

Net Investment Cost (A+C)	1.9

*Includes Overhead and Allowance for Funds Used During Construction at current rates

Date: August 2007

Hydro One Distribution – Investment Justification
Seaforth M5 27.6 kV, 25 MVA Voltage Regulation

Investment Driver: DC202 **Reference #:** **D12**

Investment Name: Seaforth M5 27.6 kV, 25 MVA Voltage Regulation **In-Service :** December, 2008

Need:

This investment is required to maintain supply voltage within Distribution System Code requirements on the Seaforth M5 feeder.

Not proceeding with the proposed improvement will lead to unacceptably low voltage, inability to connect additional customers in some parts of the municipality and increasing customer dissatisfaction as a result of power quality issues.

Investment Summary:

As recent as November 2006, Festival Hydro identified a new customer (8-10 MVA ethanol plant) to be located within Festival Hydro's service area in the town of Hensal. The Town of Hensal is supplied from the Seaforth M5 feeder at 27.6kV and is approximately 22 km from Seaforth TS. The total line length is 25 km.

Load flow studies indicate that by 2008 that there will be substandard voltage starting at a point approximately half way along the feeder (12 km). Hydro One customers connected to the furthest 12 km and Festival Hydro (Town of Hensal) will experience low voltage if remedial action is not taken. This condition can be avoided with the installation of a new 27.6kV, 25 MVA regulator approximately 10 km from Seaforth TS.

Load in the area is expected to continue to grow at 1.5 % per year. The installation of a new regulator as proposed will ensure that voltage levels on the Seaforth M5 will remain within acceptable standards for a period of 5 years.

Results:

- Avoid substandard voltage problems when the new ethanol plant connects in 2008.
- Improve voltage regulation.
- Reduce line losses by 46 kW.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	1.4
Operations, Maintenance & Administration and Removals (B)	-
Gross Investment Cost (A+B)	1.4
Recoverable (C)	-
Net Investment Cost (A+C)	1.4

Date: August 2007

Hydro One Distribution – Investment Justification
Stayner TS x Blue Mountain – Build 2 New 44 kV Feeders – Stage 1

Investment Driver: DC202 **Reference #: D13**

Investment Name: Stayner TS x Blue Mountain - Build 2 New 44 kV Feeders **In-Service:** December, 2008

Need:

This investment is required to maintain acceptable supply conditions to customers in the Blue Mountain area, meet load growth in the area and avoid the risk of unsupplied load due to feeder loading beyond protection limits.

Not proceeding with this investment will result in substandard voltage and protection conditions on the existing 44 kV feeders supplying the Blue Mountain area.

Investment Summary:

Load in the Blue Mountain and Collingwood area is supplied at 44 kV from Meaford TS and Stayner TS. The two most heavily loaded feeders are the Meaford TS M1 at 37 MVA, and the Stayner TS M1 at 32 MVA. Load on these two feeders is expected to grow at a rate of 2-2 ½ % over the next several years due to new residential and tourist developments. By winter 2008/2009, the voltage at the end of both feeders is projected to be below CSA standard of 94% of nominal unless relief is provided.

In 2006, the OPA issued a report recommending that additional transmission capacity be provided to the Southern Georgian Bay area by converting Stayner TS from 115 kV to 230 kV and installing 230-115 kV auto-transformation at this location. The additional capacity at Stayner TS will consist of 75/125 MVA transformers replacing existing 50/83 's, plus 3 new 44 kV feeder positions.

This investment covers Stage 1 of a plan to extend two new 44 kV feeders from Stayner TS to the Blue Mountain area in order to relieve the existing Meaford TS M1 and Stayner TS M1 feeders. Stage 1 involves 10 km of new double-circuit 44 kV wood pole line, overbuilding existing rural distribution circuits, and connected to existing M1 & M3 feeders out of Stayner TS. A separate investment will be issued for Stage 2, for 2009 construction, which will extend the 2 new feeders to Stayner TS to co-incide with the in-service date of the station upgrade.

Results:

- Maintain supply conditions within CSA standards in the Blue Mountain area.
- Provide new feeders to utilize new transmission capacity at Stayner TS.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	4.6
Operations, Maintenance & Administration and Removals (B)	0.5
Gross Investment Cost (A+B)	**5.1**

Date: August 2007

Hydro One Distribution – Investment Justification
Timmins TS M9 Feeder Extension

Investment Driver: DC202 **Reference #:** **D14**

Investment Name: Timmins TS M9 Feeder Extension **In-Service:** December, 2008

Need:

This investment is needed to address forecast overloading of Hoyle DS. It also addresses replacement of 4 kV line assets that are nearing end-of-life and reduces system losses.

Not proceeding with this investment would present reliability, customer, regulatory and reputation risks as the result of overloading assets.

Investment Summary:

Customers located east & south-east of Timmins are supplied by Hoyle DS, a 115-27.6 kV HVDS. Hoyle DS is a single-bank station and as a result its' firm load capability is limited to the 115 kV Mobile Substation rating of 15 MVA. Hoyle DS is currently loaded at about 12 MVA and is forecast to increase to 18 MVA by the end of 2007 due to a number of new and re-developing mines being connected in this area.

Prior to the mid-1990's, a portion of the load supplied from Hoyle DS was fed from the Timmins TS M9 feeder. This load was transferred to Hoyle DS when construction of Placer Domes' open-pit gold mine forced the relocation of the roadway on which the M9 was located. A review of alternatives for addressing the forecast overloading of Hoyle DS has concluded that the preferred plan is to re-establish the M9 supply eastwards through South Porcupine and transfer load in this area from Hoyle DS to Timmins TS.

This project involves extending the Timmins TS M9 feeder for approximately 1.3 km through South Porcupine by converting the South Porcupine DS F2 feeder from 4.16 kV to 27.6 kV. An additional 2.5 km of associated single-phase line taps will also be converted from 2.4 kV to 16 kV and approximately 1800 KVA of load, or about half the total load on South Porcupine DS, will be converted to 27.6 kV. This work addresses near end-of-life condition of the existing 4 kV feeder, which will otherwise require replacement in about 5 years. Also included are 2 new 27.6 kV load break switches and a new 3-phase electronically-controlled unit.

Results:

- Relieve overloading of Hoyle DS to maintain customer supply.
- Replace near end-of-life 4 kV assets fed from South Porcupine DS.
- Reduce peak Line Losses by 200 kW.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets (A)	2.1
Operations, Maintenance & Administration and Removals (B)	0.2
Gross Investment Cost (A+B)	**2.3**

Date: August 2007

Hydro One Distribution – Investment Justification
Timmins Moneta DS Voltage Conversion

Investment Driver: DC202 **Reference #:** **D15**

Investment Name: Timmins Moneta DS Voltage Conversion **In-Service:** December, 2009

Need:

To address the condition of an existing 4.16 kV distribution station and associated line assets that are at, or approaching, end-of-life.

Not proceeding with this work will result in deterioration of existing station & line equipment resulting in supply interruptions, negative environmental impacts and the reduced safety for Hydro One staff and the general public.

Investment Summary:

Prior to 2003, load in the central core of the City of Timmins was supplied via a 4.16 kV distribution network fed from four 27.6-4.16 kV Distribution Stations – Pine DS, Ninth DS, Vimy DS #2, and Moneta DS. The total load on this system was 17 MVA, about 15% of the total load in the City. The remainder of the load in Timmins is supplied directly at 27.6/16 kV via feeders emanating from Timmins TS and Laforest Road and Hoyle high voltage distribution stations (HVDS).

A condition assessment was conducted on the entire 4.16 kV network in 2001 and 2002, which concluded that the four stations were in need of extensive rehabilitation work including new circuit breakers and associated control systems, plus replacement of most structural support components. In addition, an assessment of the associated 4.16 kV feeders fed from these stations concluded that 60-70 % of the existing wood poles are at end-of-life, and there are numerous instances of substandard primary and secondary conductor which are prone to mechanical failure and/or electrical overloading.

The preferred solution is to eliminate the existing 4.16 kV system through conversion of the operating voltage to 27.6 kV supplied directly from Timmins TS, over a multi-year period. Elimination of Timmins Pine DS, Ninth DS, and Vimy DS #2 was completed in 2003, 2004, and 2006 respectively.

This investment covers the work necessary for the elimination of Timmins Moneta DS, which is the final station supplying load at 4.16 kV in the City core. This investment is planned to be carried out over a 2-year period (2008-2009). The voltage conversion work involves replacing approximately 150 end–of-life wood poles, 80 transformers and removal of Moneta DS.

Results:

- Eliminate DS assets that are at end-of-life thereby securing customer reliability.
- Replace 4.16 kV line assets that are at end-of-life with new 27.6/16 kV assets to secure customer reliability, safety and comply with regulatory requirements.
- Reduce peak Line Losses by 50 kW.

Hydro One Distribution – Investment Justification
Wholesale Metering Upgrades

Investment Driver: DC205 **Reference #:** **D16**

Investment Name: Wholesale Metering Upgrades **In-Service:** December, 2008

Need:

This investment is needed to upgrade or replace Hydro One Distribution wholesale meter points at the earliest seal expiry date of any meter or recorder of the metering installation to ensure compliance with the required Wholesale Revenue Metering Hardware Standards.

Not proceeding with this investment would expose metering not in compliance with the Market Rules to sanctions and delivery point penalties of up to 1.8 times the line capacity or transformer bank rating. As well, this would result in customer disputes concerning sales and revenues.

Investment Summary:

- The Market Rules stipulate that the earliest expiry date of any seal period of any meter forming part of a metering installation (MI), the Metered Market Participant (MMP) for the MI "shall make such alternative arrangement as may be necessary to comply with the provisions" of Chapter 6 of the Market Rules, "and of any policy or standard established by the IESO pursuant to this chapter".

- Hydro One Distribution has 50 distribution wholesale metering points where seals have or will expire in 2008. In compliance with Market Rules and to meet Measurement Canada requirements, the 50 meter installations will be upgraded as a combination of 45 full upgrades, 1 meter only upgrade and 4 meter cabinet only upgrades.

Results:

- Upgrade 50 Hydro One Distribution wholesale metering points due in 2008 at the most economical cost
- Ensuring compliance with the Market Rules and Measurement Canada requirements.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets	11.4

Hydro One Distribution - Business Case Summary
System-Data Archiving and Management

Investment Driver: DC 308 **Reference #:** **O1**

Investment Name: System-Data Archiving and Management **In-Service Date:** Sept, 2009

Need:

This investment is required to develop long term storage for distribution system data captured by ORMS and other operations systems. Effective analysis of distribution system performance trends and management of the asset sustaining programs requires the ability to store, access and evaluate data about past outages over a period of 15 years and therefore increased storage capabilities are needed.

Funding is required to prevent situations where effective analysis of performance trends, asset life and outage restoration could be impaired by the absence of historical distribution information.

Investment Summary:

In order to evaluate trends in operating performance, asset life cycle performance and forestry program effectiveness, operating data needs to be retained for up to about a 15 year time horizon. The current historical databases are oriented to the needs of operating and yearly statistical performance reporting and hence have storage capacity limited to about 5 years. Requests by planners for information have to be dealt with by operating staff who devise the appropriate queries for the request objective. As the volume of data increases, greater storage capacity and improved retrieval and analysis tools are needed to allow planners to harvest maximum benefit from this data asset.

This investment will provide long term storage of operating data from ORMS, NMS and other systems (such as weather data feeds) integrated into one archive. It will also provide extraction and analysis tools to allow planners to perform various data mining and correlation studies needed to guide optimum decisions on Distribution System investments.

Results:
- Improved targeting of the distribution system investments.
- Reduced labour cost for extracting and analysis of historical data.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets	1.3
Operations, Maintenance & Administration and Removals	-
Gross Investment Cost	1.3
Recoverable	-
Net Investment Cost	1.3

Hydro One Distribution - Investment Justification
NMS Enhancements for Distribution Monitoring and Control

Investment Driver: DC308 **Reference #:** **O2**

Investment Name: NMS Enhancements for Distribution Monitoring and Control **In-Service Date:** December 2008

Need:

This investment is needed to allow maximum benefit to be obtained from the development program to install Distribution Stations Monitoring (DSM) systems and remotely controllable sectionalizers (D1T3Sch3 section 2.2.2).

Not completing this work will result in no real-time monitoring of the Distribution Stations (DS's) and no monitoring and control of Sectionalizers from the OGCC. This means that response to events at DS's with DSM systems and on feeders with sectionalizers will be unnecessarily delayed. Further, the ability to use the NMS Information System to store DS loading data will not be possible and a separate system will have to be developed for this.

Investment Summary:

This investment will enhance the NMS and supporting telecom infrastructure at the OGCC and Hub sites to allow the real time monitoring of DS equipped with DSM systems and monitoring and control of feeder sectionalizers.

Monitoring of DSs will allow for faster identification and response to distribution outages and product quality issues (e.g. voltage sag, flicker and momentary outages). It will also allow for better management of heavily loaded DSs. The ability to identify momentary outages (such as may result from momentary tree contact or broken insulator) will allow these to be addressed in a planned fashion at lower cost rather than when they deteriorate to an unplanned outage which results in customer interruption and higher cost emergency response.

Monitoring and control of sectionalizers will also allow for faster identification and response to distribution outages. The location of the fault will be narrowed down to a section of the feeder thereby reducing the time to locate the fault. Also, power restoration will take less time through remote switching of the sectionalizers.

The NMS has an information system which stores all SACDA information for later analysis. Connecting the DMS systems and the sectionalizers to the NMS will allow the NMS information system to be used to store the data concerning operation and loading of DS's avoiding the need and cost for a separate storage system.

Results:

- Faster response to outages and product quality problems.
- Improved management of vegetation or insulator problems.
- Integrated and low cost storage of data.

Costs:

	2008 ($M)
Capital* and Minor Fixed Assets	1.0
Operations, Maintenance & Administration and Removals	-

Hydro One Networks – Investment Justification
Cornerstone Phase 1

Investment Name: Cornerstone Phase 1 – EAM Core ($144M); **Reference #: IT1**

In Service: Q2, 2008 (Phase 1)

Need:

The current installation of Indus PassPort is no longer eligible for vendor support. It has been heavily customized to adapt to current requirements. It does not provide full work management and supply chain functionality, nor does it provide a single asset registry "system of record." Therefore, a significant investment is required or else technology and process solutions will not be available to support the achievement of our business goals and completion of the upcoming capital work program. Moreover, significant internal control and business continuity risks would remain unaddressed.

Investment Summary:

PassPort 6 was installed in Hydro One in 1998 and is currently being utilized for supply chain, work management, asset management, and accounts payable. The 1998 installation was compromised due to two key changes in direction: the decision to include the Distribution side of the business in what had previously been a Transmission-only solution; and the decision to have all Y2K products in place certified and tested a year early, by year-end 1998. In order to make the scope achievable in the available time, much of the functionality that was available within the Passport tool was not "turned on" for the business, and the solution was heavily customized during and after go-live to meet business needs. As a legacy, there now exist numerous bolt-ons and custom solutions that interface with PassPort and attempt to overcome the business limitations of that initial solution. These limitations will hinder the ability of the company to meet its aggressive capital program and continuing to maintain the heavily customized PassPort system is costly and complex.

Phase One proposes to replace the Passport functionality with SAP functionality. The scope consists of and is restricted to doing what is required to "turn on" the SAP product and make it work as designed in the business, with no SAP software customizations. In a business context, "what is required" consists of:

- Changing business processes that currently touch PassPort, to maintain or improve business performance. We will not customize the product to accommodate current business processes; rather, we will replace current business processes with industry standard practices.
- We will reconnect to SAP, replace within SAP, or decommission applications in the interest of three criteria:
  - Mitigate project risk (complexity and cost)
  - Enable future Cornerstone phases
  - Minimize life cycle cost to the business
- Migration or replication of data needed to execute the SAP solution
- Establishment of an effective change management capability within the project to minimize disruption, maximize adoption, and reduce the overall cost and risk of implementation.

Results:

Phase One will bring the following business benefits to Hydro One:

- Improved Asset Lifecycle Decision-Making
- Enhanced Work-Program Planning & Execution
- Set the stage for subsequent phases of the Hydro one System Replacement Strategy.

Costs[1]:

Date: August, 2007

Hydro One Networks – Investment Justification

Mobile IT

Investment Name: Mobile IT **Reference #:** IT2

In Service: Q4 2008

Need:

This investment is required to permit field managers' access to critical systems and information regarding work crew projects, field assets and optimal scheduling as part of work management processes.

If this investment is not undertaken there is an ongoing risk of delayed information and/or errors and omissions being encountered with data entry from field notes. Hydro One's overall strategy of a properly equipped mobile work force will be delayed.

Investment Summary:

Significant resources are used to both manage and report on field-based activities and to respond to changes driven by events encountered in-process. Project reporting and activity planning based on timely and accurate scheduling of information for both goods and services as well as manpower and equipment require access to critical information using mobile computing tools. Field staff and managers require field utilization of technologies currently accessible only in offices. Current applications require upgrades to effectively manage and control the maintenance activities within Hydro One Distribution.

After consideration of alternatives, the preferred plan is to provide mobile application tools to field staff. This investment will provide tools in the areas of dispatch, work management, time sheets, switch orders and inspections that deliver data to support business processes from Grid Operations to Asset Management, among others. This investment provides additional commercial software products, enhancements to existing software products and the installation, configuration and integration of those products along with associated hardware (database and application servers and hand-held computers).

Results:

- *Improved Asset Decision Quality:* Provide immediate access to more comprehensive and integrated asset data in corporate systems, contributing to consistency and timeliness in asset decisions.
- *Increased Throughput:* With the ability to capture more data at source using mobile devices, enable one-time data entry and workflow approval as part of normal business processes.
- *Prevention of rework:* Asset condition assessment surveys on occasion require some rework or a revisit to the site. There is an anticipated general reduction in such rework as this initiative is implemented.
- *Timely investments: A*bility to make good decisions regarding field assets and their replacement scheduling will be assisted by additional and available information. With increased volumes of asset condition information, investment planners can utilize and analyze this information to strengthen decisions that replace assets at the right time, not sooner than required nor too late, avoiding undue risks to service levels.

Shared Costs:

	2008 ($M)
Capital* and MFA (A)	3.0
Operating, Maintenance & Administration and Removals (B)	0.3
Gross Investment Cost (A+B)	**3.3**
Capital Contribution (C)	-
Net Investment Cost (A+C)	**3.0**

*Includes overhead and AFUDC at current rates and Minor Fixed Assets include servers and hand-held computers.

hydro one

Hydro One Networks – Investment Justification
CSS- CIS Hybrid

Reference #: IT 3

Investment Name: Customer Information System – Hybrid

In Service: Q4 2008

Need:

This investment is required to address end-of-life application issues with Customer-1 and other Customer Information Systems and to improve the CIS platform to meet increased service level requirements. The customer contact centres need to update the systems capability to deal with billing and service inquiries stemming from service levels, metering, demand management, LDC rationalization, improved customer satisfaction initiatives, and billing / tariff modifications. Upgrades must be made in advance of consumer demand for information and service.

The solution proposed is to make renovations to some systems and replace portions of other systems as applicable in light of the Cornerstone Strategy. If these selected initiatives are not undertaken the useful life of the current CIS applications will be limited, impact the Smart Meter project, and possibly accelerate the timeframe to fully replace the entire CIS application suite.

Investment Summary:

The CIS application suite provides the technology backbone that enables Hydro One Distribution to provide billing, customer contact and care, field services, and open market services to its customers and key constituents. The CIS applications impact the Customer Service Operations and the Field Operation areas of the organization. The CIS system serves as the basis for customer interaction. Currently Hydro One Distribution utilizes 13 applications to provide the following functions for the organization: full customer care for all types of distribution customer billing, service order management, marketing, meter management and contact management, as well as facilitating retail competition for all customers.

The costs for CIS are included in Shared Services capital with the costs allocated 100% to Distribution.

A CIS assessment was conducted to determine the best strategy for Hydro One to utilize its CIS application suite to meet its business needs. Hydro One's specific requirements were compared to an internal solution and to other solutions in the marketplace. The recommendation is to make renovations to some systems and replace portions of other systems where such enhancements would be commercially appropriate or have continuing value. Renovations will be undertaken when resources are available and with due consideration to required regulatory changes and for Smart Metering requirements.

Results:

- Updated and enhanced CIS application suite with greater access provided to customer data.
- Lower costs for enhancement projects.

Hydro One Networks – Investment Justification
Fleet Services 2008 Capital Requirements

Investment Driver: Fleet Services 2008 Capital Requirements **Reference #:** C1

In-Service Date: Late 2008

Need:

This investment is required to meet vehicle and fleet capital requirements arising from increased work programs and staff growth.

Not proceeding or delaying this investment would lead to lower-than-required fleet levels and mix and a shift to more expensive rental units. Extending the life of the vehicles past their optimum level of economic and reliable operations will result in increased equipment and user operating costs, reduced reliability and unsafe operating conditions.

Investment Summary:

Hydro One controls and manages 4,522 fleet units which support the various lines of business (LOBs) including Provincial Lines, Stations, Forestry and Engineering and Construction Services (E&CS). Fleet vehicles must be maintained at an optimum level to comply with various regulations (Highway Traffic Act, CVOR regulations, etc.) and to maintain LOB productivity by minimizing downtime and travel time and taking advantage of technology improvement opportunities.

Present replacement criteria are based on manufacturers' recommendations and repair history. Light vehicles are replaced after 6 years or 170,000 km, service trucks are replaced after 6 years or 200,000 km, and work equipment is replaced after 8 – 10 years or 230,000 km. This is used as a guideline and ultimately it is used in combination with break even analysis, including replacement cost, depreciation, operating cost and potential life expectancy.

Of the capital required in 2008, $35M is required to replace units which have reached their end of life cycle.

Other key elements of the 2008 capital program include:

- supporting the Forestry Mechanical Brushing Program.
- replacement of a second aging helicopter (over 2007 requirements) which supports the Tx Work Program.
- replacement of an additional 50 rental pickups (over 2007 requirements) with 50 Hydro One-owned units. Analysis has determined that the rental units, which are used for approximately 9 months per year, are more expensive than owned units due to Hydro One’s lower borrowing costs.
- additional fleet required for new hires.

Results:

- Reduced operating costs and increased reliability

Shared Costs:

	2008 ($M)
Capital* and MFA	51.6
Operating, Maintenance & Administration, and Removals	0.0
Gross Investment Cost	51.6
Capital Contribution	0.0
Net Investment Cost	51.6

*Includes overheads and AFUDC at standard rates.

Date: August, 2007

Hydro One Networks – Investment Justification
MFA Service Equipment 2008

Investment Driver: MFA Service Equipment **Reference #:** C2

In-Service Date: Late 2008

Need:
Minor fixed asset expenditures for service equipment are required to replace end of life and obsolete equipment, and to provide sufficient levels of new equipment consistent with work program and staffing expansions.

Service equipment is used by field staff to carry out day-to-day work activities including specialized transportation equipment to and from the work site. This equipment must be maintained at appropriate levels such that work can be executed in a safe and cost effective manner. Inadequate investment will result in equipment breakdowns or increased labour time. Overall this would adversely impact job costs, outage duration, and work program accomplishments.

Investment Summary:
Minor fixed asset (MFA) spending for service equipment represents items > $2000 each exclusive of general computer MFA requirements, real estate MFA requirements and fleet MFA requirements, addressed elsewhere, which are necessary to replace end of life equipment used by field staff to execute the work program in a cost effective manner.

Purchases in this category include:
- Minor specialized transportation equipment such as snowmobiles, all terrain vehicles, boats, barges, and related accessories to transport crews to off-road work sites,
- measuring and testing equipment to carry out a variety of work activities including trouble shooting, performance testing of equipment, wood pole density testing, battery testing, relay test systems, moisture analyzers, circuit breaker testers, resistance testers, etc.,
- tools and a wide range of other miscellaneous equipment such as PCB waste bins, portable generators, cabling trailers and equipment, hand held meter reading devices, satellite equipment for mobile emergency preparedness, insulator power washing equipment to describe a few.
- Relatively large tanker units utilised in the service of transformers including degassifiers used to remove impurities from insulating oil, heated oil tankers, oil filters and dry air machines.

MFA service equipment requirements will vary year to year depending on a number of factors including the overall asset condition, the number of large cost "one-time" items that occur from year to year, the size of the work program and associated staffing levels projected in the business plan, random equipment failures, unanticipated system impacts, weather severity and trends which affect the intensity and use of certain types of equipment particularly related to storm and trouble call programs.

Spending in 2008 is focused on additional service equipment required to accommodate the growth in the work program. It is also the result of end of life replacement of specific large equipment such as oil tankers, degassifiers, and air supply equipment used to overhaul and maintain large power transformers and manage the related oil requirements. Such purchases are a part of long term replacement plans to replace end of life equipment that are expected to extend to 2010 and beyond.

Results:
- Maintain equipment and tool fleets at required levels to execute the 2008 transmission OM&A and capital program

Shared Costs:

	2008 ($M)
Capital* and MFA	9.3
Operating, Maintenance & Administration, and Removals	0.0
Gross Investment Cost	9.3
Capital Contribution	0.0
Net Investment Cost	9.3

*Includes overheads and AFUDC at standard rates.

Date: August, 2007

Hydro One Networks – Investment Justification
Real Estate Facilities 2008

Investment Driver: Real Estate Facilities Capital for 2008 **Reference #:** C3
In-Service Date: Late 2008

Need:

This investment provides for facilities improvements, resulting from assessments of aging facilities infrastructure across the Province. The facilities infrastructure base is comprised mainly of aged buildings, legacy building systems and components, many of which are reaching the end of their asset life cycle. This program also considers the facilities portfolio accommodation strategy in terms of facility improvements, building additions and new facilities in line with the Company's changing operational requirements.

Not proceeding with this investment would present risks related to health & safety (related to mould, drinking water quality, and potentially unsafe building structures) that could result in non-compliance with legislative and regulatory requirements.

Investment Summary:

Key program work activities include:

- Replacement of major building components including roof structures, windows, heating, ventilating and air conditioning (HVAC) systems and other structural elements and building systems.
- Dealing with environmental issues that may arise such as mould.
- Treatment upgrades to improve quality and reliability of water supply, including conversions to municipal supply.
- Facilities Improvements: Service, Administrative Centres
- HQ & Admin Facilities - new/ additional workspace demand – accommodation planning.
- Purchase of MFA at Centres (e.g., office furniture)

There are 92 Administrative Centres and Service Centres throughout the province. Administrative Centres include the Ontario Grid Control Centre in Barrie, London Call Centre, and GTA facilities (Trinity, Clegg Road and Torbram Road). Service Centres provide accommodation for Line of Business field staff, such as Provincial Lines and Forestry.

Contracted facility service providers conduct regular inspections of administrative and service centre sites across the province to ensure critical building/site components are inspected regularly and major structural and related problems are identified.
This capital program focuses on undertaking the critical component replacement work on a priority basis.

Capital spending of $9.8M is required for 2008 to replace major building components, ensure facility water well standards are met, secure and protect facilities that house critical equipment, and provide space to support work programs.

Results:

- Improved Administrative and Service Centre facilities through replacement of roof structures, windows, HVAC systems and other structural elements.
- Reduced potential environmental hazards to Hydro One employees with a focus on mould removal and water quality.
- Specific Service Centres will meet Security Standard 1300 and NERC Physical Security of Substations.

Shared Costs:

	2008 ($M)
Capital* and MFA	9.8
Operating, Maintenance & Administration, and Removals	0.0
Gross Investment Cost	9.8
Capital Contribution	0.0
Net Investment Cost	9.8

*Includes overheads and AFUDC at standard rates.

Income Taxes	39	Exhibit C2, Tab 6, Schedule 1, Att A
Return on Capital	300	Exhibit B1, Tab 1, Schedule 1
Total Revenue Requirement	**$1,067**	**Exhibit E2, Tab 1, Schedule 1**

The resultant Revenue Requirement of $1,067 million is the amount required by Hydro One Distribution to ensure the most appropriate, cost-effective solution to respond to corporate objectives mainly related to public and employee safety, electricity market and regulatory requirements.

2.0 CALCULATION OF REVENUE REQUIREMENT

The details of the Revenue Requirement components are as follows:

2.1 OM&A Expense

Sustaining	$280.0
Development	9.1
Operations	13.4
Customer Care	103.8
Shared Services and Other Costs	66.9
Taxes Other Than Income Tax	4.5
Total OM&A	**$477.7**

2.2 Depreciation and Amortization Expense

Depreciation	$207.4
Amortization	$31.6
Total Expense	**$238.9**

2.3 Capital Taxes

Capital Tax	$11.3
Total Capital Taxes	**$11.3**

2.4 Payments in Lieu of Corporate Income Taxes

Income Before Payments in Lieu of Corporate Income Taxes	$115.8
Tax Rate	34.50%
Total Payments in Lieu of Corporate Income Taxes	**$38.8**[1]

2.5 Return on Capital

Return on Capital	$299.9

[1] Calculated on the basis of regulatory taxes payable, as per 2006 Electricity Distribution Rate Handbook; adjusted for R&D ITC ($0.3 million) and Ontario Education Credit ($0.8) see Exhibit C2, Tab 6, Schedule 1 for detailed calculation.

3.0 REVENUE REQUIREMENT – COMPARISON OF YEAR 2006 TO YEAR 2008

Table 2 below compares, by element, the Year 2006 approved Revenue Requirement (as per RP-2005-0020/EB-2005-0378) against the Year 2008 proposed Revenue Requirement.

Table 2
Comparison of Revenue Requirements: 2006 vs. 2008 ($ Millions)

Line No	Description	Year 2006 OEB Approved	Year 2008	Difference
1	OM&A	423	478	55
2	Depreciation	202	239	37
3	Capital Taxes	10	11	1
4	Income Taxes	69	39	(30)
5	Return	261	300	39
	Total Revenue Requirement	**965**	**1,067**	**102**

There are a number of key operational and financial factors contributing to the increased revenue requirement that have an impact across the cost components in Table 2. The increase in Total Revenue Requirement is largely attributable to the increase in OM&A costs ($45 million), Smart Meters ($10 million OM&A, $12 million rate base) and the net impact of rate base growth ($63 million) offset by lower cost of debt and lower income tax rates.

Table 3 illustrates the value of the key impacts of the increase in the Revenue Requirement.

Table 3
Components of Change to Revenue Requirement
Previously OEB-Approved (2006) vs. Proposed (2008)

Description	**Amount ($ millions)**
Impact of increased rate base	63
Increase in OM&A	45
Impact of Smart Meters	22
Change in Common Equity	8
Impact of lower statutory tax rate	(9)
Decrease in asset removal costs	(9)
Lower ROE as per OEB formula	(8)
Decrease in cost of debt	(6)
Other	(4)
Total Change	**102**

Note 1: Per Exhibit C2, Tab1, Schedule 1

EXTERNAL REVENUES

1.0 STRATEGY

Hydro One Distribution’s strategy is to focus on core work and continue to be responsive to external work requests and accommodate customer needs where Hydro One Distribution can provide value and have the resources and/or assets to do so.

Over 96% of Hydro One Distribution’s revenues are earned through its distribution tariff. External revenues account for the remaining 4% [$42.0 million in 2008] and are earned through the provision of services to third parties and through joint use of Hydro One Distribution’s assets by third parties. These revenues are used to offset the revenue requirement from Hydro One distribution tariff and thereby reduce the required revenue to be collected from distribution ratepayers. External revenues are categorized into regulated and non-regulated categories.

2.0 COSTING AND PRICING

The costing of external work is determined on the basis of cost causality with estimates calculated in the same way as internal work estimates using the standard labor rates, equipment rates, material surcharge, and overhead rates (see Exhibit C1, Tab 4, Schedule 1 for a description of costing for internal work and section 5 of Exhibit C1, Tab 2, Schedule 6 for a description of the costing of external work). For unregulated work an appropriate margin is added to cover, as a minimum, the risk of non-payment by third parties in order to ensure there is an overall benefit for the distribution ratepayers.

3.0 DESCRIPTION

Regulated external revenues for 2008 ($31.3M) account for about 75% of external distribution revenues. These revenues, shown in table 1, cover a wide range of miscellaneous services (e.g. joint use of poles for attachment of Telecommunications, sentinel light services) based on rates and underlying costs per the 2006 Electricity Distribution Rate Handbook issued May 2005 .

Table 1
Regulated Revenues
($M)

$M	2004	2005	2006	2007	2008
Joint Use	5.3	5.6	5.8	6.0	6.2
Sentinel Lights	4.9	3.5	3.6	3.3	4.0
Retail Service Revenue	N/A	N/A	N/A	0.9	1.1
Other Regulated Misc. Services	16.3	15.2	17.2	19.7	20.0
Totals	26.5	24.3	26.6	29.9	31.3

Unregulated external revenues (e.g. competitive new connection and upgrade work, and emergency support to other North American utilities), as shown in Table 2, account for the remaining $10.7M or about 25% of 2008 external distribution revenues.

Table 2
Unregulated Revenues
($M)

$M	2004	2005	2006	2007	2008
Joint Use	2.5	2.2	3.2	3.3	3.3
New Connects/Upgrades	5.3	5.2	4.3	4.9	4.0
Generation Studies	0.1	0.1	0.7	1.5	0.5
Other External Work	23.3	9.9	2.4	3.1	2.2
Non-Regulated Misc. Rev.	1.0	0.6	0.9	0.8	0.7
Totals	32.2	18.0	11.6	13.5	10.7

3.1 Regulated Revenues

3.1.1 Joint Use Revenues

Joint Use revenues are generated from third parties who jointly use Hydro One Distribution's poles by stringing various attachments to the poles, mostly wire cables, and in return Hydro One Distribution charges a per pole attachment fee. At the end of 2006, there were approximately 800,000 joint use poles being used by 535 customers including Bell Canada, Telecommunications companies, independent telephone companies, and others including LDCs, fiber companies and municipalities. About 90% of the revenue in this segment come from Bell Canada and Telecommunications companies. The Ontario Energy Board sets the rates for joint use service, for Telecommunications companies. Other joint use rates/contracts are negotiated and include other considerations such as reciprocal pole sharing arrangements and vegetation management services are unregulated and discussed in Section 3.2. Table 3 below is a summary of the volumes (# of pole attachments) for the regulated segment of joint use.

Table 3
Volume of Joint Use permits by Customer Category

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Telecommunications	234,734	237,623	265,399	272,415	280,588
Street Lighting	70,000	74,000	77,678	78,843	80,008

As can be seen from the table, the number of attachments is increasing over the 5-year period. The increase is due to new Telecommunications companies attaching to poles and existing companies expanding their service areas.

3.1.2 Sentinel Light Revenues

The sentinel light rental program is designed to provide rural customers with low-cost security lighting. The service is provided primarily to rural residential, farm, and cottage customers, for whom street lighting is not available.

Exhibit A, Tab 5, Schedule 1, section 3, provides reference to the legislation that allows the sentinel light program to continue for existing Hydro One Distribution customers.

Table 4 summarizes the historical volumes of sentinel lights and poles owned and maintained by Hydro One Distribution. The decrease over the five-year period reflects the fact that there is no new customers added and there is a continuing decrease in the number of existing customers as discussed in Exhibit C1, Tab2, Schedule 2.

Table 4
Year-End Volume of Sentinel Lights in service

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Sentinel Lights	40,603	40,029	38,754	37,812	36,870
Sentinel Light Poles	2,490	2,513	2,377	2,319	2,261
Total	43,093	42,542	41,131	40,131	39,131

3.1.3 Other Regulated Miscellaneous Services

Hydro One Distribution provides a number of other regulated miscellaneous services as identified in Table 5 below. The rates for these services are approved and regulated by the Ontario Energy Board. A description for items 1 through 7 can be found in the "2006 Electricity Distribution Rate Handbook, Chapter 11". The associated volumes of items 1 through 7 (as identified in Table 5) are shown in Table 6 along with the 2008 revenues. Brief descriptions for items 8 and 9 follow the tables.

Table 5

Late Payment Charge applied to number of distinct accounts	N/A	N/A	N/A	N/A	N/A	$14,491
Total 2008 Revenue						$20,035

3.1.3.1 Tingle Voltage Test

Tingle voltage (also known as high neutral voltage) is undesirable as it may have an adverse effect on dairy cattle, and in extreme cases may be noticeable by humans. Hydro One Distribution strives to limit neutral voltage to 10V. In cases where customers deem the voltage to be excessive, a voltage test is conducted to determine the cause of the abnormality. Usually, there is no charge to the customer for this type of analysis; however, should the customer request further testing, the additional costs are recovered from the customer. Historically, the number of times that additional testing is required is approximately 30 per year.

3.1.3.2 Standby Charges

A standby charge is a monthly fee that is applied to a customer that has their own generation facilities and addresses those instances when the customer is dependent on Hydro One Distribution for their electricity supply whenever their own generation facilities are out of service. The monthly charge marginally offsets the cost to Hydro One of having facilities available to ensure emergency supply whenever the customer's facilities are out of service. The charge is only applicable when electricity is not supplied by Hydro One Distribution. The 2006 Electricity Distribution Rate Handbook allows standby administration charge to cover the incremental cost of monitoring, billing and administration. The Board approved this charge on an Interim basis as part of the Generic Decision on 2006 EDR issues in proceeding RP-2005-0020/EB-2005-0529. In its decision in EB-2005-0378, the OEB directed Hydro One to establish such a variance account which it has done. Hydro One will place any revenues received from the application of this rate into this variance account and will be credited back to the customers of this province, as part of the next distribution rate hearing process. To-date there have been no such charges and it is expected that there will be none in 2008.

3.2 Unregulated Revenue

3.2.1 Joint Use Revenue

As noted in section 3.1.1 above, the rates for Bell Canada and Local Distribution Company (LDC) attachments are based on a negotiated price rather than rates approved by the OEB due to other considerations such as reciprocal pole sharing arrangements and vegetation management services.

Table 9
Volume of Joint Use permits – Unregulated

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Bell Canada	479,232	479,232	479,232	479,232	479,232
LDCs	7,244	7,295	7,236	9,615	9,903

3.2.2 New Connections/Upgrades

Hydro One Distribution connects approximately 17,500 new customers to its distribution system each year consisting primarily of subdivision and rural residential customers along with farms, cottages, and industrial customers. Approximately 6,500 upgrade services are also completed each year that involves increasing a customer's existing supply capacity to meet their increased electricity requirements.

Both the new connection service and the upgrade service have elements of work that must be done by Hydro One Distribution under its Distribution License. This includes: working within Limits of Approach [working within pre-determined boundaries of live equipment which is voltage level dependent but nominally for distribution equipment is 3 metres or 10 feet] of the distribution equipment to install any required equipment; connect the customer to Hydro One's distribution system; and connect the meter at the customer site.

The remainder of the new connection/upgrade work may be performed by a qualified contractor of the customer's choice. As required by the Distribution System Code, Hydro One Distribution will carry out this work, if requested by the customer at Hydro One's fully burdened cost, since crews are usually on-site and set up. For an above ground new connection, this work would include the installation of poles, conductor, and related equipment to run from the distribution line to the meter at the customer site. Similarly, for an underground connection, this would include digging the trench and laying the cable and related equipment. This type of project is known as contestable or competitive work and is what contributes to the external revenues for this segment.

Table 10 represents the number of New Connections and Upgrades Hydro One Distribution provides to customers each year.

Table 10
Volume of New Customer Connections & Upgrades

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
New Connections & Upgrades	24,083	23,647	22,898	24,059	24,194

Into the future, it is expected that the volumes will remain relatively flat, as discussed in Exhibit D1, Tab 3, and Schedule 1.

3.2.3 <u>Distribution Generation Studies</u>

The external revenue shown is for undertaking connection impact assessments in response to requests from generation proponents. Hydro One does assessments based on the customer request that includes the proposed size of the generator and where it will be located. Connection impact assessments are technical studies that determine the impact of the new generation facility on the Distribution System and ensure the generator will comply with the technical requirements. The technical requirements generators must meet to connect to Hydro One distribution system are outlined in “Technical Requirements for Generators Connecting to Hydro One's Distribution System”. These requirements are in place to ensure public and employee safety, protect the integrity of Hydro One’s system and guarantee reliable and quality service to our customers. For more information about these studies, refer to Exhibit C1, Tab 2, and Schedule 3. The volume is expected to decline in 2008 due to the best area's for generation would have been developed first and remaining areas would not be as economical.

Table 11
Volume of Generation Studies Completed

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Distribution Generation Studies	30	30	70	300	225

3.2.4 Other External Work

Revenues from external work in this segment include minor amounts of forestry line clearing and brush control work; training related to health, safety & environment; streetlight maintenance; and subdivision redesign.

External training covers a wide range of practical and classroom delivered courses. These include courses like Electrical Safety Awareness, a mandatory course for anyone working in the proximity of live electrical apparatus regardless of trade or occupation. Packaged delivery of technical courses for numerous trade and professional types are delivered for Lines, Forestry, Power Electricians, Metering technicians, Protection engineers and technicians. Customers include large (Toronto Hydro) and small utilities (Peninsula West Utilities Limited), large (INCO) and small (Wardrop Engineering) companies including Non Utility Generators (Trans Alta, Brighton Beach) that send trainees to a cross section of courses in various trades/disciplines.

Hydro One Distribution will provide an initial subdivision design and will recover this cost through the staking fee charged to the developer. When the developer revises the subdivision plan, a redesign of the subdivision is needed. The cost of the redesign is borne by the developer.

If a subdivision design has been completed but construction has not commenced for a period of 12 months or more, a review of the subdivision design is necessary. This review includes a field visit and is necessary to determine if the original design is still viable or if a revised design is needed to supply the subdivision. The cost to do this additional work is also covered by the developer.

Table 12
Number of Subdivision Redesigns

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Subdivision Redesign	37	40	44	45	45

Other external work also includes, from time to time, emergency services provided by Hydro One Distribution crews to restore power to neighboring Canadian and U.S. utilities affected by natural disasters such as ice storms and hurricanes.

3.2.5 Non-Regulated Miscellaneous Revenues

3.2.5.1 Under density Billing

Under density Billing revenues for Northwest part of the province are generated through annual fees levied upon five large companies that utilize dedicated under density distribution lines operated and maintained by Hydro One Distribution. The load on these under density lines does not cover the annual costs of maintenance and therefore an annual fee is charged and is designed to recover maintenance costs for servicing these lines. The revenues collected by Networks represent the recovery of costs for maintenance and forestry work on the underdensity distribution lines.

Table 13
Volume of Underdensity Billings

	2004 volume	2005 volume	2006 volume	2007 volume	2008 volume
Underdensity Billings (# of customers)	6	5	5	5	5

3.2.5.2 Inergi Royalties

As a result of the outsourcing agreement with Inergi LP royalty revenue is received by Hydro One Networks Inc. to compensate it for the use of Hydro One resources by Inergi LP to service other third party customers.

Please refer to Exhibit C1, Tab 2, Schedule 6 for more information on Inergi agreement.

REGULATORY ASSETS

1.0 INTRODUCTION

The purpose of this evidence is to provide a description of the Distribution Regulatory Assets and a detailed account of their balances.

All of the Regulatory Assets reported by Hydro One Distribution have been established consistent with the Board's requirements as set out in the Accounting Procedures Handbook, subsequent Board direction, or per specific requests initiated by Hydro One Distribution.

The Distribution Regulatory Asset balances are summarized in Table 1 below:

Table 1
Distribution
Summary of Regulatory Asset Balances for Approval
$ million

Description	May 1, 2006	Dec 31, 2006	Dec 31, 2007	April 30, 2008
Total Regulatory Assets for Approval	**8.4**	**(1.7)**	**(30.0)**	**(48.7)**

Hydro One Distribution is forecasting Regulatory Asset values up to April 30, 2008. It is expected that new Distribution rates will be implemented at the start of May 2008. Details on the forecast basis will be described for each account.

Disposition of the following accounts is discussed in Exhibit F1, Tab 2, Schedule 1.

2.0 REGULATORY ASSETS REQUESTED FOR APPROVAL

The following table provides a summary of the Regulatory Asset requested for approval:

Table 2
Distribution
Regulatory Assets Requested for Approval
$ million

Description	May 1, 2006	Dec 31, 2006	Dec 31, 2007	April 30, 2008
OEB Costs Account	(0.8)	(0.9)	(0.9)	(0.9)
Tax Changes Account	0.0	(2.8)	(4.7)	(5.0)
Smart Meter Minimum Functionality Under-recovery to May 31, 2007	0	3.6	5.8	6.9
Smart Meter Exceeding Minimum Functionality Under-recovery	0	0.6	3.4	5.7
Smart Meter Minimum Functionality Under-recovery between June 1, 2007 and April 30, 2008	0	0.0	3.7	9.4
Retail Settlement Variance Accounts	9.2	(2.2)	(37.3)	(64.8)
Total Regulatory Assets for Approval	**8.4**	**(1.7)**	**(30.0)**	**(48.7)**

In the Board's December 9, 2004 *Decision with Reasons* in the Review and Recovery of Regulatory Assets Phase 2 (RP-2004-0117/0118), Hydro One was directed to use a fixed rate of 7.71% for all Regulatory Asset accounts. Accordingly, simple interest at 7.71% was applied to the monthly opening principal balance in these accounts from May 1, 2006 to November 30, 2006.

In a letter dated November 28, 2006, the Board directed Electricity LDC's to implement a new prescribed interest rate. This new rate was to be effective May 1, 2006. On December 12, 2006 Hydro One wrote to the Board saying that Hydro One would be implementing this new interest rate effective December 1, 2006 since retroactive application of the interest rates could result in financial impacts different from those included in Hydro One's previously published financial statements. Accordingly, the interest rate for these accounts was changed to 4.59% (the OEB prescribed rate effective at that time) effective December 1, 2006. Hydro One has applied the OEB prescribed rate of 4.59% since December 1, 2006 for all Regulatory Asset accounts.

2.1 Ontario Energy Board Costs Account

In a letter dated December 20, 2004 the Board announced an amendment to the Accounting Procedures Handbook and the Uniform System of Accounts to establish a deferral account to record Ontario Energy Board Cost Assessments.

The intent of this account was to record Ontario Energy Board cost assessments incremental to the 1999 base year for the Board's fiscal year 2004 and subsequent fiscal year(s) determined in accordance with the following Board requirements.

In the Board's April 12, 2006 Decision with Reasons (RP-2005-0020 / EB-2005-0378) regarding Hydro One's 2006 Distribution Rates, the Board approved Hydro One Distributions OEB Costs Deferral Account amounts as submitted. Those amounts were forecast to April 30, 2006 based on the 2005/2006 OEB Q2 Invoice to Hydro One Distribution.

The 2005/2006 OEB Q3 and Q4 Invoices to Hydro One Distribution were lower than the 2005/2006 OEB Q2 Invoice, therefore the amount approved for recovery in the Board's April 12, 2006 Decision with Reasons was higher than the actual value in the OEB Costs Regulatory Asset account on May 1, 2006.

Hydro One Distribution transferred the approved value of the account into the Regulatory Asset Recovery account on May 1, 2006 leaving the excess of the approved amount over the actual amount as a credit in the OEB Costs Regulatory Asset account. No additional principal amounts have been added to this account since May 1, 2006.

Table 3 provides a summary of Ontario Energy Board Cost Assessments related deferral balances for the Hydro One Distribution business:

Table 3
Distribution
OEB Costs Deferral Account Balances
$ million

Description	USofA Account Ref	May 1, 2006	Dec 31, 2006	Dec 31, 2007	April 30, 2008
OEB Costs Account	1508	(0.8)	(0.9)	(0.9)	(0.9)

After approval by the Board, this account will be closed.

2.2 Tax Changes Account

In the Board communique of December 2005 (to LDC's), and the Board's April 12, 2006 Decision with Reasons (RP-2005-0020 / EB-2005-0378) regarding Hydro One's 2006 Distribution Rates, the Board authorized the creation of an account to capture the tax impact of the following differences:

- differences that result from a legislative or regulatory change to the tax rates or rules, and
- differences that result from a change in, or a disclosure of, a new assessing or administrative policy that is published in the public tax administration or interpretation bulletins by relevant federal or provincial tax authorities

Hydro One Distribution has been charging the amount related to the reduction of the Capital Tax rate to this account since May 1, 2007. The amount related to the elimination of the Large Corporation Tax was charged to this account from May 1, 2006 to April 30, 2007.

The balance in Hydro One Distribution's Tax Rate Changes Account is summarized in Table 4 below:

Table 4
Distribution
Tax Rate Changes Account Balances
$ million

Tax Rate Changes	1592	0	(2.8)	(4.7)	(5.0)

2.3 Smart Metering Minimum Functionality Expenditures incurred before May 31, 2007

As part of the RP-2005-0020/EB-2005-0378 Proceeding the OEB approved an incremental fixed monthly charge of $0.27 per metered customer, applicable as of May 1, 2006, to start collecting funds for the deployment of Smart Meters. Subsequently, as part of the EB-2007-0542 Proceeding, the monthly amount was increased to $0.93 per metered customer as of May 1, 2007. The revenues collected per the above are recorded in a variance account set up for Smart Meter revenue.

On May 2, 2007, the Board issued a notice of combined proceeding (EB-2007-0063) to determine the prudence and recovery of costs associated with smart metering activities for 13 licensed distributors, including Hydro One Networks

.

The issues considered in the combined proceeding included:

1. Costs recovery relating to minimum functionality pursuant to Ontario Reg. 426/06.
2. Prudence of costs incurred.
3. The mechanism for re-setting rates for smart meter costs that are found to be prudent through this proceeding.
4. Accounting Procedures.
5. Regulatory treatment of stranded meter costs and recovery through rates.
6. The mechanisms for re-setting rates for smart meter costs incurred on a go forward basis.
7. Mechanism for dealing with costs not part of this proceeding.

The Board's Decision was released on August 8, 2007. The Board determined that the purchasing decisions of the thirteen utilities involved in this proceeding were implemented with the necessary due diligence and the terms of the contracts are prudent. The Board agreed with the overall costs incurred to May 31, 2007 related to the minimum functionality of all installed meters. These approved amounts were OM&A costs of $8.366 million, and Capital costs of $21.799 million. The approved amounts include only one half of the $1.348 million of project management capital costs incurred to May 31, 2007, and the Board requested Hydro One to include the remainder, or $0.674 million, in this application with a further explanation of these costs. This is included in Section 2.5 below. The Board also requested that the $70,000 of costs for repairing or replacing meter bases incurred to date and in the future be tracked in a variance account. This is included in Section 2.4 below.

Table 5 below details the revenue requirement (net of revenue received) related to smart meter minimum functionality up to May 31, 2007 that Hydro One is requesting recovery for in this proceeding. The revenue requirement was calculated based on the approach illustrated in Appendix E of the decision for proceeding EB-2007-0063.

Table 5
Distribution
Smart Meter Minimum Functionality Under-Recovery to May 31, 2007
$ million

Description	Dec 31, 2006	Dec 31, 2007	April 30, 2008
Revenue Requirement	6.1	10.6	11.7
Less: Revenue	(2.5)	(4.8)	(4.8)
Net Revenue Requirement to be Recovered	**3.6**	**5.8**	**6.9**

2.4 Smart Metering Expenditures Exceeding Minimum Functionality

The Smart Metering Expenditures Exceeding Minimum Functionality primarily includes TOU capability as well as some costs for outage detection capability as described below:

Meter Outage Detection Capability

Super capacitors are being installed in the meters so they have the power to communicate outage event information after loss of electrical supply. In cases where meters can notify Hydro One of “nested” outages, this will enable Hydro One to become aware of outages in our rural areas in a timely manner, resulting in increased customer satisfaction and efficiency. Currently Hydro One has to rely on customer calls to be made aware of initial and remaining power outages.

Collector Outage Detections Capability

Battery backup for the collectors is included to ensure the meter outage events can be communicated through the collectors even when power supply to them has been interrupted. This capability is important as it ensures that the outage capability in the meter described above follows through to our central control offices.

TOU (Time of Use) Capability and Integration

The ultimate benefit of smart meters is to provide proper price signals to customers based on when they use electricity. TOU functionality is therefore an imperative element of the smart meter program. The TOU functionality will be provided through the communication network work as discussed in Exhibit C1, Tab 2, Schedule 2 and Exhibit D1, Tab 3, Schedule 2. This will integrate the meter information into the format needed for the IESO to use in the meter data management and meter data repository (MDMR).

The review of these costs were not part of the Combined Smart Metering Hearing (EB-2007-0063) since the proceeding only reviewed costs associated with minimum functionality.

The $70,000 of costs for repairing or replacing meter bases incurred to date were initially included in minimum functionality. The Board in their decision for EB-2007-0063 directed that these costs be separated out and tracked in a variance account. These costs and future repair costs through April 2008 are included in the table below and are being split between OM&A and capital as requested in the decision in EB-2007-0063.

The Hydro One Smart Meter revenue requirement associated with these elements is summarized in Table 6 below:

Table 6
Distribution
Smart Meter Exceeding Minimum Functionality Under-Recovery
$ million

Description	Dec 31, 2006	Dec 31, 2007	April 30, 2008
Revenue Requirement	0.6	3.4	5.7

2.5 Smart Metering Minimum Functionality Expenditures between June 1, 2007 and April 30, 2008

The final area of Smart Meter expenditures include elements that were reviewed and approved in the Combined Smart Meter Proceeding (EB-2007-0063) but are related to the period June 1, 2007 to April 30, 2008 and therefore not part of the Decision delivered on August 8, 2007. These expenditures include the cost of meters that were included in the Smart Meter proceeding but were not yet installed. All of these meters will be installed by April 30, 2008.

The total number of meters that will be installed during this period is 522,086 for a total number of meters of 610,000. Using the Board's unit cost methodology, the unit cost in this time period has decreased from $479.47 to $428.00.

The Project management costs of $0.674 million that were not approved in the Smart Meter proceeding, as discussed in Section 2.3 above, have also been included in the costs below.

Due to the scope, complexity and specialized nature of this work, Hydro One selected Capgemini as its systems integrator, which includes providing the project management function. Capgemini was selected in 2005 as the systems integrator through a competitive RFP process. Hydro One's smart meter program has established detailed requirements to design, build, test, and commission the end to end solution to provide customers the tools and systems needed to take advantage of a smart meter system. Much of this work requires long lead times and is tied to external party timelines such as the IESO's implementation of the MDMR.

The Program Management function provides full Project Management Office (PMO) services and tools for a project that includes 12 work streams:

- Meter installation and field services
- Commissioning of head-end systems (advanced metering control computer, or "AMCC", for 1.2 million meter points)
- Network Engineering
- Integration of AMCC to MDMR to Hydro One's customer information system (CIS)
- Billing and customer care
- Settlements (retail and wholesale impact assessment)
- Customer Contact Centre (call centre to handle meter installation and TOU customer enquiries)
- CIS upgrade for TOU rates
- New systems – data and synchronization gateway and exception management for transactions exceeding 30 million per day upon full implementation
- Integrated business process design for moving from manual meter reading to an advanced metering regional collector (AMRC), including all related service orders, managing a network that encompasses over one million communication nodes, TOU billing, etc.
- Infrastructure Management (managing the procurement and implementation of computer hardware required for AMCCs, Integration, and TOU upgrades, this includes all required environments, e.g. for development, testing and production)
- Project management and tracking, which includes the following activities;
    - tracking cost and schedule performance; management of issues, risks, assumptions and change logs and associated action plans for all workstreams;

- the development and operation of a quality management program for the project;
- the development and operation of a project governance plan; and
- the development and maintenance of the integrated project plan.

The services above are the project related functions typically provided by the systems integrator. Although Hydro One is providing overall project management and direction to Capgemini, the competitively tendered role of PMO described above is not a role that Hydro One is able to resource internally. As noted in Exhibit D1, Tab 3, Schedule 2, the total project management costs on a per installed smart meter unit are forecast to drop from $21.7 per unit, based on costs and units installed to the end of May 2007, to $7.2 per unit based on total costs and units installed to the end of 2008.

The total Minimum Functionality net revenue requirement between June 1, 2007 and April 30, 2008 is summarized in Table 7 below:

Table 7
Distribution
Smart Meter Minimum Functionality Under-Recovery between
June 1, 2007 and April 30, 2008
$ million

Description	**Dec 31, 2006**	**Dec 31, 2007**	**April 30, 2008**
Revenue Requirement	0.0	11.3	21.4
Less: Revenue	0.0	(7.6)	(12.0)
Net Revenue Requirement to be Recovered	**0.0**	**3.7**	**9.4**

2.6 Retail Settlement Variance Accounts (RSVA)

The RSVA accounts have been established pursuant to Article 490 which requires that all distributors establish Retail Settlement Variance Accounts to record the differences between the amount owed to the IESO / host distributors and the amount billed to customers and retailers.

The vast majority of the balance in the RSVA accounts is related to Wholesale Market Services (WMS). The purpose of the WMS account is to capture the net of the amounts charged by the IESO, host distributors, and embedded generators (based on the settlement invoices for the operation of the IESO administered markets and the IESO – controlled grid) and the revenue accrued for customers using the Board approved Wholesale Market Service Rate.

The RSVA accounts were previously reviewed and approved by the Board in RP-2004-0117/0118 and RP-2005-0020 / EB-2005-0378. The balance of the RSVA account has been filed with the Board on a quarterly basis per the Electricity Reporting and Record Keeping Requirements and is included in the Board's annual review of deferral account balances.

Pursuant to the Board's October 29, 2007 letter to Electricity Distributors re: "Ontario Uniform Transmission Rate Order, EB-2007-0759: Effect on Distributor Retail Transmission Rates", which directs Distributors to incorporate the disposition of variance account balances relating to retail transmission rates in their 2008 Cost of Service application, Hydro One is requesting disposition of RSVA balances in this submission.

The total Retail Settlement Variance Accounts balance is summarized in Table 8 below:

Table 8
Distribution
Retail Settlement Variance Accounts
$ million

Description	May 1, 2006	Dec 31, 2006	Dec 31, 2007	April 30, 2008
RSVA Wholesale Market Services	0.6	(23.8)	(60.3)	(72.6)
RSVA Tx Network & Tx Network Aggregation	1.4	7.6	12.5	1.4
RSVA Tx Connection & Tx Connection Aggregation	1.6	5.4	7.5	2.5
RSVA Provincial Benefit	5.6	7.8	0.0	0.0
RSVA Low Voltage	0.0	0.8	3.0	3.8
Total RSVA	9.2	(2.2)	(37.3)	(64.8)

2.7 Accounts Not Being Requested For Recovery

2.7.1 RCVA and RRRP Accounts

RCVA and RRRP deferral accounts are currently being tracked by Hydro One Distribution but are not being requested for recovery as part of this proceeding. Balances in these accounts will continue to be filed with the Board on a quarterly basis per the Electricity Reporting and Record Keeping Requirements and included in the Board's annual review of deferral account balances.

2.7.2 Regulatory Asset Recovery Account – Phase I

Ontario's local electricity distribution companies (LDCs or distributors) incurred costs in preparation for the competitive market which opened in May 2002. In addition to these transition costs, utilities incurred other costs associated with regulatory directives related to market restructuring and the ongoing competitive market.

On January 10, 2005, the Board issued an *Order* (RP-2004-0117/0118) granting Hydro One approval for its regulatory asset account balance of $155 million as filed on December 20, 2004.

Simple interest is applied to the monthly opening principal balance in this account.

The Recovery of Regulatory Asset Balances – Phase I account (USofA 1590) is monitored and reported on a quarterly basis to the Board per the Electricity Reporting and Record Keeping Requirements. A final reconciliation (and true up adjustment) will be done at the end of the three year duration of the rate rider (April 30, 2008 for Distribution customers with volumetric rate riders, and March 31, 2008 for Embedded LDCs and Directs with fixed dollar amount rate riders).

2.7.3 Regulatory Asset Recovery Account – Phase II

On August 17, 2005, Hydro One Distribution filed an application with the Board for an order approving or fixing just and reasonable rates for the distribution of electricity effective May 1, 2006. On April 12, 2006, the Board issued a *Decision with Reasons* (RP-2005-0020 / EB-2005-0378) granting Hydro One approval for its regulatory asset account balances of $100 million as approved for Rate Rider recovery under that application.

Simple interest is applied to the monthly opening principal balance in this account.

The Recovery of Regulatory Asset Balances – Phase II account (USofA 1590) is monitored and reported on a quarterly basis to the Board per the Electricity Reporting and Record Keeping Requirements. A final reconciliation (and true up adjustment) will be done at the end of the four year duration of the rate rider (April 30, 2010).

PLANNED DISPOSITION OF REGULATORY ASSETS

1.0 INTRODUCTION

The purpose of this evidence is to outline the planned disposition of Regulatory Assets.

2.0 PLANNED DISPOSITION OF REGULATORY ASSETS

Hydro One Distribution is requesting approval to reduce the annual revenue requirements over a four year period by the Regulatory Asset total balance of $(48.7) million, or $(12.2) million per year.

Hydro One Distribution is requesting disposition of Regulatory Asset balances up to April 30, 2008. Balances as of April 30, 2008 are reasonably predictable. Allowing disposition of balances up to April 30, 2008 is more efficient as it provides the opportunity to close out certain deferral accounts. For the purposes of this filing, April 30, 2008 was chosen as it is assumed approved Distribution rates will be in place at the beginning of May 2008.

Hydro One Distribution's requested reduction to the Revenue Requirement of $(48.7) million is detailed in Table 1:

Table 1
Distribution
Disposition of Regulatory Asset Balances ($ Millions)

Description	Balance April 30, 2008
OEB Costs Account	(0.9)
Tax Changes Account	(5.0)
Smart Meter Minimum Functionality Under-recovery to May 31, 2007	6.9
Smart Meter Exceeding Minimum Functionality Under-recovery	5.7
Smart Meter Minimum Functionality Under-recovery between June 1, 2007 and April 30, 2008	9.4
Retail Settlement Variance Accounts	(64.8)
Total Requested for Disposition	**(48.7)**

Hydro One Distribution is requesting a reduction to the Revenue Requirement by the amounts detailed in Table 1 over a four year period to maintain consistency with previous recovery periods approved for Regulatory Accounts within the Electricity Transmission and Distribution Businesses, such as the 2006 Distribution Rate Proceeding (RP-2005-0020 / EB-2005-0378) and the 2004 Regulatory Assets Review Proceeding (RP-2004-0117/0118).

A Regulatory Asset Recovery Account will be established for any difference between the amount of Regulatory Assets approved and the actual value of the Regulatory Assets detailed above as at April 30, 2008. This variance will continue to be tracked and will be interest improved on a monthly basis (using a simple interest calculation) at the OEB approved rate. This account will be reported to the Board on a quarterly basis consistent with the Electricity Reporting and Record Keeping Requirements and subject to the Board's annual Regulatory Asset Review.

VARIANCE ACCOUNTS REQUESTED

This exhibit requests approval to establish new variance accounts for Hydro One Distribution as follows:

- Pension Cost Differential
- OEB Cost Differential
- Bill Impact Mitigation

The need for these accounts and the accounting and control process is described in further detail in the remainder of this exhibit.

1.0 PENSION COST DIFFERENTIAL

Hydro One Distribution proposes to track the difference between actual pension costs booked using the actuarial assessment, provided by Mercer Human Resource Consulting, and the estimated pension costs used in this rate filing. Hydro One's actuarial valuation was prepared as at December 31, 2006 and was filed with FSCO in September 2007.

2.0 OEB COST DIFFERENTIAL

This account will track the difference between the annual OEB Cost Assessments, intervenor cost awards, and costs associated with OEB-initiated studies and the amount for these expenditures approved by the OEB as part of the 2008 Distribution Rates until these rates are rebased.

3.0 BILL IMPACT MITIGATION

This account will record the difference between Hydro One's requested revenue requirement and distribution rates resulting from the Application of the Cost Allocation for Electricity Distributors report issued by the Board on November 28, 2007. In this report the Board indicated that Distributors should endeavor to move their revenue-to-cost ratios within an acceptable range which is closer to one but should not move them away from one and be cognizant of customer bill impacts. To comply with these requirements, Hydro One Distribution proposed rates will result in a revenue differential of $2.5 million. The establishment of the Bill Impact Mitigation variance account will enable this balance to be recorded and submitted for recovery at a future proceeding. The intent of this account is similar in nature to the MEU Rate Mitigation account approved by the Board in their RP-2005-0014/EB-2005-0099 to 0185 decision At that time, the Board directed Hydro One to limit the rate increase to no more than 10 percent on the average customer's total bill and recognized that Hydro One would have a revenue shortfall. The Board wrote that they would allow for the recovery of this deferred revenue in future years.

4.0 ACCOUNTING AND CONTROL PROCESS

The variance accounts requested above will be managed in the same manner as existing Hydro One Distribution variance accounts. Accounts will be updated monthly and interest applied consistent with the Board approved rate. Balances will be reported to the Board as part of the quarterly reporting process. The outstanding balance whether in a debit or credit position will be submitted for approval by the Board as part of Hydro One Distribution's next rate filing.

INTRODUCTION TO COST ALLOCATION AND RATE DESIGN

This exhibit provides a road map to the evidence associated with cost allocation and rate design, which Hydro One Distribution proposes in this submission in respect of its Legacy, Acquired LDCs and Embedded (Low Voltage) customers.

The G1 exhibits describe Hydro One's proposal in a number of cost allocation and rate design areas, including: establishing new customer classes into which all current customer classes will be mapped; use of the OEB-recommended cost allocation methodology to allocate costs to the new customer classes; the harmonization process that is used to integrate existing customers into the new rate classes; use of the OEB-approved rate design methodology for setting the rates for the new customer classes; the proposals for mitigating customer bill impacts; and a number of other cost allocation and rate design issues as detailed in the following Sections of this Exhibit.

The G2 exhibits provide the 2008 rate schedules for all customers, including: rate schedules for the Legacy customers, which can be found in Exhibit G2, Tab 5, Schedule 1; rate schedules for the Acquired LDCs , which are provided in Schedule 1 of Exhibits G2, Tab 6, through Exhibit G2, Tab 93; and finally, the rate schedule for the Sub-Transmission customers, including current Embedded customers, which can be found in Exhibit G2, Tab 94, Schedule 1. The G2 exhibits also provide some miscellaneous exhibits (e.g. Miscellaneous rates, Conditions of Service) as detailed in the following Sections of this Exhibit.

1.0 COST ALLOCATION STUDY

Hydro One is using the Cost Allocation methodology recommended by the Board in its September 29, 2006 report, Proceeding EB-2005-0317, to allocate the revenue requirement by customer group. Hydro One modified the methodology to deal with its unique circumstances, such as the provision of Sub-Transmission service to Embedded customers and the numerous number of customer classes. The modifications are described in Exhibit G2, Tab 1, Schedule 1.

2.0 CUSTOMER CLASSIFICATION

The current customer classification is presented in Exhibit G1, Tab 2, Schedule 2. Hydro One is proposing to adopt 12 new customer classes into which all of its Legacy and Acquired customers will be mapped. The proposed 12 customer classes are shown below.

1. Urban Residential (High Density)
2. R1 Residential (Medium Density)
3. R2 Residential (Low Density)
4. Seasonal
5. Urban General Service energy billed
6. Urban General Service demand billed
7. General Service energy billed
8. General Service demand billed
9. Sub-Transmission
10. Street Light
11. Sentinel Light
12. Distributed Generation

More details on the proposed new 12 customer classes are presented in Exhibit G1, Tab 2, Schedule 3.

As part of the process for mapping Acquired customers to the 12 new customer classes Hydro One undertook a review of customers that meet the Urban Density criteria. The results of the review are presented in Exhibit G1, Tab 2, Schedule 4 and Exhibit G2, Tab 3, Schedule 1.

3.0 HARMONIZATION OF RATE CLASSES

Hydro One proposes to harmonize the rate classes for the customers of the 88 Acquired Utilities, including Terrace Bay, into six of the 12 new customer classes: Urban Residential, R1 Residential, Urban General Service energy billed, Urban General Service demand billed, General Service energy billed, and General Service demand billed customer classes. Hydro One also proposes to map and harmonize the rate classes for existing Legacy customers to the 12 new proposed classes. The purpose of the mapping and harmonization processes is to reduce the current 281 rate classes to a more manageable level in order to simplify the rate structures, facilitate customer understanding and achieve administrative efficiencies.

The evidence in support of this proposal is provided in Exhibit G1, Tab 2, Schedule 5 and Exhibit G2, Tab 2, Schedule 1.

4.0 APPORTIONMENT OF REVENUE REQUIREMENT

The revenue requirement by customer class and corresponding revenue to cost ratios that result from the application of the cost allocation methodology provide a guide on over or under-contribution by rate group. The allocated revenue requirement for each of the new 12 customer classes is shown in Exhibit G1, Tab 3, Schedule 1.

5.0 RATE DESIGN CONSIDERATIONS

The rate design is not changing for any customer classes other than for Sentinel and Street Lights, and for Sub-transmission customers, for whom a fixed service charge is proposed in addition to a variable charge as supported by feedback received during stakeholdering. A description of Hydro One's proposal with respect to rate design issues for 2008 Distribution rates is presented in Exhibit G1, Tab 4, Schedule 1.

The proposed 2008 target rates for the 12 new customer classes is presented in Exhibit G1, Tab 4, Schedule 2, rate considerations for Acquired customers is presented in Exhibit G1, Tab 4, Schedule 3, and rate considerations for Sub-Transmission customers are presented in Exhibit G1, Tab 4, Schedule 4. These exhibits provide a summary of the proposed 2008, 2009, 2010 and 2011 Distribution rates. The rates for Acquired LDCs are harmonized using a 4 year phase-in approach to deal with the wide variation of rates in the Acquired LDCs .

Hydro One's proposal with respect to Low Use Secondary Service customer rates is presented in Exhibit G1, Tab 2, Schedule 6.

Exhibit G1, Tab 4, Schedule 5 explains the development of the fixed service charge credit for unmetered scattered load and Exhibit G1, Tab 4, Schedule 6 explains the proposal with respect to the Transformer Ownership Allowance.

6.0 REGULATORY ASSET RATE RIDER # 3

Exhibit G1, Tab 5, Schedule 1, provides a description of the methodology applied by Hydro One Distribution in respect to allocating the balance accrued in the five Regulatory Asset accounts to April 30, 2008 to the various customer classes.

Exhibit G1, Tab 5, Schedule 2 provides a description of the allocators and charge determinants that Hydro One Distribution proposes to use in respect of recovering the accumulated Regulatory Asset balances from the various customer classes.

Rate Riders # 3 that will apply in respect of the recovery of the Regulatory Asset balances are derived in Exhibit G1, Tab 5, Schedule 3.

7.0 RETAIL TRANSMISSION SERVICE RATES

Hydro One Distribution proposes to revise its Retail Transmission Service Rates (RTSR) for 2008, and Exhibit G1, Tab 6, Schedule 1 provides the corresponding evidence in terms of the methodology used and the resultant rates that would apply for the 12 new proposed rate classes. Additional supporting details are presented in Exhibit G2, Tab 4, Schedule 1.

The corresponding 2008 RTSR for the proposed new 12 customer classes is included in Exhibits G2, Tabs 5 to 94 that contain all the applicable rates.

8.0 CUSTOMER BILL IMPACTS AND MITIGATION

An assessment of customer bill impacts is provided in Exhibit G1, Tab 7, Schedule 1 for the Legacy customers, in Exhibit G1, Tab 7, Schedule 2 for Acquired LDC customers, and in Exhibit G1, Tab 7, Schedule 3 for the Sub-Transmission customers.

Hydro One Distribution believes it is necessary to propose an approach which mitigates bill impacts for Legacy and Acquired LDCs customers. Evidence in this respect is provided in Exhibit G1, Tab 8, Schedule 1 and Exhibit G1, Tab 8, Schedule 2.

9.0 PROPOSAL FOR CUSTOMERS CURRENTLY ON THE INTERIM TIME-OF-USE RATE PILOT

Exhibit G1, Tab 9, Schedule 1 provides information on Hydro One Distribution proposal for the three customers currently enrolled in the Interim Time-of-Use rate pilot.

10.0 DISTRIBUTION LOSS FACTORS

An assessment of Hydro One Distributions loss factor is included in Exhibit A, Tab 15, Schedule 3. A description of the proposed Total Loss Factors are included in Exhibit G1, Tab 10, Schedule 1, and are also included in the corresponding Rate Schedules for Legacy, Acquired and Sub-Transmission customers in Exhibit G2, Tabs 5 to 94.

11.0 MISCELLANEOUS RATES

The proposed rates for Miscellaneous charges can be found in Exhibit G2, Tab 95, Schedule 1 and in the corresponding Rate Schedules for Legacy, Acquired and Sub-Transmission customers in Exhibits G2, Tabs 5 to 94.

12.0 TERMS AND CONDITIONS OF SERVICE

The Terms and Conditions of Service applicable to all Hydro One customers are provided in Exhibit G2, Tab 96, Schedule 1.

CUSTOMER CLASSIFICATION

In order to set the context for the allocation of Hydro One's revenue requirement to customer classes, Exhibits G1, Tab 2, Schedule 2 to Schedule 6 provide a review of the current and proposed customer classes.

1.0 CATEGORIES OF SERVICE

Within the Hydro One Distribution business there are two categories of service provided to customers. The first category entails distribution service to over one million Retail customers. Retail customers consist of Legacy customers (customers of the former Ontario Hydro and its successor companies) and Acquired customers (customers of the LDCs acquired by Hydro One, excluding Brampton Hydro which is a subsidiary of Hydro One and whose customers are not part of this Application). Retail customers currently fall into rate classes designated for residential, seasonal, general service and farm customers.

The second category entails distribution service to Sub-Transmission customers that are directly connected to the Hydro One Distribution Sub-Transmission (ST) system. ST customers consist of all Embedded LDCs, all Embedded Direct delivery points with demands above 5 MW, and large customers with demands above 500 kW that provide their own transformation facilities and are connected to Hydro One's distribution system at voltages of 13.8 kV or above.

2.0 REDUCING THE NUMBER OF CUSTOMER CLASSES

One of the main objectives of this Application is to simplify the structure of Hydro One Distribution's current rate classes to better reflect utilization of assets and services which impact cost causality. The simplified rate classes are also designed to be more consistent with the number, and categorization of rate classes typically used in other Ontario distribution companies (LDCs), and are expected to reduce customer confusion and be significantly easier to manage from an administrative perspective.

As described in Exhibit G1, Tab 2, Schedule 2 Hydro One currently has over 280 rate classes to administer its Retail and ST customers. With the implementation of time-of-use rates, and assuming not all customers within a rate class will want to adopt time-of-use, the number of rate classes to be administered can potentially expand to a value of close to 600 if action is not taken to reduce the number of rate classes. Hydro One is concerned that this vast array of distribution tariffs has the potential to create significant customer confusion and increase the overall cost of administrating the rates and the customer interface.

Hydro One discussed the possibility of reducing the number of rate classes applicable to its customers at a stakeholder session held September 5th, 2007. The discussion with stakeholders included Hydro One's intent of creating customer classes that reflect the type of customer served, consumption level, types of assets used to provide the service, and customer density. As detailed in Exhibit A, Tab 16, Schedule 1, Stakeholders were actively engaged in this discussion and provided valuable input that was used to shape the 12 new customer classes discussed in Exhibit G1, Tab 2, Schedule 3.

3.0 MAPPING EXISTING RATE CLASSES TO PROPOSED RATE CLASSES

All of the existing Legacy rate classes and Acquired utility rate classes will be mapped to the 12 new proposed rate classes using the harmonization process described in Exhibit G1, Tab 2, Schedule 5.

CURRENT CUSTOMER CLASSIFICATION

This exhibit describes Hydro One's current customer classification.

1.0 CURRENT CUSTOMER CLASSES

Hydro One Distribution currently has three basic distribution customer groups that have 281 customer classes and their own distinct rate structures:

- Legacy Retail customers,
- Acquired Utility customers, and
- Embedded customers.

1.1 Legacy Retail Rate Classes:

Hydro One Distribution has 13 Retail rate classes for its Legacy customers to reflect its diverse customer and geographical base, while each of the Acquired LDCs have three to four rate classes that are more typical of urban-based utilities.

Table 1 summarizes the existing Legacy Retail rate classes with a brief description. A more detailed description of the rate classes follows the table.

Table 1
Existing Legacy Retail Rate Classes

Symbol	Description
UR2	Residential Year Round Class – Urban Density
R1	Residential Year Round Class - High Density
R2	Residential Year Round Class - Normal Density
R3	Seasonal Class - High Density
R4	Seasonal Class - Normal Density
F1	Farm Class - Single Phase
F3	Farm Class - Three Phase
UG2	General Service Class – Urban Class
G1	General Service Class - Single Phase
G3	General Service Class – Three Phase
T	Transmission Class
Light	Street Lighting Sentinel Light

Existing Density Criteria:

Urban Density: areas containing 3,000 or more customers with a line density of at least 60 customers per kilometer

High Density: areas containing 100 or more customers with a line density of at least 15 customers per kilometer.

Normal Density: areas that are neither High Density nor Urban Density.

Existing Legacy Retail Customer Classes

Residential - Year-Round: This classification applies to a customer's main place of residence and may include additional buildings served through the same meter, provided they are not rental income units. To be classified as year-round residential, all of the following criteria must be met:

a. Occupants must state that this is their principle residence for purposes of the *Income Tax Act.*
b. The occupant must live in this residence for at least 8 months of the year.
c. The address of this residence must appear on the occupant's electric bill, driver's license, credit card invoice, property tax bill, etc
d. Occupants who are eligible to vote in Provincial or Federal elections must be enumerated for this purpose at the address of this residence.

Residential – Seasonal: This classification is comprised of cottages, chalets, and camps, any residential service not meeting the Residential - Year-Round criteria.

Farm: This classification is applicable to properties actively engaged in agricultural production as defined by Statistics Canada. It does not include tree, sod, or pet farms. Services to year-round pumping stations or other ancillary services remote from the main farm shall be classed as farm. It includes single-phase and three-phase customers that can be energy or demand billed.

General Service: This classification is applicable to any service that does not fit the description of the Residential or Farm classes. Generally, it is comprised of commercial, industrial, educational, administrative, auxiliary and government services. It also includes combination services where a variety of uses are made of the service by the owner of one property, and all multiple services except residential. It includes single-phase and three-phase customers that can be energy or demand billed.

Transmission: This classification is applicable for General class customers supplied by the sub-transmission system up to 5,000 kW.

Street Lighting: Classification for street lighting service only.

Sentinel Lighting: Classification for sentinel lighting service only.

1.2 Existing Acquired LDCs Customer Classes

The Acquired LDCs customer classes consist of: Residential customer class, General Service energy billed for customers with average demands below 50 kW, General Service demand billed for customers with average demands above 50 kW, and Large User for Acquired LDCs with customers that have average demand exceeding 5,000 kW. In 2006, Unmetered Scattered Load rates for Acquired General Service customers were developed following the 2006 EDR guidelines.

Currently each Acquired LDC has separate and distinct rates as derived from the Board's Rate Unbundling and Design (RUD) model. Therefore, Hydro One Distribution is currently maintaining approximately 270 rates for the approximately 160,000 Acquired LDC customers.

One of the goals of this Submission is to harmonize the Acquired LDCs' more than 270 rate classes into Hydro One's new proposed customer classes to achieve a smaller and more manageable set of rates. This manageable set is achieved through the Harmonization process described in Exhibit G1, Tab 2, Schedule 5.

<u>Special Subclasses</u>:

Low Use Secondary Services: Applicable only for low use secondary services located on the same property as the main service, supplied from the same transformer, with the same owner and consumes less than annual threshold levels. There is no service charge applicable for consumption not exceeding the following thresholds per rate class:

Residential year-round	<1,500 kWh / annum
Residential – seasonal	< 500 kWh / annum
General Service & Farm	< 2,500 kWh / annum

There are 2,500 customers with these accounts in 2007. Their consumption is included within the rate classes where they reside to derive total revenues per rate class. However, to derive revenues the customer counts need to be reduced to reflect that this sub-class of customers pays no monthly service charge.

Unmetered Scattered Loads: This category captures services to phone booths, bill boards, cable boxes, etc., but excludes street and sentinel lighting, which are separate classes. Unmetered loads reside in rate classes G1, G3 and UG2. The analysis of these classes included these customers to derive the total revenues for each rate class.

1.3 Embedded (LV) Rate Classes:

The LV rates consist of the following rate structures that were approved by the OEB in proceeding RP-2000-0023:

Shared LV line – line used by more than one embedded customer, LDC or Direct
HVDS hi – provides transformation service from above 50 kV to 44 kV or above 24.9 kV

Shared LVDS - provides transformation service from above 44 kV or 24.9 kV to lower voltages

HVDS low - provides transformation service from above 50 kV to 13.8 kV or lower voltage

Specific LV line – LV line used by one embedded customer and the line is located in their territory

Specific DX line – DX line used by one embedded customer and the line is located in their territory

Currently only the Shared LV line charge applies to Direct customers due to the fact that these are the only facilities that Direct customers utilize. Embedded LDCs are subject to all of the above LV rates depending on the facilities they use.

PROPOSED CUSTOMER CLASSIFICATION

This exhibit presents Hydro One's proposed customer classification.

1.0 PROPOSED CUSTOMER CLASSES

In order to simplify rates, provide similar customer classes as other LDCs, reduce customer confusion, improve administrative efficiency and to better reflect asset utilization and cost causality, Hydro One is proposing 12 new customer classes:

1. Urban Residential (High Density)
2. R1 Residential (Medium Density)
3. R2 Residential (Low Density)
4. Seasonal
5. Urban General Service energy billed
6. Urban General Service demand billed
7. General Service energy billed
8. General Service demand billed
9. Sub-Transmission
10. Street Light
11. Sentinel Light
12. Distributed Generation

Based on Stakeholder feedback received on September 5, 2007 Urban General Service energy billed and Urban General Service demand billed customer classes have been included in our proposal. Also based on Stakeholder feedback at the same session, Hydro One will change the current definitions used for Residential customers Urban, High and Normal density. The current description of Urban Residential, R1 Residential High density and R2 Residential Normal density will be changed to Urban Residential (high density), R1 Residential (medium density) and R2 Residential (low density) to minimize potential customer confusion.

Urban Residential (High Density)

This customer class will include all existing Legacy residential, farm and Acquired LDCs residential customers that meet the Urban Density Criteria. The Urban Density criteria is unchanged and is defined as areas containing 3,000 or more customers with a line density of at least 60 customers per kilometer. The proposed Urban Residential customer class has 155,840 customers in 2006 some of which are mapped from the other original Legacy classes and the Acquired residential classes, as shown in the Table below.

Table 1
Proposed Urban Residential (High Density) customers 2006 Data

Current Customer Class	Number of Customers
Urban Legacy	82,519
R1 Legacy	11,753
R2 Legacy	293
Farm single-phase	128
Acquired LDCs Residential	61,147
	155,840

R1 Residential (Medium Density)

This customer class will include all R1 Legacy customers that have not been reclassified to Urban class and all remaining Acquired Residential customers that have not been reclassified as Urban class. The proposed R1 Residential customer class in 2006 has 365,190 customers as shown in the Table below.

Table 2
Proposed R1 Residential (Medium Density) customers 2006 Data

Current Customer Class	Number of Customers
R1	292,508
Acquired LDCs Residential	72,682
	365,190

R2 Residential (Low Density)

This customer class includes all current R2 customers that have not been reclassified to Urban and all energy billed Farm customers that are currently single-phased or three-phased Farms. These groups of customers receive Rural or Remote Electricity Rate Protection, (RRRP). This group also includes one Caledon residential class. The proposed R2 Residential customer class has 358,328 customers in 2006 as shown in the Table below.

Table 3
Proposed Rural Residential (Low Density) customers 2006 Data

Current Customer Class	Number of Customers
R2	272,111
Caledon OH-06	7,266
Farms single phase	78,720
Farms three-phase	231
	358,328

Seasonal Residential

This customer class will include all current R3 and R4 and Caledon OH-07 customers. This customer class in 2006 has 154,437 customers as shown in the Table below:

Table 4
Proposed Seasonal Residential customers 2006 Data

Current Customer Class	Number of Customers
R3	70,750
R4	83,477
Caledon OH-07	210
	154,437

Urban General Service Energy Billed

This customer class will include all existing Legacy General Service, Farms and Acquired General Service customers that meet the Urban Density Criteria and are energy billed. The Urban Density criteria is unchanged and is defined as areas containing 3,000 or more customers with a line density of at least 60 customers per kilometer. The proposed Urban General Service energy billed customers class has 12,427 customers in 2006 as show in the Table below.

Table 5
Proposed Urban General Service energy billed customers 2006 Data

Current Customer Class	Number of Customers
Urban General Service Legacy customers energy billed	5,309
General Service single phase	425
General Service three-phase	432
Farm single-phase	18
Acquired LDCs General Service	6,243
	12,427

Urban General Service Demand Billed

This customer class will include all existing Legacy General Service and Acquired General Service customers that meet the Urban Density Criteria, are demand billed, and are supplied at voltages below 13.8 kV. The Urban Density criteria is unchanged and is defined as areas containing 3,000 or more customers with a line density of at least 60 customers per kilometer. The proposed Urban General Service energy billed customers class has 1,375 customers in 2006 as show in the Table below.

Table 6
Proposed Urban General Service demand billed customers 2006 Data

Current Customer Class	Number of Customers
Urban General Service Legacy customers demand billed	593
General Service single phase	8
General Service three-phase	119
Acquired LDCs General Service	655
	1,375

General Service Energy Billed

This customer class will include: all energy billed customers that are currently single–phase General Service customers, three-phase General Service customers, Acquired General Service customers, all energy billed Farm customers that are currently single-phased or three-phased Farms that do not receive RRRP, and energy billed T-class customers. All these customers are customers with average demands below 50 kW and do not meet the Urban Density criteria. The proposed General Service energy billed customer class in 2006 has 92,225 customers as show in the Table below. This class will also include all unmetered scattered load connections.

Table 7
Proposed General Service Energy Billed customers 2006 Data

Current Customer Class	Number of Customers
General Service single-phase energy billed	55,032
General Service three-phase energy billed	10,318
T-Class customers energy billed	14
Farm single phase energy billed and no RRRP	8,723
Farm three phase energy billed and no RRRP	589
Acquired LDCs General Service customers energy billed	12,632
Unmetered Scattered Load	4,917
Total Number of Customers	**92,225**

General Service Demand Billed

This customer class will include: all demand billed single–phase General Service customers, three-phase General Service customers, Acquired General Service customers, all demand billed Farm customers that are currently single-phased or three-phased Farms, and T-Class customers below 500 kW of demand. All these are customers with average demands above 50 kW, supplied at voltages below 13.8 kV, and do not meet the Urban Density criteria. The proposed General Service energy billed customer class in 2006 has 6,849 customers, as shown in the Table below.

Table 8
Proposed General Service Demand Billed customers 2006 Data

Current Customer Class	Number of Customers
General Service single-phase demand billed	579
General Service three-phase demand billed	4,044
Farm single phase demand billed	495
Farm three-phase demand billed	389
T-Class customers demand billed and with demands below 500 kW	175
Acquired LDCs General Service customers demand billed	1,167
Total Number of Customers	**6,849**

Distributed Generator

As per the Board's direction in the EB-2005-0528 proceeding, Hydro One has created a new customer class consisting of all 81 active Distributed Generators located within its territory in 2006. The current customer classification for these customers is 48 T-class Customers, 1 Acquired General Service customer, and 32 General Service three-phase customers.

Street Lighting

Classification for street lighting service only

Sentinel Lighting

Per the requirements of Regulation 116/02 made under the *Electricity Act, 1998* Hydro One Networks includes the provision of sentinel lighting service as part of its regulated business. This rate classification is applicable for sentinel lighting service only, and includes the cost of providing distribution service to the sentinel lights. The cost for providing this service is determined using the cost allocation methodology recommended by the Board as part of proceeding EB-2005-0317, and is net of the miscellaneous revenues associated with charges for providing the sentinel lights themselves.

Sub-Transmission (ST) Customer Class

This customer class will include all three-phase customers with demands above 500 kW that provide their own transformation facilities and are connected at voltages of 13.8 kV or above. The class will also include all Embedded LDC supply points, some of which are connected at voltages below 13.8 kV. This ST class will include some customers from the following groups: T-class customers, Acquired General Service customers, Urban General Service customers, three-phase General Service customers, three-phase Farms, all Acquired Large Users, all Direct customers and all Embedded LDC supply points. The proposed Sub-Transmission customer class in 2006 has 670 Delivery Points as show in Table 9.

Table 9
Proposed Sub-transmission Delivery Points 2006 Data

Current Delivery Points	Number of Delivery Points
Urban General Service above 500 kW	10
General Service three-phase above 500 kW	57
Acquired LDCs General Service customers above 500 kW	72
T-Class customers above 500 kW	124
Farm three-phase above 500 kW	1
Acquired Large Users	6
Embedded Direct	42
Embedded LDCs	358
Total Number of Delivery Points	**670**

The above mentioned 12 customer classes have been used in Hydro One’s Cost Allocation Study to allocate the 2008 proposed Revenue Requirement amongst the customer classes.

DENSITY REVIEW

This exhibit presents a description of the Density Review undertaken by Hydro One to identify customers that qualify for Urban Density classification.

1.0 INTRODUCTION

Hydro One undertook a review of Urban areas to update the classification of Residential and General Service customers. This review entailed identifying areas in the Province that meet the Urban Density criteria and using 2006 data gathered from maps, operating diagrams and customer connectivity information to identify all Residential and General Service Legacy and Acquired customers served within the areas that meet the Urban Density criteria.

This review identified 11,753 current R1 customers, 293 current R2 customers, and 128 current single-phase Farm customers that meet the Urban Density criteria and will be re-classified from their current customer classification. In addition, 61,147 current Acquired LDCs Residential customers meet the Urban Density criteria and are proposed to be grouped as part of the new Urban Residential customer class. All existing Urban customers will also be included in this new Urban class. The remaining 72,682 Acquired Residential customers, excluding Caledon Residential OH-06 and OH-07 customer classes, will be grouped with the R1 customer class.

The review also identified 425 current single–phase General Service customers, 432 current three-phase General Service customers, and 18 current single-phase Farms that meet the Urban Density criteria and will be re-classified from their current customer classification. In addition, 6,243 current Acquired General Service customers and 5,309 current Urban General Service customers that meet the Urban Density criteria are proposed to be grouped as part of the new Urban General Service energy billed customer class. Finally, the review also identified 8 current single–phase General Service customers, and 119 current three-phase General Service customers that meet the Urban Density criteria and will be re-classified from their current customer classification. In addition,, 655 current Acquired General Service customers and 593 current Urban General Service customers that meet the Urban Density criteria are proposed to be grouped as part of the new Urban General Service demand billed customer class.

Results of the Density review for Urban areas are included in Exhibit G2, Tab 3, Schedule 1.

HARMONIZATION OF ACQUIRED LDC CUSTOMERS AND CONSOLIDATION OF LEGACY CUSTOMER CLASSES

This exhibit discusses the proposal to harmonize the rate classes for the customers of the Acquired Utilities and to consolidate the rate classes for Hydro One Distribution's Legacy customers with the 12 new proposed customer classes.

Terrace Bay, whose purchase by Hydro One has been approved by the OEB is also included in this harmonization plan for a total of 88 Acquired utilities to be harmonized. Brampton Hydro is a separate business, and not part of Hydro One Distribution submission for distribution rates. Since the initial unbundling of distribution rates, each of the 88 Acquired Utilities have maintained their own individual distribution rates as developed via the Board's Rate Unbundling Design (RUD) Model.

The purpose of the plan presented herein for both Legacy and Acquired customers is to reduce the numerous existing rate classes to a more manageable level in order to minimize the degree of customer confusion over the numerous rates and to improve administrative efficiencies.

1.0 INTRODUCTION TO HARMONIZATION

Hydro One Distribution proposed to harmonize the rates for its Acquired LDCs as part of the 2006 Distribution Rate submission RP-2005-0020/EB-2005-0378. The 2006 proposal was intended to harmonize rates only amongst the Acquired LDCs, The Board Decision with Reasons dated April 12, 2006, indicated that the then proposed harmonization was premature and that there was no evidence to determine that the proposed rate would be fair and reasonable because the proposed harmonized rates were not based on a cost allocation study.

Hydro One believes that the concerns raised by the Board in the 2006 proposal have been addressed in the current harmonization plan.

1. A Cost Allocation Study Methodology has been recommended by the Board and the results of this cost allocation study now provide support for the target distribution rates that are the basis of the harmonization plan. Given the impact on customer bills resulting from the harmonization plan a multiple year phased-in approach is being proposed by Hydro One. The relevant statistics for the Acquired LDC customer groups in terms of current rates and customer numbers are provided in Tables 1 to 3 in Exhibit G2, Tab 2, Schedule 1.

2. The current plan entails harmonization of all of the Acquired LDCs residential rate classes into the two new Residential rate classes proposed by Hydro One: Urban or R1. Density for each Acquired LDC customer determines if the Acquired LDC's Residential customer is to be harmonized with the Urban or the R1 residential group.

3. Three of Caledon's Residential customer classes, OH 01, OH 06 and OH 07 are being harmonized with the Urban (UR), Rural (R2) and Seasonal customer class respectively. Caledon Residential OH 01 was based on the previous Ontario Hydro Urban Residential customer class, Caledon Residential OH 06 was based on the previous Ontario Hydro Residential R2 customer class and Caledon Residential OH 07 was based on the previous Ontario Hydro R4 Seasonal customer class.

4. The Acquired General Service customer classes are proposed to be harmonized into the four new General Service classes: Urban General Service energy billed, Urban General Service demand billed, General Service energy billed, or General Service demand billed. Density for each Acquired LDC customer determines if the Acquired

LDC's General Service customer is to be harmonized with the Urban General Service or the General Service group.

5. Acquired Large Users are proposed to be grouped as part of the new Sub-Transmission customer class which is described in Exhibit G1, Tab 2, Schedule 3.

2.0 HARMONIZATION OF RESIDENTIAL AND GENERAL SERVICE RATES

The proposed harmonization plan entails merging some of the customers in Acquired Residential classes with the Urban Residential customer class. All the remaining residential customers of the 88 Acquired LDCs will be merged with the R1 Residential customer class. Similarly, some of the Acquired General Service customers are proposed to be harmonized into either Urban General Service, or General Service, depending on meeting the Urban Density criteria, and further grouped into energy, or demand billed customer classes. As stated in Exhibit G1, Tab 2, Schedule 1, one of the benefit of harmonizing the customer classes would be the elimination of over 270 Acquired rate classes.

The proposed harmonization plan would entail combining all Residential and General Service Acquired customers into six new customer classes that include Hydro One's Legacy customers. The results in terms of the number of customers in the Acquired LDCs moving to the six new rate classes are shown in Table 1 below.

Table 1
Acquired Rate Classes

Customer class	Number of Acquired customers affected based on 2006 data	Number of Acquired LDCs affected
Urban Residential	61,147	12
R1 Residential	72,682	88
Urban General Service energy billed	6,243	11
Urban General Service demand billed	655	11
General Service energy billed	12,632	88
General Service demand billed	1,167	88

The plan proposed to harmonize Acquired customer rates is described in section 2.1 below. The plan was presented at the second Stakeholder session on September 5th, 2007 and Stakeholders generally supported the proposed approach as noted in Exhibit A, Tab 16, Schedule 1. The starting point of the harmonization plan is the current service charge in the Acquired LDCs and the target of the harmonization plan is the corresponding service charge in the proposed rate class. The two principles applied are to group Acquired LDCs customers according to the proposed service charges and to ensure that the distribution revenues allocated to the group are recovered from all customers in the groups. An example on how these two principles are applied is provided in the following section.

2.1 Description of Process to Harmonize Acquired Rates

Starting with the harmonization of Residential customer classes of Acquired LDCs that moved to the new Urban Residential customer class, the proposed harmonization plan would entail the following step:

1. Current Acquired fixed service charges are truncated downward into rounded dollar amounts, (e.g. $3.60 becomes $3.00).
2. Determine the target fixed and volumetric rates that would be applicable to the Acquired Residential customers. The target rates would be the new Urban Residential distribution rates
3. Determine the incremental increase, or reduction required to bring the service charge to the target service charge
4. Divide the increment into four, (based on a four year phase-in plan)
5. Apply the increment calculated in step 4 above to the truncated service charge to determine year one service charge
6. Year two service charge is the service charge for year one calculated in step 5 above plus the increment calculated in step 4 above
7. Year three service charge is the service charge for year two calculated in step 6 above plus the increment calculated in step 4 above
8. Year four service charge is the target service charge for the new Urban Residential class
9. A common volumetric charge is determined for all customers in the group to recover the balance of Distribution revenue not collected through fixed charges in each year of the four year-plan
10. Three of Caledon's Residential rate classes would be moved to Urban, R2 Residential, and Seasonal residential classes since they are similar to the Legacy Urban, R2 Residential, and Seasonal rate classes proposed.

A numerical example of the above steps is provided in Table 2 below.

Table 2
Development of Harmonized group rates for the Residential Urban Customer Class

Residential Urban	LDC 1	LDC 2
Target rates (fixed and volumetric)	$9.45/month & 0.89 ¢/kWh	$9.45/month & 0.89 ¢/kWh
May 2007 Rates (fixed and volumetric)	$3.94/month & 0.62 ¢/kWh	$11.46/month & 1.17 ¢/kWh
LDC truncated fixed service charge	$3.00/month	$11.00/month
LDC increase/(decrease) to achieve target fixed service charge	$5.51/month	$(2.01)/month
LDC year 1 rates	$3.00 + $5.51/4 = $4.38/month & 0.92*¢/kWh	$11.00 - $2.01/4 = $10.50/month & 0.92* ¢/kWh
LDC year 2 rates	$4.38 + $5.51/4 = $5.76/month & 0.91*¢/kWh	$10.50 - $2.01/4 = $10.00/month & 0.91* ¢/kWh
LDC year 3 rates	$5.76 + $5.51/4 = $7.14/month & 0.90*¢/kWh	$10.00 - $2.01/4 = $9.50/month & 0.90* ¢/kWh
LDC year 4 rates	$9.45 & 0.89 ¢/kWh	$9.45 & 0.89 ¢/kWh

*Calculation of the volumetric charge is not shown, but it is adjusted to ensure recovery of the required distribution revenue from customers in the group.

The same process as described above is followed for Acquired Residential classes that are being moved to the R1 Residential customer class and for General Service customers of Acquired LDCs that are being moved to Urban General Service energy billed, Urban General Service demand billed, General Service energy billed, or General Service demand billed classes.

Tables 6 and 7 in Exhibit G2, Tab 2, Schedule 1, provide examples of the derivation of rates for acquired customers that have the lowest and highest service charges in Urban Residential, R1 Residential, General Service energy billed, General Service demand billed, Urban General Service energy billed and Urban General Service demand billed. The Large users of the Acquired LDCs are being mapped to the new Sub-Transmission class in 2008.

2.2 Impacts due to Harmonization of Acquired Residential and General Service Customer Rates

The range of impacts on total bill resulting from the harmonization of Acquired Residential and General Service customer rates before bill impact mitigation are summarized in Table 3 below, where percentage changes compared to approved 2007 rates are shown. The complete set of impacts can be found in Tables 8, 9, and 10 of Exhibit G2, Tab 2, Schedule 1. Commodity, Wholesale Market Service and Debt Retirement charges are based on current, 2007 applicable charges and kept constant before and after harmonization. Retail Transmission Service Rates (RTSR) for 2008 are based on the new proposed RTSR, as described in Exhibit G1, Tab 6, Schedule 1. Losses for 2008 are based on the proposed loss factors described in Exhibit G1, Tab 10, Schedule 1.

Table 3
Range of impacts for Acquired Residential and General Service customers of Harmonization

Customer Class	Number of customers in 2006	Range of impacts on total bill (percent)
Residential	141,305	1.6 to 30.9
General Service	20,697	-3.0 to 36.2

Impacts are being mitigated to all Acquired Residential and General Service customers by phasing-in the harmonization plan over four years.

3.0 MAPPING OF LEGACY CUSTOMER CLASSES

Currently, Hydro One Distribution has 15 rate classes for Residential, General Service and Embedded LDCs and Direct customers. The proposed consolidation plan results in 12 new customer classes into which the Acquired LDC customer classes will be harmonized.

A similar process as described in Section 2 above is also used to consolidate Hydro One existing Legacy customer classes to the 12 new proposed customer classes.

As described in Exhibit G1, Tab 8, Schedule 1, a four-year plan can be implemented such that all Legacy customers would, on average have a total yearly bill impact of less than 10 percent, including the impact of the 2008 revenue requirement increase.

4.0 CONCLUSION

Currently, Hydro One Distribution has 88 Acquired LDCs and each LDC has 3 or 4 individual rate classes for Residential, General Service energy billed, General Service demand billed, and in some cases Large User rates.

The Hydro One Distribution harmonization plan for the Acquired LDCs ensures that the resultant bill impact for Acquired LDC customers are kept within prescribed thresholds in accordance with the 2006 Electricity Distribution Rate Handbook.

The harmonization plan covers a four year period at the end of which Acquired LDC customers will be part of the Urban, R1 Residential, Urban General Service energy billed, Urban General Service demand billed, General Service energy billed or General Service demand billed customer classes.

As described in Exhibit G1, Tab 8, Schedule 2, a four-year plan can be implemented such that all Acquired customers would, on average, have a total yearly bill impact of less than 10 percent, including the impact of the 2008 revenue requirement increase.

At the end of the four-year harmonization plan, rates for Acquired and legacy customers would be harmonized into the 12 new proposed customer classes.

LOW USE SECONDARY CUSTOMER RATE CONSIDERATION

This exhibit describes the proposal to eventually eliminate the Low Use Secondary customer rates.

1.0 LOW USE SECONDARY SERVICE

Hydro One is proposing to eventually eliminate its Low Use Secondary Service rates. This rate design was introduced in 1996 as a mitigation measure when Ontario Hydro changed the rate structure used to bill end-use customers from a declining block rate structure to a fixed monthly charge and a volumetric charge. For customers with very low consumption, the introduction of a fixed charge would have resulted in substantial bill impacts. For 2008, Hydro One proposes to introduce a fixed monthly charge for this rate design and bill the low use secondary service customer consumption at the General Service energy billed customer classification consumption using the corresponding applicable distribution rates. To mitigate large rate impacts the fixed charge is being phased-in over 5 years. The target fixed charge is the General Service energy billed service charge.

COST ALLOCATION OF REVENUE REQUIREMENT

This exhibit presents an overview of the process to allocate Hydro One Distribution related revenue requirement costs to Legacy, Acquired, and Sub-Transmission customer groups (including current Embedded LV customers).

1.0 INTRODUCTION

The 2008 revenue requirement of $1,067 million for Hydro One Distribution was derived in Exhibit E1, Tab 1, Schedule 1, and is attributed to the Retail, (Legacy and Acquired), and Sub-Transmission customers.

This revenue requirement is allocated to the proposed customer groups using the Cost Allocation methodology issued by the OEB on September 29, 2006 in the RP-2005-0317 proceeding. Hydro One modified the OEB methodology to reflect its unique circumstances related to the provision of an LV system and a very large number of rates. The modifications are detailed in Exhibit G2, Tab 1, Schedule 1, and are similar to the modifications applied in Hydro One's Cost Allocation Information Filing of January 15, 2007 as part of Proceeding RP-2007-0001.

2.0 APPORTIONMENT OF REVENUE REQUIREMENT

Hydro One used the OEB Cost Allocation Methodology to allocate the proposed $1,067 million revenue requirement to customer classes. The allocated revenue requirement was compared to the revenues that would be collected from customers at adjusted 2007 Distribution rates. The adjustment consisted of increasing the 2007 approved rates proportionally to recover the 2008 Revenue Requirement of $1,067 million. Revenue to cost ratios were then calculated. Revenue to cost ratios above 1 mean that the customer class is over-contributing and revenue to cost ratios below 1 mean that the customer class is under-contributing. The results of the cost allocation study are summarized in the Table below.

Table 1
Hydro One Cost Allocation Study Results

	UR	R1	R2	Seasonal	UGSe	UGSd	GS e	GS d	ST	DG	Street Light	Sent. Light	Total
Rev Req $M	66.0	240.2	390.3	83.6	9.3	16.8	111.1	105.4	27.4	0.4	8.1	8.0	1,066.6

More details on the results of the cost allocation study can be found in Exhibit G2, Tab 1, Schedule 1.

3.0 TARGET REVENUE TO COST RATIO

Hydro One is proposing to use the revenue to cost ratio ranges recommended in the Board's report issued November 28, 2007 under proceeding EB-2007-0667, "Application of Cost Allocation for Electricity Distributors". The Board recommended revenue to cost ratios range from 0.7 for street lights to 1.8 for large commercial customers. Given that this is the first time that the OEB's cost allocation methodology is being used as a basis for determining distribution rates, the wider range of revenue to cost ratios proposed by the Board will reduce the potential bill impacts on customers whose distribution rates have to increase to closer reflect cost causality. The proposed range of revenue to cost ratios will result in those customer classes with a revenue to cost ratio above 1 continuing to cross-subsidize those customer classes with a revenue to cost ratio below 1.

Hydro One is proposing the following revenue to cost ratios for the various new proposed customer classes.

For the R2 Residential, General Service energy billed, and General Service demand billed customer classes, the current revenue to cost ratio is proposed to be maintained:

For the Distributed Generation customer class, the revenue to cost ratio is proposed to be set at 1.0 rather than the current 1.63 in support of Government policy to promote Distributed Generation in Ontario.

For Street Light and Sentinel Light classes it is proposed to increase the revenue to cost ratio from about 0.6 to 0.7. This is the lower end of the revenue to cost ratio proposed by the Board for this class of customers.

For the Urban General Service energy billed class it is proposed to reduce the revenue to cost ratio from 1.29 to 1.2. This is the higher end of the revenue to cost ratio proposed by the Board for small commercial customers.

For the Sub-Transmission class it is proposed to reduce the revenue to cost ratio from 2.35 to 1.15. This is the higher end of the revenue to cost ratio proposed by the Board for large users.

In order to recover almost all of the 2008 Revenue Requirement based on the revenue to cost ratios described above, the revenue to cost ratio for Urban Residential, R1 Residential, Seasonal Residential and Urban General Service demand billed customer classes will have to increase. The revenue to cost ratios for the Urban Residential, Seasonal Residential, and Urban General Service demand billed customer classes are proposed to be set to 1.0. For the R1 Residential customer class, the proposed revenue to cost ratio is 0.88, which results in bill impacts that are considered to be the maximum that Acquired residential customers being harmonized to this customer class can sustain.

The proposed revenue to cost ratios result in Hydro One not being able to fully recover its 2008 proposed Revenue Requirement. The shortfall is estimated to be $2.5 million per year, which is the difference in the total proposed revenue requirement shown in Table 2 as compared to Table 1. Hydro One proposes to establish a variance account, as described in Exhibit F1, Tab 3, Schedule 1 to record this revenue shortfall for recovery at a future date from all customers.

Table 2
Proposed Revenue/Cost Ratio by Customer Class

	UR	R1	R2	Seasonal	UGSe	UGSd	GS e	GS d	ST	DG	Street Light	Sent. Light	Total

*Revenue to cost ratios in bold show the proposed change

4.0 REVENUE TO COST RATIO EQUAL TO ONE

In response to feedback received during the stakeholdering process, Hydro One explored the impact of moving all customer classes to a revenue to cost ratio of 1. Table 3 shows the average impacts that would result from making this change. As shown in Table 3, the resulting average total bill impacts under a revenue to cost ratio of 1 is generally greater and could be as much as three times the impact under the proposed revenue to cost ratios. As a result, using a revenue to cost ratio of 1 for all customer classes would result in either unacceptable bill impacts or the need for an excessively long impact mitigation period.

Table 3
Impact to Customer Classes of Revenue/Cost Ratios

	Proposed R/C	Average impact %	R/C = 1	Average impact %
UR	1.0	3.4	1	3.4

RATE DESIGN CONSIDERATIONS

This exhibit presents the rate design structure that Hydro One Distribution proposes for 2008 distribution rates. More details are provided in Exhibits G1, Tab 4, Schedule 2 to Schedule 6.

1.0 RETAIL RATE CONSIDERATIONS

Hydro One Distribution proposes to follow the direction in the 2006 EDR Handbook with respect to the design of its retail distribution rate structure. This means continuing with the use of a combination of a monthly service charge and a volumetric charge.

The cost allocation methodology determines the revenue requirement by customer class that is fixed and variable. These results provide the basis for determining the proposed fixed and variable distribution charges. The OEB Cost Allocation Methodology also determines the fixed charges based on three methods: a) Avoided costs, b) Directly Related customer costs and c) Minimum System with PLCC Adjustment. The Board recommended that the fixed charge be set at a range between the Avoided costs and method c). Hydro One is proposing fixed charges that are consistent with the Board's recommended range with the exception for the gross fixed charge for R2 Residential customers.. The proposed fixed charges are the service charge determined by method c) using the cost allocation methodology, or the service charge of the predominant class in the new customer groups, whichever is the lower. For customers in the R2 Residential class that receive Rural or Remote Electricity Rate Protection, (RRRP), the gross service charge before RRRP has been set at 10% above method c. The service charge for R2 customers net of RRRP falls within the Board's recommended range for setting service charges. In cases were the service charge is proposed to be set at the level of the current service charge of the predominant customer class in the new groups, the lower service charge is chosen to mitigate bill impacts on low use consumers as a result of being mapped into the new groups. For Street Lights and Sentinel Lights, Hydro One Distribution proposes to introduce a nominal fixed charge of $1 per account per month consistent to how other LDCs charge for this type of service.

2.0 SUB-TRANSMISSION (ST) RATE CONSIDERATIONS

As recommended by Hydro One and supported by Stakeholder feedback received at the session on September 5th, 2007, Hydro One Distribution proposes to expand its current Low Voltage (LV) rates from a volumetric charge to a fixed and volumetric charge. This new rate structure will be applicable to all customers in the new ST customer group that includes Embedded customers currently being billed based on LV rates. The cost allocation study provides a basis for determining a fixed charge by delivery point that will recover the fixed costs that Hydro One incurs in delivering electricity to ST customers. The proposed ST rates include:

- Fixed monthly charge by delivery point
- Meter Charge if Hydro One, rather than the customer, owns the meters
- Volumetric charge for the use of common lines
- Volumetric charges for the use of High Voltage Distribution Stations (provides transformation service from above 50 kV to under 50 kV)
- Volumetric charge for the use of Low Voltage Distribution Stations (provides transformation service from above 50 kV to 13.8 kV, or lower voltage)
- Volumetric charge for the use of Low Voltage Distribution Stations (provides transformation service from above 44 kV to 12.5 kV or lower voltages)
- Specific ST line – ST line section (44kv to 13.8 kV) used by solely one embedded customer and located in their territory

- Specific Primary line – Primary line section (below 13.8 kV) used by solely one embedded customer and located in their territory.

TARGET RATES FOR RETAIL CUSTOMERS

This exhibit presents numerical information in support of the target rates that Hydro One Distribution proposes for the proposed 12 new rate classes described in Exhibit G1, Tab 2, Schedule 3.

1.0 INTRODUCTION

Hydro One Distribution derives its Retail distribution rates consistent with the Board's 2006 Electricity Distribution Rate (EDR) Handbook guidelines that propose a fixed and a volumetric distribution charge. The level of the charges has been determined based on the results of the Cost Allocation methodology using the 2008 Revenue Requirement.

2.0 DISTRIBUTION RATES

Using the information from the cost allocation methodology and the allocated Revenue Requirement by customer class, the proposed rates for the Hydro One Distribution new rate classes can be derived.

Table 1 below shows the fixed and volumetric rates that result from the application of the cost allocation methodology and the fixed and volumetric distribution rates, before any mitigation plan to address bill impacts. For Street Lights and Sentinel Lights, Hydro One proposes to introduce a nominal service charge of $1 per account per month. This is consistent to how other LDCs charge for this type of service.

Table 1
Distribution Rates

Rate Class	Fixed Charge [$/Cust] range per Cost Allocation	Proposed Fixed Charge [$/Cust]	Proposed Volumetric Charge [¢/kWh or $/kW]
UR	8.47 to 22.12	14.32	2.29
R1	8.56 to 29.67	19.04	2.60
R2	9.41 to 45.37	49.91 *	3.10
Seasonal	6.34 to 30.58	19.51	6.38
UGe	10.73 to 12.33	12.33	2.09
UGd	29.19 to 39.65	29.19	7.25 **
GSe	10.72 to 30.97	30.97	3.39
GSd	26.49 to 54.46	46.75	9.22 **
Dist Gen	25.26 to 36.66	36.66	7.07 **
Street Lights	5.01 to 12.4	1.00 ***	4.57
Sentinel Lights	2.36 to 32.77	1.00 ***	5.30

* Gross, set at 110% of $45.37
** $/kW
*** per connection

For General Service energy billed customers, the proposed fixed charge has to be increased to recover the revenue shortfall from Unmetered Scattered Load (USL) connection determined in Exhibit G1, Tab 4, Schedule 5. The increase is $0.35/customer/month, based on a revenue shortfall of $404,767 to be recovered from 97,005 General Service energy billed customers per month. The value of the credit was determined by the OEB Cost Allocation Model, Sheet O3.5 USL Metering Credit.

For the GSd, UGd and DGen rate classes, the variable rate has to be increased to recover the proposed $0.60/kW credit for the Customer Supplied Transformer Allowance [CSTA]. The projected CSTA credit is $0.93 million and it will be recovered by an $.07/kW CSTA rate adder to the variable rates.

RATE CONSIDERATIONS FOR ACQUIRED LDC CUSTOMERS

This exhibit presents information in support of the process that Hydro One Distribution proposes for setting the rates of the Acquired LDC customer classes.

1.0 INTRODUCTION

Hydro One Distribution derives its retail distribution rates for the Acquired LDC customer classes using the proposed harmonization plan for Residential and General Service customers of the Acquired LDCs. Hydro One is proposing to phase-in over four years the target distribution rates, so that at the end of the four-year period all Acquired LDCs' customers would have been migrated to Urban, Residential R1, Urban General Service energy billed, Urban General Service demand billed, General Service energy billed or General Service demand billed customer classes. All Acquired Large Users will migrate to the new Sub-Transmission customer group.

The rates per Acquired customer rate classes are derived using the six proposed rates for the customer classes that the Acquired LDCs customers are being migrated to. In addition to the proposed phase-in approach, additional impact mitigation measure as discussed in Exhibit G1, Tab 8, Schedule 2, will be required to keep total average bill impacts at below 10% as per the 2006 EDR Handbook.

2.0 DISTRIBUTION RATES

Using the information on 2008 Revenue Requirement and the harmonized rates for 2008 the proposed Acquired Distribution Rates can be derived.

2.1 Residential and General Service Classes Adjustments.

Table 1 shows how the Acquired rate classes map to the target rates. The proposed target rates are the same as described in Exhibit G1, Tab 4, Schedule 2.

Table 1
Harmonized target rates

Customer Group	Distribution Charge	Target Rates
Acquired Residential migrated to Urban Residential	Fixed service charge ($/customer) Volumetric charge (¢/kWh)	14.32 2.29
Acquired Residential migrated to R1 Residential	Fixed service charge ($/customer) Volumetric charge (¢/kWh)	19.04 2.60
Acquired General Service migrated to Urban General Service energy billed	Fixed service charge ($/customer) Volumetric charge (¢/kWh)	12.33 2.09
Caledon Residential OH 06	Fixed service charge ($/customer) Volumetric charge (¢/kWh)	21.41* 3.10
Caledon OH 07	Fixed service charge ($/customer) Volumetric charge (¢/kWh)	19.51 6.38
Acquired General Service migrated to Urban General Service demand billed	Fixed service charge ($/customer) Volumetric charge ($/kW)	29.19 7.25
Acquired General Service migrated to General Service energy billed	Fixed service charge ($/customer) Volumetric charge (¢/kWh)	30.97 3.39
Acquired General Service migrated to General Service demand billed	Fixed service charge ($/customer) Volumetric charge ($/kW)	46.75 9.22

*Net of $28.50 RRRP

The target rates in Table 1 above were used to derive harmonized rates for Residential and General Service customers, following the methodology described in Exhibit G1, Tab 2, Schedule 5. These target rates are the proposed end-state rates effective May 1, 2011. Table 2 summarizes the harmonized 2008 distribution rates for Acquired LDCs Residential and General Service customer classes.

Rates for the various Residential and General Service customer classes in Caledon follow the same methodology outlined above for other Acquired LDCs that are being harmonized.

The exceptions are for existing Residential OH 06 and OH 07 rate classes of Caledon. The proposed distribution rates for these two classes are based on the R2 and Seasonal Legacy proposed Distribution rates. Table 2 below shows the proposed rates for all Acquired LDC Residential and General Service customer classes prior to the application of any mitigation plan required to keep bill impacts at below 10% of total bill as per the 2006 EDR Handbook.

Table 2

2.2 Large User Class

For Acquired Large User customers, the proposed 2008 rates are the Sub-Transmission rates proposed in Exhibit G1, Tab 4, Schedule 4 and shown in Table 3.

Table 3
Proposed 2008 Distribution Rate for Acquired Large User classes

	Fixed Charge $/delivery point/month*	Volumetric charge $/kW/month
Arnprior	188	0.58
Brockville	188	0.58
Caledon	188	0.58
GBE	188	0.58
Quinte West	188	0.58

* Excludes meter charge of $553/delivery point/month if applicable

3.0 2009, 2010 AND 2011 PROPOSED RATES FOR ACQUIRED LDCS

For the Residential and General Service classes of the Acquired LDCs that are being harmonized, the proposed 2011 Distribution rates are the harmonized target distribution rates shown in Table 1 above. These rates would become effective May 1st, 2011 i.e. in the fourth year of the harmonization phase-in process and would be adjusted by the third generation Incentive Rate mechanism yet to be determined by the OEB.

The Distribution rates effective as of May 1, 2009 for Residential and Acquired General Service customers of Acquired LDCs would be the rates shown in Table 4 below. The Distribution rates effective as of May 1, 2010 for Residential and Acquired General Service customers of Acquired LDCs would be the rates shown in Table 5 below. The 2009 and 2010 rates were derived using the harmonization plan described in Exhibit G1, Tab 2, Schedule 5 and will also be adjusted by the third generation Incentive Rate mechanism yet to be determined by the OEB. The rates shown are prior to the application of any required rate impact mitigation plan which keep bill impacts at below 10% of total bill as per the 2006 EDR Handbook.

RATE CONSIDERATIONS FOR SUB-TRANSMISSION CUSTOMERS

This exhibit provides information in support of the derivation of Sub-Transmission (ST) rates replacing the existing Low Voltage (LV) rates. These rates will be applicable to all customers grouped in the new ST customer class.

1.0 ST CLASS DESCRIPTION

The proposed ST class consists of all supply points to Embedded LDCs, plus other accounts whose supply from Hydro One Distribution assets is three-phase, between 44 kV and 13.8 kV inclusive, for whom Hydro One does not have the responsibility for the local customer-site transformation and whose load is over 500 kW.

2.0 ST RATE DERIVATION

2008 proposed ST rates are developed using the results of the Cost Allocation Methodology. Exhibit G2, Tab 1, Schedule 1, includes more details on the results of the Cost Allocation and the basis for the proposed ST rates. As recommended by Hydro One and supported by Stakeholder feedback received at the session on September 5th, 2007, the proposed ST rates have a fixed monthly charge, and also various volumetric charges to be applied based on the types of asset used. The charges for the use of ST line, High Voltage Distribution Stations, Low Voltage Distribution Stations with Secondary voltages of 12.5 kV or below, Specific ST line and Specific Primary Line, were derived using the Cost Allocation Methodology and replace the corresponding LV charges. In addition a fixed charge for customers that do not own their meters is proposed.

For consistency with billing of RTSR charges, addressed in Exhibit G1, Tab 6, Schedule 1, the ST line and HVDS charges are proposed to be billed to customers supplied from multiple feeders connected to the same TS or HVDS based on their aggregated billing demand.

For customers with Load Displacement generation above 1 MW, or 2 MW for renewable generation installed after October 1998, it is proposed that the ST volumetric charges be billed on a gross load basis, consistent with the methodology used to bill for Retail Transmission Service Rates connections.

The following Table shows the current LV charges and the proposed 2008 ST charges.

Table 1

ST Proposed 2008 monthly charges

LV		ST	
Asset Type Utilized	Current Volumetric Rate*	Asset Type Utilized	Proposed Volumetric Rate**
Shared LV Line	$0.633/kW	Common ST Line	$0.58/kW
HVDS-high	$1.678/kW	HVDS-high	$1.42/kW
HVDS-low	$3.797/kW	HVDS-low	$2.66/kW
Shared LVDS	$2.12/kW	LVDS-low	$1.24/kW
Specific LV Line	$526/km	Specific ST Line	$729/ km
Specific Distribution Line	$358/km	Specific Primary Line	$565/ km

*No applicable Service Charge

** Fixed Charge of $188 and a meter charge of $553 will also apply

HVDS-High Rate

For consistency purposes, it is proposed that the HVDS-high rate be set equivalent to the Retail Transmission Service Rate (RTSR) – transformation. Customers in the ST group can obtain transformation from above 50 kV to a voltage between 44 kV and 13.8 kV either through the use of an HVDS–high, or through a TS owned by Hydro One Transmission. Customers that obtain supply through a TS are charged the RTSR – transformation.

HVDS-low rate

It is proposed, that consistent with the current rate structure, the HVDS-low rate be set to be the sum of the HVDS-high rate and LVDS-low rate. HVDS-lows supply voltage at or below 12.5 kV.

LVDS-low rate

LVDS-lows transform power from between 44 kV and 13.8 kV, to under 13.8 kV. The rate is set to recover the portion of the Cost Allocation Methodology dollars attributable to LVDS-low.

Specific ST Line and Specific Primary Line rates

A line section is “Specific” if it supplies solely one LDC and is within that LDC’s territory. ST lines are between 44 kV and 13.8 kV, while Primary lines are between 12.5 kV and 4.16 kV. These Specific Line rates are set at values which would recover the Cost Allocation Methodology dollars attributable to ST and Primary lines, and also reflect the relationship in unit costs between ST and Primary lines. Specific Line rates are charged by km rather than by kW.

Meter Charge for Hydro One Owned Meter

Most of the customers in the ST group provide their own metering facilities. To reflect this, Hydro One is proposing an additional fixed charge applicable only to customers for whom Hydro One provides metering facilities.

Fixed charge

Hydro One is proposing to introduce a fixed charge per delivery point in cases where a customer uses common ST lines, or uses HVDSs and the customer owns the lines emanating from the HVDS. The fixed charge is intended to recover costs that do not vary with consumption. All other customer groups have a distribution rate structure that includes both a fixed and a volumetric charge. The level of the fixed charge is proposed to be $188 per account. This value is lower than the fixed charge that would be determined using the fixed Revenue Requirement estimated by the Cost Allocation Methodology. The $188 charge is based on the OEB Cost Allocation method c) of determining fixed charges: Minimum System with PLCC Adjustment, adjusted to exclude Low Voltage meter costs. A lower fixed charge results in a higher volumetric charge than estimated by the Cost Allocation Methodology, to enable Hydro One to recover the revenue requirement allocated to the ST group.

UNMETERED SCATTERED LOAD FIXED SERVICE CHARGE

This exhibit explains the development of a fixed service charge credit for unmetered scattered load customers based on the results of the Cost Allocation Study.

1.0 INTRODUCTION

Currently, Hydro One Distribution Legacy General Service class rate schedules include a separate and lower fixed service charge that is applicable to unmetered scattered load connections.

In 2006 Hydro One Distribution established a fixed service charge applicable to unmetered scattered load (USL) customers within the Acquired LDC General Service customers. The charge was set at half of the fixed service charge applicable to the corresponding Acquired General Service customer class. This was consistent with the 2006 EDR Handbook guidelines.

2.0 PROPOSAL

Hydro One has completed a Cost Allocation Study which enables a proper fixed charge credit to be established for USL customers. This credit reflects the nature of USL customers, that is, no meter or meter reading costs should be recovered from USL customers.

The fixed service charge credit will be applied to the proposed General Service energy billed fixed service charge for Legacy and Acquired customers.

3.0 CALCULATIONS

The following table illustrates the development of the fixed service charge for unmetered scattered load based on the results of the Cost Allocation Study.

Table 1
General Service Energy Billed Fixed Service charge

	Fixed Service charge ($/customer/month)
Fixed charge as per Cost Allocation Study	30.97
Credit for USL customers (Sheet O3.5 USL Metering Credit)	6.86
Net Fixed Charge for USL customers	24.11

The number of unmetered scattered load connections and the revenue shortfall are shown in Table 2 below, based on the unmetered service charge credit in Table 1 above.

Table 2
General Service number of 2006 Unmetered connections and revenue shortfall

	Number of Unmetered connections in 2006	Revenue shortfall ($)
General Service	4,917	404,767

This revenue shortfall is re-allocated to the General Service energy billed customer class when determining Distribution fixed charges to ensure that Hydro One recovers the Revenue Requirement allocated to the General Service energy billed group.

TRANSFORMER OWNERSHIP ALLOWANCE

This exhibit presents a description of the Transformer Ownership Allowance proposed for 2008.

1.0 CUSTOMER SUPPLIED TRANSFORMER ALLOWANCE

There are circumstances under which, Hydro One Distribution does not supply customers with transformation equipment, but rather the customer provides its own equipment. This occurs usually when the customer has unique consumption characteristics that require the use of special equipment not usually provided by Hydro One Distribution or the level of consumption is above a certain threshold. Since the rates developed for some customer classes assume that Hydro One Distribution provides transformation to the customer, customers that provide their own transformation should be entitled to receive a credit equivalent to the costs of transformation included in customer rates.

Hydro One is proposing to maintain the current Transformer Ownership Allowance of $0.60/kW and establish a Transformer Ownership Allowance based on ¢/kWh basis. Some customers that provide their own transformation are energy billed, therefore, in order to be able to provide them with a Transformer Ownership Allowance, a rate based on ¢/kWh is required. Hydro One used 2006 billing data to determine the equivalent Transformer Ownership Allowance in ¢/kWh. The 2008 proposed Transformer Ownership Allowance for energy billed customers is 0.14 ¢/kWh. The proposed Transformer Ownership Allowance will also apply to current single-phase customers that provide their own transformation equipment.

The projected cost based on the proposed $0.60/kW credit is $0.93 million resulting in a $.07/kW CSTA rate adder to the variable charges

REGULATORY ASSET RECOVERY ALLOCATION TO CUSTOMER GROUPS

This exhibit describes Hydro One Distribution proposed methodology to allocate the costs in respect of the Regulatory Assets identified in Exhibit F1, Tab 1, Schedule 1, to the various customer classes.

1.0 METHODOLOGY

The methodology proposed to allocate the Regulatory Asset balances to the various customer classes follows the methodology principles reviewed and approved by the Board in proceeding RP-2004-0117/RP-2004-0118.

The five new Regulatory Asset accounts, described in Exhibit F1, Tab 1, Schedule 1, are:

- OEB Costs
- Tax Change
- Smart Meter Minimum Functionality Under-recovery to May 31, 2007
- Smart Meter Exceeding Minimum Functionality Under-recovery
- Smart Meter Minimum Functionality Under-recovery between June 1, 2007 and April 30, 2008

The four current Regulatory Asset account balances that are also proposed to be cleared as of April 30, 2008 are:

- o RSVA Wholesale Market Service Charge
- o RSVA Retail Transmission Network Charges
- o RSVA Retail Transmission Connection Charges

- RSVA Low Voltage Charges

2.0 ALLOCATION PRINCIPLES

Cost causality is the basic principle applied in determining how costs should be allocated to customer groups. There are three main mechanisms by which Regulatory Asset costs may be allocated and which Hydro One Distribution has used in the context of this submission. These are as follows:

- If costs were incurred for the benefit of all customers irrespective of their energy consumption, number of customers would be the recommended allocator for this group of costs.
- If costs have been included in the Revenue Requirement, for example as OM&A costs, now that Hydro One conducted a Cost Allocation Study, these costs can be allocated to the various customer groups based on the results of the Cost Allocation Study, and in particular how OM&A costs are allocated to customer groups.
- If costs are allocated in the Cost Allocation Study based on a specific composite allocator, for example Net Fixed Assets, then these costs can be allocated to the various customer groups based on the results of the Cost Allocation Study, and in particular how Net Fixed Assets are allocated to customer groups.

3.0 PROPOSED ALLOCATION OF REGULATORY ASSET ACCOUNTS TO CUSTOMER GROUPS

The amounts accumulated in the Regulatory Asset accounts are described in Exhibit F1, Tab 1, Schedule 1. The proposed method of recovering these costs from customer groups is consistent with the OEB decision in RP-2004-0017/RP-2004-0018 and the following sub-sections describe the approach taken.

3.1 OEB costs ($(0.9) million)

OEB costs are included in Hydro One Distribution revenue requirement as OM&A costs. Exhibit C1, Tab 2, Schedule 6 describes these costs. The amount in the Regulatory Asset variance account, were originally included as OM&A costs. Using the Cost Allocation Study, OM&A costs is the proposed allocator amongst customer classes.

3.2 Tax Change ($(5.0) million)

Tax costs are included in Hydro One Distribution revenue requirement. In the Cost Allocation Study, Tax costs are allocated to the customer groups based on allocation of Net Fixed Assets, therefore, Net Fixed Assets is the proposed allocator amongst customer classes.

3.3 Smart Meters Minimum Functionality Expenditures incurred before May 31, 2007 ($6.9 million)

Smart meter costs are included in Hydro One Distribution revenue requirement as OM&A costs and are related to customers, regardless of customer consumption. Number of customers is the proposed allocator for this account amongst customer classes.

3.4 Smart Meter Expenditures Exceeding Minimum Functionality ($5.7 million)

Smart meter costs are included in Hydro One Distribution revenue requirement as OM&A costs and are related to customers, regardless of customer consumption. Number of customers is the proposed allocator for this account amongst customer classes.

3.5 Smart Meter Minimum Functionality Expenditures between June 1, 2007 and April 30, 2008 ($9.4 million)

Smart meter costs are included in Hydro One Distribution revenue requirement as OM&A costs and are related to customers, regardless of customer consumption. Number of customers is the proposed allocator for this account amongst customer classes.

3.6 RSVA Wholesale Market Service Charge ($(72.6) million)

Wholesale Market Service charges are billed by Hydro One to customers that are not market participants. Energy for non-market participants is the allocator proposed for this account amongst customer classes.

3.7 RSVA Retail Transmission Service Charges Network ($1.4 million)

Hydro One proposes to use energy consumed as an allocator of this variance account amongst customer classes.

3.8 RSVA Retail Transmission Service Charges Connections ($2.5 million)

Hydro One proposes to use energy consumed as an allocator of this variance account amongst customer classes.

3.9 RSVA Low Voltage ($3.8 million)

Hydro One proposes to use energy consumed as an allocator of this variance account amongst customer classes.

4.0 DETAILS OF ALLOCATION OF COSTS

Table 1 below shows the details of the allocation of Regulatory Asset account costs to the various customer classes. Columns show the various customer groups and rows show each individual Regulatory Asset account. The top part of Table 1 shows the various allocators to be used for the different accounts. The last rows show the amount that will need to be recovered for the various customer classes and the average class total bill impact.

Table 1

See attachment

5.0 CUSTOMER CLASS AMOUNTS

As shown in Table 1, based on balances to April 30, 2008 of the Regulatory Asset accounts, using cost causality principles, and 2008 data, the estimated amounts allocated to the various customer groups are as follows:

Customer Class	Amount ($ million)
UR	(1.49)
R1	(6.55)
R2	(10.98)
Seasonal	0.48
Urban General Service energy	(1.0)
Urban General Service demand	(2.40)
General Service energy	(5.22)
General Service demand	(9.58)

Customer Class	**Amount ($ million)**
Distributed Generator	(0.01)
Street Light	(0.39)
Sentinel Light	(0.07)
Sub-Transmission	(11.47)
Total	**(48.68)**

Exhibit G1, Tab 5, Schedule 2, provides the allocators and charge determinants to be used to derive the Regulatory Asset Rate Rider # 3 and Exhibit G1, Tab 5, Schedule 3, calculates the Rate Riders # 3 proposed for the period May 2008 to April 2012 by customer class.

BILLING PARAMETERS FOR RECOVERY OF REGULATORY ASSET COSTS

1.0 INTRODUCTION

This exhibit describes the allocators and charge determinants that are necessary to develop Regulatory Rate Riders # 3 to recover accumulated Regulatory Asset balances. These charge determinants will be used in Exhibit G1, Tab 5, Schedule 3, to calculate Rate Rider # 3 by customer class.

Exhibit G1, Tab 5, Schedule 1, explains how the Regulatory Assets amounts are proposed to be allocated to the various customer classes.

2.0 REGULATORY ASSET ALLOCATORS

The allocators used to allocate the costs to the various customer groups are number of customers, OM&A by customer class, Net Fixed Assets by customer class, energy for non-market participants, and energy for all customers. The data is derived from the sales forecast data for 2008 on a customer class by customer class basis and from the Cost Allocation Study results. The aggregate sales forecast methodology explained in Exhibit A, Tab 14, Schedule 3, is predicated on a more detailed customer class forecast and this customer class forecast is used for rate design purposes. Table 1 below provides the 2008 customer numbers, OM&A, and Net Fixed Assets by customer class data that will be used in these calculations.

Table 1
2008 Allocator Data

Rate Class	Number of Customers	OM&A ($M)	Net Fixed Assets ($M)	Energy non-market participant (GWh)	Energy (GWh)

3.0 RATE RIDER CHARGE DETERMINANTS

The charge determinants used to calculate Rate Rider # 3 are energy or demand by customer class. The data is derived from the sales forecast data for 2008 and is derived on a customer class by customer class basis. The sales forecast methodology is explained in Exhibit A, Tab 14, Schedule 3. The charge determinants for Rate Rider # 3 are shown in the Table below.

Table 2
2008 Charge Determinants

Rate Class	Energy GWh	Demand kW
UR	1,494	N/A
R1	4,407	N/A
R2	5,624	N/A
Seasonal	707	N/A
Urban General Service energy	424	N/A
Urban General Service demand	N/A	2,203,297
General Service energy	2,299	N/A
General Service demand	N/A	11,019,445
Distributed Generation	N/A	48,843
Street Lights	121	N/A
Sentinel Light	22	N/A
Sub-Transmission	N/A	43,021,924

DEVELOPMENT OF REGULATORY ASSET RATE RIDER # 3

This exhibit presents the process for calculating the Rate riders in respect of recovery of the Regulatory Assets, which is comprised of the following steps:

a) isolate the amounts to be collected
b) determine the class allocators and charge determinants
c) derive initial rates as the ratio of the amounts to be collected divided by the respective class charge determinants

1.0 INTRODUCTION

Hydro One Distribution proposes to derive the Regulatory Rate riders consistent with the approach approved by the Board to develop Rate Riders #1 to recover the Regulatory Assets in proceeding RP-2004-0117/RP-2004-0118. The resultant Rate riders provided herein are consistent with the Board's guidelines and approval under that same proceeding.

2.0 RATE DESIGN

Hydro One Distribution proposes in this submission that the Rate riders developed to recover the costs of the Regulatory Assets from the various rate classes should be based on 2008 forecast sales information to make it consistent with the data used to establish 2008 Distribution rates. It is also proposed that the rate adjustments be made to the volumetric charge only, consistent with the decision in RP-2004-0117/RP-2004-0118, and that the Regulatory Asset Account balances be recovered from customers over a four year period.

Hydro One Distribution proposes to use the same mechanism as was previously used to recover the Regulatory Asset account balances as per RP-2004-0117/RP-2004-0118 to recover the new Regulatory Asset account balances.

For all the Acquired customer classes that are being harmonized as per Exhibit G1, Tab 2, Schedule 5, it is proposed that the Regulatory Riders developed for the corresponding customer classes, be used for the Acquired LDCs' customer classes. For example, if an Acquired Residential customer group is being harmonized with the Urban Residential customer class, it is the Urban Residential customer class Regulatory Rate Rider # 3 that would be applied to the Residential customers of this Acquired LDC.

2.1 Rate Rider Design Steps

The initial rate riders per rate class are derived by apportioning to customer classes the amounts to be recovered, arrived at through the same allocation process approved as part of RP-2004-0117/ RP-2004-0118 and described in Exhibit G1, Tab 5, Schedule 1, using the allocators described in Exhibit G1, Tab 5, Schedule 2.

2.2 Class Amounts To Be Recovered

The amounts to be recovered for each customer group were determined in Exhibit G1, Tab 5, Schedule 1. Table 1 below re-states the annual amounts to be recovered from customer classes in column 2 assuming a four year recovery period.

2.3 Charge Determinants

The charge determinants to be used are described in Exhibit G1, Tab 5, Schedule 2. Table 1 below re-states the charge determinants to be used by customer class in column 3.

3.0 RATE RIDER # 3

Using the class amounts in column 2 and the corresponding charge determinants in column 3, Rate Rider # 3 can be derived. Table 1 below provides the rate rider for each customer class.

Table 1
Customer Class Rate Rider

Customer Class	Amount Allocated (A) $000's	Consumption (B) GWhs or MWs	Rate Rider (C)=(A)/(B) ¢/kWh or $/kW
Urban Residential (UR)	(372)	1,494	(0.02)
R1 Residential (R1)	(1,638)	4,407	(0.04)
R2 Residential (R2)	(2,745)	5,624	(0.05)
Seasonal	119	707	0.02
Urban General Service energy	(249)	424	(0.06)
Urban General Service demand ($/kW)	(601)	2,203.3	(0.27)
General Service energy	(1,305)	2,299	(0.06)
General Service demand ($/kW)	(2,395)	11,019.4	(0.22)
Distributed Generator ($/kW)	(2)	48.8	(0.04)
Street Lights	(97)	121	(0.08)
Sentinel Lights	(18)	22	(0.08)
Sub-Transmission ($/kW)	(2,867))	43,021.9	Note 1
Total	(12,170)	N/A	N/A

Note 1. For ST customers the value of Rider # 3 will depend if the customer is market participant or not

Acquired LDC Customers

To provide consistency in approach with the proposed harmonization plan, rate riders will be developed for each harmonized Acquired LDC customer class based on the customer class that they are being harmonized to.

Table 2, 3 and 4 below show the Regulatory assets by Acquired LDC.

Regulatory Rate Rider # 3 Large Users Acquired LDCs

Regulatory Rate Rider # 3 for Large Users of Acquired LDCs will be the Regulatory Rate Rider # 3 applicable to the Sub-Transmission customer class.

RETAIL TRANSMISSION SERVICE RATES

1.0 INTRODUCTION

This exhibits describes the proposal to revise the Retail Transmission Service Rates (RTSR) to reflect the proposed new customer classes and also to take into account the impact on RTSR of aggregation of demand for purposes of determining RTSR charges for customers supplied by multiple feeders emanating from the same TS. The proposed RTSR also reflects the new Uniform Transmission rates effective November 1, 2007, resulting from the Rate Order on proceeding EB-2007-0759.

Aggregation for purposes of billing RTSR charges was approved by the Board in Proceeding EB-2004-0451. For customers that are being aggregated for purposes of RTSR, the aggregated demand is arrived at by applying losses to the measured quantities, in situations where different loss factors are being applied to individual delivery points.

Hydro One Distribution developed its initial RTSR following the guidelines set out in Chapter 11 of the 2000 Distribution Rate Handbook. In this submission, Hydro One is proposing new customer classes and the corresponding RTSR have been developed using the methodology outlined in Chapter 11 of the 2000 Distribution Rate Handbook.

Supporting detail for the derivation of the new RTSR is presented in Exhibit G2, Tab 4, Schedule 1.

1.1 Hydro One Distribution Situation

Hydro One Distribution as a Host Utility is billed at each of its transmission delivery points for the transmission of power to its Retail (Legacy and Acquired) customers, its

Embedded LDCs and its Embedded Direct customers. Its total transmission charges are the sum total of all the transmission charges at these delivery points. The charges at each transmission delivery point are based on the loads of the customers downstream of the delivery point and their contribution to the delivery point's total loading.

1.2 Approved Transmission Rates

The Ontario Uniform Transmission Rates which result from the proceeding EB-2007-0759, effective November 1, 2007 comprise the following charges:

- A Transmission Network charge of $2.31/kW, to be applied to the demand at each transmission delivery point based on billed demand which is defined to be the larger of: a) 85% of non-coincident peak from 7 a.m. to 7 p.m. or b) the peak coincident with the transmission system peak.

- Line and transformation connection charges of $0.59/kW and $1.61/kW, respectively, which are applied to the non-coincident peak at each transmission delivery point.

These rates apply to the load at the deemed transmission delivery point which is set to be on the high side of the transformation station. Metering is typically on the low voltage side at the station, so appropriate loss factors have been applied to uplift the meter readings to the high side of the transformation station.

2.0 ESTIMATING RETAIL TRANSMISSION SERVICE CHARGES FROM IESO

2.1 Method

To estimate the charges from IESO for Transmission, Hydro One estimated the 2008 load at each of its transmission connections and applying the currently approved Transmission rates. This resulted in a total estimated charge of $166.2 million for Network services, $114.8 million for Transformation charges and $36.6 million for Line Connection Charges for a total of $317.6M.

The estimated 2008 charges from the IESO need to be recovered from all Hydro One customers. For the proposed ST customer group, sufficient connectivity data exists to allow Hydro One to allocate the appropriate cost based on each customer's coincident peak with the IESO billing time per month per their transmission delivery point. This resulted in 46% of the $317.6M being allocated to the ST customer class with the residual 54% being recovered from the other Retail (Legacy and Acquired) customers. Within the Retail customer classes, Hourly Load Shape data was used to allocate to each individual customer classes consistent with the methodology of Chapter 11 of the 2000 Electricity Distribution Rate Handbook.

The following Table shows the estimated 2008 IESO charges allocated to the proposed customer classes.

Table 1
2008 IESO charges

	Tx Network	Tx Line	Tx Transformation	Total IESO Bill	Share
IESO Bill	$ 166,226,978	$ 36,611,777	$ 114,776,007	$ 317,614,762	
ST	$ 76,899,232	$ 16,207,183	$ 51,593,835	$ 144,700,250	46%
Retail	$ 89,327,746	$ 20,404,594	$ 63,182,172	$ 172,914,512	54%
UR	$ 7,570,443	$ 1,769,046	$ 5,477,795	$ 14,817,285	
R1	$ 22,697,678	$ 5,351,517	$ 16,570,801	$ 44,619,996	
R2	$ 28,517,822	$ 6,467,960	$ 20,027,830	$ 55,013,611	
Seasonal	$ 3,374,629	$ 809,307	$ 2,505,993	$ 6,689,929	
Uge	$ 1,674,964	$ 370,818	$ 1,148,225	$ 3,194,007	
Ugd	$ 3,289,432	$ 727,263	$ 2,251,945	$ 6,268,640	
GSe	$ 8,807,534	$ 1,967,457	$ 6,092,168	$ 16,867,159	
GSd	$ 12,932,797	$ 2,841,350	$ 8,798,148	$ 24,572,294	
Lighting	$ 449,148	$ 96,938	$ 300,166	$ 846,252	
Dgen	$ 13,298	$ 2,939	$ 9,101	$ 25,338	

In total, Hydro One Distribution needs to collect $166.2 million for RTSR Network and $151.4 million for RTSR Connection and Transformation.

3.0 PROPOSED 2008 RTSR RATES

Using the available Load Research data, the amounts allocated to each customer class divided by the corresponding billing parameters resulted in the proposed 2008 RTSR Rates by customer class shown in Table 2 below. Table 2 below also shows the currently approved RTSR. Customers billed based on energy will be charged these RTSR applied to meter quantities uplifted for losses. Customers billed on demand will be charged the rates below uplifted for losses. For customers that install load displacement generation after October 1998, RTSR connection is billed at the gross demand level consistent with the guidelines in the Distribution Rate Handbook, section 11.3.2.5. The proposed RTSR rates are included in the rate Schedules for Legacy, Acquired, and ST customer groups shown in Exhibits G2, Tabs 5 to 94, Schedule 1.

Table 2
Proposed 2008 RTSR

	Current rates		**Proposed rates**		
	¢/kWh or $/kW	**¢/kWh or $/kW**	**¢/kWh or $/kW**	**¢/kWh or $/kW**	
RATE CLASS	Network	Connection	Network	Line Con.*	Tran.
Urban	0.52-0.55	0.42-0.47	0.47	0.45	N/A
R1	0.52-0.55	0.42-0.47	0.47	0.46	N/A
R2	0.52	0.42	0.46	0.43	N/A
Seasonal	0.41	0.40	0.44	0.43	N/A
Urban General Service energy	0.50 – 0.52	0.33 – 0.43	0.36	0.33	N/A
Urban General Service demand ($/kW)	1.584 – 1.94	0.998 – 1.61	1.41	1.27	N/A
General Service energy	0.48-0.52	0.33-0.39	0.35	0.32	N/A
General Service demand ($/kW)	1.584-1.8	0.998-1.329	1.11	1.00	N/A
Distributed Generator ($/kW)	0.52	0.34	0.25	0.23	N/A
Street and Sentinel Lights	0.3	0.23	0.29	0.25	N/A
ST ($/kW)	1.734-2.52	1.083-2.09	2.01	0.50	1.38

* For customer classes that do not have separate proposed Line and Transformation charges, the Line Connection charges shown include Transformation charges

The current RTSR for all Acquired LDC customers are based on the default value guidelines for RTSR established by the Board. The same rates apply to all Acquired LDCs. The proposed RTSR for Acquired LDCs are the rates shown above and will depend on what customer classes the Acquired Customers are being mapped into.

As in the case for Legacy customers, Acquired customers billed based on energy will be charged these RTSR applied to meter quantities uplifted for losses. Customers billed on demand will be charged the above RTSR uplifted for losses.

BILL IMPACTS LEGACY CUSTOMERS

This exhibit presents the results of the assessment of customer total bill impacts using average levels of consumption by customer class. As per the guidelines in the 2006 Electricity Distribution Rate Handbook, impacts are also shown for Distribution rate increases. Finally, impacts are shown including the impact of Regulatory Asset Rate Rider # 3 as derived in Exhibit G1, Tab 5, Schedule 3, changing Retail Transmission Service Rates (RTSR) as described in Exhibit G1, Tab 6, Schedule 1 and Total Loss Factors as described in Exhibit G1, Tab 10, Schedule 1.

Impacts are derived using the applicable May 1, 2007 rates, the ending of Regulatory Rate Rider # 1, and the proposed initial distribution rates, Regulatory Asset Rate Rider # 3 and 2008 RTSR.

1.0 INTRODUCTION

The total bill impacts are derived for the current average Legacy rate class customer. The rates are assessed on the basis of moving to the proposed distribution rates derived in Exhibit G1, Tab 4, Schedule 2, including Regulatory Asset Rate Rider # 3 derived in Exhibit G1, Tab 5, Schedule 3, RTSR derived in Exhibit G1, Tab 6, Schedule 1, and Total Loss Factors shown in Exhibit G1, Tab 10, Schedule 1 from their current rates as of May 1, 2007. The total bill impacts are premised on the distribution rates arising from the new revenue requirement and moving customer classes towards a target revenue to cost ratio determined by using the cost allocation study methodology and also taking into account the end of Regulatory Rate Rider # 1. All other non-distribution charges, except RTSR, are kept unchanged. Commodity price for eligible customers is based on the Regulated Price Plan for conventional meters, i.e. 5.0 ¢/kWh for the first 600 kWh and 5.9 ¢/kWh for consumption above 600 kWh for Residential customers. For General

Service customers, the consumption threshold is 750 kWh. For non-eligible customers, commodity costs were assumed to be 5.2 ¢/kWh when calculating the class average impact.

Bill impacts are calculated as a change in customer bills in relation to their existing bills that are based on distribution rates and other charges in effect as of May 1, 2007.

The Legacy customers that meet the Urban density criteria will be re-classified as Urban customers in 2008.

2.0 RECAP PROPOSED RETAIL CUSTOMER RATES

At the conclusion of Exhibit G1, Tab 4, Schedule 2, Hydro One Distribution summarized the proposed set of distribution rates for Legacy Retail customers. Table 1 below recaps the proposed rates.

Table 1
Proposed Target Distribution Rates

Rate Class	Service Charge [$/month]	Volumetric Charge [¢/kWh or $/kW]
Urban Residential (High Density)	14.32	2.29
R1 Residential (Medium Density)	19.04	2.60
R2 Residential (Low Density)	21.41*	3.10
Seasonal	19.51	6.38
Urban General Service energy billed (UGS e)	12.33	2.09
Urban General Service demand billed (UGS d) $/kW	29.19	7.25****
General Service energy billed (GS e)	30.97***	3.39
General Service demand billed (GS d) $/kW	46.75	9.22****
Distributed Generator ($/kW)	36.66	7.07****
Street Lights	1.00**	4.57
Sentinel Light	1.00**	5.30

* Net of RRRP ** Per Connection *** Excludes $0.35 adder for USL credit

****Excludes $0.07/kW adder for CSTA

At the conclusion of Exhibit G1, Tab 5, Schedule 3, Hydro One Distribution summarized a set of proposed Regulatory Asset Rate Rider # 3. Table 2 below recaps those riders.

Table 2
Proposed Regulatory Asset Rate Rider # 3

	Rate Rider # 3 ¢/kWh or $/kW
Urban Residential (High Density)	(0.02)
R1 Residential (Medium Density)	(0.04)
R2 Residential (Low Density)	(0.05)
Seasonal	0.02
Urban General Service energy billed (UGS e)	(0.06)
Urban General Service demand billed (UGS d) $/kW	(0.27)
General Service energy billed (GS e)	(0.06)
General Service demand billed (GS d) $/kW	(0.22)
Distributed Generator	(0.04)
Street Lights	(0.08)
Sentinel Light	(0.08)

At the conclusion of Exhibit G1, Tab 6, Schedule 1, Hydro One Distribution summarized a set of proposed RTSR for Legacy Retail customers. Table 3 below recaps those RTSR.

Table 3
Proposed RTSR

	RTSR Network ¢/kWh or $/kW	RTSR Connection ¢/kWh or $/kW
Urban Residential (High Density)	0.47	0.45
R1 Residential (Medium Density)	0.47	0.46
R2 Residential (Low Density)	0.46	0.43
Seasonal	0.44	0.43
Urban General Service energy billed (UGS e)	0.36	0.33
Urban General Service demand billed (UGS d) $/kW	1.41	1.27
General Service energy billed (GS e)	0.35	0.32
General Service demand billed (GS d) $/kW	1.11	1.00
Distributed Generator	0.25	0.23
Lights (Street and Sentinel)	0.29	0.25

3.0 IMPACT BY CUSTOMER CLASSES

Combining the proposed Distribution rates in Table 1, Regulatory Asset Rate Rider # 3 in Table 2 and RTSR rates in Table 3 with other applicable charges including loss factors, the customer bill can be calculated for all customer classes based on average consumption. Table 4 provides the impacts of the Distribution revenue increase only on the distribution portion of the bill, total bill impacts including Rate Rider # 3 and excluding RTSR changes and the impacts of all rate changes on total bill.

The third column from the left in Table 4 shows the impact of 2008 distribution Revenue Requirement on the distribution portion of the bill, excluding Regulatory Rate riders. The impacts reflect moving the various customer classes to revenue to cost ratios that closer reflect cost causality and the reclassification of certain customers to Urban Density. The fourth column in Table 4 shows the impact of the 2008 distribution

Revenue Requirement on the distribution portion of the bill including Regulatory Rate rider # 3. The variability in the results reflects the different amounts for regulatory rate riders recovered from each customer class. The fifth column on Table 4 shows the impact of the 2008 distribution Revenue Requirement on total customer bill. The variability in the results reflects the fact that distribution revenues and regulatory rate riders comprise a different proportion of the total bill for each customer class. The sixth column in Table 4 shows the impact of the 2008 distribution Revenue Requirement, Rate Rider # 3, total loss factors, and the new RTSR on total customer bill. The variability in the results reflects the fact that distribution revenues and RTSR comprise a different proportion of the total bill for each customer class. The impact shown below excludes the effect of the $0.07/kW rate adder for CSTA.

Table 4
Impacts by Customer classes

New Class	Existing Class	Basic Distribution Bill Only	Distribution Bill incl Riders	Total Bill incl Distribution and Riders	Total Bill incl Distribution and Riders plus RTSR
UR	UR	14.2%	6.8%	1.3%	1.0%

Sentinel Lgts	Sentinel Lgts	74.5%	70.9%	25.0%	25.0%

* Excludes impact of $0.35 adder for USL credit,

4.0 CONCLUSION

Based on the results shown in the tables above, to mitigate customer class impacts to less than 10% of total bill per year, using the 2006 EDR guidelines, Hydro One proposes to phase-in basing Distribution rates on the target fixed and volumetric charges calculated using the Cost Allocation Study over a period of four years. The phase-in process is similar to the harmonization plan described in Exhibit G1, Tab 2, Schedule 5.

The total bill impact to Sentinel Lights is estimated to be less than $1.80 per connection per month.

Exhibit G1, Tab 8, Schedule 1, describes the mitigation plan proposed for Legacy customer classes.

BILL IMPACTS ACQUIRED LDC CUSTOMERS

This exhibit presents the results of the assessment of customer total bill impacts by rate class for Acquired LDC customers. Impacts are derived by comparing the applicable May 1st, 2007 rates with the proposed harmonized distribution rates described in Exhibit G1, Tab 2, Schedule 5. As per the guidelines in the 2006 Electricity Distribution Rate Handbook, impacts are also shown for Distribution rate increases excluding Rate Rider # 3. Finally, impacts are shown including the impact of Regulatory Asset Rate Rider # 3 derived in Exhibit G1, Tab 5, Schedule 3 and RTSR changes described in Exhibit G1, Tab 6, Schedule 1.

1.0 INTRODUCTION

The total bill impacts are derived for the average customer per Acquired LDC rate class. The impacts are assessed on the basis of moving to the proposed distribution rates derived in Exhibit G1, Tab 4, Schedule 3, that include the effect of harmonization, Regulatory Asset Rate Rider # 3 derived in Exhibit G1, Tab 5, Schedule 3 and the RTSR derived in Exhibit G1, Tab 6, Schedule 1, from their current rates as of May 1st, 2007. The total bill impacts are premised on the distribution rates arising from the 2008 revenue requirement, Regulatory Rate Rider # 3 and harmonization of distribution rates. All other non-distribution charges, except RTSR and ending of Regulatory Rate Rider # 1, are kept unchanged. Commodity price for eligible customers is based on the Regulated Price Plan for conventional meters, i.e. 5.0 ¢/kWh for the first 600 kWh and 5.9 ¢/kWh for consumption above 600 kWh for Residential customers. For General Service customers, the consumption threshold is 750 kWh. For non-eligible customers, commodity costs were assumed to be 5.2 ¢/kWh when calculating the class average impact.

Bill impacts are calculated as a change in customer bills in relation to their existing bills that are based on distribution rates and other charges in effect as of May 1st, 2007.

2.0 PROPOSED ACQUIRED LDC CUSTOMERS RATES

To recap, Table 1 in Exhibit G1, Tab 4, Schedule 3, include the proposed set of target harmonized distribution rates for Acquired LDC customers.

Tables 2, to 4 in Exhibit G1, Tab 5, Schedule 3, include the proposed Regulatory Asset Rate Rider # 3.

Table 2 of Exhibit G1, Tab 6, Schedule 1, includes the proposed RTSR for Acquired LDC customers.

Combining the proposed Distribution rates, Regulatory Asset Rate Rider # 3, and RTSR rates with other applicable charges including loss factors, the customer bill can be calculated for all customer classes. Table 1 provides the impacts of the Distribution revenue increase only on the distribution portion of the bill, total bill impacts including Rate Rider # 3 and excluding RTSR changes and the impacts of all rate changes on total bill. This table provides a snapshot summary of the average impacts. Schedules 3 through Schedule 6 of Exhibits G2, Tab 5 show the results of the bill impact analysis for each Acquired customer class broken down by levels of consumption. Schedule 3 provides the impacts due to Distribution revenue increase only on the distribution portion of the bill. Schedule 4 shows the impact of the Distribution rate changes due to revenue requirement increase and Regulatory Rate Rider # 3 only on the Distribution portion of the bill. Schedule 5 shows total bill impacts that include Regulatory Rate Rider # 3 and 2008 revenue increase, but exclude RTSR changes. Schedule 6 shows total bill impacts due to all rate changes.

Each column in Table 1 below is sub-divided into three parts to provide the results for the Residential, General Service energy billed and General Service demand billed customer classes. For Residential customers, the second column in Table 1 below shows the average impact of 2008 Distribution revenue increase on the distribution portion of the bill, excluding Regulatory Rate Rider # 3. The third column in Table 1 shows the average impact of the 2008 Distribution revenue increase including Regulatory Rate Rider # 3 on the distribution portion of the bill including current Regulatory Rate riders. The fourth column in Table 1 shows the average impact of the 2008 Distribution revenue increase and proposed Regulatory Rate Rider # 3 on total customer bill. The fifth column in Table 1 shows the average impact of the 2008 distribution revenue increase, the proposed Regulatory Rate Rider # 3 and the RTSR change on total customer bill. The impact shown below excludes the effect of the $0.07/kW rate adder for CSTA.

3.0 CONCLUSION

The results in Table 1 above show that prior to mitigation some customer classes would see an average impact higher than 10 percent on total bill as a result of the target Distribution rates. To mitigate impacts Hydro One is proposing to phase-in the target fixed and volumetric charges calculated using the Cost Allocation Methodology for Acquired customers over a period of four years.

Exhibit G1, Tab 8, Schedule 2, describes the mitigation plan for customer classes that would have seen an impact higher than 10 percent prior to mitigation.

BILL IMPACTS SUB-TRANSMISSION CUSTOMERS

This schedule presents an assessment of the Sub-Transmission (ST) customer bill impacts. The impacts are due to both the change in Revenue Requirement and the customers' transition from their existing classes to the proposed ST class. The proposed ST rates are described in Exhibits G1, Tab 4, Schedule 4. The existing classes mapped to ST include Urban General Service, Three-Phase General Service, Three-Phase Farms, T-class, Acquired General Service, Acquired Large Users, Embedded Direct and Embedded LDCs. The bill impact assumes no change to other non-ST related charges, except the creation of Regulatory Asset Rate Rider # 3 described in Exhibit G1, Tab 5, Schedule 3, ending Regulatory Rate Rider # 1, and the proposed change to Retail Transmission Service Rates (RTSR) as described in Exhibit G1, Tab 6, Schedule 1. Commodity costs are assumed to be 5.2 ¢/kWh. Total Loss Factor proposed for the ST class is 3.4% as explained in Exhibit G1, Tab 10, Schedule 1. Impacts include the recovery for Regulatory Asset # 2 as approved by the OEB.

1.0 ESTIMATED CUSTOMER BILL IMPACTS

The table below presents estimates of annual bill revenue by customer classification.

Table 1
Bill Impacts for ST Customers

Customer Existing Rate class	Total current Bill with Rate Riders ($M/yr)	2008 Change in DX related charges ($M/yr)	Change in Regulatory Asset Rate Riders ($M)	2008 Change in RTSR and Losses ($M/yr)	Total 2008 Bill ($M/yr)	Total Bill Impact (%)
UGS	6.6	(1.1)	(0.1)	(0.0)	5.3	(18.7)
Acquired General Service	51.2	(2.6)	(1.1)	(0.0)	47.5	(7.3)
Three-phase General Service	41.2	(8.9)	(0.4)	0.3	32.3	(21.7)
T class	92.7	(16.5)	(0.8)	1.2	76.5	(17.5)
Large Users	28.7	(2.8)	(0.4)	0.1	25.6	(10.8)
Embedded LDC (LV)	1,004.1	(2.2)	(8.1)	(19.4)	974.4	(3.0)
Embedded Direct (LV)	229.8	(0.1)	(2.1)	(3.4)	224.1	(2.5)

2.0 DISCUSSION OF CUSTOMER BILL IMPACTS

The total bill impacts for Embedded LDCs and Embedded Direct customers shown in Table 1 takes into account only the load supplied to Embedded customers by Hydro One's ST facilities. Embedded LDCs and Embedded Directs may also be supplied through Transmission connections. For this reason a range of impacts has not been provided in this submission for Embedded LDCs and Embedded Direct customers as it would not represent the impact on the total embedded customer load, only an average group impact is provided.

All customer classes being mapped to the new ST customer class will see estimated average bill impact reductions. The proposed ST rates will be implemented in 2008 and are not proposed to be phased-in over multiple years.

The impact of Regulatory Asset Rate Rider # 3 and the revised RTSR have been included in the total bill impacts.

MITIGATION OF BILL IMPACTS LEGACY CUSTOMERS

This exhibit presents the proposed impact mitigation plan for Legacy customers. As per the guidelines in the 2006 Electricity Distribution Rate Handbook, LDCs have to present a mitigation plan, if as a result of the proposed rate increase, customer classes or group of customers have yearly impacts higher than 10 percent on total bill.

1.0 INTRODUCTION

As was shown in Exhibit G1, Tab 7, Schedule 1, R3 Seasonal customers prior to mitigation would see impacts higher than 10 percent on total bill resulting from the proposed increase in 2008 Revenue Requirement, moving distribution rates to the target distribution rates determined by using the Cost Allocation Study methodology, creating new customer groups, Regulatory Asset Rate Rider # 3, and RTSR changes.

The bill impact mitigation that Hydro One Distribution proposes includes the following approach to address the impacts on the customer class that could see impacts, on average, of over 10 percent on total bill.

1. Average total bill impacts have been limited to a maximum of 10% in 2008, 8% in 2009, and 7% in 2010. These maximums still leave some room to accommodate third generation Incentive Rate Mechanism increases. Increases in 2011 reflect the remaining increases resulting from the multi-year proposed harmonization process and are under 10% on average total bill
2. Regulatory Rate Rider # 3 is being refunded over 4 years, consistent with Hydro One approved past practices for Regulatory Rate Riders and to provide for a smoother bill impact over the 4 year period.

3. The target revenue to cost ratio proposed for the various customer groups is in the range of 0.7 to 1.2, as opposed to using revenue to cost ratio of 1. This is consistent with the Board's Report issued November 28, 2007.
4. The target distribution rates are being phased-in over a period of four years.
5. A deferral account is being set up to recover the shortfall in 2008 proposed Revenue Requirement that results from Hydro One's proposed Revenue to Cost Ratios by customer class. The revenue to cost ratios are consistent with the Board's recommended revenue to cost ratios. Table 1 and 2 do not include the effect of the $0.07/kW CSTA rate adder.

Table 1 below shows the initial 2008 Distribution rates derived in Exhibits G1, Tab 4, Schedule 2, and the adjusted 2008 Distribution rates after taking into account the four year phase-in period for the customer classes.

Table 1
2008 Distribution Rates

	2008 Initial Distribution Rates		2008 Mitigated Distribution Rates	
	Target Fixed Service Charge [$/cust]	Target Volumetric Charge [¢/kWh or $/kW]]	Target Fixed Service Charge [$/cust]	Target Volumetric Charge [¢/kWh or $/kW]]
UR	14.32	2.29	14.00	2.44
R1	19.04	2.60	19.00	2.81
R2	49.91	3.10	26.2* - 30.64*	2.2 - 2.68
Seasonal	19.51	6.38	19 - 33.18	3.2 - 4.7
Uge	12.33	2.09	14.27	2.00
Ugd	29.19	7.25	18.49	7.42
Gse	30.97	3.39	34.74*** - 203.36***	3.38
GSd	46.75	9.22	38.68 - 207.3	9.44
Street Light	1.00	4.57	1.00**	4.57
Sentinel	1.00	5.30	1.00**	5.30
DGen	36.66	7.07	36.66	7.07

*Net of RRRP **Nominal fixed Charge ***Excludes $0.35 adder for USL meter credit

All Legacy customer rate classes, with the exception of Street Lights, Sentinel Lights, and Distributed Generator are being phased-in to the target distribution rates over a four year period, similar to the period over which Acquired customer classes will be harmonized. Street Lights and Sentinel Lights achieve their corresponding target rates in 2008 since the total bill impact is less than 10 percent, or is less than $1.80 per month per connection. Distributed Generator rates are also not being phased in as the majority of these customers see bill decreases. The range in fixed charges provided in Table 1 above reflects the fact that in many instances there are various legacy customer classes being mapped into the new customer classes. It also includes Caledon classes being mapped to R2 and Seasonal groups, Terrace Bay Street lights, and an Acquired General Service customer being mapped to Distributed Generator group.

For USL, Hydro One is proposing to mitigate the impact to these type of customers by setting a volumetric charge that results in annual bill impacts near $10 per month. The fixed charge is being phased-in in a similar fashion as for the other Acquired LDC customers. The shortfall in revenues resulting from this mitigation measure for USL customers is being recovered from the current USL General Service single-phase energy billed customers.

The following table shows the bill impacts for the customer groups using the mitigated Distribution rates. All customer classes have impacts of less than 10% on total bill with the exception of Distributed Generator, Street Light and Sentinel Light. Street Light and Sentinel Light have total bill impacts of less than $1.80 per month per connection. Fifty one Distributed Generators will see bill decreases. Twenty nine Distributed Generators are estimated to have total bill impacts of 15%. One Distributed Generator customer has a total bill impact of 112%, or approximately $25 per month.

Table 2
2008 Customer Class Total Bill Impact after Mitigation Plan

	Bill Impact % increase/(decrease)
UR	(11) to 1.9
R1	1.30
R2	(1.8) to 9
Seasonal	7 to 9.8
Urban General Service energy	(21.5) to (8.8)
Urban General Service demand	(10) to (5.6)
General Service energy	(8.4) to 2.5
General Service demand	(7.7) to 1.5
Street Light	5 to 21.9
Sentinel	25.0
Distributed Generator	(30.9) to 111.9

The range in bill impacts provided in Table 2 above reflects the various legacy customer groups being mapped into the new customer groups. It also includes Caledon classes being mapped to R2 and Seasonal groups, Terrace Bay Street lights, and an Acquired General Service customer being mapped to Distributed Generator group.

Combining the proposed Distribution rates with other applicable charges and using 2008 sales forecast, customer bills can be calculated for all customer classes and groups. Schedule 3 through Schedule 6 of Exhibit G2, Tab 5 show the results of the bill impact analysis for each Legacy customer group broken down by levels of consumption for each customer class. Schedule 3 provides the impacts due to Distribution revenue increase only on the distribution portion of the bill. Schedule 4 shows the impact of the Distribution rate changes due to revenue requirement increase and Regulatory Rate Rider # 3 only on the Distribution portion of the bill. Schedule 5 shows total bill impacts that include Regulatory Rate Rider # 3 and 2008 revenue increase, but exclude RTSR changes. Schedule 6 shows total bill impacts due to all rate changes.

The complete 2008 Rate Schedule is provided in Exhibit G2, Tab 5 Schedule 1.

MITIGATION OF BILL IMPACTS ACQUIRED LDC CUSTOMERS

This exhibit presents the proposed impact mitigation plan for Acquired LDC customers. As per the guidelines in the 2006 Electricity Distribution Rate Handbook, LDCs have to present a mitigation plan if as a result of the proposed rate increase customer classes, or group of customers, have impacts higher than 10 percent on total bill.

1.0 INTRODUCTION

As was shown in Exhibit G1, Tab 7, Schedule 2, customer classes of Acquired LDCs prior to mitigation would see impacts higher than 10 percent on total bill resulting from the proposed increase in 2008 Revenue Rates, harmonization of distribution rates, Regulatory Asset Rate Rider # 3, and RTSR changes.

Hydro One Distribution proposes the following mitigation initiatives to address the impacts on the Acquired LDC customer classes that could see impacts, on average, of over 10 percent on total bill.

1. The target distribution rates are being phased-in over a period of four years. Average total bill impacts have been limited to a maximum of 10% in 2008, 8% in 2009, and 7% in 2010. These maximums leave some room to accommodate third generation Incentive Rate Mechanism increases. Increases in 2011 reflect the remaining increases resulting from the multi-year proposed harmonization process and result in average total bill impacts below 10%. The volumetric charges were adjusted as necessary each year to limit total bill impacts in 2008, 2009 and 2010. Any shortfall in revenues resulting from this mitigation measure is being absorbed first by the Acquired LDC in subsequent years, and if this is not possible, then by the Legacy

customer classes in the same group as the Acquired customer classes requiring mitigation.

2. Regulatory Rate Rider # 3 is being refunded over 4 years consistent with Hydro One approved past practices with respect to Regulatory Rate Riders and to provide for a smoother bill impacts over the 4 year period.
3. The target revenue to cost ratio range proposed is between 0.7 and 1.2 instead of proposing revenue to cost ratio of 1. This is consistent with the Board's Report issued November 28, 2007.
4. Proposed rates in 2010 and 2011 were adjusted to provide for a smoother set of impacts in those years.
5. A deferral account is being set up to recover the shortfall in 2008 proposed Revenue Requirement that results from Hydro One's proposed Revenue to Cost Ratios by customer class. The Revenue to Cost ratios are consistent with the Board's recommended Revenue to Cost ratios.

Table 1, below shows the initial 2008 Distribution rates derived in Exhibits G1, Tab 4, Schedule 3, and the adjusted 2008 Distribution rates after taking into account the rate mitigation initiative above for the customer classes.

The complete 2008 Rate Schedules are provided in Exhibit G2, Tabs 6 to Tab 93.

REVIEW OF PILOT TIME-OF-USE RATES

This exhibit provides an update on the experience to date of offering interim time-of-use (TOU) distribution rates to a selected group of customers.

1.0 INTRODUCTION

Hydro One Distribution received approval from the Board[1] to implement, on an interim basis, distribution TOU rates for customers whose off-peak demand consumption (kW) was at least twice their on-peak demand consumption. For customers on the interim TOU rates, the Distribution rates were the same as for other comparable Distribution customers, but the charge determinants are applied to billing demands (kW) established only during the peak period. The pilot program was included as part of Hydro One Distribution Conservation and Demand Management programs.

Originally three customers met the criteria for interim TOU rates.

2.0 ANALYSIS

The experience to date has been that no additional customers have modified their operation patterns to qualify for the interim TOU rate, so there has been no change in the program since the original application. This would indicate that distribution rates are not a major component in the customer’s total electricity bill and that any possible savings from customers modifying their electricity consumption to take advantage of interim TOU Distribution rates is not a significant enough benefit to warrant such a change in customer behavior.

[1] Interim Order dated November 24, 2004, RP-2004-0203/EB-2004-0457

Some interest has been expressed by ski resort operators to participate in this program, but given the interim nature of the program, no firm commitment has been made.

3.0 RECOMMENDATION

Hydro One Distribution recommends that its current Time-of-Use pilot program be discontinued. Hydro One will await the Board's recommendation with respect to Distribution TOU rates that are part of the Board's Distribution Rate Design review process before offering customers time-differentiated Distribution rates. The Board will need to address the issue of any potential shortfall in Distribution revenues resulting from customers participating in optional TOU distribution rates before TOU rates are implemented.

The move to new customer classes and rates will mitigate the impact of discontinuing the TOU pilot. Two of the three customers are being re-classified as ST customers and the third customer is being re-classified as General Service demand billed customer. Two of the three customers will receive lower bills while the third customer will see a significant percentage increase, the total dollar amount is about $73k per year.

TOTAL LOSS FACTORS

1.0 INTRODUCTION

This exhibit describes the proposal with respect to loss factors for Hydro One Distribution Legacy, Acquired and ST customers for use in conjunction with 2008 distribution rates.

1.1 Hydro One Distribution Situation

Hydro One Distribution undertook an update study of losses, as requested by the Board in RP-2005-0020/EB-2005-0378. Results of the study are presented in Exhibit A, Tab 15, Schedule 3, Attachment A. The study results show that, on average, Hydro One Distribution losses are estimated to be higher than the values currently approved by the Board. In light of Hydro One Distribution on going efforts to reduce losses as discussed in Exhibit A, Tab 15, Schedule 3, Hydro One Distribution does not propose at this time, to change the distribution loss factors to the values established in the study.

Hydro One also undertook a study of individual customer losses for all customers in its Sub-Transmission class, as requested by the Board in RP-2005-0020/EB-2005-0378. The study shows that some customers would benefit while other customers would see bill increases if losses are implemented on a customer by customer basis, as opposed to class average losses. The study also shows that site specific losses can vary unpredictably from year to year for reasons outside customer control. The study is included as Appendix A in this Schedule. Hydro One is proposing to maintain the average class loss approach for 2008 and beyond.

Losses are used to uplift, or adjust, the Commodity, Retail Transmission Service, Wholesale Market Service, and Rural or Remote Rate Protection charges to the wholesale level at which Hydro One Distribution settles for these charges with the IESO. Debt Retirement and Distribution charges are not subject to loss adjustments.

For energy billed customers, Board guidelines dictate that loss adjustments be applied to metered or estimated energy billing quantities. For demand billed customers, loss adjustments are applied to the corresponding tariffs and the billed quantities used are the metered quantities.

Exhibit G2, Tab 5 to Tab 94, Schedule 1, shows the corresponding Supply Facilities Loss Factors, Distribution Loss Factors, and Total Loss Factors that Hydro Ones Distribution proposes for 2008 for its Legacy, Acquired and ST customers, (including Embedded LDC).

The Total Loss Factors for the new proposed UR and R1 customer classes were derived by taking the weighted average, by energy, of the currently OEB approved TLFs of the customers comprising the new customer class. This approach was endorsed by Stakeholders at the Session on September 5th, 2007.

For example, the new Urban Residential class is made up of Legacy Urban Residential, Acquired Residential, Legacy R1 and Legacy R2 customers. Legacy customers have a TLF of 9.2% while Acquired Residential customers have TLFs of 5.45%. Taking these two TLFs values and multiplying by the energy for the Legacy and Acquired customer classes respectively, the weighted average TLF for the new Urban residential customer class is 7.8%. The same approach was used to develop the proposed TLFs for R1.

For R2, Seasonal, Distributed Generator, Street Light and Sentinel Lights, the TLFs are unchanged from their current TLFs. For Urban General Service energy billed and General Service energy billed the TLFs are the current TLFs approved for secondary metered customers of 9.2%. For Urban General Service demand, General Service demand, and Distributed Generator, the TLFs are the currently approved TLFs for primary metered customers of 6.1%. For the ST class, it is proposed to maintain the TLF of 3.4%, since the vast majority of the customers in this new class, by energy, are Embedded LDCs and Embedded Directs, with TLFs of 3.4%.

The Table below shows the proposed loss factors for the new customer classes compared with the current approved loss factors.

Table of loss factors

Proposed Customer Class	Current TLF %	Proposed TLF %
Urban Residential	5.45 or 9.2	7.8
R1	5.45 or 9.2	8.5
R2	5.45 or 9.2	9.2
Seasonal	5.45 or 9.2	9.2
Urban General Service energy	5.45, 6.1 or 9.2	9.2
Urban General Service demand	5.45, 6.1 or 9.2	6.1
General Service energy	5.45, 6.1 or 9.2	9.2
General Service demand	5.45, 6.1 or 9.2	6.1
Street Light	4.26 or 9.2	9.2
Sentinel Lights	9.2	9.2
Distributed Generator	5.45 or 6.1	6.1
Sub-Transmission	1.45, 3.4, 5.45, 6.1 or 9.2	3.4

Measurement Canada requires that meters used for billing must be sealed and re-verified on a periodic basis. The IESO market rules require that legacy metering installations must be brought into compliance with the IESO's metering standards upon the earliest seal expiry date after market opening. These metering installations are substantially more complex than a meter used for residential customers and the installation requires design engineering. This results in many meters requiring either a substantial upgrade or total replacement, depending on the degree of equipment replacement needed to achieve compliance with IESO market rules.

Hydro One Distribution requested and received Board approval as part of the 2006 Distribution rates, that if the meter is located at the TS or HVDS, at time of reseal of the meter, if Hydro One requires the customer to relocate the meter to either inside the fence or immediately outside the TS or HVDS, for safety, security and access reasons, depending on physical characteristics of the station, then the applicable Total Loss Factor is 0.6% for customers supplied by express feeders[1]. This applies to all ST customers whose meter is being relocated and was implemented as of May 1, 2006.

Also, if the meter is relocated away from the TS or HVDS, losses must be based on engineering studies. Hydro One will add non-technical losses consistent with the method inherent in the existing Distribution Loss Factors.

Customers also requested that they be allowed to estimate losses based on engineering studies, instead of using average loss factor, in cases where the meter is being relocated. In these situations, this would result in more accurate loss adjustments and would be consistent with the mechanism to apply loss adjustments in the IESO administered market.

[1] Feeder used by only one customer and the meter is located at the station

The above deal with situations in which Hydro One does not want the metering within the TS or HVDS. However, Hydro One Distribution proposes that in all situations in which a feeder delivers to solely one supply point, and in which the metering is located away from the supplying station, that the customer calculates applicable losses based on engineering studies. Hydro One will add non-technical losses consistent with the method inherent in the existing Distribution Loss Factors.

Also, Hydro One Distribution proposes that in situations in which the metering is at the supplying TS or HVDS (either inside the fence or immediately outside the fence), that the DLF not be applied, but solely the losses associated with the transformation at the station, i.e. the approved Supply Facility Loss Factor be applied.

There are situations in which there is no metering at the customer supply point, and quantities are calculated by taking the differences between other metering (for example, feeder total minus the only other customer on the feeder). In such situations, the normal application of the DLF to the difference in metering quantities could result in double-counting the feeder losses. Therefore, Hydro One Distribution proposes that in such a situation, the application of loss adjustment avoid double-counting the feeder losses by adjusting appropriately the meter quantities separately.

July 30, 2007

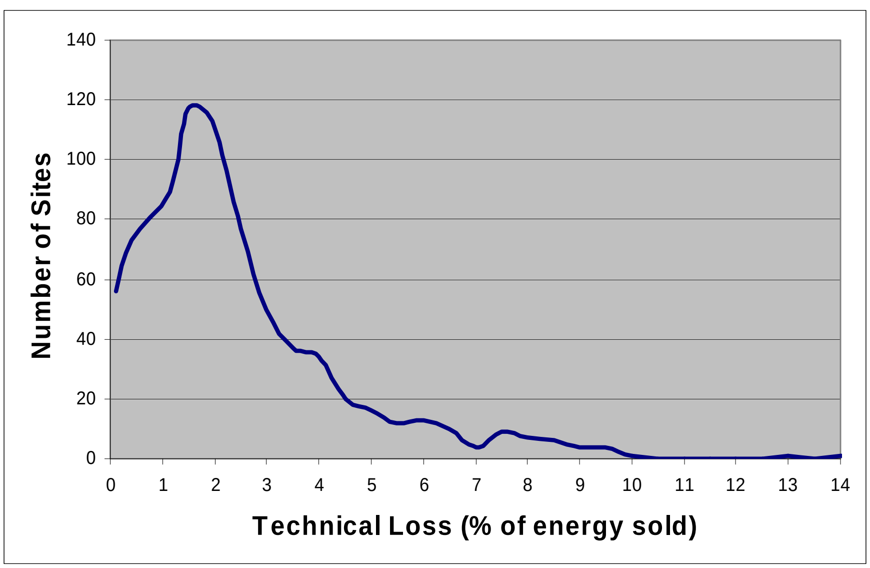
EXECUTIVE SUMMARY

As part of the support for the rate application to the OEB, Hydro One requested a calculation of the site specific technical losses for subtransmission customers and embedded LDC and Direct customers. Technical losses are part of the distribution loss factor (DLF) that is used to adjust metered energy to account for technical and non-technical losses. The technical losses include energy losses in power lines and transformers. The technical losses, expressed as a percentage of energy sold, can be multiplied with the annual energy sales of the specific customer site to determine the energy loss allocated to that customer site. Site specific technical losses depend on a large number of factors including:

- the site load
- the load of other sites on the circuit
- the length of line to the site and locations of other load sites
- the conductor size
- the line voltage
- the power factor
- the line current imbalance
- the site transformer's rating and loss parameters.

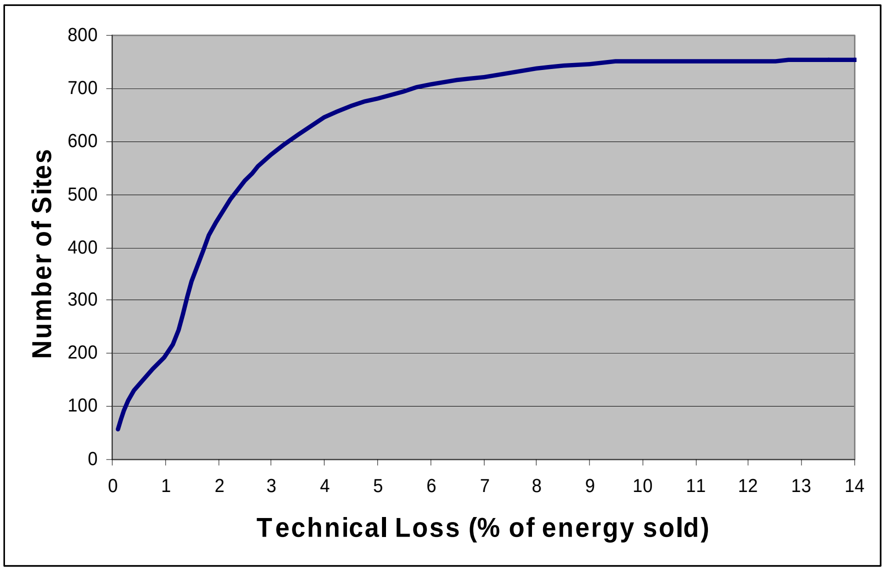
Calculations of site specific technical losses were made for all 765 subtransmission customer sites. The calculated technical losses ranged from 0 to 14% of energy sold at the site, with an average of 2.2%. The complete distribution is shown below in Figure 1. These technical losses represent only a part of the total loss factor that would result from implementation. Non-technical losses and the supply facilities loss factor must be added to these technical losses.

Figure 1 Frequency Distribution of Site Specific Technical Losses



About two thirds of site specific losses are less than the 2.6% overall subtransmission system loss and these sites would see a reduction in their allocated cost of losses if site specific losses are implemented in the rate structure. The remaining third would see their loss allocation increase, typically by a factor of 2 but by up to a factor of four at some sites.

Figure 2 Cumulative Frequency of Site Specific Technical Losses



If the average technical loss is weighted by the amount of energy sold at each customer site, then the average is 1.4%, i.e. the larger energy users tend to have lower losses. This is a due to their location closer to large transformer stations (TSs) and to their primary metering which includes the transformer losses in the metered energy. The weighted average is an indication of the actual cost of losses that would be recovered from this group of customers if site specific DLFs are adopted. The 1.4% weighted average loss represents a reduction of 35% in recovered costs compared to the technical loss recovered by the existing rate structure. This reduction in recovered loss would need to be balanced by a corresponding increase in technical losses recovered from other customers to ensure that the total technical loss is still recovered.

The 1.4% weighted average loss is lower than the 2.6% for subtransmission customers calculated in the overall loss report previously filed with the OEB because it is the loss of a different set of load sites. The overall loss report calculates the total loss on all subtransmission circuits and power transformers (2.6%) as a percentage of the total energy sold. The site specific losses have been calculated only for a subset of load sites that tend to be on shorter lines and 40% have no power transformer included because of primary metering.

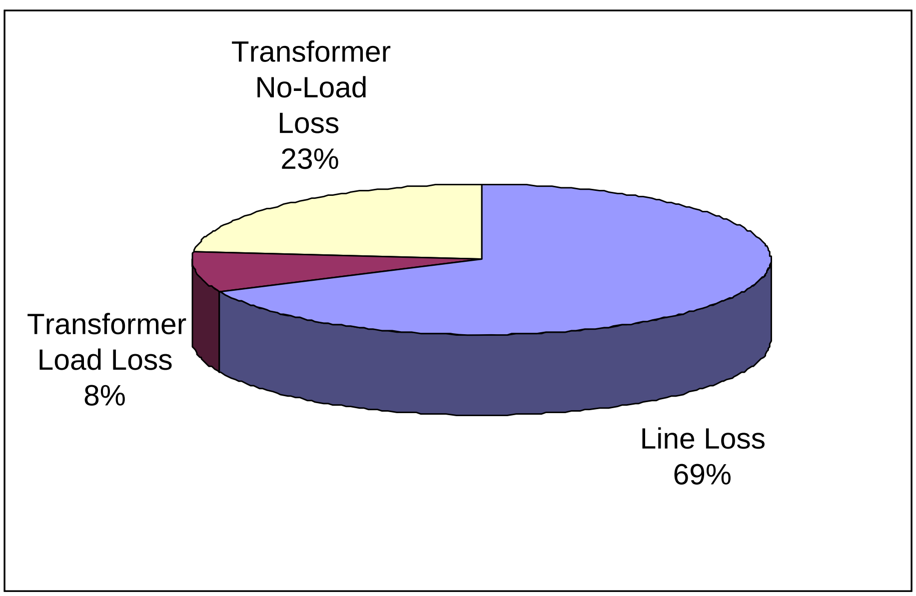
The average expected uncertainty in the individual calculated site specific technical loss is ±10% if no site transformer is required in the calculation and ±30% if a transformer is included. The largest sources of uncertainty are assumptions which need to be made for:

- the size and loss parameters of individual site transformers
- the conductor size on some circuits
- the location of some loads and current unbalance on the 27.6 kV lines in southwestern Ontario.

Hydro One would need complete data to generally eliminate the above assumptions solely if site specific loss factors were actually implemented. The data was unavailable because it has never been needed before and it would be expensive to collect and maintain. There are other smaller sources of uncertainty in the calculation that could be reduced with more data, such as the hourly load of Hydro One substations, power factors, and unknown load locations. There are some sources of uncertainty that can never be eliminated, such as conductor temperatures.

The proportion of the loss caused by line loss, transformer load loss and transformer no-load loss is shown on the pie chart in Figure 3. Again the differences from the proportions in the overall loss report are caused by these results being for a subset of all the load sites. In this subset the transformer no-load loss is a larger proportion because the transformers tend to be lightly loaded compared to Hydro One substations. The line loss is a lower proportion because the lines tend to be shorter to this subset of load sites.

Figure 3 Relative Contribution of Different Sources of Energy Loss



Based on the results of this study it is recommended that site specific losses not be used for all embedded LDC and Direct customers. This recommendation is based on the following rationale:

- site specific losses are highly dependent on variables outside of the control of the customers, such as loads of other customers and power system design and operation decisions. As a result, the customer's cost of losses could vary unpredictably from year to year for reasons beyond their control, which is inherently unfair.

- site specific losses would require expensive data to be collected and kept up to date, data that is not required for any other purpose.

- site specific losses would need to be re-calculated frequently because of changes to the power system and to the customers loads

- the inherent error in the loss estimate is larger than the difference in losses between most sites, the major exception being large customers with dedicated circuits metered at or near the TS. The exception might be better handled by not adding technical losses to this small group of customers.

TABLE OF CONTENTS

PAGE

TABLE OF FIGURES

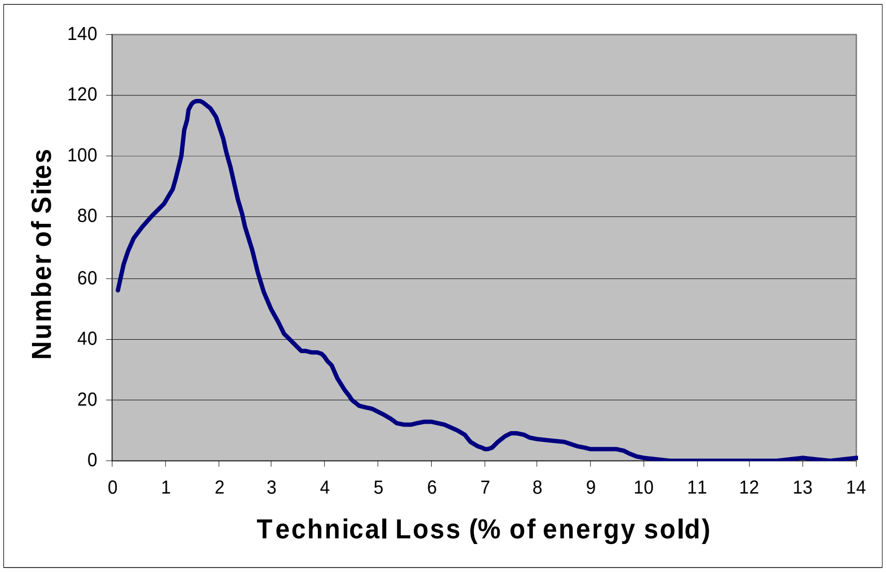
SITE SPECIFIC LOSSES

1. CONCLUSIONS AND RECOMMENDATIONS

1.1 TECHNICAL LOSS RESULTS

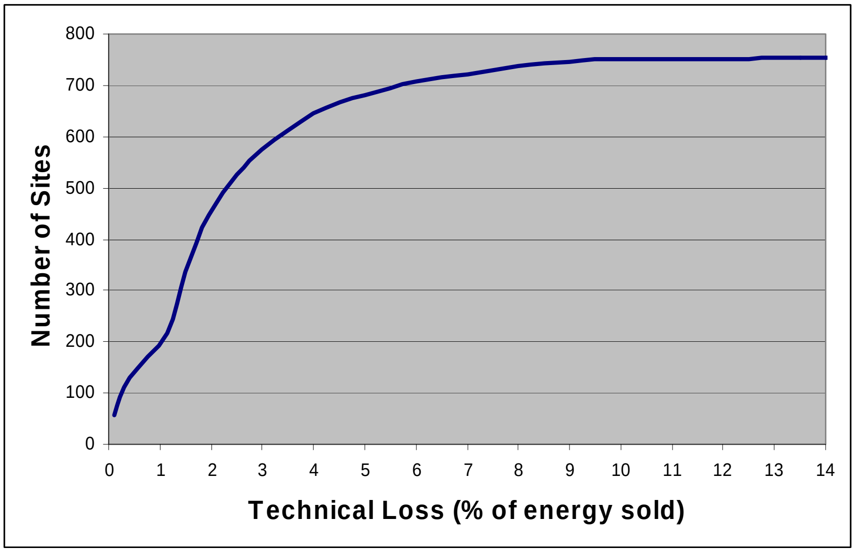
Calculations of site specific technical losses were made for all 765 subtransmission customer sites. The calculated technical losses ranged from 0 to 14% of energy sold at the site, with an average of 2.2%. The complete distribution is shown below in Figure 4.

Figure 4 Frequency Distribution of Site Specific Technical Losses



About two thirds of site specific losses are less than the 2.6% overall subtransmission system loss and these sites would see a reduction in their allocated cost of losses if site specific losses are implemented in the rate structure. The remaining third would see their loss allocation increase, typically by a factor of 2 but by up to a factor of four at some sites.

Figure 5   Cumulative Frequency of Site Specific Technical Losses



1.2 EFFECT ON RECOVERED COST OF LOSSES

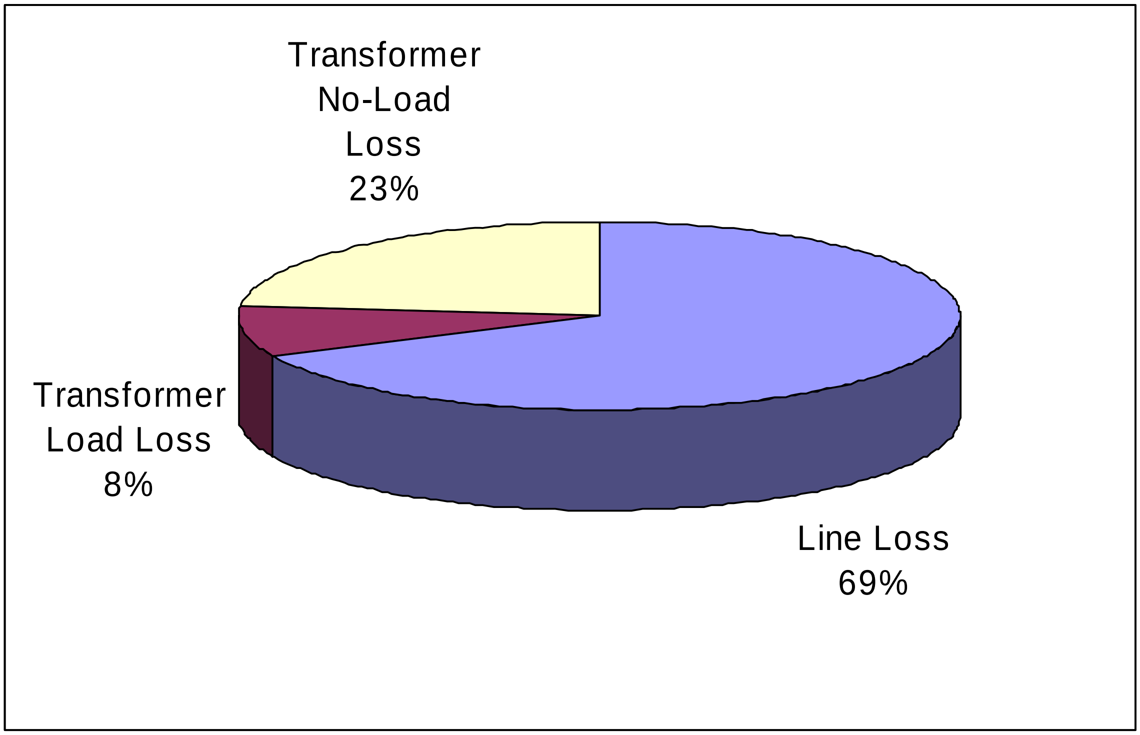
If the average technical loss is weighted by the amount of energy sold at each customer site, then the average is 1.4%, i.e. the larger energy users tend to have lower losses. This is a due to their location closer to large transformer stations (TSs) and to their primary metering which includes the transformer losses in the metered energy. The weighted average is an indication of the actual cost of losses that would be recovered from this group of customers if site specific DLFs are adopted. The 1.4% weighted average loss represents a reduction of 35% in recovered costs compared to the technical loss recovered by the existing rate structure. This reduction in recovered loss would need to be balanced by a corresponding increase in technical losses recovered from other customers to ensure that the total technical loss is still recovered.

1.3 COMPARISON WITH OTHER LOSS ESTIMATES

The 1.4% weighted average loss is lower than the 2.6% for subtransmission customers calculated in the overall loss report previously filed with the OEB (Reference 1) because it is the loss of a different set of load sites. The overall loss report calculates the total loss on all subtransmission circuits and power transformers as a percentage of the total energy sold on the entire system. The site specific losses have been calculated only for a subset of load sites that tend to be on shorter lines and many have no power transformer included because of primary metering.

The proportion of the loss caused by line loss, transformer load loss and transformer no-load loss is shown on the pie chart in Figure 6. Again the differences from the proportions in the overall loss report are caused by these results being for a subset of all the load sites. In this subset the transformer no-load loss is a larger proportion because the transformers tend to be lightly loaded compared to Hydro One substations. The line loss is a lower proportion because the lines tend to be shorter to this subset of load sites.

Figure 6   Relative Contribution of Different Sources of Energy Loss



1.4 ACCURACY

The average expected uncertainty in the individual calculated site specific technical loss is ±10% in most circuits where conductor size, load and phase current balance are known and if no site transformer is required in the calculation. The expected uncertainty increases to ±30% if a transformer is included. The largest sources of uncertainty are assumptions which need to be made for:

- the size and loss parameters of individual site transformers
- the conductor size on some circuits
- the location of some loads and current unbalance on the 27.6 kV lines in southwestern Ontario.

Hydro One would need complete data to generally eliminate the above assumptions solely if site specific loss factors were actually implemented. The data was unavailable because it has never been needed before and it would be expensive to collect and maintain. There are other smaller sources of uncertainty in the calculation that could be reduced with better data, such as the hourly load of Hydro One substations, power factors, and unknown load locations. There are also some sources of uncertainty that can never be eliminated, such as conductor temperatures.

Because the average values for many of the necessary assumptions are known quite well, the uncertainty in the average loss allocation is less than in the individual loss allocations.

1.5 RECOMMENDATION #1

Based on the results of this study it is recommended that site specific losses not be used for all embedded LDC and Direct customers. This recommendation is based on the following rationale:

- site specific losses are highly dependent on variables outside of the control of the customers, such as loads of other customers and power system design and operation decisions. As a result, the customer's cost of losses could vary unpredictably from year to year for reasons beyond their control, which is inherently unfair.
- site specific losses would require expensive data to be collected and kept up to date, data that is not required for any other purpose.
- site specific losses would need to be re-calculated frequently because of changes to the power system and to the customers loads
- the inherent error in the loss estimate is larger than the difference in losses between most sites, the major exception being large customers with dedicated circuits metered at or near the TS. The exception might be better handled by not adding technical losses to this small group of customers.

1.6 RECOMMENDATION #2

If site specific losses are implemented, the cost of data collection and maintenance at different levels of detail should be determined so that the level of data detail can be chosen appropriately, by comparing with the effect of data detail on accuracy.

1.7 RECOMMENDATION #3

If site specific losses are implemented, the frequency at which site specific losses will be estimated (every year, every two years, every five years) needs to be determined. Procedures will be needed to handle new customers in between recalculations.

2. INTRODUCTION

As part of the support for the rate application to the OEB, Hydro One requested a calculation of the site specific technical losses for subtransmission customers and embedded LDC and Direct customers. Technical losses are part of the distribution loss factor (DLF) that is used to adjust metered energy to account for technical and non-technical losses. The technical losses include energy losses in power lines and transformers. The technical losses, expressed as a percentage of energy sold, can be multiplied with the annual energy sales of the specific customer site to determine the energy loss allocated to that customer site. Site specific technical losses depend on a large number of factors including:

- the site load
- the load of other sites on the circuit
- the length of line to the site
- the conductor size
- the line voltage
- the power factor
- the line current imbalance
- the site transformer's rating and loss parameters.

Calculations of site specific technical losses were performed for all 765 subtransmission customer sites. Since the technical loss calculation is dependent on the total load on the circuit, data from Hydro One substation sites were also used in the calculations.

2.1 DEFINITION OF TERMS

Distribution Loss Factor (DLF)
A factor used to increase the measured energy from a customer's meter before billing to account for losses in the delivery of the energy. Strictly speaking it should be a value with no units such as 1.02, but it is often expressed as a fraction (0.02) or as a percentage (2%). It includes technical losses and an adjustment for theft and other non-technical losses.

Supply Facilities Loss Factor (SFLF)
A value added to the DLF to account for loss in the transmission system transformer. This has been previously approved by the OEB as 0.6%.

Total Loss Factor (TLF)
The "sum" of the DLF and SFLF. This is the value that is actually used to adjust the meter reading to determine the energy billed. The formula with all factors expressed as a fraction is: TLF = (1+DLF)x(1+SFLF)-1

Technical Losses
Power or energy used in the components of the system that delivers electricity to the customer's meter. This includes conductor losses that depend on resistance and current and transformer losses that include a conductor loss (load loss) and a transformer core loss (no-load loss). The core loss does not vary with loading.

Power losses are expressed in kW or as a % of the loss at peak load.
Energy losses are expressed in kW-h per year or as a % of the total energy sold in a year.

Non-technical Losses
Non-technical losses include all unaccounted for energy other than technical losses. This can occur through theft, meter inaccuracies, billing errors and various frauds.

Loss Allocation
When technical losses are not averaged over all customers on the system they are divided into parts and each part assigned (allocated) to a different customer or group of customers. The loss allocation can be either power or energy losses, but usually it is energy losses. It can be expressed in kW-h or as a % of energy sold to that customer or group of customers in a year. The loss allocation is often used as a basis for a DLF. The TLF for a specific customer group can be calculated by adjusting for the amount of energy sold to that group and adding a factor for non-technical losses and the supply facilities loss factor.

Loss Factor
A factor used to convert the power loss at peak load to the average power loss. It depends on the details of the load profile, i.e. how the load changes with time. It is often estimated based on an equation involving the load factor as follows:

$$\text{Loss Factor} = p \times \text{load factor} + (1-p) \times \text{load factor}^2$$

The constant "p" in this equation depends on the load profile. It is typically 0.3 for subtransmission systems, 0.2 for distribution lines, and 0.15 for distribution transformers and secondary circuits.

Load Factor
A factor used to convert peak power to average power. It is the ratio of the average power to the peak power.

2.2 FAIRNESS ISSUES IN LOSS ALLOCATION

One of the considerations when selecting a loss allocation method is the perceived fairness of each alternative. Unfair aspects arise in both alternatives, either to allocate losses based on the actual loss that each site contributes to the total loss (site specific losses), and the alternative of allocating losses evenly to all customers in proportion to their energy use.

The even allocation method has been used historically. It has the advantage that the amount a customer pays for losses compared to other customers does not change for reasons outside of the control of the customer. If customer "A" reduces their load then customer "A" will pay less for losses, but if customer "B" reduces load, then it does not significantly lower the loss allocated to customer "A". Similarly if "B" increases their load it will not significantly increase the cost of losses for customer "A". This seems inherently "fair".

Another factor outside the control of customers is the design and operation of the power system, and the "even" allocation method works well for this also. If Hydro One builds a new substation beside customer “A”, the reduced losses in the overall system will reduce the cost of losses for both customers “A” and “B” by the same amount. If Hydro One changes the circuit that supplies customer “A”, to a circuit with higher losses (perhaps done to alleviate overloading on a transformer station) then customer “A” will not pay more for losses. This also seems inherently “fair”.

However, in the “even” loss allocation method large customers located close to major supply points (TS, transformer stations), who contribute very little to the loss on Hydro One facilities will pay the same for losses on Hydro One facilitates as a customer located far from the supply point. This seems inherently “unfair”.

In the “even” loss allocation method there is no incentive to locate new facilities where losses will be minimized. Consider two new customers “A” and “B”. “A” chooses a location near a TS where land prices are higher, but losses will be lower. “B” chooses a location in a remote rural area where land prices are low, but electrical losses are high because of the large distance from a TS. In the “even” loss allocation method both will pay the same for losses and customer “B” will have gained a competitive advantage over customer “A”. Customer “A” is, in effect, subsidizing customer “B”. This seems inherently “unfair”.

Site specific loss allocation methods can remove the “unfairness” of the last two examples. Each customer pays for the losses that their own load creates in the Hydro One system. However, it creates “unfairness” in the first two example situations. Consider two customers “A” and “B”, both located at the same location on the same circuit, each drawing 10 amps over a line of 1 ohm. The total loss on the line will be 20x20x1 = 400 W. Each customer will pay for 200W of loss, since their energy use is the same. If customer “B” doubles their load to 20 amps, the total loss will be 30x30x1= 900W. Customer “A” now uses 1/3 of the total energy so customer “A” will pay only for 1/3 of the loss, which would be 300 W. Notice that customer “A” pays for more loss even though customer “A” load has not changed. In this case the site specific loss allocation method seems “unfair”. In the second example, in which Hydro One changes the circuit that supplies a customer to a higher loss circuit, site specific loss allocation would increase that customers loss cost. This also seems “unfair”.

In designing a site specific loss allocation method in this project, no method was identified that would be “fair” in all cases. For example, an allocation proportional to the square of the current rather than proportional to energy was considered. However, this results in unfairness to end-use customers of LDCs. If two LDCs (A and B) share a supply line, and every end use customer has an identical load, and A has twice as many customers as B, then the end use customers of A will pay a larger share of the line losses if they are allocated proportional to the square of the current. In this case allocating losses proportional to energy use is fair, because it results in all end use customers paying the same amount of the line loss.

The cost of implementation of site specific losses is not insignificant. The data required to calculate site specific losses is much more extensive than that required for “even” loss allocation methods. The data is expensive to obtain and expensive to keep up to date. Customers and loads change every year, even every month. The frequency at which losses would need to be recalculated will affect the implementation cost. This frequency could be determined from the desired accuracy and the rate at which changes are made to the customer loads and to the power system. Every other year would appear to be a minimum.

3. ALGORITHM USED IN THE CALCULATION OF TECHNICAL LOSSES

Energy losses on electricity distribution systems are often calculated using commercially available load flow software. The usual procedure is to calculate the loss at peak load and then apply an empirically derived "loss factor" to convert the calculated loss at peak to the average loss. This procedure is not suitable for calculation of site specific losses, because it cannot take into account the differences between the load profiles of the different customers. If the load for customer A occurs mainly at times of low overall load then customer A will contribute less loss than customer B whose load occurs mainly at heavily loaded times. This could only be taken into account by the general purpose software by running it on each circuit 8760 times, for every hour of the year. This calculation procedure would be very expensive to use on the 494 circuits included in this study.

Since the circuits are all radial, with no loops or meshed networks, a computer program can be easily written to do the energy loss calculation 8760 times. The calculation method used in the program developed for this study is shown in Figure 3. Basically, the load in a line section or transformer is calculated separately for each hour of the year by summing the hourly load of all customers who are supplied through that component. The loss from that total load is then divided among the customers who are supplied through that component in proportion to their load in that hour of the year.

The program has been verified against hand calculations and commercially available loss calculation software.

Step 8 accounts for the fact that not all loads are known on the circuit. This is especially critical for the distribution circuits and for the 27.6 kV subtransmission circuits in the south west that have significant single phase loads. The "extra load sites" are set up at locations evenly distributed on the circuit, unless specific information was available to suggest a more accurate location. The 'extra load sites" have zero loads, unless the total measured currents are larger than the currents from the known loads.

The losses in voltage regulators are added to the transformer losses for all customers downstream of the regulator. Since data on the actual tap position of the regulator at every hour of the year is not available, an average boost of 5% has been assumed. The increase in line current upstream of the regulator is accounted for by the adjustment of the total load to the measured peak currents.

When a line passes through the service area of an LDC, to serve other loads beyond it, a primary meter is installed at both boundaries of the LDC territory. The difference between the meters is used to bill the LDC. The LDC meter reading must be adjusted up with a DLF to account for losses before the first meter, and adjusted down by a DLF to account for losses on the line between the meters that are caused by the downstream loads. The later DLF was estimated based on a manual calculation using the energy lost on the line between the meters calculated by the program, and the proportion of the total energy sold to the LDC and the downstream load.

When the site specific loss is calculated on a distribution line, the algorithm calculates the loss on the distribution line separately from the loss on the subtransmission line and

Hydro One substation. The two separately calculated losses are summed manually to produce the total loss for the site.

3.1 INPUT PARAMETERS

The algorithm uses the following input parameters:

- length of each section of power line
- size of conductor in each section
- circuit topology (which line sections are used by each load site)
- peak current on the circuit
- hourly load in kW for each load site with hourly data available
- an estimated hourly load based on customer class load profiles for sites with monthly energy data
- an estimated hourly load based on customer class load profiles for sites with annual peak data
- power factor for each load site
- transformer rating
- transformer load loss %
- transformer no-load loss %
- voltage regulator location and rating
- metering locations

4. DATA QUALITY ISSUES

When the 8760 load data was incomplete (264 sites were missing 1 to 3 months) then data was estimated by using the data from the hour of the week that was viewed likely to be similar: the count of the weeks from the missing week forward to year end equaled the count of the weeks from the start of the year to the week to use as the data source. So if the data for October was missing, then the data for March was used for October; and if the data for January was missing then the data from December was used.

For 126 sites, only monthly energy sales and peak power data were available. In these cases the monthly energy sales were used to estimate the hourly loads by scaling the known hourly load profile for the customer class. The monthly peak power data was not used for scaling because adjusting the load profile by total energy is more likely to provide a good estimate of monthly loss since the peak power can be affected by circumstances that do not last for most of the month. The use of the class load profile will tend to under estimate the losses, since any individual customer would likely have a "peakier" load profile than the class as a whole.

For Hydro One substations the load data that was available was an estimate of the annual peak load. Hourly load data was estimated by multiplying the annual peak by the per unit hourly load profile of all customers combined, except leaving out the classes T, embedded LDC and embedded Direct customers.

The uncertainty in the results for sites at which a meter is installed on the low voltage side of a customer owned transformer could be reduced if more data on the transformer rating and loss parameters was available. The size of the customer owned transformer had to be estimated in many cases and typical loss and no-load loss parameters were used. The transformer size was estimated from the peak load of the site by doubling the load, i.e. a 50% load at peak was assumed. A previous study of one area of Hydro One had found that typically customer transformers were loaded to 30-50% at peak load.

It is not always known if the customer site energy meter is installed upstream or down stream of the transformer. If it is upstream then the transformer losses should not be included in the technical loss estimate used to calculate a DLF. This is a significant change since on average 31% of the energy loss is in the transformers rather than the lines. If a primary meter was shown on the operating diagram or map then no transformer losses were included for that site. The results are presented for all sites both with and without the transformer loss included so that if mistakes in the location of the meter have been made, the calculation will not have to be repeated.

Data was not available on the power factor of each customer site and the load current imbalance. Load current imbalance for the entire circuit was often available and it was assumed to apply to all customers evenly. When power factor was unknown it was assumed to be 0.95.

Conductor size data is available from maps and operating diagrams for about 63% of the circuits. For circuits with missing data, the conductor size was estimated from the load level and typical design practices for similar circuits.

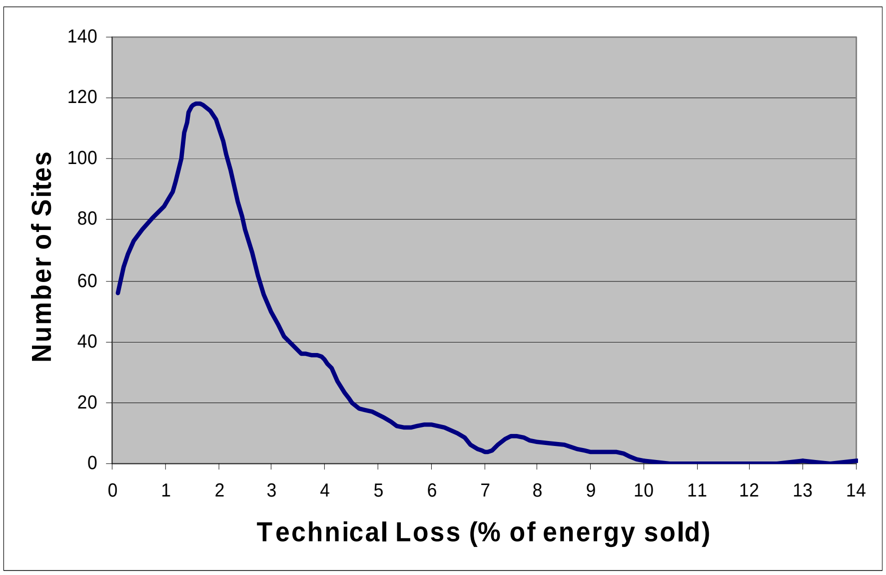
5. RESULTS

The detailed results for each site are shown in Appendix A.

The average technical loss is 2.2% and the frequency distribution is shown in Figure 8.

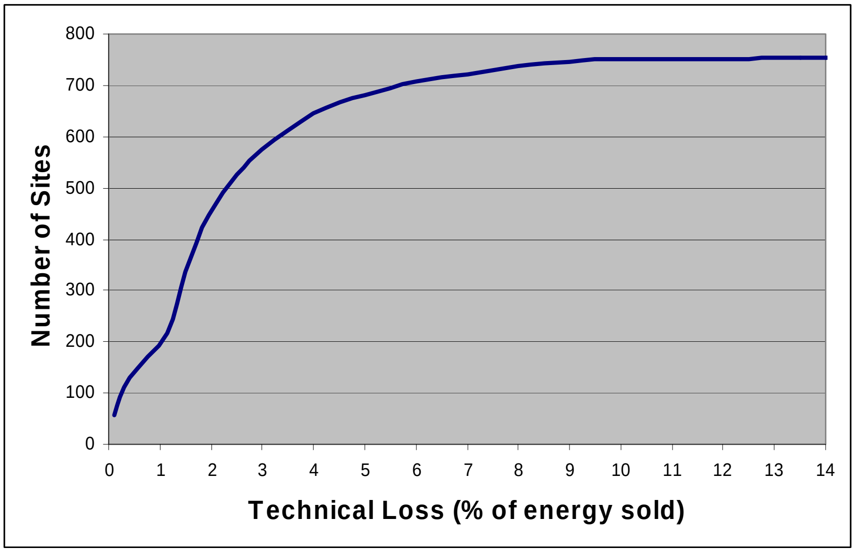
There were two sites with technical losses above 10% one at 13% and another at 14%. The high values here are caused by lightly loaded transformers and a predominance of no-load loss (>90% of the loss). The transformer size in these cases has not been assumed, but was clearly shown on the operating diagram. However, there are many sites that have predominantly no-load losses. This can be caused by a low load factor (for example a peak load ten times the average load) as well as by over sized transformers. A transformer can be over sized as a result of load reductions in a customer's processes or by a change in ownership with the new owner using much less energy than the original owner.

Figure 8 Frequency Distribution of Site Specific Technical Losses



About two thirds of site specific losses are less than the 2.6% overall subtransmission system loss and these sites would see a reduction in their allocated cost of losses if site specific losses are implemented in the rate structure. The remaining third would see their loss allocation increase, typically by a factor of 2 but by up to a factor of four at some sites.

Figure 9   Cumulative Frequency of Site Specific Technical Losses

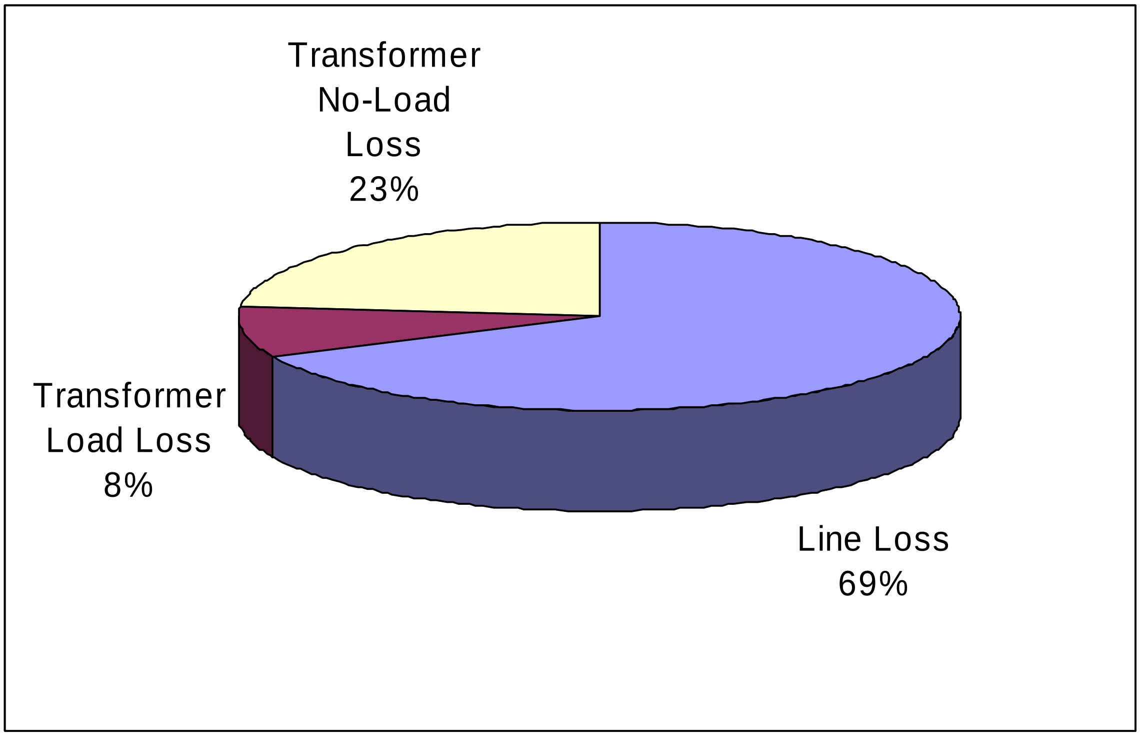


If the average technical loss is weighted by the amount of energy sold at each customer site, then the average is 1.4%, i.e. the larger energy users tend to have lower losses. This is a due to their location closer to large transformer stations (TSs) and to their primary metering which includes the transformer losses in the metered energy. The weighted average is an indication of the actual cost of losses that would be recovered from this group of customers if site specific DLFs are adopted. The 1.4% weighted average loss represents a reduction of 35% in recovered costs compared to the technical loss recovered by the existing rate structure. This reduction in recovered loss would need to be balanced by a corresponding increase in technical losses recovered from other customers to ensure that the total technical loss is still recovered. However, the method for recovering non-technical losses will also affect the total cost of loss recovered.

The 1.4% weighted average loss is lower than the 2.6% for subtransmission customers calculated in the overall loss report previously filed with the OEB because it is the loss of a different set of load sites. The overall loss report calculates the total loss on all subtransmission circuits and power transformers (2.6%) as a percentage of the total energy sold. The site specific losses have been calculated only for a subset of load sites that tend to be on shorter lines and many have no power transformer included because of primary metering.

The average composition of the losses by source is shown in Figure 10. The differences from the proportions in the overall loss report (Ref 1) are caused by these results being for a subset of all the load sites. In this subset the transformer no-load loss is a larger proportion because the transformers in the subset tend to be lightly loaded compared to Hydro One substations. Hydro One maintains a much higher loading level because Hydro One can re-configure the distribution lines to shift load between substation transformers. Customers often do not have this kind of load flexibility. The transformer losses are the least accurate, due to lack of data on the transformer size and loss parameters. This is discussed further in section 6. The line loss is a lower proportion because the lines tend to be shorter to this subset of load sites.

Figure 10 Relative Contribution of Different Sources of Energy Loss



6. ACCURACY OF THE DLF CALCULATION

Since every site specific technical loss may eventually be used to calculate a site specific DLF that will be applied to a customer's measured energy consumption to determine a total bill amount, it is critical to know the accuracy to which the site specific technical loss has been computed. There are several factors that can affect the accuracy of the technical loss calculation in general but they do not all apply to every calculation. The factors include uncertainties in the input data and inherent limitations in the modeling.

The accuracy of the technical loss calculation has been estimated by examining the underlying equations, or by changing the input data and repeating the calculation.

The factors that can affect the accuracy of loss allocations are summarized in Table 1 in two categories, line loss parameters and transformer loss parameters. On average 31% of the loss allocation is attributable to transformer losses and 69% to line losses.

Table 1 Summary of Accuracy Estimates

Loss Type	Parameter	Possible Error in Calculated Loss
Line Loss	line length	±3%
	conductor size (when not known)	±20%
	conductor temperature	±5%
	unknown loads	±2%
	unknown load location	±10%
	power factor	±10%
	phase current balance (some 27.6 kV only)	±20%
	load profile	±1%
Total Best Estimate for Line Loss		**±10%**
Transformer Loss	no-load loss %	±90%
	load loss %	±100%
	rating	±25%
Total Best Estimate for Transformer Loss		**±75%**

The accuracy of any specific technical loss depends on the circuit on which it is located and on the presence of a customer site transformer in the calculation.

The total error in line loss, if all errors were in the same direction, would be ±19% (in most circuits, where conductor size, load, and phase current balance are known). However, since all errors will not operate in the same direction, a reasonable estimate of actual error in the line loss portion of a specific technical loss can be estimated as ±10%.

The total error in transformer loss, if all errors were in the same direction, would be over 200%. However, since all errors will not operate in the same direction a reasonable estimate of the actual error in the transformer loss portion of a specific technical loss can be estimated as ±75%. This means that the accuracy of the technical loss for a customer site with a transformer upstream of the meter is 30% (10% of 69% plus 75% of 31%).

A discussion of each of the loss parameters is presented in section 6.1 and 6.2 below.

6.1 LINE LOSS PARAMETERS

- Circuit length to the customer
- Conductor resistance
    - o That in turn depends upon conductor size and temperature
- Conductor current
    - o That in turn depends on size and location of all loads on the circuit, power factor, and phase balance

In general the circuit length to the customer is known quite well. The estimated error in this input parameter is ±3%. This will create a ±3% uncertainty in the line loss.

The conductor size is only shown on the system maps or diagrams for 63% of the circuits. The others have been estimated based on loading and the size of conductors in similar situations, such as other circuits from the same transformer station. These estimated sizes could easily be either high or low by a single conductor size step. This represents an average error of ±20% in the resistance of the conductor. This will create a ±20% uncertainty in the line loss for circuits that have an estimated conductor size.

The temperature of the conductor affects its resistance. Tabulated values are typically made at 75ºC which represents a conductor loaded at its ampacity limit in a 35 ºC ambient with very light wind. Actual conductor resistance will be lower if the current is lower (about 25% lower at no load), if the ambient temperature is lower (about 25% less resistance in the winter), or if there is a large wind. The effect of loading was included in the calculations. A "typical" variation was assumed for the variation of resistance with load. Although different conductor types respond slightly differently the overall error would be insignificant. The effect of ambient temperature was not included since data was not available. The two effects acting together are not a simple sum. As the conductor temperature drops the effect on resistance becomes smaller and smaller. The effect of wind speed could also not be included in the model because of lack of data. Since the largest effect on conductor temperature has been included in the calculations, this source of error is estimated to contribute only ±5% uncertainty in the line loss estimate.

The size of the loads is known quite accurately for most of the circuits. For most 44 kV circuits every significant load is included in the input data. For the circuits at 27.6 kV and below, where many significant loads were not included in the input data, the total load was known from direct measurements at the transformer station. It is estimated that the load data is accurate to ±1%. This will create a ±2% uncertainty in the line loss.

Customers who have more than one load point but only one load data value (one Service Point ID#) create a similar situation to load data that is missing, it introduces an uncertainty into the size of the loads. The split of the total load among the load points must be estimated. Again since the total circuit load is adjusted anyway, this will affect the accuracy of other technical losses very little (<1%). However, it could have a much larger effect on the sites with the assumed loading. Errors of 10% in the calculated loss could be anticipated.

The location of the loads on the circuits relative to the other loads is also quite well known on the 44 kV circuits. However on the circuits at 27.6 kV and below, where the total load was only known by the measurement at the transformer station, the location of these loads is not known. If they are close to the station they will add little to the line losses. If they are far away from the station they will add significantly to the line losses. In order to estimate the likely effect of this unknown load location the calculations were performed under three separate assumptions. The “best estimate” assumption is that the loads with unknown location are evenly distributed over the entire circuit. The “minimum” estimate assumes they are all located at the transformer station. The “maximum” estimate assumes they re all located farther out on the circuit beyond the known loads. Comparing the three assumptions shows that the average loss allocation changes from 1.95 for the “best estimate” to 1.6 for the minimum and 4.4 for the maximum. This establishes an upper bound on the error due to the location of the unknown load. However since the “worst case” is highly unlikely, a more probable estimate for the error due to this parameter is ±10% of the line loss in circuits for which there is a significant level of load with an unknown location.

The power factor affects the loss calculation by altering the current calculated from the kW load. Although no site specific data on power factor was available, previous measurements on Hydro One circuits have shown the average to be about 0.95. This value was assumed for all loads. The circuit power factor on any specific circuit is not likely to be less than 0.9 which would increase line losses by 12%. Similarly if the actual power factor was 1 then the line loss would decrease by 10%.

The phase balance affects the line loss by increasing the current in some conductors and decreasing it in others. The net effect is an increase in line loss. Phase balance on the 44 kV circuits is usually quite good so this factor can be ignored. For circuits at 27.6 kV and below there are significant single phase loads which can produce up to a 40% imbalance. On average a more typical value would be 20% .

The load profile (how the load varies over the year) affects the calculation of the annual energy loss for the power loss at the peak load. Hourly load profile data was available for most loads which increases the accuracy of this calculation over methods based on monthly load data. The effect of the remaining uncertainty in load profiles has been estimated at 1%.

In total the line loss estimate for 44 kV circuits has a cumulative uncertainty of about 10% and circuits at 27.6 kV and less about 40%. If the conductor size had to be estimated these could increase by 20%.

These line loss parameters on average affect only 69% of the total loss allocation, so each estimate of uncertainty can be multiplied by 0.69 to get the effect of that parameter on the total loss allocation.

6.2 TRANSFORMER LOSS PARAMETERS

The estimate of the energy loss in transformers is calculated in two parts, load loss and no load loss.

The no load loss depends only on the size of the transformer and the details of its design. There was no data available on the no load loss of transformers supplying specific customers so a "typical" value of 0.15% of rating was used for all transformers. For individual transformers this could range from 0.38 % down to 0.014 % a range of ±90%.

The load loss depends on the transformer load loss value. Individual data on each customer transformer was not available so a "typical" value of 0.5% of rating at rated load was used. For individual transformers this could range from 0.84 % down to 0.015 % a range of over 100%. The load loss was adjusted for loadings other than the rated load by multiplying by the square of the ratio of the actual load to the rated load.

The rating of the transformer was known for only about 20% of the customers. The rating for the other customers was estimated based on previous studies that had shown that customer transformers are typically loaded at 30-50% of rating at their peak load time. This uncertainty in the size of the customer's transformer could be as large as a factor of two and that would introduce an error of ±25% in the transformer losses. Although this is smaller than the 100% range due to individual transformer loss parameters it is a significant addition to the uncertainty for many of the customer specific technical losses.

In summary, the errors in individual transformer load loss estimates could range from double the value estimated to one tenth of the value estimated, or ±90%.

The location of the energy meter relative to the transformer was not always known. If the meter is upstream then the transformer losses are included in the meter reading and the technical loss used to calculate DLF should not have transformer losses included. The technical loss has been calculated both with and without the transformer losses, so that if an assumed location is determined to be incorrect, the calculation would not have to be repeated.

6.3 OTHER CALCULATION ISSUES

In addition to data quality issues there have been other site specific technical loss calculation issues identified:

- changing loads from year to year will invalidate the site specific technical loss calculation
- changing operational configurations will invalidate the site specific technical loss calculation

The circuit loading and configuration that changes over time cannot be addressed in the technical loss calculation. Although the over all loss changes slowly, since some customer loads increase and others decrease and losses move from circuit to circuit with reconfiguration, the individual loss specific to each customer can change rapidly and it can change widely. It is not necessary for a particular customer's load to change for a change to occur in that customer's loss factor since any customer on the circuit affects all the others. The best that can be done is to calculate the loss factors at a particular point in time and then recalculate them again and again. The frequency of recalculation depends on the accuracy that is desired. A 10% change can easily occur in two years and a 30% change in five.

7.0 COMPARISON OF RESULTS WITH OTHER LOSS ESTIMATES

Estimates of the loss on the HONI subtransmission system have been made previously. The overall loss calculation filed with the OEB (Ref 2) estimated a 2.6% loss for subtransmission lines and power transformers. A recent update of this analysis (Ref 1) estimated 2.2% for subtransmission lines and 0.4% in power transformers.

The loss as a percentage of energy sold calculated in the site specific study for subtransmission customers (1.4%) is slightly lower than the studies estimating losses for the entire Hydro One subtransmission system (2.6%). This is expected since the site specific studies do not include the very long lines to remote rural substations and 40% of the site loss estimates do not include transformer losses because they are metered on the primary side. The LDC and Direct customers are on average closer to the TS than the Hydro One substations are.

The site specific studies calculate a larger proportion of the loss to be due to transformer losses. Again this is due to the long lines to rural stations being missing and also to the lower average loading on the site specific transformers compared to Hydro One substation transformers.

The total loss attributed to the group of customers calculated in this study is 288 GWh. This is composed of 197 GWh of line loss, 24 GWH of transformer load loss and 67 GWh of transformer no load loss. The total energy sales were 20,500 GWh. This indicates that the weighted average technical loss (weighted by the energy sold to each customer) is 1.4%. This weighted average is much lower then the average because the largest load sites have primary meters (no transformer in the technical loss calculation) and short dedicated lines and therefore have very low site specific technical losses.

Presently the total TLF for embedded LDC and Direct customers is 3.4%. Subtracting the supply facilities loss factor (0.6) and then the 10% that was included in this for non-technical losses (such as theft) estimates the technical losses as 2.55% of energy sold. This would be equivalent to an estimated loss of 522 GWh.

If the site specific technical losses were used in billing it would reduce the recovery of technical distribution system losses, compared to the existing rate structure by 36%, when the supply facilities factor (0.6%) is included. [1-(288+0.006*20500) / (522+0.006*20500) =1-(411/645)=0.36] This reduction in recovered loss would need to be balanced by a corresponding increase in technical losses recovered from other customers to ensure that the total technical loss is still recovered.

The actual reduction in revenue from the embedded LDC and embedded Direct customers from the move to site specific losses would depend on the treatment of the non-technical losses. Given the extremely small values of some site specific technical losses (0.0001) the treatment of non-technical losses as a percentage of technical losses may not be appropriate. If the new treatment is used, of adding a fixed percentage of energy sold to the technical losses (1.2%), to account for non-technical losses then the reduction in revenue would be 6%. [1-(288+(0.012+0.006)*20500) / (20500*0.034) = 1-(657/697) = 0.057)]

9.0 APPENDIX A Calculated Site Specific Loss Values

The table below contains the actual calculated values of site specific technical losses for all the customers included in the study and the maximum and minimum values based on the accuracy analysis specific to the individual circuit and site. The three rows above the table contain the minimum, average and maximum values of each column. The supply facilities loss factor and non-technical losses are not included.

Some data has been removed from the table to respect the confidentiality of customer information. This results in some blank columns.

Negative DLFs result from special cases. When a line serving Hydro One loads passes through the service territory of an LDC, the LDC is sometimes billed by the subtraction of a meter reading at the entrance and exit to the service territory. This energy measurement includes the losses that occur on the line between the meters that are caused by the current to the Hydro One beyond the LDC territory. These losses must be subtracted off the energy meter reading. If the loss on the circuit upstream of the LDC territory that is caused by the LDC load is less than the loss to subtract, then the technical loss for the LDC becomes negative.

Table of Site Specific Technical Loss Results[1]

MODIFICATION TO OEB COST ALLOCATION METHODOLOGY AND RESULTS

1.0 INTRODUCTION

This exhibit details the modifications that Hydro One Distribution made to the OEB Cost Allocation model to reflect its unique circumstances and also presents the results of the Cost Allocation Study.

2.0 COMPUTER MODEL

Hydro One modified the OEB Cost Allocation model to take into account density aspects, serving a large number of Embedded customers through its Low Voltage system and having multiple customer classes in addition to over 270 customer classes for Acquired LDCs.

Hydro One used Version 50 of the Cost Allocation model as a starting point and understands from Board staff that differences between version 50 and the first official Cost Allocation model version are mainly cosmetics. In addition, Hydro One has implemented updates to version 50 as identified by Board staff in the releases of the latest Cost Allocation Model versions 1.1 and 1.2.

Attachment A includes the Input and Output sheets of the Cost Allocation model, the same information provided for the Cost Allocation Information filing under Proceeding EB-2007-0001.

3.0 DENSITY WEIGHTING FACTORS

Density factors have been incorporated as weighting factors for Overhead lines and Transformers, consistent with the customer classes approved by the OEB that are based on Density definitions. The Density definitions have also been approved by the OEB.

For lines, Customer Density weighting factors were developed by calculating for all feeders the number of customers by customer class on each feeder and assigning the total distance of the feeders to the various customer classes proportionally. A similar method was used to develop Demand Density weighting factors, by using energy by customer class by feeder and total energy supplied by feeder to assign the feeder length for each feeder to customer classes proportionally.

For transformers, Customers Density weighting factors were developed by calculating Net Book Value of Transformation Assets by feeder and assigning the total Net Book Value of Transformation assets by feeder to the various customer classes proportionally. A similar method was used to develop Demand Density weighting factors, by using energy by customer class by feeder and total energy supplied by feeder to assign the Net Book Value of Transformation assets for each feeder to customer classes proportionally.

4.0 MODIFICATIONS

Hydro One created a new customer class, Subtransmission (ST) class that includes all Directs, Large Users, most T-class customers, all Embedded LDCs, some three-phase General Service, one Farm customer, some Acquired General Service customers, and some Urban General Service customers. All these customers are directly served at voltages between 44 kV and 13.8 kV, have consumption above 500 kW and provide their own transformation. Some of the LDCs are served below 13.8 kV and Hydro One provides an additional level of transformation.

Distribution assets which are used to supply the planned ST customer group include: High Voltage Distribution Stations, a small number of Low Voltage Distribution Stations whose secondary voltages are between 27.6 kV and 13.8 kV inclusive, and power lines between the voltages of 44 kV and 13.8 kV inclusive. In addition Distribution assets which are used to supply customers below 13.8 kV include Low Voltage Distribution Stations and power lines between the voltages of 12.5 kV and 4.16 kV inclusive.

To better align with the customer classes in other LDCs that typically have one Residential customer class and two General Service customers broken down between below and above 50 kW, and to better reflect customer characteristics, Hydro One has modified its Residential and General Service customer groupings. Four Residential customer classes have been created:

1. Urban includes the current Urban Residential customer class and customers from 12 Acquired LDC Residential customer classes who met the Urban Density Criteria,
2. Residential R1 includes the current high density and 88 Residential Acquired LDCs customers
3. Residential R2 includes normal density residential classes as well as Farm single phase and three phase energy billed customer classes that currently receive RRRP,
4. Seasonal includes the current high density and normal density seasonal residential customer classes.

Four General Service customer classes have been created:

1. General Service below 50 kW includes the existing single-phase General Service, three-phase General Service, Farm single-phase and Three-phase that do not qualify for RRRP, T-class customers that are energy billed, and Acquired General Service customers that are energy billed.
2. General Service above 50 kW includes General Service single-phase, General Service three-phase, T-class customers that are demand billed and consumption below 500 kW and all Farms that are demand billed and all these customers have not been reclassified into the ST customer class.
3. Urban General Service below 50 kW includes all current Urban General Service customers that are energy billed and energy billed single-phase General Service, three-phase General Service, single–phase Farms and Acquired General Service customers in 11 Acquired LDCs that meet the Urban density criteria.
4. Urban General Service above 50 kW includes all current Urban General Service customers that are demand billed and demand billed single-phase General Service, three-phase General Service, and Acquired General Service customers in 11 Acquired LDCs that meet the Urban density criteria and that have not been reclassified into the ST customer class.

As per OEB direction, Hydro One has created a new customer class for Merchant Generators (Distributed Generators). This class is composed of 76 interval meter customers and 5 non-interval metered customers. These customers are currently three-phase General Service, T-class customers, and one Acquired General Service customer. The load profile for this class is based on the consumption Distributed Generators require as station service when the active generators are not operating. No meter costs have been allocated to this class, as these customers are required to provide their own meters.

<u>Customer classes (Input Sheet 2)</u>

In Input Sheet 2, reproduced below, Hydro One is using the following Customer classes compared to the customer classes in the Model:

		Utility's Class Definition
1	Residential	Urban - Residential, Acquired Residential
2	GS <50	Residential – R1, Acquired Residential
3	GS>50-Regular	Residential – R2, Farms with RRRP
4	GS> 50-TOU	Seasonal
5	GS >50-Intermediate	General Service Energy-Billed
6	Large Use >5MW	General Service Demand-Billed
7	Street Light	Street Lights
8	Sentinel	Sentinel Lights
9	Unmetered Scattered Load	N/A
10	Embedded Distributor	N/A
11	Back-up/Standby Power	N/A
12	Rate Class 1	Distributed Generators
13	Rate Class 2	Sub-Transmission
14	Rate Class 3	Urban General Service Energy-Billed
15	Rate Class 4	Urban General Service Demand-Billed

4.0 MODEL CHANGES

As per Board staff instructions in version 1.1, Hydro One removed reference to step 4 and updated text for steps 1-3.

Trial Balance (Input Sheet 3)

Transformer Ownership Allowance not populated as Hydro One's approved Revenue Requirement of $1,067 million already includes cost of Transformer Ownership allowance.

Adjusted formula dealing with Working Capital (Cell G 20) to reflect the proposed Hydro One total working Capital of $296.5 million, or 11.2% instead of 15% for other LDCs. Hydro One's Working Capital includes $273.3 million of cash working capital and $23.3 million of Materials and Supplies Inventory in USoA 1330. USoA 1985 Sentinel Lights is also taken into account when calculating Working Capital. Hydro One has an exemption from the Government that allows it to continue maintaining Sentinel Lights.

Wholesale meters of $1.04 million reclassified from USoA 1815 to USoA 1820.

External Revenues of $5.85 million reclassified from USoA 4380 to USoA 5135, ($5.3 million Forestry Line work) and USoA 5420, ($0.58 million Health and Safety external revenues).

$4.5 million in USoA 5065 for Interval Meter Reads and Retail Settlements directly allocated to classes using number of interval meters by delivery point by customer class.

Amortization Environmental Assets of $8 million in USoA 5715 mapped 10% to USoA 5112 and 90% to USoA 5114 based on number of stations per category.

$1.19 million moved from USoA 5170 to USoA 5665 to reflect Sentinel Light and allocated directly to this class.

$0.3 million moved from USoA 5172 to USoA 5665 to reflect Sentinel Lights and allocated directly to this class.

$31.6 million moved from USoA 5715 to USoA 5645 reflecting amortization of OPEB, [$23.6million] and to USoA 5112/5114 reflecting land reclamation around stations [$8million].

Billing and Settlement Costs directly attributable to Interval Metered customers was determined for further direct assignment to classes using number of interval meters by delivery point by customer class. Balances direct assigned are: $59k from USoA 5610, $600k from USoA 5615, $11k from USoA 5630, $284k from USoA 5665 and $190k from USoA 5675.

Asset Breakout (Input Sheet 4)

Created sub-accounts for USoA 1815 1-5 Transformer Station Equipment to take into account that Hydro One owns High Voltage Distribution Stations and Low Voltage Distribution Stations. The stations can be shared between Low Voltage (LV) system customers and other end-use customers, or used exclusively by one customer group.

Created sub-accounts for USoA 1830-3 Poles, Towers and Fixtures – Sub-Transmission Bulk Delivery to provide a split between LV and other end use customers.

Created sub-accounts for USoA 1830-4 Poles, Towers and Fixtures - Primary to provide a split between LV and other end use customers.

Created sub-accounts for USoA 1835-3 Overhead Conductors and Devices – Sub-Transmission Bulk Delivery to provide a split between LV and other end use customers.

Created sub-accounts for USoA 1835-4 Overhead Conductors and Devices - Primary to provide a split between LV and other end use customers.

Created sub-accounts for USoA 1850 1-2 Line Transformers to provide a split between LV and other end use customers.

Created sub-accounts for USoA 1860 Meters to provide a split between single, poly, LV, and Smart meters.

Added USoA 1985 Sentinel Lights.

Modified Totals to include Sub Accounts and exclude Main Accounts when creating new sub-accounts.

Miscellaneous Data (Input Sheet 5)

The fixed service charge for the proposed rate classes is the customer weighted average service charge of the customer classes being mapped to the new classes.

Customer Data (Input Sheet 6)

The default Billing weighting factors were aligned with Hydro One’s customer classes.

Meter Capital (Input Sheet 7.1)

Hydro One matched its new customer classes (column B) with the default “Cost per Meter (installed) Col 1”. Column C default rate class definition not used.

Meter Reading (Input Sheet 7.2)

Used Hydro One specific Meter Reading weighting factors based on Hydro One Meter Reading Optimization analysis. The weights range between values of 1 to 4.

Demand Data (Input Sheet 8)

Total Loss Factor by class introduced in cells C16 to W25 to calculate load data at different delivery levels: TS, Bulk, Primary, and Secondary. The LT NCPs were developed using the ratio of the billed demand for customers that receive transformer ownership allowance over the total customer class billed demand as shown in Input Sheet 6.

Direct Allocation (Input Sheet 9)

The following USoA accounts were directly allocated:

5065 Meter Expense ($4.5 million),
5610 Management Salaries and Expenses ($59,000),
5615 General Administrative Salaries and Expenses ($0.6 million),
5630 Outside Services Employed ($11,000)
5665 Miscellaneous General Expenses ($1.8 million)
5675 Maintenance of General Plant ($0.19 million).

These expenses relate to interval meters and to staff dealing with this type of larger customers and Sentinel Light costs.

The allocation factor used for all these accounts is number of Interval Meter by delivery point by class except for Sentinel Lights included in account 5665 ($1.48 million) that has been allocated directly to Sentinel Lights..

Revenue To Cost RR (Output Sheet 1)

Hydro One Depreciation Expense includes $23.6 million for Other Post Employment Benefits (OPEB) and $8.2 million for Environmental work. OPEB was added to USoA 5645 in Input Sheet 3 and Environment was added to USoA 51112/5114 in Input Sheet 3. [Refer to rows 53 and 54.]

Also in Input Sheet 3 USoA 1330 of $23.3 million was included. Since Output Sheet 1 picks up the OM&A values from Input Sheet 3, Hydro One has to deduct these two amounts from the OM&A and add USoA 1330 when calculating Working Capital as a percentage of OM&A costs.[Refer to row 59]

Hydro One's Working Capital is based on 11% of OM&A instead of 15% in RP-2005-0020/EB-2005-0378. [Refer to row 58]

Rows 76 to 100 have been added to reflect Hydro One's Miscellaneous External Revenues and Common and Preferred Equity financial structure.

Rows 87 to 94 have been added to properly allocate Miscellaneous External Revenues instead of using Weighted Number of Bills (CWNB) as per OEB model.

Rows 97 to 100 reflect revenues and costs of standard distribution rates, including Miscellaneous External Revenues. The proposed Revenue Requirement of $1,067 million is recovered from Standard Distribution rates and from Miscellaneous External Revenues.

Adjusted the Rate Base checking formulae in Row 62 to be based on nearest million dollar.

Fixed Charge Floor Ceiling (Output Sheet 2)

Formula on row 28 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Adjusted formulas in rows 94, 97, 131, 148, 149, 152, 153, 163 and 164 to reflect new sub-accounts.

Line Transformers PLCC Adjustment (Output Sheet 2.1)

Adjusted formulas in rows 11, 41, and 42 to reflect new sub-accounts.

Formula on row 28 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Formula on row 25 adjusted to ensure allocated cost does not exceed total cost when the PLCC kW is changed from the default of 400 W in E3: PLCC.

Primary Costs PLCC Adjustment (Output Sheet 2.2)

Adjusted formulas in rows 11, 12, 43, 44, 49, 50, 58, and 59 to reflect new sub-accounts.

Formula on row 30 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Secondary Costs PLCC Adjustment (Output Sheet 2.3)

Titles of USoA accounts in rows 11, 12, 13, 14, 41, 42, 43, 44, 47, 48, 49 and 50 changed to Secondary – 5, instead of -4.

Formula on row 28 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Line Transformer Unit Costs (Output Sheet 3.1)

Adjusted formulas in rows 11, 44, and 45 to reflect new sub-accounts.

Formula on row 31 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Substation Transformation Unit Costs (Output Sheet 3.2)

Formula on row 36 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Primary Cost Pools (Output Sheet 3.3)

Adjusted formulas in rows 11, 12, 37, 38, 43, 44, 52, and 53 to reflect new sub-accounts.

Formula on row 24 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Secondary Cost Pools (Output Sheet 3.4)

Titles of USoA accounts in rows 11, 12, 13, 14, 37, 38, 39, 40, 43, 44, 45, and 46 changed to Secondary – 5, instead of -4.

Formula on row 24 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Formulas on rows 52 and 53 adjusted to reflect new sub-accounts.

USL Metering Credit (Output Sheet 3.5)

Formulas on rows 11, 41, and 42 adjusted to reflect new sub-accounts.

Formula on row 28 changed for Gross Plant to include USoA 1985 Sentinel Light Assets.

Summary By Class and Accounts (Output Sheet 4)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Details By Class and Accounts (Output Sheet 5)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Trial Balance Totals in column E of Main Accounts are zero to avoid double counting with new sub-accounts.

Source Data for E2, (Output Sheet 6)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Main account formulas adjusted to reflect the sum of sub-accounts.

Amortization (Output Sheet 7)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Main account formulas adjusted to reflect the sum of sub-accounts.

USoA 1985 directly allocated to Sentinel Lights.

Categorization (Exhibit Sheet 1)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Based on an updated Minimum System done for Hydro One, the Categorization factors for Fixtures, Conductors and Rural Transformers have been updated from the Rural default of 60% to 47.8%, 54.8% and 61.9%, respectively.

This was accommodated in the model by using the above on the following USoA Asset accounts and sub-accounts:

1830	Overhead Fixtures	47.8%
1835	Conductors	54.8%
1840/45	Underground	54.8%
1850	Transformers	61.9%

Further, the associated O&M accounts were also adjusted to track the Asset Accounts. For example:

USoA 5035, 5055 and 5160 for Rural Transformers was set at 61.9%

USoA 5120 for Fixtures Maintenance was set at 47.8%

Conductor Related USoA set to 54.8%.

Allocators (Exhibit Sheet 2)

New Allocators applicable to Hydro One added after row 119.

Allocator	ID	Basis
Mtr-Single	CWMC-1	Number of single-phase meters by class
Mtr-Poly	CWMC-2	Number of poly-phase meters by class
Mtr-LV	CWMC-3	Number of LV meters by class
Mtr-Smart	CWMC-4	Number of smart meters by class
1805/1806/1808/1810-2: <50 kV Assets	BCP(1-4-12)AA	Bulk CP with est of RCD of ST
1815-1	BCP (1-4-12) B	High Voltage DS Rural Only
1815-2	1815-2D	High Voltage DS Low Specific - LV Only
1815-3	1815-3D	High Voltage DS High Specific - LV Only
1815-4	1815-4D	High Voltage DS Low LV - LV Only
1815-5	1815-5D	High Voltage DS High LV - LV Only
1820-2	PNCP(1-4-12)AA	NCP with estimate for RCD of ST
1820-3	Cen2	Class Energy less Market Participants
1830-3A	1830-3A	Bulk Fixtures LV
1830-3B	BCP(1-4-12) DlinesB	Bulk Fixtures Retail (Density Weights)
1830-4A	1830-4AC 1830-4AD	Primary Fixtures LV Customer Related Primary Fixtures LV Demand Related
1830-4B	PNCP(1-4-12) DlinesB CCP-DLinesC	Primary Fixtures Retail (Density Wts) Retail customers with Density Wts
1835-3A	1835-3A	Bulk Lines LV

Allocator	ID	Basis
1835-3B	BCP(1-4-12)-DlinesB	Bulk Lines Retail (Density Weights)
1835-4A	1835-4AC 1835-4AD	Primary Lines LV Customer Related Primary Lines LV Demand Related
1835-4B	PNCP(1-4-12)-DlinesB CCP-DLinesC	Primary Lines Retail (Density Weights) Retail Customers Density Weighted
1840-4 &1845-4	PNCP(1-4-12)C CCP-C	Excludes ST/LV Excludes ST/LV
1840-5 & 1845-5	SNCP(1-4-1)C CCS-C	Excludes ST/LV Excludes ST/LV
1850-1	1850-1D 1850-1C	100% to ST/LV class 100% to ST/LV class
1850-2	LTNCP(1-4-12)RtransfB CCLT-RtransfB	Rural Transformers Retail Demand Related (Density Weights) Rural Transformers Retail Customer Related (Density Weights)

PLCC (Exhibit Sheet 3)

Hydro One has updated the 400 W PLCC default with new values based on Updated Minimum System study : 544 W for Conductors and 3100 W for Rural Transformers.

The PLCC-Customer Watts calculated in rows 24 to 28 were updated to replace 400 W:

PLCC-CCA	544W x number of customers
PLCC-CCB	544W x number of customers on bulk
PLCC-CCP	544W x number of customers on primary
PLCC-CCLT	3100W x number of customers with Rural Transformation
PLCC-CCS	544W x number of customers on secondary

Trial Balance Allocation Details (Exhibit Sheet 4)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Hydro One specific allocators were chosen and derived in E2: Allocators.

Reconciliation (Exhibit Sheet 5)

New rows added to reflect new Sub-accounts: 1815 -1, 2, 3, 4, 5, 1830 – 3A and 3B, 4A and 4B, 1835 -3A and 3B, 4A and 4B, 1850 – 1 and 2, 1860 – 1, 2, 3, and 4, and 1985 Sentinel Lights.

Cost Allocation Results

The results of the cost allocation methodology are presented below. Revenues collected from each customer class, Revenue Requirement by customer class, revenue cost ratios and the amount of miscellaneous revenues credited to each customer class is shown. The OEB Cost Allocation Methodology also determines the fixed charges based on three methods: a) Avoided costs, b) Directly Related customer costs and c) Minimum System with PLCC Adjustment. The table below shows the results of methods a and c. Finally, the credit applicable to USL connections is shown.

	Existing	**Alloc Cost**	**Rev-Cost**	**Misc Rev**	**Fixed Charge Method a**	**Fixed Charge Method c**	**USL Credit**
	Rev [$M]	**Rev Req [$M]**	**Ratio**	**[$M]**	**Avoid Cost**	**Min System**	
UR	57.70	65.95	0.87	3.82	$ 8.47	$ 22.12	
R1	197.14	240.19	0.82	10.63	$ 8.56	$ 29.67	
R2	404.61	390.30	1.04	11.96	$ 9.41	$ 45.37	
Seasonal	76.96	83.60	0.92	2.15	$ 6.34	$ 30.58	
GSe	119.59	111.13	1.08	5.67	$ 10.72	$ 30.97	$ 6.86
GSd	107.88	105.43	1.02	2.35	$ 26.49	$ 54.46	
UGe	12.08	9.34	1.29	0.47	$ 10.73	$ 12.33	
UGd	16.00	16.81	0.95	0.33	$ 29.19	$ 39.65	
St Lgt	4.89	8.11	0.60	0.11	$ 5.01	$ 12.40	
Sen Lgt	4.92	7.96	0.62	4.03	$ 2.36	$ 32.77	
Dgen	0.63	0.39	1.63	0.00	$ 25.26	$ 36.66	
ST	64.18	27.35	2.35	0.76	$ 192.71	$ 372.12	
	1,066.58	1,066.58	1.00	42.30			

In designing the proposed ST rates, the following information was calculated in the Cost Allocation Study.

	Amounts ($)
Fixed Revenue Requirement	8,381,668
Variable Revenue Requirement	18,968,378
Total ST Revenue Requirement	27,350,045

Minimum System Study

Hydro One retained Black and Veatch in 2007 to update the Minimum System Study used in the Cost Allocation Methodology. The Minimum System Study was first developed in the mid 1980's by Ontario Hydro. The results of the original Ontario Hydro study and the current Black and Veatch study are presented in the Table below.

Minimum System Study % of Fixed Costs

% Fixed	1980's	2007
Overhead Lines	61	54.8
Underground Lines	61	Included in Overhead Lines
Transformers	62	61.9
Poles Towers and Fixtures	N/A	47.8

The Minimum System Study update from Black and Veatch also updated the value of the Peak Load Carrying Capabilities (PLCC) and the new value for Conductors is 544 Watts and for Transformers is 3,100 Watts. These new values have been used in the Cost Allocation Study. The Black and Veatch report is included as Attachment B.

Input Sheet for Selection of Classes, Demand Allocators and Specific Allocators

Hydro One Distribution: 12 Rate Classes

Instructions
Step 1 - Please input your existing classes
Step 2 - If this is your first run, select "First Run" in the drop down menu below
Step 3 - After all classes have been entered, Click the "Update" in cell E41.

If this is your first run, select "**First Run**" and click on the "**Update**" button.
Note: You must always do a first run with current selected.

First Run

		Utility's Class Definition	Current
1	Residential	UR	YES
2	GS <50	R1	YES
3	GS>50-Regular	R2	YES
4	GS> 50-TOU	Seasonal	YES
5	GS >50-Intermediate	GSe	YES
6	Large Use >5MW	GSd	YES
7	Street Light	St Lgt	YES
8	Sentinel	Sen Lgt	YES
9	Unmetered Scattered Load		NO
10	Embedded Distributor		NO

Metering Unit Cost

ALLOCATION BY RATE CLASSIFICATION

Description	GSe
Depreciation on Acct 1860 Metering	$1,155,178
Depreciation on General Plant Assigned to Metering	$217,229
Acct 5065 - Meter expense	$709,625
Acct 5070 & 5075 - Customer Premises	$1,443,925
Acct 5175 - Meter Maintenance	$143,136
Acct 5310 - Meter Reading	$1,630,202
Admin and General Assigned to Metering	$1,262,096
PILs on Metering	$203,531
Debt Return on Metering	$603,280
Equity Return on Metering	$615,061
Total	$7,983,264
Number of Customers	97,005
Metering Unit Cost ($/Customer/Month)	**$6.86**
General Plant - Gross Assets	$75,974,676
General Plant - Accumulated Depreciation	($41,406,864)
General Plant - Net Fixed Assets	$34,567,813
General Plant - Depreciation	$5,623,567
Total Net Fixed Assets Excluding General Plant	$394,728,573
Total Administration and General Expense	$12,800,842
Total O&M	$39,828,568
Metering Rate Base	
Acct 1860 - Metering - Gross Assets	$13,404,195
Metering - Accumulated Depreciation	$1,843,521
Metering - Net Fixed Assets	$15,247,715
General Plant Assigned to Metering - NFA	$1,335,298
Metering Net Fixed Assets Including General Plant	$16,583,013

Data Sheet to Show How Density is Derived and How Costs are Categorized

Hydro One Distribution: 12 Rate Classes

Density of Utility

Density	Number of Customers	kM of Lines
9.8	1177552	119900

Dx Lines	0.548
0	1
Old	New
0.6	0.548

Fixtures	0.478
0	1
Old	New
0.6	0.478

Deemed Customer Cost Component based on Survey Results

		Customer Component	
If Density is < 30 customers per kM of lines then	LOW	0.548	All
If Density is Between 30 and 60 customers per kM of	MEDIUM	0.4	All
If Density is Between > 60 customers per kM of lines t	HIGH	0.35	Distribution
If Density is Between > 60 customers per kM of lines t	HIGH	0.3	Transformers

Rtransf	0.619
0	1
Old	New
0.6	0.619

Hydro One Distribution: 12 Rate Classes

This sheet shows what accounts are included in the COSS, and how they are grouped into working capital and rate base. It shows how accounts are categorized in the customer and demand related costs. It will then show how the categorized costs are allocated to customer and demand related components. It will also show how Miscellaneous Revenue and General Plant and Administration costs are allocated. FInally, it will show how costs are being grouped together for presentation purposes.

Report to

Hydro One Networks Inc.

Regarding

Distribution Business Minimum System Study

August 20, 2007

TABLE OF CONTENTS

I. Summary

A. Background and Purpose

R. J. Rudden Associates, a unit of the Enterprise Management Solutions Division of Black & Veatch Corporation ("B&V" or "we") is pleased to submit this Report on Hydro One Networks Inc. Distribution Business Minimum System Study ("Study") to Hydro One Networks Inc. ("Hydro One").

BV was engaged by Hydro One to perform this Study for the purpose of computing the minimum system components for the conductors (sometimes called feeders) and line transformers used in Hydro One's distribution system. The Study included reviewing Line Transformers (account 1850) and Distribution Feeders, which includes poles and conductors (accounts 1830 -1845), and included computation of the Peak Load Carrying Capability of the minimum system.

Hydro One intends to use the results of the Study in its class cost allocation study. The Minimum System approach was recommended by the OEB in its Cost Allocation Review report issued September 29, 2006.

In this Report we present and support our methodology for performing the Study and present the results.

B. Hydro One Distribution System

Hydro One Networks is an integrated transmission and distribution utility, regulated by the OEB. The distribution business spans roughly 75% of the area of Ontario and serves 71 Local Distribution Companies, over one million customers and 43 directly connected large users. There are over $3 billion in fixed assets consisting of over 119,600 circuit kilometers of distribution lines, operating at voltages below 50 kV, and over 1,000 distributing and regulating substations. Most of the distribution system serves areas with low customer densities. The system is mainly radial in design, with very little redundancy in supply to customers, which is consistent with other rural systems.

C. Minimum System Study

The purpose of a Minimum System Study is to determine the smallest components (i.e., transformers, overhead conductors, underground conductors, services) that is generally installed by the utility. The cost of each minimum system component is compared to the actual average cost for each component, to determine the minimum system ratio, or the portion of total costs represented by the minimum system.

The results of the Minimum System Study are used to classify Hydro One's transformers, conductors, conduits and services plant, as either demand-related or customer-related. The minimum system study identifies the hypothetical minimum system that the utility could install and uses the ratio of the hypothetical minimum system to the cost of the existing system as the basis for the customer –related classification of costs. The hypothetical minimum system created by the study has some peak load-carrying capacity ("PLCC"), and our Study also determined the PLCC for each component.

D. Results

Table 1 below summarizes the results of the Study.

TABLE 1. SUMMARY OF RESULTS

Component	Minimum Component	Minimum System Ratio	PLCC Watts Per Customer
Line transformers	10 kVA 1-phase	61.90%	3,099 W
Conductors	#2 ASCR two-wire system (one conductor, one neutral)	54.78%	544 W
Poles, Towers and Fixtures		47.80%	

The Company's prior Minimum System Study, completed in 1985 ("1985 Study"), showed a 62% minimum system ratio for transformers, based on a 3 kVA minimum component. The 1985 Study also showed a 61% minimum system ratio for Conductors, based on a minimum components of #6 Cu for the primary portion of distribution system, 1 X #4 Al plus 2 X #6 Al for the secondary portion and 2X #6 Al for services.

The Minimum System Ratios that resulted from our Study, as presented in Table 1, are reasonable based on our experience and knowledge of minimum system studies for electric distributors, and are reasonably consistent with the results of the 1985 Study.

The 1985 Study showed a transformer minimum system PLCC of 300 Watts per customer. Some of the difference is due to the higher minimum component specified for the present Study (10kVA) and the 1985 Study (3 kVA). The 1985 Study also showed a conductor minimum system PLCC of 180 Watts per customer.

E. About BV; Scope of Assignment

The Enterprise Management Solutions Division of Black & Veatch Corporation provides strategic, economic and management consulting firm specializing in energy matters. We provide assistance in areas such as economic analysis, strategy development, operational assessment, industry restructuring support, litigation and regulatory support and technical analysis. BV has assisted many electric, gas, water and telecommunications clients in hundreds of proceedings, including recent work in the area of shared services cost allocations.

Consistent with standard practice for consulting assignments, we relied on the genuineness and completeness of all documents presented to us by Hydro One and we accepted factual statements made to us by Hydro One, subject only to overall reasonableness and actual contrary knowledge, but without independent confirmation.

All amounts in this Report are in Canadian dollars.

II. MINIMUM SYSTEM STUDY APPROACH

A. Purpose and Uses

The purpose of a Minimum System Study is to determine the smallest components that is generally installed by the utility. Two separate analyses are performed; one for transformers, another for overhead conductors and underground conductors and services.

The cost of the minimum system for each component is compared to the actual cost of the existing system for each component. The ratio of the minimum system costs to the existing system cost is the minimum system ratio for each component.

The results of the Minimum System Study are used to classify Hydro One's transformers, conductors, conduits and services plant, as either demand-related or customer-related. The classification affects how the utility's costs (or revenue requirement) are allocated among the customer classes. The minimum system for each component includes some peak load-carrying capacity ("PLCC"), and our Study determined the PLCC for each component. The PLCC is used to adjust the allocators used for the demand-related component of costs.

The following definitions may be helpful:

Minimum Component- The least-cost/smallest size component that is generally installed by the utility. For example, the minimum component for line transformers was determined to be a 10 kVA transformer.

Minimum System- The system that would be installed if all existing components were replaced with the Minimum Component. For example, the minimum system for line transformers would be a system comprising all 10 kVA transformers instead of the existing mix of transformers capacities.

Minimum System Ratio- The ratio of the X) the cost of the Minimum System to Y) the cost of the existing system.

Peak load-carrying capability- The load carrying capability of each component at the time of the system peak.

In this Study we performed two analyses- One for line transformers, and one for all Conductors including overhead, underground and services.

B. Approach

Our approach for preparing a Minimum System Study is presented below. This approach is applied to each distribution system component in the study. For each component:

1. Obtain a listing of all types of the component installed on the system. 'Types' includes differentiation as to capacities, materials, sizes and other pertinent qualities. For example each transformer type is identified as to capacity (kVA), design (line or pad mount) and number of phases.

2. Compute the current replacement cost for the existing system, either by indexing historical costs or by using current replacement costs for each component type.

3. Determine the Minimum Component; i.e., the least-cost component that is generally installed by the utility, as well as the current cost of the Minimum Component.

4. Compute the current cost for the Minimum System; i.e., the system that would be installed if all existing components were replaced with the Minimum Component.

5. Compute the Minimum System Ratio; i.e., ratio of the X) current cost of Minimum System to Y) current replacement cost of existing system.

6. Compute the PLCC based on the capacity of the minimum system and the number of customers supplied

C. Components in Minimum System Study

In this Study we performed separate analyses for line transformers and for Conductors. Line Transformers included assets in Hydro One's account 1850. Conductors, or Distribution Feeders included overhead conductors (account 1835), underground conduits (account 1840) and underground conductors and devices (account 1845).

Poles, towers and fixtures (account 1830) are classified proportionately to Overhead conductors because these assets support the overhead conductors.

The amounts in the accounts included the costs of material and installation and a charge for corporate overheads.

III. LINE TRANSFORMERS

A. Types of Transformers

Table 2 below summarizes Hydro One's distribution line transformers.

TABLE 2- NUMBERS OF TRANSFORMERS					
Capacity kVA	**Overhead Transformers**		**Pad Mount Transformers**		
	1-Phase Supply	**3-Phase Supply from 1-Phase (a)**	**1-Phase Supply**	**3-Phase Supply**	**3-Phase Supply from 1-Phase (a)**

Total All	**451,440**				
(a) Number of 1-phase units that would replace existing units.					

B. Current Replacement Cost for Existing System

To determine the current replacement cost for Hydro One's existing transformers, we first obtained from Hydro One the current replacement costs for the transformer types for which the costs were available. These transformer types are shown in **bold** in Table 2.

The unit transformer costs provided by Hydro One are shown in Table 3, which also shows the percentage of units and dollars represented by the costs provided by Hydro One. For the other transformer types listed in Table 2, we determined the replacement costs by extrapolation or interpolation.

A range costs were provided for each transformer type. For example, for 10 kVA 1-phase overhead transformers, Hydro One provided costs for units with high side voltages from 2.4 kV to 7.2/16 kV. Costs ranged from $1,828 to $2,354 per unit. In this Study we used the average of all costs to represent 10 kVA 1-phase overhead transformers.

TABLE 3- UNIT TRANSFORMER COSTS					
Capacity kVA	**Overhead Transformers**		**Pad Mount Transformers**		
	1-Phase Supply	**3-Phase Supply from 1-Phase**	**1-Phase Supply**	**3-Phase Supply**	**3-Phase Supply from 1-Phase**
10	$1,982	$6,466			
25	2,414	7,236	$5,134		$15,402
50	3,056	8,961	5,624		16,872
75	3,825	11,336	6,318		18,955
100	4,002	12,297	6,378		19,133
150				$16,324	
167	5,624	18,982	8,134		
300				17,508	
500/501				20,112	
750				19,992	
999/1000				30,722	
Costs Provided by Hydro One					
% of Units	85%	93%	91%	37%	97%
% of Dollars	89%	94%	93%	33%	98%
Total % of Units	**86%**				
Total % of Dollars	**88%**				

The total current replacement cost for existing transformers was $1,333,357,659.

C. Minimum Component and Minimum System

The least-cost Transformer Minimum Component was determined to be a 10 kVA 1-phase overhead transformer, with high-side voltage of 7.2 kV.

The current replacement cost of the Minimum Component is $1,828.29, as provided by Hydro One. This cost is lower than the cost in Table 3; the cost in Table 3 represents the average of costs for 10 kVA 1-phase overhead transformers with high-side voltages from 2.4 kV to 7.2/16 kV.

The current cost for the Transformer Minimum System, the system that would be installed if all existing components were replaced with the Minimum Component, is $825,363,000, equal to 451,440 transformers times $1,828.29 per transformer.

D. Minimum System Ratio

The Minimum System Ratio is the ratio of X) current cost of Minimum System to Y) current replacement cost of existing system. The Transformer Minimum System Ratio is computed in Table 4:

TABLE 4- TRANSFORMERS MINIMUM SYSTEM RATIO

	Total ($000s)
Current replacement cost:	
Existing transformers at existing capacities	$1,333,358
Minimum System Cost	$ 825,363
Transformers Minimum System Ratio	**61.90%**

E. Peak Load Carrying Capability

The Transformers Peak Load-Carrying Capability ("PLCC") is based on all existing transformers being replaced with the minimum component, 10 kVA 1-phase transformers. The Transformers PLCC was calculated as follows:

Number of existing transformers	451,440
Capacity (kVA) of Minimum Component	10
Assumed power factor	80%
Distribution system Transformers PLCC	3,611,520
Number of customers	1,165,092
Transformers PLCC (Watts Per Customer)	**3,099**

IV. CONDUCTORS

A. Types of Conductors

Hydro One's distribution system includes conductors operating at voltages 12.5 kV and under. The primary distribution system comprises voltages 12.5 kV to 4.16 kV, and the secondary distribution system, which is primarily service drops, comprises conductors operating at voltages under 750 V. Table 5 below shows the types and lengths of conductors in Hydro One's distribution system, as provided by Hydro One.

TABLE 5- CONDUCTOR TYPES AND LENGTHS

Description	Voltages	Conductors (km)	Neutrals (km)	Total (km)
Subtransmission	44 kV-13.8 kV	75,600	8,200	83,800
Primary	12.5 kV-4.16 kV	155,100	83,800	238,900
Secondary / Services	<750 V	47,800		47,800
Total		**278,500**	**92,000**	**370,500**

The Subtransmission portion of the distribution system was determined by Hydro One to be 100% capacity-related, which is consistent with generally accepted practice. The Study included the Primary and Secondary / Services portions of the distribution system.

B. Current Replacement Cost for Existing System

To compute the current replacement cost for the existing Primary Distribution system and for Secondary / Services system, we obtained the vintaged historical costs for Overhead conductors, Underground conductors and devices and Underground conduits, from Hydro One's PeopleSoft Asset Management ("PS_AM") system.

The PS_AM system provided vintaged historical costs for each of Overhead conductors, Underground conductors and devices and Underground conduits. To compute the historical cost in 2006 dollars, we indexed each year's costs for each asset category using the appropriate Handy-Whitman index, for the North Central region, which is the region used by Hydro One for planning purposes.

The PS_AM report includes the entire distribution system. To obtain the Primary distribution portion we multiplied the total by 65%, which is Hydro One's estimate of the Primary portion of the Historical costs. To obtain the Secondary / Services portion we multiplied the total by 15%, Hydro One's estimate of that portion of Historical costs.

The results are presented in Table 6 below. The Lengths and Historical Costs for Overhead conductors, Underground conductors and devices and Underground conduits are from the PS_AM Report. The Indexed Costs were computed by applying the appropriate Handy-Whitman index. The Primary and Secondary / Services portions were computed by multiplying the totals by the 65% and 15% portions respectively.

TABLE 6- CONDUCTOR SYSTEM REPLACEMENT COSTS

Description	Length (km)	Historical Cost ($000s)	Indexed Cost (a) ($000s)
Overhead conductors	363,517	$964,228	$2,377,566
Underground conductors / devices	6,183	98,321	158,871
Underground conduits		22,895	44,735
Total	**369,700**	**$1,085,444**	**$2,581,172**
Primary portion	65%	65%	65%
Primary	**238,900**	**$705,539**	**$1,677,762**
Secondary / Services portion	15%	15%	15%
Secondary / Services	**47,800**	**$162,817**	**$387,176**
(a) Indexed to 2006 dollars.			

C. Minimum Component and Minimum System

1. Primary Distribution System

The Primary distribution system comprises conductors operating at voltages from 12.5 kV to 4.16 kV.

The Minimum Component was determined to be a #2 ASCR two-wire system (one conductor and one neutral). The length of the minimum system was determined to be the length of the existing neutrals, 83,800 km. All existing conductors were deemed to be replaced with Overhead conductors in the Minimum System, because Overhead conductors are less costly than Underground conductors and there are no regions with engineering restrictions on Overhead conductors. There may be some restrictions on Overhead conductors due to local by-laws but these were deemed to be not relevant and not material for the Study.

Hydro One provided the standard current cost for a 1km installation of the Minimum Component, including a corporate overhead charge to be comparable to the values in the PS_AM Report. The current cost for the Minimum System was calculated by scaling the

1 km standard cost for a 720 meter installation, which was the average installation length reported in 2006. The current replacement cost was thus computed to be $9,109 per km.

The current cost for the Primary Minimum System, the system that would be installed if all existing Primary components were replaced with the Minimum Component, is $763,334,000 equal to 83,800 circuit km times $9,109 per km.

2. Secondary Distribution System / Services

The Secondary distribution system / Services comprises conductors operating at voltages under 750 V. The material and length, and therefore cost, for these conductors vary based on the customers' requirements, however the service installed for each customer must be selected to meet that customer's needs without the benefit of diversity. No Minimum Component was specified for the Secondary distribution system / Services.

Based on our experience and generally accepted practice, B&V determined that the Secondary distribution system / Services Minimum System Ratio was 95%. Multiplying 95% times the current replacement cost of Secondary / Services, $387,176,000 as shown in Table 6, produces a current replacement cost for Secondary / Services Minimum System of $367,817,000.

D. Minimum System Ratio

The Minimum System Ratio is the ratio of X) current cost of Minimum System to Y) current replacement cost of existing system. The Conductors Minimum System Ratio is computed as shown in Table 7:

TABLE 7- CONDUCTORS MINIMUM SYSTEM RATIO

Description	Primary ($000s)	Secondary / Services ($000s)	Total ($000s)
Current replacement cost:			
Existing conductors	$1,677,762	$387,176	$2,064,938
Minimum System Cost	763,334	367,817	1,131,151
Conductors Minimum System Ratio			**54.78%**

E. Poles, Towers and Fixtures Minimum System Ratio

Poles, towers and fixtures (account 1830) are classified proportionately to Overhead conductors because these assets support the overhead conductors. The Minimum System Ratio for Poles, towers and fixtures was computed as shown in Table 8.

TABLE 8- POLES, TOWERS AND FIXTURES MINIMUM SYSTEM RATIO

Description	Amount ($000s except per km)
Overhead conductors, Index costs	$2,377,566
Primary portion	65%
Primary	1,545,418
Replacement circuit km	81,099
Replacement cost per circuit km	$9,109
	738,726
Poles, Towers and Fixtures Minimum System Ratio	**47.80%**

F. Peak Load Carrying Capability

The Conductors Peak Load-Carrying Capability ("PLCC") is based on is based on a rating of 184 amps per feeder of #2 ASCR wire. Hydro One's system contains 1,035 distribution substations and it is assumed that (in the Minimum System) each distribution substation would supply a single feeder.

The existing system has a combination of feeders at capacities of 12.5 kV and 4.16 kV. The Transformer Minimum Component has a high-side capacity of 7.2 kV; therefore the Minimum System would operate at 4.16 kV, because 12.5 kV would exceed the capacity of the Transformer Minimum Component.

The Conductors PLCC was calculated as follows:

Rating for each distribution feeder circuit, amps (a)	184
Line-to-Neutral Voltage, kV	4.16
Circuit capacity per distribution feeder, kVA	765
Assumed power factor	80%
Circuit capacity per distribution feeder, kW	612
Number of distribution substations (b)	1,035
Distribution system Conductors PLCC, kW	633,420
Number of customers	1,165,092
Conductors PLCC (Watts Per Customer)	**544**

(a) Continuous Current Rating Under Summer 60C/40C, Sun/No Wind Condition (Amp)

(b) Assumed equal to number of distribution feeders

HARMONIZATION OF ACQUIRED LDC CUSTOMERS

1.0 INTRODUCTION

This exhibit provides numerical details in support of the proposed harmonization plan for the 88 Acquired Utilities. Included here also are the complete set of likely customer bill impacts.

Initially, a review is provided of the existing rates for each of the Acquired Utilities as of May 1st, 2007 including Regulatory Asset Rate Riders. Then the harmonization proposal supporting data is presented.

2.0 ACQUIRED LDC RATE CLASSES AND CURRENT RATES

The current individual rates and rate riders for each of the Acquired LDCs are shown in Tables 1, 2, 3 and 4 with Table 5 being a summary.

Table 1
